oldSize: The size of the split view before the user resizes it.

If the delegate implements this method, it receives this message after the split view resizes.

Resize the subviews so that the sum of the sizes of the subviews plus the sum of the thickness of the dividers equals the size of the new frame of the NSSplitView. You can get the thickness of a divider through the dividerThickness method.

If you implement this delegate method to resize subviews on your own, the NSSplitViewMBS doesn,Äôt perform any error checking for you. However, you can invoke adjustSubviews() to perform the default sizing behavior.

35.30.25 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.30.26 shouldAdjustSizeOfSubview(view as NSViewMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to specify whether to resize the subview.
Notes:

subview: The subview to resize.

If adjustSubviews() can change the size of the subview, return true; otherwise, false. By returning false, you lock the size of the split view subview while the split view resizes.

Regardless of the value that this method returns, adjustSubviews() may change the origin of the subview. Nonresizable subviews may resize to prevent an invalid subview layout.
If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if this method returns true.

35.30.27 shouldHideDivider(dividerIndex as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to determine whether the user can drag a divider or adjust it off the edge of the split view.
Notes:

dividerIndex: The zero-based index of the divider.

Return true if the user can drag the divider off the edge of the split view, resulting in it not being visible.

If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if it has a delegate that returns false when it receives this message.

35.30.28 splitViewDidResizeSubviews

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Notifies the delegate when the split view resizes its subviews.
Notes: The control invokes this event after the split view resizes two of its subviews in response to the repositioning of a divider.

35.30.29 splitViewWillResizeSubviews

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Notifies the delegate when the split view is about to resize its subviews.
Notes: The control invokes this method before the split view resizes two of its subviews in response to the repositioning of a divider.

35.31 control DesktopNSSwitchControlMBS

35.31.1 control DesktopNSSwitchControlMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSSwitch as control in Xojo.
Notes: Available on macOS 10.15 or newer.

35.31.6 Properties

35.31.7 State as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The current state.
Notes:

Set to true for toggle on and set to false for toggle off.
(Read and Write property)

35.31.8 View as NSSwitchMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.31.9 Events

35.31.10 Action

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The action event.

35.31.11 BoundsChanged

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.31.12 Closing

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.31.13 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.31.14 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.31.15 FocusLost

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.31.16 FocusReceived

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.31.17 FrameChanged

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.31.18 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.31.19 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.31.20 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.31.21 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.31.22 Opening

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.31.23 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.32 control DesktopNSTableControlMBS

35.32.1 control DesktopNSTableControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control for a NSTableView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

35.32.8 Properties

35.32.9 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

35.32.10 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes:

The default value of this property is true, which allows the user to rearrange the table view,Äôs columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

35.32.11 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes:

The default of this property is true, which allows the user to resize the table view,Äôs columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

35.32.12 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes:

The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

35.32.13 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes:

The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

35.32.14 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes:

The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.

(Read and Write property)

35.32.15 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes:

The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

35.32.16 disableCellEvents as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether to disable cell based events.
Notes:

The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable cells and use only views.
(Read and Write property)

35.32.17 disableViewEvents as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether to disable view based events.
Notes:

The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable views and use only cells.
(Read and Write property)

35.32.18 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

35.32.19 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

35.32.20 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scroll view used in this control.
Notes: (Read only property)

35.32.21 View as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The table view used in this control.
Notes: (Read only property)
See also:

- 35.32.87 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS 7987

35.32.22 Events

35.32.23 acceptDrop(info as NSDraggingInfoMBS, row as Integer, dropOperation as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called by TableView when the mouse button is released over a table view that previously decided to allow a drop.
Notes:

info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation.

Returns true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can use the draggingPasteboard method to get the data for the drop operation from info.
To accept a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To accept a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

35.32.24 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.32.25 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.32.26 ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event informs the delegate that a column was moved by user action in the table view.

35.32.27 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event informs you that a column was resized in the table view.

35.32.28 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.32.29 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.32.30 dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Optional return a different cells for each row.
Notes:

A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don't return a cell, the method will be called once for each tableColumn in the tableView, as usual.

35.32.31 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the delegate that a row view was added at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

35.32.32 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called if a table column was clicked on.

35.32.33 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent at the time the mouse button goes up in tableView and tableColumn has been dragged during the time the mouse button was down.
Notes:

tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the dragged column is sent to the subclass. In earlier versions the table column that is currently located at the dragged column's original index is sent.

35.32.34 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Tells the delegate that a row view was removed from the table at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.

35.32.35 didTile

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

35.32.36 DoubleClick

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse made a double click.

35.32.37 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Implement this method to determine when a dragging session has ended.
Notes:

session: The dragging session.
screenPoint: The ending drag location in screen coordinates.
operation: The drag operation. See NSDragOperation for supported values.

This delegate method can be used to determine when the dragging source operation ended at a specific location, such as the trash, by checking for an operation of NSDragOperationDelete.

35.32.38 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, rowIndexes as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Implement this method to determine when a dragging session will begin.
Notes:

session: The dragging session.
screenPoint: The initial drag location in screen coordinates.
rowIndexes: The indexes of the rows to be dragged, excluding rows that were not dragged due to pasteboardItemForRow returning nil.

Implement this method to know when the dragging session is about to begin and to potentially modify the dragging session.
The dragged item order will directly match the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo pasteboard classes.

35.32.39 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.32.40 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.32.41 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the frame changed.

Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.32.42 heightOfRow(row as Int64) as Double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Implement this event to support a table with varying row heights.
Notes: The height returned by this method should not include intercell spacing and must be greater than zero. Performance Considerations: For large tables in particular, you should make sure that this method is efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged is called, otherwise unpredicable results will happen. NSTableView automatically invalidates its entire row height cache in reloadData, and noteNumberOfRowsChanged.

35.32.43 isGroupRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to indicate that a specified row is a group row.
Notes:

row: The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually ‚Äòfloat' by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.
Available in Mac OS X v10.5 and later.

35.32.44 LeftMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has pressed the left mouse button.

Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.45 LeftMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.46 LeftMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.47 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.32.48 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.

- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.32.49 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent to the subclass whenever the mouse button is clicked in the table view's header column.
Notes: tableColumn: The table column.

35.32.50 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.32.51 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.32.52 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedRowsWithIndexes as NSIndexSetMBS) as string()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Returns an array of filenames that represent the indexSet rows for a drag to dropDestination.
Notes:

dropDestination: The drop location where the files are created.
indexSet: The indexes of the items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

This method is called when a destination has accepted a promise drag.
For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination:.

35.32.53 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to modify how type selection works.
Notes:

startRow: The starting row of the search range.
endRow: The ending row of the search range.
searchString: A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches selectionString. Return -1 if no match is found.

It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

35.32.54 numberOfRowsInTableView as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when the table view needs to know the number of rows.
Notes: numberOfRowsInTableView is called very frequently, so it must be efficient.

35.32.55 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a value is required for a given cell.
Notes: Please implement your own arrays to store values.

35.32.56 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.32.57 OtherMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.58 OtherMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.59 OtherMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.60 pasteboardItemForRow(row as Integer) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called to allow the table to support multiple item dragging.
Notes:

row: The row.

Returns an instance of NSPasteboardItem. Returning nil excludes the row from being dragged.

This method is required for multi-image dragging.
If this method is implemented, then writeRowsWithIndexes will not be called.

This is pasteboardWriterForRow method.

35.32.61 RightMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.62 RightMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.63 RightMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.32.64 rowActionsForRow(row as Integer, edge as Integer) as NSTableViewRowActionMBS()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Asks the control to provide an array of row actions to be attached to the specified edge of a table

row and displayed when the user swipes horizontally across the row.
Notes:

row: The index of the target row.
edge: The edge (NSTableRowActionEdgeLeading or NSTableRowActionEdgeTrailing) for which row actions are requested. This is based on the direction in which the user swiped on the row. Swiping to the right results in an edge value of leading. Swiping to the left results in an edge value of trailing.

Returns an array of row actions (of class NSTableViewRowActionMBS) to be enabled on the specified edge of the table row.

Implement this method if your table row supports actions that are displayed when the user swipes horizontally across the row. For example, your table view could use this method to implement a swipe left to delete function in your table rows. When called, this method receives the table view, the index of the row the user swiped, and an edge of type NSTableRowActionEdge. The method should return an array of any row actions of class NSTableViewRowAction that are supported for the specified edge. If no row actions are available, an empty array should be returned.
If this method isn,Äôt implemented, then the table row displays no actions when the user swipes horizontally away from the specified edge.

35.32.65 rowViewForRow(row as Integer) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Asks the delegate for a view to display the specified row.
Notes:

row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.
The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before it,Äôs added to the tableView.

This method is only valid for NSView-based table views.

35.32.66 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.32.67 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event informs you that the table view's selection has changed.

35.32.68 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view's existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

35.32.69 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event informs you that the table view's selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).

35.32.70 selectionShouldChangeInTableView as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Returns whether the selection should change.
Notes:

Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can't select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

35.32.71 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a cell value is saved to the datasource.

35.32.72 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Returns whether the cell at the specified row and column can be edited.
Notes:

TableColumn: The table column.
rowIndex: The row index.
Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.
Note: This method is only valid for cell-based table views.

35.32.73 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.

Notes:

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable.
Available in Mac OS X v10.6 and later.

35.32.74 shouldSelectRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Returns whether the table view should allow selection of the specified row.
Notes:

rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows.
For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

35.32.75 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Returns whether the specified table column can be selected.
Notes:

TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.

35.32.76 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control cell expansion for a specific row and column.
Notes:

TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

35.32.77 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.
Notes:

cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

35.32.78 shouldTypeSelectForEvent(e as NSEventMBS, searchString as string) as Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control type select for a specific event.
Notes:

event: The event.
searchString: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event.
Available in Mac OS X v10.5 and later.

35.32.79 sizeToFitWidthOfColumn(column as Int64) as Double

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to provide custom sizing behavior when a column's resize divider is double clicked.
Notes:

column: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.

35.32.80 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn,Äôt manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.

35.32.81 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

35.32.82 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

35.32.83 toolTipForCell(cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Returns a string that is displayed as a tooltip for the specified cell in the column and row.
Notes:

Cell: The cell.
r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
TableColumn: The table column.
row: The row index.

mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).
Available in Mac OS X v10.4 and later.

35.32.84 typeSelectString(tableColumn as NSTableColumnMBS, row as Int64) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.
Notes:

tableColumn: The table column.
row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default, all cells with text in them are searched.

If this event is not implemented the string value is the cell string value.
Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

35.32.85 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Implement this method to allow the table to update dragging items as they are dragged over a view.
Notes:

The dragging information.

Required for multi-image dragging. Typically this will involve invoking enumerateDraggingItemsWithOp-

tions on the draggingInfo parameter value and setting the draggingItem object,Äôs imageComponentsProvider to a proper image based on the content.
For view-based table views, you can use the NSTableCellView method draggingImageComponents. For cell-based tables, use the NSCell method draggingImageComponentsWithFrame.

35.32.86 validateDrop(info as NSDraggingInfoMBS, proposedRow as Integer, dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Used by aTableView to determine a valid drop target.
Notes:

info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation proposed.

Returns the dragging operation the data source will perform.

The data source may retarget a drop by calling setDropRow and returning something other than NSDragOperationNone. A data source might retarget for various reasons, such as to provide better visual feedback when inserting into a sorted position.
To propose a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To propose a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

35.32.87 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Asks the delegate for a view to display the specified row and column.
Notes:

see also
https://developer.apple.com/reference/appkit/nstableviewdelegate/1527449-tableview?language=objc
See also:

- 35.32.21 View as NSTableViewMBS 7967

35.32.88 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs you that the tableview will display the specified cell at the row in the column.
Notes:

Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.

The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

35.32.89 willTile

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

35.32.90 writeRowsWithIndexes(rowIndexes as NSIndexSetMBS, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes:

rowIndexes: An index set of row numbers that will be participating in the drag.
pboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, false otherwise.

Called by TableView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with true.

35.33 control DesktopNSTextFieldControlMBS

35.33.1 control DesktopNSTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSTextField.
Notes:

This control embeds a special NSTextField subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

35.33.2 Blog Entries

35.33.4 Properties

35.33.5 View as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.33.6 Events

35.33.7 Action

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The control's action was triggered.
Notes: The text changed.

35.33.8 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.33.9 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.33.10 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.33.11 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.33.12 FocusLost

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.33.13 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.33.14 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.33.15 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.33.16 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.33.17 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.33.18 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.33.19 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.33.20 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.33.21 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

35.33.22 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.33.23 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditing-Notification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

35.33.24 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.33.25 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.34 control DesktopNSTextViewControlMBS

35.34.1 control DesktopNSTextViewControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSTextView.
Notes:

This control embeds a special NSTextView subclass.
Designed for Xojo 2021r3 and newer.
Please use view property to access the underlaying object and set properties.

35.34.4 Properties

35.34.5 AcceptTabs as Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

35.34.6 Scrollview as Variant

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The scrollview for this textview.
Notes: (Read only property)

35.34.7 View as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.34.8 Events

35.34.9 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.34.10 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.34.11 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.34.12 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.34.13 FocusLost

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.34.14 FocusReceived

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.34.15 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.34.16 MenuBarSelected

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.34.17 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.34.18 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.34.19 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.34.20 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.34.21 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.34.22 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when a text view needs to determine if text in a specified range should be changed.
Notes:

affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

35.34.23 textDidBeginEditing

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs you that the text object has begun editing (that the user has begun changing it).

35.34.24 textDidChange

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs you that the text object has changed its characters or formatting attributes.

35.34.25 textDidEndEditing

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Informs you that the text object has finished editing (that it has resigned first responder status).

35.34.26 textShouldBeginEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked when a text object begins to change its text, this method requests permission to begin editing.
Notes: If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

35.34.27 textShouldEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

35.34.28 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when the selection changes in the text view.

35.35 control DesktopNSTokenFieldControlMBS

35.35.1 control DesktopNSTokenFieldControlMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSTokenField.

35.35.2 Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo Plugins, version 21.4pr1
- MBS Xojo Plugins, version 21.1pr2

35.35.3 Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo Plugins, version 21.4pr1
- MBS Xojo Plugins, version 21.1pr2

35.35.4 Properties

35.35.5 View as NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The view used for the control.
Notes: (Read only property)

35.35.6 Events

35.35.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.35.8 Closing

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.35.9 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes:

substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.

If the delegate does not implement this method, no completions are provided.
Available in OS X v10.4 and later.

35.35.10 ConstructContextualMenu(base as DesktopMenuItem, x as Integer, y as Integer) As Boolean

Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.35.11 ContextualMenuItemSelected(selectedItem As DesktopMenuItem) As Boolean

Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.35.12 displayStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented object.
Notes:

representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

35.35.13 editingStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes:

representedObject: A represented object of the token field.

Returns a string that's an editable proxy of the represented object, or nil if the token should not be editable.

35.35.14 FocusLost

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.35.15 FocusReceived

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.35.16 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.35.17 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes:

representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

35.35.18 MenuBarSelected

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.35.19 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to provide a menu for the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.

35.35.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.35.21 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.35.22 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.35.23 Opening

Plugin Version: 21.5, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.35.24 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes:

pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

35.35.25 representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to provide a represented object for the given editing string.
Notes:

editingString: The edited string representation of a represented object.

Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

35.35.26 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.35.27 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows to validate the tokens to be added to the receiver at a particular location.
Notes:

tokens: An array of tokens to be inserted in the receiver at index.
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

35.35.28 styleForRepresentedObject(representedObject as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Allows the delegate to return the token style for editing the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don't implement this method, the token field's tokenStyle is used.

35.35.29 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

35.35.30 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.35.31 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

35.35.32 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.35.33 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.35.34 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The control's action was triggered.
Notes: For a button if it was pressed.

35.35.35 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing.

35.35.36 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow text editing.

35.35.37 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: .

Function: Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
Notes:

objects: An array of represented objects associated with the token field.
pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

35.36 class DesktopPopupMenu

35.36.1 class DesktopPopupMenu

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Gives access to the NSMenuMBS of the PopupMenu.

35.36.2 Methods

35.36.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox PopupMenu1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.36.4 NSPopUpButtonMBS as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSPopUpButtonMBS object for the given control.
Example:

```
// get cocoa view for the popupmenu
dim p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
dim it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
dim pic as Picture = LogoMBS(500)
dim img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes: This way you can manipulate Cocoa controls directly.

35.37 class DesktopProgressWheel

35.37.1 class DesktopProgressWheel

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in ProgressWheel class in Xojo.

35.37.2 Methods

35.37.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSProgressIndicatorMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.38 class DesktopRadioButton

35.38.1 class DesktopRadioButton

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

35.38.2 Methods

35.38.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox RadioButton1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.39 class DesktopRadioGroup

35.39.1 class DesktopRadioGroup

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

35.39.2 Methods

35.39.3 NSButtonsMBS as NSButtonMBS()

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Queries the buttons within a radio button group.
Example:

```
Dim buttons() As NSButtonMBS = RadioGroup1.NSButtonsMBS

For Each button As NSButtonMBS In buttons
button.alphaValue = 0.5 // half transparent
Next

Break
```

35.40 class DesktopScrollBar

35.40.1 class DesktopScrollBar

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in Scrollbar class in Xojo.

35.40.2 Methods

35.40.3 NSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollerMBS object for the given control.
Example:

MsgBox ScrollBar1.NSScrollerMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.41 class DesktopSearchField

35.41.1 class DesktopSearchField

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built-in search field control in Xojo.
Notes: Only for Xojo 2020r2 or newer.

35.41.2 Methods

35.41.3 NSSearchFieldMBS as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Queries search field object for the control.
Notes: Only for Xojo 2021r3 or newer.

35.42 class DesktopSegmentedButton

35.42.1 class DesktopSegmentedButton

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Build in Segmented Control class in Xojo.

35.42.2 Methods

35.42.3 NSSegmentedControlMBS as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSegmentedControlMBS object for the given control.
Example:

SegmentedControl1.NSSegmentedControlMBS.selectedSegment = 0

Notes: This way you can manipulate Cocoa controls directly.

35.43 class DesktopSeparator

35.43.1 class DesktopSeparator

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in Separator class in Xojo.

35.43.2 Methods

35.43.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.44 class DesktopSlider

35.44.1 class DesktopSlider

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The built in slider class in Xojo.

35.44.2 Methods

35.44.3 NSSliderMBS as NSSliderMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSliderMBS object for the given control.
Example:

MsgBox Slider1.NSSliderMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.45 class DesktopTabPanel

35.45.1 class DesktopTabPanel

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Extends the TabPanel control inside Xojo.

35.45.2 Methods

35.45.3 NSTabViewMBS as NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTabViewMBS object for the given control.
Example:

MsgBox TabPanel1.NSTabViewMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.46 class DesktopTextArea

35.46.1 class DesktopTextArea

Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in textarea class in Xojo.
Example:

```
// make a PDF from a textarea in Cocoa Xojo target:

// find view
dim n as NSViewMBS = TextArea1.NSViewMBS
if n = nil then
MsgBox "Only in Cocoa!"
Return
end if

// make pdf data
dim s as string = n.dataWithPDFInsideRect(0,0,n.frame.Width, n.frame.Height)

// save
dim f as FolderItem = GetSaveFolderItem("", "test.pdf")

if f<>Nil then

dim b as BinaryStream = BinaryStream.Create(f, true)

b.Write s

end if
```

Notes: Requires Xojo 2021r3 or newer.

35.46.2 Methods

35.46.3 NSScrollViewMBS as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollViewMBS object for the given control.
Example:

```
MsgBox TextArea1.NSScrollViewMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

35.46.4 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes:

This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

35.46.5 NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextViewMBS object for the given control.
Example:

```
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes:

This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

35.46.6 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Example:

```
// called im a thread:
TextArea1.SetTextThreadSafeMBS "Hello World"
```

Notes:

This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

35.46.7 WinInsertImageMBS(data as string, Width as Integer, Height as Integer)

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Inserts image to file.
Example:

```
Dim pic As Picture = LogoMBS(500)
Dim data As String = pic.GetData(pic.SaveAsJPEG)

call TextArea1.WinInsertImageMBS(data, 500, 500)
```

Notes:

Specify size in pixels and image data.
Image data works with JPEG and other data types.
Requires Windows 8 or newer.

35.46.8 WinShowFontPanelMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Shows font dialog.
Example:

```
If TextArea1.WinShowFontPanelMBS Then
// update controls as font may have been changed?

End If
```

Notes:

You can make changes and apply them with OK button.
Returns true when OK is selected.

35.46.9 Properties

35.46.10 RTFDataMBS as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Get or set the textview content as RTF data.
Example:

```
dim rtf as MemoryBlock = TextArea1.RTFDataMBS
TextArea2.RTFDataMBS = rtf
```

Notes:

Works only for Cocoa and uses RTF parser/generator from Apple.

See also RTFDataMBS in StyledText, WinRTFDataMBS in TextArea and DesktopTextArea controls and RTFData in NSTextViewMBS class.
(Read and Write computed property)

35.46.11 WinAutoCorrectionMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Enables auto correction for Textarea.
Example:

```
# If TargetWindows Then
TextArea1.WinAutoCorrectionMBS = True
# ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.AutomaticSpellingCorrectionEnabled = True
# EndIf
```

Notes:

Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS

for MacOS.
(Read and Write computed property)

35.46.12 WinAutoHorizontalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll horizontally.
Notes:

Automatically scrolls text to the right by 10 characters when the user types a character at the end of the line. When the user presses the ENTER key, the control scrolls all text back to position zero.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

35.46.13 WinAutoVerticalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll vertically.
Notes:

Automatically scrolls text up one page when the user presses the ENTER key on the last line.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

35.46.14 WinRTFDataMBS(SelectionOnly as boolean = false) as string

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set the RTF data for the text area.
Example:

```
Dim rtfData As String

# If TargetWindows Then
rtfData = TextArea1.WinRTFDataMBS
# ElseIf TargetMacOS Then
rtfData = TextArea1.RTFDataMBS
# EndIf
```

Notes:

Including images and probably faster as StyledText.RTFData.
(Read and Write computed property)

35.46.15 WinSelHasTextBackColorMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether a custom background color is in used for the selection.
Example:

textArea1.WinSelHasTextBackColorMBS = false

Notes:

If false, standard background color is used.
(Read and Write computed property)

35.46.16 WinSelHasTextColorMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Whether a custom text color is in used for the selection.
Example:

textArea1.WinSelHasTextColorMBS = false

Notes:

If false, standard text color is used.
(Read and Write computed property)

35.46.17 WinSelStrikeThroughMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set StrikeThrough text style.
Example:

TextArea1.WinSelStrikeThroughMBS = True

Notes:

See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

35.46.18 WinSelSubScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set subscript text style.
Example:

TextArea1.WinSelSubScriptMBS = True

Notes:

Subscript text has a lower base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

35.46.19 WinSelSuperScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Get or set superscript text style.
Example:

TextArea1.WinSelSuperScriptMBS = True

Notes:

Superscript text has a higher base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

35.46.20 WinSelTextBackColorMBS as Color

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: The current background text color.
Example:

textArea1.WinSelTextBackColorMBS = & cFF0000

Notes:

If set also sets WinSelHasTextBackColorMBS to true internally.
(Read and Write computed property)

35.46.21 WinSelTextColorMBS as Color

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: The current foreground text color.
Example:

textArea1.WinSelTextColorMBS = & cFF0000

Notes:

If set also sets WinSelHasTextColorMBS to true internally.
(Read and Write computed property)

35.46.22 WinSpellcheckingMBS as Boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop only.

Function: Enables spellchecking for Textarea.
Example:

```
# If TargetWindows Then
TextArea1.WinSpellcheckingMBS = True
# ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.continuousSpellCheckingEnabled = True
# EndIf
```

Notes:

Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS for MacOS.
(Read and Write computed property)

35.47 class DesktopUpDownArrows

35.47.1 class DesktopUpDownArrows

Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: The build in control class in Xojo.

35.47.2 Methods

35.47.3 NSStepperMBS as NSStepperMBS

MBS MacControls Plugin, Plugin Version: 21.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSStepperMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.48 class DisclosureTriangle

35.48.1 class DisclosureTriangle

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in DisclosureTriangle class in Xojo.

35.48.2 Methods

35.48.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox DisclosureTriangle1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.49 class Groupbox

35.49.1 class Groupbox

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in Groupbox class in Xojo.

35.49.2 Methods

35.49.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.50 class ImageWell

35.50.1 class ImageWell

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in ImageWell class in Xojo.

35.50.2 Methods

35.50.3 NSImageViewMBS as NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSImageViewMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.51 class KeyValueCodingMBS

35.51.1 class KeyValueCodingMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The class for key value coding and using NSSortDescriptor class.
Notes: Events are only raised if called on main thread to avoid threading trouble.

35.51.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr3

35.51.3 Blog Entries

- MBS Xojo Plugins, version 17.1pr3

35.51.4 Methods

35.51.5 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.

35.51.6 sortedArrayUsingDescriptor(values() as KeyValueCodingMBS, sortDescriptor as NSSortDescriptorMBS) as KeyValueCodingMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.
Notes:

sortDescriptor: The NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptor.

35.51.7 sortedArrayUsingDescriptors(values() as KeyValueCodingMBS, sortDescriptor() as NSSortDescriptorMBS) as KeyValueCodingMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.
Notes:

sortDescriptors: An array of NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving array,Äôs contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.

35.51.8 Properties

35.51.9 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The description text property.
Notes: (Read only property)
See also:

- 35.51.14 Description as String 8037

35.51.10 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The internal object handle.
Notes: (Read and Write property)

35.51.11 Tag as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The tag value.
Notes:

Store anything you need, e.g. a dictionary.

(Read and Write property)

35.51.12 valueForKey(key as String) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Get/set the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.
(Read and Write computed property)
See also:

- 35.51.17 valueForKey(key as string) as Variant 8038

35.51.13 Events

35.51.14 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event when system queries description for object.
See also:

- 35.51.9 Description as String 8036

35.51.15 setValueForKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Sets the property of the receiver specified by a given key to a given value.
Notes:

value: The value for the property identified by key.
key: The name of one of the receiver's properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.
The search pattern that setValueForKey uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
In a reference-counted environment, if the instance variable is accessed directly, value is retained.

35.51.16 setValueForUndefinedKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by setValueForKey when it finds no property for a given key.
Notes:

value: The value for the key identified by key.
key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an NSUndefinedKeyException.

35.51.17 valueForKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Return the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.

Returns the value for the property identified by key.

If event is not implemented, the search pattern that valueForKey uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
See also:

- 35.51.12 valueForKey(key as String) as Variant 8037

35.51.18 valueForUndefinedKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by valueForKey when it finds no property corresponding to a given key.
Notes:

key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an NSUndefinedKeyException.

35.52 class NSActionCellMBS

35.52.1 class NSActionCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: An NSActionCell defines an active area inside a control (an instance of NSControl or one of its subclasses).
Notes:

As an NSControl's active area, an NSActionCell does three things: it usually performs display of text or an icon; it provides the NSControl with a target and an action; and it handles mouse (cursor) tracking by properly highlighting its area and sending action messages to its target based on cursor movement.
Subclass of the NSCellMBS class.

35.52.2 Blog Entries

35.52.6 Methods

35.52.7 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSActionCellMBS(n)
```

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath

See also:

- 35.52.8 Constructor(text as string) 8040

35.52.8 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSActionCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 35.52.7 Constructor(image as NSImageMBS) 8039

35.53 class NSBoxMBS

35.53.1 class NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The NSBox class implements simple views that can title themselves and draw a border around their content.
Notes:

These objects are known as boxes. You can use box to group, visually, some number of other views.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

35.53.2 Blog Entries

35.53.4 Methods

35.53.5 borderRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver's border is drawn.
Notes: The rectangle in which the border of the NSBox is drawn.

35.53.6 Constructor

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new box view with size 100/100 and position 0/0
Example:

```
dim x as new NSBoxMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.53.7 Constructor(Handle as Integer) 8042
- 35.53.8 Constructor(left as Double, top as Double, width as Double, height as Double) 8042

35.53.7 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSView handle.
Example:

```
dim t as new NSBoxMBS(0, 0, 100, 100)
dim v as new NSBoxMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSBox and the plugin retains this handle.
See also:

- 35.53.6 Constructor 8041
- 35.53.8 Constructor(left as Double, top as Double, width as Double, height as Double) 8042

35.53.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
dim left,top,width,height as Integer
// define rectangle
dim x as new NSBoxMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 35.53.6 Constructor 8041
- 35.53.7 Constructor(Handle as Integer) 8042

35.53.9 setFrameFromContentFrame(contentFrame as NSRectMBS)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Places the receiver so its content view lies on the specified frame.
Notes: contentFrame: The rectangle specifying the frame of the box's content view, reckoned in the coordinate system of the box's superview. The box is marked for redisplay.

35.53.10 setTitleWithMnemonic(stringWithAmpersand as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Sets the title of the receiver with a character denoted as an access key.
Notes:

Mnemonics are not supported in Mac OS X.

By default, a box's title is "Title." The content view is not automatically resized, and the box is not marked for redisplay.

35.53.11 sizeToFit

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Resizes and moves the receiver's content view so it just encloses its subviews.
Example:

```
dim n as new NSProgressIndicatorMBS
n.sizeToFit

MsgBox n.frame.String
```

Notes:

The receiver is then moved and resized to wrap around the content view. The receiver's width is constrained so its title will be fully displayed.

You should invoke this method after:

- Adding a subview (to the content view)
- Altering the size or location of such a subview
- Setting the margins around the content view

The mechanism by which the content view is moved and resized depends on whether the object responds to its own sizeToFit message: If it does respond, then that message is sent, and the content view is expected to be so modified. If the content view doesn't respond, the box moves and resizes the content view itself.

35.53.12 titleCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the cell used to display the receiver's title.

35.53.13 titleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver's title is drawn.
Notes: The rectangle in which the title is drawn.

35.53.14 Properties

35.53.15 borderColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the color of the receiver's border when the receiver is a custom box with a simple line border.
Notes:

The receiver's border color. It must be a custom box,Äîthat is, it has a type of NSBoxCustom,Äîand it must have a border style of NSLineBorder.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

35.53.16 borderType as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The border type to aType, which must be a valid border type.
Notes:

A constant describing the type of border. Border types are defined in NSView.h. Currently, the following border types are defined: NSNoBorder, NSLineBorder, NSBezelBorder, NSGrooveBorder.

If the size of the new border is different from that of the old border, the content view is resized to absorb the difference, and the box is marked for redisplay.
(Read and Write computed property)

35.53.17 borderWidth as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The border width.
Notes:

Functional only when the receiver's box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.

Available in Mac OS X v10.5 and later.
(Read and Write computed property)

35.53.18 boxType as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The box type.
Notes:

Use the NSBox* constants.
(Read and Write computed property)

35.53.19 contentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The receiver's content view.
Notes:

On settings the NSView object is resized to fit within the box's current content area and the box is marked for redisplay.
(Read and Write computed property)

35.53.20 contentViewMargins as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The horizontal and vertical distance between the border of the receiver and its content view.
Notes:

Value: The width and height of the offset between the box's border and content view. The horizontal value is applied (reckoned in the box's coordinate system) fully and equally to the left and right sides of the box. The vertical value is similarly applied to the top and bottom.

Unlike changing a box's other attributes, such as its title position or border type, changing the offsets doesn't automatically resize the content view. In general, you should send a sizeToFit message to the box after changing the size of its offsets. This message causes the content view to remain unchanged while the box is sized to fit around it.
(Read and Write computed property)

35.53.21 cornerRadius as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The corner radius for the box.
Notes:

Functional only when the receiver's box type (boxType) is NSBoxCustom and its border type (borderType) is NSLineBorder.
(Read and Write computed property)

35.53.22 fillColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The color of the receiver's background when the receiver is a custom box with a simple line border.
Notes:

The receiver's fill color. It must be a custom box,Äîthat is, it has a type of NSBoxCustom,Äîand it must have a border style of NSLineBorder.
Available in Mac OS X v10.5 and later.

(Read and Write computed property)

35.53.23 title as string

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The title for the box.
Notes:

By default, a box's title is "Title."
(Read and Write computed property)

35.53.24 titleFont as NSFontMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The font object used to draw the receiver's title.
Notes:

By default, the title is drawn using the small system font (obtained using (smallSystemFontSize as the parameter of systemFontOfSize:, both NSFont class methods). If the size of the new font is different from that of the old font, the content view is resized to absorb the difference.
(Read and Write computed property)

35.53.25 titlePosition as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The position of the box's title.
Notes:

If the new title position changes the size of the box's border area, the content view is resized to absorb the difference, and the box is marked as needing redisplay.

Use this constants: NSNoTitle, NSAboveTop, NSAtTop, NSBelowTop, NSAboveBottom, NSAtBottom and NSBelowBottom.
(Read and Write computed property)

35.53.26 Transparent as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver is transparent.
Notes:

True makes the receiver transparent.
False makes the receiver opaque.
(Read and Write computed property)

35.53.27 Constants

35.53.28 NSAboveBottom = 4

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants for the title position.
Notes: Title positioned above the box's bottom border.

35.53.29 NSAboveTop = 1

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants for the title position.
Notes: Title positioned above the box's top border.

35.53.30 NSAtBottom = 5

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants for the title position.
Notes: Title positioned within the box's bottom border.

35.53.31 NSAtTop = 2

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants for the title position.
Notes: Title positioned within the box's top border.

35.53.32 NSBelowBottom = 6

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants for the title position.
Notes: Title positioned below the box's bottom border.

35.53.33 NSBelowTop = 3

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants for the title position.
Notes: Title positioned below the box's top border.

35.53.34 NSBoxCustom = 4

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies that the appearance of the box is determined entirely by the by box-configuration methods, without automatically applying Apple human interface guidelines.

35.53.35 NSBoxOldStyle = 3

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies that the box is a Mac OS X v10.2,Äìstyle box.

35.53.36 NSBoxPrimary = 0

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies the primary box appearance. This is the default box type.

35.53.37 NSBoxSecondary = 1

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies the secondary box appearance.

35.53.38 NSBoxSeparator = 2

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants and data type identifies box types, which, in conjunction with a box's border type, define the appearance of the box.
Notes: Specifies the secondary box appearance.

35.53.39 NSNoTitle = 0

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants for the title position.
Notes: The box has no title.

35.54 class NSButtonCellMBS

35.54.1 class NSButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The NSButtonCell class is a subclass of NSActionCell used to implement the user interfaces of push buttons, checkboxes (switches), and radio buttons.
Notes:

It can also be used for any other region of a view that's designed to send a message to a target when clicked. The NSButton subclass of NSControl uses a single NSButtonCell.

The NSButtonCell class implements the user interface of NSButton.

Setting the integer, float, double, or object value of an NSButtonCell object results in a call to setState with the value converted to integer. In the case of setObjectValue, nil is equivalent to 0, and a non-nil object that doesn't respond to intValue sets the state to 1. Otherwise, the state is set to the object's intValue. Similarly, querying the integer, float, double, or object value of an NSButtonCell returns the current state in the requested representation. In the case of objectValue, this is an NSNumber containing true for on, false for off, and integer value -1 for the mixed state.

For more information on the behavior of NSButtonCell, see the NSButton and NSMatrix class specifications, and Button Programming Topics.
Subclass of the NSActionCellMBS class.

35.54.6 Methods

35.54.7 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSButtonCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 35.54.8 Constructor(text as string) 8052

35.54.8 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSButtonCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 35.54.7 Constructor(image as NSImageMBS) 8052

35.54.9 Properties

35.54.10 alternateImage as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The image the button displays in its alternate state and, if necessary, redraws its contents.
Notes:

Note that some button types don't display an alternate image.
(Read and Write property)

35.54.11 alternateTitle as String

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The title the button displays when it's in its alternate state.
Notes:

Note that some button types don't display an alternate title.
(Read and Write property)

35.54.12 attributedAlternateTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The string the button displays when it's in its alternate state to the given attributed string.
Notes:

Note that some button types don't display an alternate title.

Graphics attributes that are set on the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

35.54.13 attributedTitle as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The string the button displays when it's in its normal state to the given attributed string and redraws the button.
Notes:

The title is always shown on buttons that don't use their alternate contents when highlighting or displaying their alternate state.

Graphics attributes configured for the cell (backgroundColor, alignment, font, etc.) are overridden when corresponding properties are set for the attributed string.
(Read and Write property)

35.54.14 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The background color for the button.
Notes: (Read and Write property)

35.54.15 imageDimsWhenDisabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Whether to dim image when button is disabled.
Notes:

When disabled, the image and text of an NSButtonCell are normally dimmed with gray.
Radio buttons and switches use (imageDimsWhenDisabled = false) so only their text is dimmed.
(Read and Write property)

35.54.16 imagePosition as Integer

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The position of the receiver's image relative to its title.
Notes: (Read and Write property)

35.54.17 imageScaling as Integer

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The scale factor for the receiver's image.
Notes:

Available in OS X v10.5 and later.
(Read and Write property)

35.54.18 showsBorderOnlyWhileMouseInside as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Whether to show border only while mouse is inside.
Notes: (Read and Write property)

35.54.19 sound as Variant

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: The sound that's played when the user presses the receiver.
Notes:

The sound is played during a mouse-down event, such as NSLeftMouseDown.
Value is a NSSoundMBS object.
(Read and Write property)

35.55 control NSButtonControlMBS

35.55.1 control NSButtonControlMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSButton.
Notes:

This control embeds a special NSButton subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

35.55.4 Properties

35.55.5 AlternateTitle as String

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The title that the button displays when it's in its alternate state.
Notes: (Read and Write property)

35.55.6 BezelStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The appearance of the border, if the view has one.
Notes:

Use this constants:

NSRoundedBezelStyle	= 1
NSRegularSquareBezelStyle	= 2
NSThickSquareBezelStyle	= 3
NSThickerSquareBezelStyle	= 4
NSDisclosureBezelStyle	= 5
NSShadowlessSquareBezelStyle	= 6
NSCircularBezelStyle	= 7
NSTexturedSquareBezelStyle	= 8
NSHelpButtonBezelStyle	= 9
NSSmallSquareBezelStyle	= 10
NSTexturedRoundedBezelStyle	= 11
NSRoundRectBezelStyle	= 12
NSRecessedBezelStyle	= 13
NSRoundedDisclosureBezelStyle	= 14

(Read and Write property)

35.55.7 ButtonType as Integer

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The button type.
Notes:

See also NSButtonMBS.ButtonType and the constants there like NSPushOnPushOffButton.
(Read and Write property)

35.55.8 Title as String

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The title displayed on the button when it's in its normal state.
Notes: (Read and Write property)

35.55.9 View as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.55.10 Events

35.55.11 Action

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: .

Function: The action event.

35.55.12 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.55.13 Close

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.55.14 Closing

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.55.15 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.55.16 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.55.17 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.55.18 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.55.19 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.55.20 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.55.21 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.55.22 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.55.23 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.55.24 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.55.25 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.55.26 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.55.27 Open

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.55.28 Opening

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.55.29 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.56 class NSButtonMBS

35.56.1 class NSButtonMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The Cocoa class for a button control.
Notes: Subclass of the NSControlMBS class.

35.56.6 Methods

35.56.7 Constructor

MBS MacControls Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSButtonMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.56.8 Constructor(Handle as Integer) 8064
- 35.56.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8064
- 35.56.10 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 8065

35.56.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSButton handle.
Example:

```
dim t as new NSButtonMBS(0, 0, 100, 100)
dim v as new NSButtonMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSButton and the plugin retains this handle.
See also:

- 35.56.7 Constructor 8064
- 35.56.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8064
- 35.56.10 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 8065

35.56.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with the given size and position.
Example:

```
dim x as new NSButtonMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.56.7 Constructor 8064
- 35.56.8 Constructor(Handle as Integer) 8064
- 35.56.10 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0) 8065

35.56.10 Constructor(Title as String, Image as NSImageMBS = nil, Type as Integer = 0)

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with default settings.
Notes:

For macOS 10.12, we use the convenience functions from Apple.
For older systems, we use our own code.
Title is the title to use. Can be empty.
Image is the image to use. Can be nil.
Type is the type, e.g. NSMomentaryLightButton.
See also:

- 35.56.7 Constructor 8064
- 35.56.8 Constructor(Handle as Integer) 8064
- 35.56.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8064

35.56.11 setButtonType(buttonType as Integer)

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Sets how the button highlights while pressed and how it shows its state.
Notes:

Use this constants:

NSMomentaryLightButton	= 0
NSPushOnPushOffButton	= 1
NSToggleButton	= 2
NSSwitchButton	= 3
NSRadioButton	= 4
NSMomentaryChangeButton	= 5
NSOnOffButton	= 6
NSMomentaryPushInButton	= 7

35.56.12 setNextState

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Sets the view to its next state.
Notes: If the button has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the button has two states, it toggles between them.

35.56.13 Properties

35.56.14 allowsMixedState as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the button allows a mixed state.
Notes: (Read and Write property)

35.56.15 alternateImage as NSImageMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The image that appears on the button when it's in its alternate state.
Notes:

The image displayed by the button when it's in its alternate state, or nil if there is no alternate image. Note that some button types don't display an alternate image. Buttons don't display images by default.
(Read and Write property)

35.56.16 alternateTitle as string

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title that the button displays when it's in its alternate state.

Notes: (Read and Write property)

35.56.17 attributedAlternateTitle as NSAttributedStringMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title that appears on the button when it's in its alternate state to the given attributed string.
Notes: (Read and Write property)

35.56.18 attributedTitle as NSAttributedStringMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title that the button displays in its normal state as an attributed string.
Notes: (Read and Write property)

35.56.19 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes:

The background color is used only when drawing borderless buttons.
(Read and Write property)

35.56.20 bezelColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: The color of the button's bezel, in appearances that support it.
Notes: (Read and Write property)

35.56.21 bezelStyle as Integer

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The appearance of the border, if the view has one.
Notes:

Use this constants:

NSRoundedBezelStyle	= 1
NSRegularSquareBezelStyle	= 2
NSThickSquareBezelStyle	= 3
NSThickerSquareBezelStyle	= 4
NSDisclosureBezelStyle	= 5
NSShadowlessSquareBezelStyle	= 6
NSCircularBezelStyle	= 7
NSTexturedSquareBezelStyle	= 8
NSHelpButtonBezelStyle	= 9
NSSmallSquareBezelStyle	= 10
NSTexturedRoundedBezelStyle	= 11
NSRoundRectBezelStyle	= 12
NSRecessedBezelStyle	= 13
NSRoundedDisclosureBezelStyle	= 14

(Read and Write property)

35.56.22 hasDestructiveAction as Boolean

MBS MacControls Plugin, Plugin Version: 22.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that defines whether a button,Äôs action has a destructive effect.
Notes:

Available on macOS 11.0 and newer.

The default value of hasDestructiveAction is false. Setting this to true allows the system to guard a destructive-action button against accidental presses, and can give the button a special appearance in certain contexts to caution against unintentional use.
(Read and Write property)

35.56.23 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The view's image.
Notes:

A button's image is displayed when the button is in its normal state, or all the time for a button that doesn't change its contents when highlighting or displaying its alternate state.
(Read and Write property)

35.56.24 imageDimsWhenDisabled as Boolean

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver,Äôs image appears "dim" when the button cell is disabled.
Notes:

True to indicate that the button's image should dim when the button is disabled.

By default, all button types except NSSwitchButton and NSRadioButton do dim when disabled. When NSSwitchButtons and NSRadioButtons are disabled, only the associated text dims. The default setting for this condition is reasserted whenever you set ButtonType, so be sure to specify the button cell,Äôs type before you set ImageDimsWhenDisabled.
(Read and Write property)

35.56.25 imageHugsTitle as Boolean

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether image hugs title.
Notes:

Available in macOS 10.12 and newer.
(Read and Write property)

35.56.26 imagePosition as Integer

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The position of the button's image relative to its title.
Notes:

Value can be:

NSNoImage	0	The cell doesn,Äôt display an image.
NSImageOnly	1	The cell displays an image, but not a title.
NSImageLeft	2	The image is to the left of the title.
NSImageRight	3	The image is to the right of the title.
NSImageBelow	4	The image is below the title.
NSImageAbove	5	The image is above the title.
NSImageOverlaps	6	The image overlaps the title.

(Read and Write property)

35.56.27 imageScaling as Integer

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The scale factor for the receiver,Äôs image.
Notes:

These constants specify a cell,Äôs image scaling behavior.

NSImageScaleProportionallyDown	0	If it is too large for the destination, scale the image down while preserving the aspect ratio.
NSImageScaleAxesIndependently	1	Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image.
NSImageScaleNone	2	Do not scale the image.
NSImageScaleProportionallyUpOrDown	3	Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.

Available in OS X v10.5 and later.
(Read and Write property)

35.56.28 isBordered as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the button has a border.
Notes: (Read and Write property)

35.56.29 isTransparent as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the button is transparent.
Notes: (Read and Write property)

35.56.30 keyEquivalent as string

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The key-equivalent character of the view.
Notes: (Read and Write property)

35.56.31 keyEquivalentModifierMask as Integer

MBS MacControls Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: the controls's keyboard equivalent modifier mask.
Example:

```
const NSShiftKeyMask=131.072
const NSControlKeyMask=262144
const NSAlternateKeyMask=524288
const NSCommandKeyMask=1048576

dim d as NSButtonMBS // your button
d.KeyEquivalent="A"
d.KeyEquivalentModifierMask=NSShiftKeyMask+NSCommandKeyMask+NSAlternateKeyMask // command-option-shift
```

Notes:

Constants for the mask:

NSAlphaShiftKeyMask = 65536
Set if Caps Lock key is pressed.
Available in Mac OS X v10.0 and later.

NSShiftKeyMask = 131072
Set if Shift key is pressed.
Available in Mac OS X v10.0 and later.

NSControlKeyMask = 262144
Set if Control key is pressed.
Available in Mac OS X v10.0 and later.

NSAlternateKeyMask = 524288
Set if Option or Alternate key is pressed.
Available in Mac OS X v10.0 and later.

NSCommandKeyMask = 1048576
Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrow-

FunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).
Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
(Read and Write property)

35.56.32 maxAcceleratorLevel as Integer

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Configures the maximum allowed level for an NSMultiLevelAcceleratorButton, allowed values range from [1,5] .
Notes:

Defaults to 2.
Available on Mac OS X 10.10.3.
(Read and Write property)

35.56.33 showsBorderOnlyWhileMouseInside as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the view's border is displayed only when the cursor is over the button.
Notes:

If isBordered returns false, the border is never displayed, regardless of what this method returns.
(Read and Write property)

35.56.34 sound as Variant

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The sound played when the user presses the button.
Notes:

The sound that should be played when the user presses the button. The sound is played during a mouse-down event, such as NSLeftMouseDown.
Value is NSSoundMBS object.
(Read and Write property)

35.56.35 SpringLoaded as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Sends action on deep-press or extended hover while dragging.
Notes:

Defaults to false.
Available on Mac OS X 10.10.3.
(Read and Write property)

35.56.36 state as Integer

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The state of the button.
Notes:

This can be NSOnState (1), NSOffState (0), NSMixedState (-1).
(Read and Write property)

35.56.37 title as string

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The title displayed on the button when it's in its normal state.
Notes: (Read and Write property)

35.56.38 Constants

35.56.39 NSCircularBezelStyle=7

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes:

A round button with room for a small icon or a single character.

This style has both regular and small variants, but the large variant is available only in gray at this time.

35.56.40 NSDisclosureBezelStyle=5

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes:

A bezel style for use with a disclosure triangle.

To create the disclosure triangle, set the button bezel style to NSDisclosureBezelStyle and the button type to NSOnOffButton.

35.56.41 NSHelpButtonBezelStyle=9

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A round button with a question mark providing the standard help button look.

35.56.42 NSInlineBezelStyle=15

MBS MacControls Plugin, Plugin Version: 14.3.

Function: One of the button styles that can be specified using bezelStyle.
Notes: Inline Style.

35.56.43 NSMomentaryChangeButton=5

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes:

While the button is held down, the alternate image and alternate title are displayed.

The normal image and title are displayed when the button isn't pressed. This option is called "Momentary Change" in Interface Builder's Button Inspector.

35.56.44 NSMomentaryLightButton=0

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes:

While the button is held down it's shown as "lit," and also "pushed in" to the screen if the button is bordered.

This type of button is best for simply triggering actions, as it doesn't show its state; it always displays its normal image or title. This option is called "Momentary Light" in Interface Builder's Button Inspector.

35.56.45 NSMomentaryPushInButton=7

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes:

While the button is held down it's shown as "lit."

This type of button is best for simply triggering actions, as it doesn't show its state; it always displays its normal image or title. This option is called "Momentary Push In" in Interface Builder's Button Inspector.

35.56.46 NSOnOffButton=6

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes: The first click highlights the button; a second click returns it to the normal (unhighlighted) state.

35.56.47 NSPushOnPushOffButton=1

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes: The first click both highlights and causes the button to be "pushed in" if the button is bordered; a second click returns it to its normal state.

35.56.48 NSRadioButton=4

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes: This style is similar to NSSwitchButton, but it used to constrain a selection to a single element from several.

35.56.49 NSRecessedBezelStyle=13

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A bezel style that matches the recessed buttons in Mail, Finder and Safari.

35.56.50 NSRegularSquareBezelStyle=2

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A rectangular button with a 2 point border, designed for icons.

35.56.51 NSRoundedBezelStyle=1

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A rounded rectangle button, designed for text.

35.56.52 NSRoundedDisclosureBezelStyle=14

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A bezel style that matches the disclosure style used in the standard Save panel.

35.56.53 NSRoundRectBezelStyle=12

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A bezel style that matches the search buttons in Finder and Mail.

35.56.54 NSShadowlessSquareBezelStyle=6

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes:

Similar to NSRegularSquareBezelStyle, but has no shadow so you can abut the cells without overlapping shadows.

This style would be used in a tool palette, for example.

35.56.55 NSSmallSquareBezelStyle=10

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A simple square bezel style. Buttons using this style can be scaled to any size.

35.56.56 NSSwitchButton=3

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes: This style is a variant of NSToggleButton that has no border and is used to represent a checkbox.

35.56.57 NSTexturedRoundedBezelStyle=11

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A textured (metal) bezel style similar in appearance to the Finder's action (gear) button.

35.56.58 NSTexturedSquareBezelStyle=8

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A bezel style appropriate for use with textured (metal) windows.

35.56.59 NSThickerSquareBezelStyle=4

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A rectangular button with a 4 point border, designed for icons.

35.56.60 NSThickSquareBezelStyle=3

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button styles that can be specified using bezelStyle.
Notes: A rectangular button with a 3 point border, designed for icons.

35.56.61 NSToggleButton=2

MBS MacControls Plugin, Plugin Version: 7.8.

Function: One of the button types that can be specified using ButtonType.
Notes: After the first click, the button displays its alternate image or title; a second click returns the button to its normal state.

35.57 class NSCellMBS

35.57.1 class NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The NSCell class provides a mechanism for displaying text or images in an NSView object without the overhead of a full NSView subclass.
Notes: It's used heavily by most of the NSControl classes to implement their internal workings.

35.57.6 Methods

35.57.7 acceptsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver accepts first responder status.
Notes: The default value is true if the receiver is enabled. Subclasses may override this method to return a different value.

35.57.8 calcDrawInfo(theRect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Recalculates the cell geometry.
Notes:

Objects (such as controls) that manage NSCell objects generally maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If so, calcSize method of NSControl is automatically invoked prior to the display of the cell, and that method invokes the calcDrawInfo method of the cell.
The default implementation of this method does nothing.

35.57.9 cellSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the minimum size needed to display the receiver.
Notes:

Returns the size of the cell, or the size (10000, 10000) if the receiver is not a text or image cell. If the cell is an image cell but no image has been set, returns NSZeroSize.
This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell.

35.57.10 cellSizeForBounds(theRect as NSRectMBS) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the minimum size needed to display the receiver, constraining it to the specified rectangle.
Notes:

aRect: The size of the cell, or the size of the aRect parameter if the cell is not a text or image cell. If the cell is an image cell but no image has been set, returns an empty size.

This method takes into account of the size of the image or text within a certain offset determined by the border type of the cell. If the receiver is of text type, the text is resized to fit within aRect (as much as aRect is within the bounds of the cell).

35.57.11 compare(otherCell as NSCellMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Compares the string values of the receiver another cell, disregarding case.
Notes:

otherCell: The cell to compare against the receiver. This parameter must be of type NSCell; if it is not, this method raises NSBadComparisonException.

This value must not be nil. If the value is nil, the behavior is undefined and may change in future versions of Mac OS X.

Returns NSOrderedAscending if the string value of the receiver precedes the string value of otherCell in lexical ordering, NSOrderedSame if the string values are equivalent in lexical value, and NSOrderedDescending string value of the receiver follows the string value of otherCell in lexical ordering.

35.57.12 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 35.57.13 Constructor(text as string) 8081

35.57.13 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSCellMBS("Hello")
MsgBox c.StringValue
```

See also:

• 35.57.12 Constructor(image as NSImageMBS) 8081

35.57.14 defaultFocusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the default type of focus ring for the receiver.
Notes:

Use this constants:

NSFocusRingTypeDefault	= 0	The default focus ring type for NSView or NSCell.
NSFocusRingTypeNone	= 1	No focus ring. If you set the focus ring type to this value, NSView and NSCell will not draw any focus ring.
NSFocusRingTypeExterior	= 2	The standard Aqua focus ring.

35.57.15 defaultMenu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the default menu for instances of the receiver.
Notes: Returns the default menu. The NSCell implementation of this method returns nil.

35.57.16 drawingRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle within which the receiver draws itself.
Notes:

theRect: The bounding rectangle of the receiver.
Returns the rectangle in which the receiver draws itself. This rectangle is slightly inset from the one in theRect.

35.57.17 highlightColorWithFrame(theRect as NSRectMBS, controlView as NSViewMBS) as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Redraws the receiver with the specified highlight setting.
Notes:

theRect: The bounding rectangle of the receiver.
controlView: The control that manages the cell.

Returns the color the receiver uses when drawing the selection highlight.
You should not assume that a cell would necessarily want to draw itself with the value returned from selectedControlColor. A cell may wish to draw with different a selection highlight color depending on such things as the key state of its controlView.

35.57.18 imageRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver draws its image.
Notes:

theRect: The bounding rectangle of the receiver.

The rectangle in which the receiver draws its image. This rectangle is slightly offset from the one in theRect.

35.57.19 isEntryAcceptable(aString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns whether a string representing a numeric or date value is formatted in a suitable way for the cell's entry type.
Notes: This method is being deprecated in favor of a new class of formatter objects. For more information, see NSFormatter. This documentation is provided only for developers who need to modify older applications

35.57.20 mnemonic as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the character in the receiver's title that appears underlined for use as a mnemonic.
Notes: A string containing the mnemonic character, or an empty string if no mnemonic character is set.

35.57.21 nextState as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's next state.
Notes: If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth.

If the receiver has two states, it toggles between them.

35.57.22 performClick

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Simulates a single mouse click on the receiver.
Notes:

This method performs the receiver's action on its target. The receiver must be enabled to perform the action. If the receiver's control view is valid, that view is used as the sender; otherwise, the value in sender is used.

The receiver of this message must be a cell of type NSActionCell. This method raises an exception if the action message cannot be successfully sent.

35.57.23 prefersTrackingUntilMouseUp as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether tracking stops when the cursor leaves the cell.
Notes: The default implementation returns false. Subclasses may override this method to return a different value.

35.57.24 sendActionOn(mask as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the conditions on which the receiver sends action messages to its target.
Notes:

mask: A bit mask containing the conditions for sending the action. The only conditions that are actually checked are associated with the NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDraggedMask, and NSPeriodicMask bits.

Returns a bit mask containing the previous settings. This bit mask uses the same values as specified in the mask parameter.

You use this method during mouse tracking when the mouse button changes state, the mouse moves, or if the cell is marked to send its action continuously while tracking. Because of this, the only bits checked in mask are NSLeftMouseDownMask, NSLeftMouseUpMask, NSLeftMouseDraggedMask, and NSPeriodicMask, which are declared in the NSEvent class reference.

You can use the setContinuous method to turn on the flag corresponding to NSPeriodicMask or NSLeftMouseDraggedMask, whichever is appropriate to the given subclass of NSCell.

35.57.25 setNextState

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Changes the state of the receiver to its next state.
Notes: If the receiver has three states, it cycles through them in this order: on, off, mixed, on, and so forth. If the receiver has two states, it toggles between them.

35.57.26 setTitleWithMnemonic(stringWithAmpersand as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the title of the receiver with one character in the string denoted as an access key.
Notes:

stringWithAmpersand: The new title of the cell. One character in the string should be preceded by an ampersand (&) character. The character that follows becomes the mnemonic character for the title. Mnemonics are not supported in Mac OS X.

35.57.27 titleRectForBounds(theRect as NSRectMBS) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle in which the receiver draws its title text.
Notes: If the receiver is a text-type cell, this method resizes the drawing rectangle for the title (theRect) inward by a small offset to accommodate the cell border. If the receiver is not a text-type cell, the method does nothing.

35.57.28 wantsNotificationForMarkedText as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the field editor initiated by the receiver should post text change notifications.
Notes: Returns true if the field editor initiated by the receiver should post text change notifications (NSTextDidChangeNotification) while editing marked text; otherwise, they are delayed until the marked text confirmation.

35.57.29 Properties

35.57.30 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The alignment of text in the receiver..
Notes:

The alignment of text in the receiver (one of the following constants: NSLeftTextAlignment, NSRightTextAlignment,NSCenterTextAlignment, NSJustifiedTextAlignment, NSNaturalTextAlignment).
The default value is NSNaturalTextAlignment.
(Read and Write property)

35.57.31 allowsEditingTextAttributes as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows user editing of textual attributes.
Notes: (Read and Write property)

35.57.32 allowsMixedState as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver supports three states.
Notes:

Valus is true if the receiver supports all three states (on, off, and mixed), otherwise false (the receiver supports only the on and off states).
(Read and Write property)

35.57.33 allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver assumes responsibility for undo operations.
Notes:

By default, the NSTextFieldCell class uses this feature to handle undo operations for edited text. Other controls set a value that is appropriate for their implementation.
Available in Mac OS X v10.4 and later.
(Read and Write property)

35.57.34 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as an attributed string using the receiver's formatter object (if one exists).
Notes:

The textual attributes are the default paragraph style, the receiver's font and alignment, and whether the receiver is enabled and scrollable.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, then the cell will use that method to fetch the string to draw rather than using stringValue.
(Read and Write property)

35.57.35 backgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the background style for the receiver.
Notes:

The background describes the surface the cell is drawn onto in drawWithFrame A control typically sets this before it asks the cell to draw. A cell may draw differently based on background characteristics. For example, a tableview drawing a cell in a selected row might set cell.backgroundStyle=NSBackgroundStyleDark. A text cell might decide to render its text white as a result. A rating-style level indicator might draw its stars white instead of gray.
Available in Mac OS X v10.5 and later.
(Read and Write property)

35.57.36 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The initial writing direction used to determine the actual writing direction for text.
Notes:

The default value is NSWritingDirectionNatural.
The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly.
(Read and Write property)

35.57.37 Bezeled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver has a bezeled border.
Notes: (Read and Write property)

35.57.38 Bordered as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver has a plain border.
Notes: (Read and Write property)

35.57.39 className as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The name of this NSCell class.
Example:

```
dim c as new NSActionCellMBS("Hello")
MsgBox c.className // shows "NSActionCell"
```

Notes: (Read only property)

35.57.40 classPath as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The path of this NSCell class.
Example:

```
dim c as new NSActionCellMBS("Hello")
MsgBox c.classPath // shows "NSActionCell:NSCell:NSObject"
```

Notes:

Useful for debugging to know what super classes the view has.
(Read only property)

35.57.41 Continuous as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver's cell sends its action message continuously to its target during mouse tracking.
Notes: (Read and Write property)

35.57.42 controlSize as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver.
Notes:

Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write property)

35.57.43 controlTint as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's control tint.
Notes:

Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.
(Read and Write property)

35.57.44 controlView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's control view.
Notes:

The control view represents the control currently being rendered by the cell.
(Read and Write property)

35.57.45 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as a double-precision floating-point number.
Notes:

The value of the cell interpreted as a double-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

35.57.46 Editable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver is editable.
Notes: (Read and Write property)

35.57.47 Enabled as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver is enabled or disabled.
Notes: (Read and Write property)

35.57.48 floatValue as Double

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as a single-precision floating-point number.
Notes:

Returns the value of the cell interpreted as a single-precision floating-point number. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
(Read and Write property)

35.57.49 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The font used to display text in the receiver.
Notes:

The receiver's current font, or nil if the receiver is not a text-type cell.
(Read and Write property)

35.57.50 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The internal NSCell reference.
Notes: (Read and Write property)

35.57.51 hasValidObjectValue as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver has a valid object value.
Notes:

A valid object value is one that the receiver's formatter can "understand." Objects are always assumed to be valid unless they are rejected by the formatter.
(Read only property)

35.57.52 Highlighted as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver is highlighted.
Notes: (Read and Write property)

35.57.53 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The image displayed by the receiver (if any).
Notes:

The image displayed by the receiver, or nil if the receiver is not an image-type cell.
(Read and Write property)

35.57.54 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the text of the receiver can contain imported graphics.
Notes:

true if the receiver's text is in the RTFD format and supports imported graphics, otherwise false.
(Read and Write property)

35.57.55 interiorBackgroundStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the interior background style for the receiver.
Notes:

The interior background style describes the surface drawn onto in drawInteriorWithFrame:inView:. This is often the same as the backgroundStyle, but a button that draws a bezel would have a different interiorBackgroundStyle.
This is both an override point and a useful method to call. In a custom button with a custom bezel you can override this method to describe that surface. A cell that has custom interior drawing might query this method to help pick an image that looks good on the cell. Calling this method gives you some independence from changes in framework art style.
Available in Mac OS X v10.5 and later.
(Read only property)

35.57.56 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's value as an integer.
Notes:

The value of the cell interpreted as an integer. If the receiver is not a text-type cell or the cell value is not scannable, returns 0.
On Mac OS X v10.5 and later, you should use integerValue instead.
(Read and Write property)

35.57.57 isOpaque as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver is opaque (nontransparent).
Notes: (Read only property)

35.57.58 keyEquivalent as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the key equivalent to clicking the cell.
Notes:

Subclasses can override this method to return a string with a valid character for the key equivalent.
(Read only property)

35.57.59 lineBreakMode as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The line break mode currently used when drawing text.
Notes:

The line break mode the receiver currently uses when drawing text (one of the following constants: NSLineBreakByWordWrapping, NSLineBreakByCharWrapping, NSLineBreakByClipping, NSLineBreakByTruncatingHead, NSLineBreakByTruncatingTail, or NSLineBreakByTruncatingMiddle).
Available in Mac OS X v10.4 and later.
(Read and Write property)

35.57.60 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's contextual menu.
Notes:

The receiver's contextual menu, or nil if no menu is assigned.
(Read and Write property)

35.57.61 mnemonicLocation as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The position of the underlined mnemonic character in the receiver's title.
Notes:

A zero-based index into the receiver's title string indicating the position of the character. If there is no mnemonic character, this method returns NSNotFound.
Mnemonics are not supported in Mac OS X.
(Read and Write property)

35.57.62 refusesFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver should not become the first responder.
Notes:

To find out whether the receiver can become first responder at this time, use the method acceptsFirstResponder.
(Read and Write property)

35.57.63 Scrollable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver scrolls excess text past the cell's bounds.
Notes: (Read and Write property)

35.57.64 Selectable as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the text of the receiver can be selected.
Notes: (Read and Write property)

35.57.65 sendsActionOnEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver's NSControl object sends its action message whenever the user finishes editing the cell's text.
Notes:

If this method returns true, the receiver's NSControl object sends its action message when the user does one of the following:

- Presses the Return key
- Presses the Tab key to move out of the field
- Clicks another text field

If it returns false, the cell's NSControl object sends its action message only when the user presses the Return key.

(Read and Write property)

35.57.66 showsFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver should draw some indication of its first responder status.
Notes:

The NSCell class itself does not draw a first-responder indicator. Subclasses may use the returned value to determine whether or not they should draw one, however.
(Read and Write property)

35.57.67 state as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's state.
Notes:

Cells can have two or three states. If the receiver has two states, it returns either NSOffState (the normal or unpressed state) or NSOnState (the alternate or pressed state). If it has three, it may also return NSMixedState, indicating the feature is in effect somewhere.
To check whether the receiver uses the mixed state, use the method allowsMixedState.
Note that the value state returns may not be the same value you passed into setState.
(Read and Write property)

35.57.68 stringValue as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as a string.
Notes:

If no formatter exists and the cell's value is a string, this method returns the value as a plain, attributed, or localized formatted string. If the value is not a string or cannot be converted to one, this method returns an empty string.

For Mac OS X v10.3 and later: If you use a class that responds to the selector attributedStringValue for the object value of a cell, the cell uses that method to fetch the string to draw rather than the stringValue method.
(Read and Write property)

35.57.69 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The tag identifying the receiver.
Notes:

The tag value. The NSCell implementation of this method returns ,Äì1.
Tags allow you to identify particular cells. Tag values are not used internally; they are only changed by external invocations of setTag:. You typically set tag values in Interface Builder and use them at runtime in your application. When you set the tag of a control with a single cell in Interface Builder, it sets the tags of both the control and the cell to the same value as a convenience.
(Read and Write property)

35.57.70 title as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's title.
Notes:

Subclasses (such as NSButtonCell) may override this method to return a different value.
(Read and Write property)

35.57.71 truncatesLastVisibleLine as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver truncates and adds the ellipsis character to the last visible line if the text doesn't fit into the cell bounds.
Notes:

The line break mode must be either NSLineBreakByWordWrapping or NSLineBreakByCharWrapping. Otherwise, this setting is ignored.
Available in Mac OS X v10.5 and later.
(Read and Write property)

35.57.72 type as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The type of the cell, changing it to a text cell, image cell, or null cell.
Notes:

If the cell is already the same type as the one specified in the aType parameter, this method does nothing.

If aType is NSTextCellType, this method converts the receiver to a cell of that type, giving it a default title and setting the font to the system font at the default size. If aType is NSImageCellType, the cell type is not changed until you set a new non-nil image.
(Read and Write property)

35.57.73 userInterfaceLayoutDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: The layout direction of the user interface.
Notes:

This property specifies the general user interface layout flow directions. For subclasses that have multiple visual components in a single cell instance, this property should specify the directionality or flow of components.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.6 and later.
(Read and Write property)

35.57.74 usesSingleLineMode as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the text cell restricts layout and rendering of its content to a single line.
Notes:

If true, the cell ignores the return value from wraps, interprets NSLineBreakByWordWrapping and NSLineBreakByCharWrapping returned by lineBreakMode as NSLineBreakByClipping, and configures the field editor to ignore key binding commands that insert paragraph and line separators.

The field editor bound to a single line cell filters paragraph and line separator insertion from user actions. Cells in the single line mode use the fixed baseline layout. The text baseline position is determined solely by the control size regardless of content font style or size.
(Read and Write property)

35.57.75 wraps as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether text in the receiver wraps when its length exceeds the frame of the cell.

Notes:

If the text of the receiver is an attributed string value you must explicitly set the paragraph style line break mode. Calling this method with the value true is equivalent to calling the setLineBreakMode: method with the value NSLineBreakByWordWrapping.
(Read and Write property)

35.57.76 cellAttribute(aParameter as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The value for the specified cell attribute.
Notes:

aParameter: The cell attribute whose value you want to get. Attributes include the receiver's current state and whether it is disabled, editable, or highlighted.

Returns the value for the cell attribute specified by aParameter.
(Read and Write computed property)

35.57.77 focusRingType as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The type of focus ring currently set for the receiver.
Notes:

You can disable a view's focus ring drawing by overriding this method so it always returns NSFocusRingTypeNone, or by calling setFocusRingType: with NSFocusRingTypeNone. You should only disable a view from drawing its focus ring if you want to draw your own focus ring, or if there isn't sufficient space to display a focus ring in the default location.
Available in Mac OS X v10.3 and later.
(Read and Write computed property)

35.57.78 Constants

35.57.79 NSAnyType = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell formats numeric data.
Notes:

Any value is allowed.

Deprecated in Mac OS X v10.4 and later.

35.57.80 NSBackgroundStyleDark = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants for background styles.
Notes:

The background is a dark color.
Light content contrasts well with this background.
Available in Mac OS X v10.5 and later.

35.57.81 NSBackgroundStyleLight = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants for background styles.
Notes:

The background is a light color.
Dark content contrasts well with this background.
Available in Mac OS X v10.5 and later.

35.57.82 NSBackgroundStyleLowered = 3

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants for background styles.
Notes:

The background is intended to appear lower than the content drawn on it.
Content might need to be embossed.
Available in Mac OS X v10.5 and later.

35.57.83 NSBackgroundStyleRaised = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants for background styles.
Example:

```
// ask for the textfield behind the label
dim n as NSTextFieldMBS = NSTextFieldMBS(label1.NSViewMBS)

// query cell
dim c as NSTextFieldCellMBS = n.cell

// and set background style
c.backgroundStyle = NSTextFieldCellMBS.NSBackgroundStyleRaised
```

Notes:

The background is intended to appear higher than the content drawn on it.
Content might need to be inset.
Available in Mac OS X v10.5 and later.

35.57.84 NSBlueControlTint = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's tint.
Notes:

Aqua control tint
Available in Mac OS X v10.3 and later.

35.57.85 NSCellAllowsMixedState = 16

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Lets the cell's state be NSMixedState, as well as NSOffState and NSOnState.

35.57.86 NSCellChangesContents = 14

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell's state is NSMixedState or NSOnState, displays the cell's alternate image.

35.57.87 NSCellDisabled = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Does not let the user manipulate the cell.

35.57.88 NSCellEditable = 3

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Lets the user edit the cell's contents.

35.57.89 NSCellHasImageHorizontal = 12

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Controls the position of the cell's image: places the image on the right of any text in the cell.
Together, NSCellHasImageOnLeftOrBottom, NSCellHasImageHorizontal, and NSCellHasOverlappingImage control the position of the cell's image and text. To place the image above, set none of them. To place the image below, set NSCellHasImageOnLeftOrBottom. To place the image to the right, set NSCellHasImageHorizontal. To place the image to the left, set NSCellHasImageHorizontal and NSCellHasImageOnLeftOrBottom. To place the image directly over, set NSCellHasOverlappingImage.

35.57.90 NSCellHasImageOnLeftOrBottom = 13

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Controls the position of the cell's image: places the image on the left of or below any text in the cell.
See NSCellHasImageHorizontal for more details.

35.57.91 NSCellHasOverlappingImage = 11

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Controls the position of the cell's image: places the image over any text in the cell.
See NSCellHasImageHorizontal for more details.

35.57.92 NSCellHighlighted = 5

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Draws the cell with a highlighted appearance. (Deprecated. Use Highlighted instead.)

35.57.93 NSCellHitContentArea = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

A content area in the cell.
Available in Mac OS X v10.5 and later.

35.57.94 NSCellHitEditableTextArea = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

An editable text area of the cell.
Available in Mac OS X v10.5 and later.

35.57.95 NSCellHitNone = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

An empty area, or did not hit in the cell.
Available in Mac OS X v10.5 and later.

35.57.96 NSCellHitTrackableArea = 4

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants are used by hitTestForEvent to determine the effect of an event.
Notes:

A trackable area in the cell.
Available in Mac OS X v10.5 and later.

35.57.97 NSCellIsBordered = 10

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Draws a border around the cell.

35.57.98 NSCellIsInsetButton = 15

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes:

Insets the cell's contents from the border.
By default, the cell's contents are inset by 2 points. This constant is ignored if the cell is unbordered.

35.57.99 NSCellLightsByBackground = 9

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell is pushed in, changes the cell's background color from gray to white.

35.57.100 NSCellLightsByContents = 6

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell is pushed in, displays the cell's alternate image.

35.57.101 NSCellLightsByGray = 7

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell is pushed in, displays the cell's image as darkened.

35.57.102 NSCellState = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: The cell's state can be NSMixedState, NSOffState, or NSOnState.

35.57.103 NSChangeBackgroundCell = 8

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell's state is NSMixedState or NSOnState, changes the cell's background color from gray to white.

35.57.104 NSChangeBackgroundCellMask = 8

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: Same as NSChangeGrayCellMask, but only background pixels are changed.

35.57.105 NSChangeGrayCell = 4

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: If the cell's state is NSMixedState or NSOnState, displays the cell's image as darkened.

35.57.106 NSChangeGrayCellMask = 4

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell swaps the "control color" (the controlColor method of NSColor) and white pixels on its background and icon.

35.57.107 NSClearControlTint = 7

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's tint.
Notes:

Clear control tint
Available in Mac OS X v10.0 and later.

35.57.108 NSContentsCellMask = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell displays its alternate icon and/or title.

35.57.109 NSDefaultControlTint = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's tint.
Notes:

The current default tint setting.
Available in Mac OS X v10.0 and later.

35.57.110 NSDoubleType = 6

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell formats numeric data.
Notes:

Must be between ,ÄìFLT_MAX and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

35.57.111 NSFloatType = 3

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell formats numeric data.
Notes:

Must be between ,ÄìFLT_MAX and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

35.57.112 NSGraphiteControlTint = 6

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's tint.
Notes:

Graphite control tint
Available in Mac OS X v10.3 and later.

35.57.113 NSImageAbove = 5

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify the position of a button's image relative to its title.
Notes: The image is above the title.

35.57.114 NSImageBelow = 4

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify the position of a button's image relative to its title.
Notes: The image is below the title.

35.57.115 NSImageCellType = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell represents its data (as text or as an image).
Notes: Cell displays images.

35.57.116 NSImageLeft = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify the position of a button's image relative to its title.
Notes: The image is to the left of the title.

35.57.117 NSImageOnly = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify the position of a button's image relative to its title.
Notes: The cell displays an image, but not a title.

35.57.118 NSImageOverlaps = 6

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify the position of a button's image relative to its title.
Notes: The image overlaps the title.

35.57.119 NSImageRight = 3

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify the position of a button's image relative to its title.
Notes: The image is to the right of the title.

35.57.120 NSImageScaleAxesIndependently = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

Scale each dimension to exactly fit destination.
This setting does not preserve the aspect ratio of the image.
Available in Mac OS X v10.5 and later.

35.57.121 NSImageScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

Do not scale the image.
Available in Mac OS X v10.5 and later.

35.57.122 NSImageScaleProportionallyDown = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

If it is too large for the destination, scale the image down while preserving the aspect ratio.
Available in Mac OS X v10.5 and later.

35.57.123 NSImageScaleProportionallyUpOrDown = 3

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.
Available in Mac OS X v10.5 and later.

35.57.124 NSIntType = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell formats numeric data.
Notes:

Must be between INT_MIN and INT_MAX.
Deprecated in Mac OS X v10.4 and later.

35.57.125 NSMiniControlSize = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: These constants specify a cell's size.
Notes: The control has a smaller size than NSSmallControlSize.

35.57.126 NSMixedState = -1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's state and are used mostly for buttons.
Notes: The corresponding feature is in effect somewhere.

35.57.127 NSNoCellMask = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell doesn't change.

35.57.128 NSNoImage = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify the position of a button's image relative to its title.
Notes: The cell doesn't display an image.

35.57.129 NSNullCellType = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell represents its data (as text or as an image).
Notes: Cell displays nothing.

35.57.130 NSOffState = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's state and are used mostly for buttons.
Notes: The corresponding feature is in effect nowhere.

35.57.131 NSOnState = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify a cell's state and are used mostly for buttons.
Notes: The corresponding feature is in effect everywhere.

35.57.132 NSPositiveDoubleType = 7

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell formats numeric data.
Notes:

Must be between FLT_MIN and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

35.57.133 NSPositiveFloatType = 4

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell formats numeric data.
Notes:

Must be between FLT_MIN and FLT_MAX.
Deprecated in Mac OS X v10.4 and later.

35.57.134 NSPositiveIntType = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell formats numeric data.
Notes:

Must be between 1 and INT_MAX.
Deprecated in Mac OS X v10.4 and later.

35.57.135 NSPushInCell = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a button behaves when pressed and how it displays its state.
Notes: Determines whether the cell's image and text appear to be shifted down and to the right.

35.57.136 NSPushInCellMask = 2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify what happens when a button is pressed or is displaying its alternate state.
Notes: The button cell "pushes in" if it has a border.

35.57.137 NSRegularControlSize = 0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: These constants specify a cell's size.
Notes: The control is sized as regular.

35.57.138 NSSmallControlSize = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: These constants specify a cell's size.
Notes:

The control has a smaller size.
This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

35.57.139 NSTextCellType = 1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants specify how a cell represents its data (as text or as an image).
Notes: Cell displays text.

35.58 class NSClipViewMBS

35.58.1 class NSClipViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: An NSClipView contains and scrolls the document view displayed by an NSScrollView.
Notes:

You normally don't need to program with NSClipViews, as NSScrollView handles most of the details of their operation.

An NSClipView holds the document view of an NSScrollView, clipping the document view to its frame, handling the details of scrolling in an efficient manner, and updating the NSScrollView when the document view's size or position changes. You don't normally use the NSClipView class directly; it's provided primarily as the scrolling machinery for the NSScrollView class. However, you might use the NSClipView class to implement a class similar to NSScrollView.

Interaction With NSScrollView
When using an NSClipView within an NSScrollView (the usual configuration), you should issue messages that control background drawing state to the NSScrollView, rather than messaging the NSClipView directly. This recommendation applies to the following methods:

- backgroundColor
- drawsBackground

The NSClipView methods are intended for when the NSClipView is used independently of a containing NSScrollView. In the usual case, NSScrollView should be allowed to manage the background-drawing properties of its associated NSClipView.

There is only one background-drawing state per NSScrollView/NSClipView pair. The two objects do not maintain independent and distinct drawsBackground and backgroundColor properties; rather, NSScrollView's accessors for these properties largely defer to the associated NSClipView and allow the NSClipView to maintain the state. In Mac OS X v10.2 and earlier system versions, NSScrollView maintained a cache of the last state it set for its NSClipView. If the NSClipView was sent a setDrawsBackground: message directly, the cache might not reflect the state accurately. This caching of state has been removed in Mac OS X v10.3.

It is also important to note that sending a setDrawsBackground message with a parameter of false to an NSScrollView has the added effect of sending the NSClipView a setCopiesOnScroll message with a parameter of false. The side effect of sending the setDrawsBackground message directly to the NSClipView is the appearance of "trails" (vestiges of previous drawing) in the document view as it is scrolled.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.

Subclass of the NSViewMBS class.

35.58.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr1

35.58.3 Blog Entries

- MBS Real Studio Plugins, version 11.3pr1

35.58.4 Methods

35.58.5 autoscroll(theEvent as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver proportionally to theEvent's distance outside of it.
Notes:

theEvent's location should be expressed in the window's base coordinate system (which it normally is), not the receiving NSClipView's. Returns true if any scrolling is performed; otherwise returns false.

Never invoke this method directly; instead, the NSClipView's document view should repeatedly send itself autoscroll: messages when the cursor is dragged outside the NSClipView's frame during a modal event loop initiated by a mouse-down event. The NSView class implements autoscroll to forward the message to the receiver's superview; thus the message is ultimately forwarded to the NSClipView.

35.58.6 constrainScrollPoint(newOrigin as NSPointMBS) as NSPointMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a scroll point adjusted from proposedNewOrigin, if necessary, to guarantee the receiver will still lie within its document view.
Notes: For example, if proposedNewOrigin's y coordinate lies to the left of the document view's origin, then the y coordinate returned is set to that of the document view's origin.

35.58.7 Constructor

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new clipview with the given size and position.
Example:

```
dim x as new NSClipViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.58.8 Constructor(Handle as Integer) 8115
- 35.58.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8115

35.58.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSClipView handle.
Example:

```
dim t as new NSClipViewMBS(0, 0, 100, 100)
dim v as new NSClipViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSClipView and the plugin retains this handle.
See also:

- 35.58.7 Constructor 8114
- 35.58.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8115

35.58.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSClipView with the given size and position.
Example:

```
dim x as new NSClipViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.58.7 Constructor 8114
- 35.58.8 Constructor(Handle as Integer) 8115

35.58.10 documentRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle defining the document view's frame, adjusted to the size of the receiver if the document view is smaller.
Notes:

In other words, this rectangle is always at least as large as the receiver itself.

The document rectangle is used in conjunction with an NSClipView's bounds rectangle to determine values for the indicators of relative position and size between the NSClipView and its document view. For example, NSScrollView uses these rectangles to set the size and position of the knobs in its scrollers. When the document view is much larger than the NSClipView, the knob is small; when the document view is near the same size, the knob is large; and when the document view is the same size or smaller, there is no knob.

35.58.11 documentVisibleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the exposed rectangle of the receiver's document view, in the document view's own coordinate system.
Notes: Note that this rectangle doesn't reflect the effects of any clipping that may occur above the NSClipView itself. To get the portion of the document view that's guaranteed to be visible, send it a visibleRect message.

35.58.12 reflectScrolledClipView(clipView as NSClipViewMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Adjusts the receiver's scrollers to reflect the size and positioning of its content view.

35.58.13 scrollClipView(clipview as NSClipViewMBS, toPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Notifies the superview of a clip view that the clip view needs to reset the origin of its bounds rectangle.

35.58.14 scrollToPoint(newOrigin as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Changes the origin of the receiver's bounds rectangle to newOrigin.

35.58.15 viewBoundsChanged(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Handles an NSViewBoundsDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new bounds.

35.58.16 viewFrameChanged(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Handles an NSViewFrameDidChangeNotification, passed in the aNotification argument, by updating a containing NSScrollView based on the new frame.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.58.17 Properties

35.58.18 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The color of the receiver's background.
Notes: (Read and Write computed property)

35.58.19 copiesOnScroll as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver copies rendered images while scrolling.
Notes:

If true, the receiver copies the existing rendered image to its new location while scrolling and only draws exposed portions of its document view. If false, the receiver always forces its document view to draw itself on scrolling.
(Read and Write computed property)

35.58.20 documentCursor as Variant

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The cursor object used over the receiver.
Notes:

Value is an NSCursorMBS object.
(Read and Write computed property)

35.58.21 documentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The document view.
Notes:

Gets or sets the receiver's document view. On set removes any previous document view, and sets the origin of the receiver's bounds rectangle to the origin of the new view's frame rectangle.

If the receiver is contained in an NSScrollView, you should set the NSScrollView DocumentView instead, so it can perform whatever updating it needs.

In the process of setting the document view, this method registers the receiver for the notifications NSViewFrameDidChangeNotification and NSViewBoundsDidChangeNotification, adjusts the key view loop to include the new document view, and updates a parent NSScrollView's display if needed using reflectScrolledClipView.
(Read and Write computed property)

35.58.22 drawsBackground as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver draws its background color.
Notes:

If your NSClipView is enclosed in an NSScrollView, you should set the DrawsBackground on the NSScrollView.
(Read and Write computed property)

35.58.23 Constants

35.58.24 NSClipViewFindBarPositionAboveContent = 1

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the scroll view content.
Available in Mac OS X v10.7 and later.

35.58.25 NSClipViewFindBarPositionAboveHorizontalRuler = 0

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the horizontal ruler, if visible.
Available in Mac OS X v10.7 and later.

35.58.26 NSClipViewFindBarPositionBelowContent = 2

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed below the scroll view content.
Available in Mac OS X v10.7 and later.

35.58.27 NSScrollElasticityAllowed = 2

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to determine the elasticity behavior for an axis of the scrollview.
Notes:

Allow content to be scrolled past its bounds on this axis in an elastic fashion.
Available in Mac OS X v10.7 and later.

35.58.28 NSScrollElasticityAutomatic = 0

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to determine the elasticity behavior for an axis of the scrollview.
Notes:

Automatically determine whether to allow elasticity on this axis.
Available in Mac OS X v10.7 and later.

35.58.29 NSScrollElasticityNone = 1

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to determine the elasticity behavior for an axis of the scrollview.
Notes:

Disallow scrolling beyond document bounds on this axis.
Available in Mac OS X v10.7 and later.

35.59 control NSComboBoxControlMBS

35.59.1 control NSComboBoxControlMBS

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSComboBox.
Notes:

This control embeds a special NSComboBox subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

35.59.6 Properties

35.59.7 View as NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.59.8 Events

35.59.9 Action

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The action event run, when e.g. return key is pressed.

35.59.10 BoundsChanged

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.59.11 Close

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.59.12 Closing

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.59.13 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.59.14 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.59.15 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.59.16 FocusLost

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.59.17 FocusReceived

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.59.18 FrameChanged

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.59.19 GotFocus

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.59.20 LostFocus

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.59.21 MenuBarSelected

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.59.22 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.59.23 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.59.24 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.59.25 Open

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.59.26 Opening

Plugin Version: 21.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.59.27 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.59.28 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

35.59.29 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.59.30 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

35.59.31 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.59.32 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 21.4, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.

Be aware that an event in Xojo without return will cause false to be returned.

35.60 class NSComboBoxMBS

35.60.1 class NSComboBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The ComboBox control from Cocoa.
Notes:

An NSComboBox is a kind of NSControl that allows you to either enter text directly (as you would with an NSTextField) or click the attached arrow at the right of the combo box and select from a displayed ("pop-up") list of items.
Subclass of the NSTextFieldMBS class.

35.60.2 Methods

35.60.3 addItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Adds an object to the end of the receiver's internal item list.
Notes:

anObject: The object to add to the internal item list.

This method logs a warning if usesDataSource returns true.

35.60.4 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSComboBoxMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 35.60.5 Constructor(Handle as Integer) 8130
- 35.60.6 Constructor(left as Double, top as Double, width as Double, height as Double) 8130

35.60.5 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSComboBox handle.
Example:

```
dim t as new NSComboBoxMBS(0, 0, 100, 100)
dim v as new NSComboBoxMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSComboBox and the plugin retains this handle.
See also:

- 35.60.4 Constructor 8129
- 35.60.6 Constructor(left as Double, top as Double, width as Double, height as Double) 8130

35.60.6 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new combo box with the given size and position.
Example:

```
dim left,top,width,height as Integer
// define rectangle
dim x as new NSComboBoxMBS(left, top, width, height)
```

Notes: On success the handle property is not zero.
See also:

- 35.60.4 Constructor 8129
- 35.60.5 Constructor(Handle as Integer) 8130

35.60.7 deselectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Deselects the pop-up list item at the specified index if it's selected.
Notes:

index: The index of the item to deselect.

If the selection does in fact change, this method posts an NSComboBoxSelectionDidChangeNotification to the default notification center.

35.60.8 indexOfItemWithObjectValue(value as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Searches the receiver's internal item list for the specified object and returns the lowest matching index.
Notes:

anObject: The object for which to return the index.

Returns the lowest index in the internal item list whose corresponding value is equal to that of the specified object. Objects are considered equal if they have the same id or if isEqual returns true.

If none of the objects in the receiver's internal item list are equal to anObject, indexOfItemWithObjectValue returns NSNotFound (-1).

This method logs a warning if usesDataSource returns true.

35.60.9 indexOfSelectedItem as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the last item selected from the pop-up list.
Notes:

Returns the index of the last item selected from the receiver's pop-up list or -1 if no item is selected.

Note that nothing is initially selected in a newly initialized combo box.

35.60.10 noteNumberOfItemsChanged

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the number of items in its data source has changed.
Notes:

This method allows the receiver to update the scrollers in its displayed pop-up list without actually reloading data into the receiver. It is particularly useful for a data source that continually receives data in the background over a period of time, in which case the NSComboBox can remain responsive to the user while the data is received.

See the NSComboBoxDataSource informal protocol specification for information on the messages an NSComboBox sends to its data source.

35.60.11 numberOfItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the total number of items in the pop-up list.

35.60.12 reloadData

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Marks the receiver as needing redisplay, so that it will reload the data for visible pop-up items and draw the new values.

35.60.13 removeAllItems

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes all items from the receiver's internal item list.
Notes: This method logs a warning if usesDataSource returns true.

35.60.14 removeItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes the object at the specified location from the receiver's internal item list.
Notes:

index: The index of the object to remove. All items beyond index are moved up one slot to fill the gap.

The removed object receives a release message. This method raises an NSRangeException if index is beyond the end of the list and logs a warning if usesDataSource returns true.

35.60.15 removeItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes all occurrences of the given object from the receiver's internal item list.
Notes:

anObject: The object to remove from the internal item list. Objects are considered equal if they have the same id or if isEqual: returns true.

This method logs a warning if usesDataSource returns true.

35.60.16 scrollItemAtIndexToTop(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver's pop-up list vertically so that the item at the specified index is as close to the top as possible.
Notes:

index: The index of the item to scroll to the top.

The pop-up list need not be displayed at the time this method is invoked.

35.60.17 scrollItemAtIndexToVisible(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver's pop-up list vertically so that the item at the specified index is visible.
Notes:

index: The index of the item to make visible.

The pop-up list need not be displayed at the time this method is invoked.

35.60.18 selectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the pop-up list row at the given index.
Notes:

index: The index of the item to select in the pop-up list.

Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method does not alter the contents of the combo box's text field,Äîsee Setting the Combo Box's Value for more information.

35.60.19 selectItemWithObjectValue(value as Variant)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the first pop-up list item that corresponds to the given object.
Notes:

anObject: The object to select in the pop-up list. Objects are considered equal if they have the same id or if isEqual: returns true.

This method logs a warning if usesDataSource returns true. Posts an NSComboBoxSelectionDidChangeNotification to the default notification center if the selection does in fact change. Note that this method doesn't alter the contents of the combo box's text field,Äîsee Setting the Combo Box's Value for more information.

35.60.20 Properties

35.60.21 completes as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver tries to complete what the user types in the text field.
Notes:

Returns true if the receiver tries to complete what the user types in the text field; otherwise false.
(Read and Write computed property)

35.60.22 hasVerticalScroller as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the receiver will display a vertical scroller.
Notes:

Returns true if the receiver will display a vertical scroller; otherwise false.

Note that the scroller will be displayed even if the pop-up list contains fewer items than will fit in the area specified for display.
(Read and Write computed property)

35.60.23 intercellSpacing as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the horizontal and vertical spacing between cells in the receiver's pop-up list.
Notes:

Returns the space between cells in the pop-up list. The default spacing is (3.0, 2.0).
(Read and Write computed property)

35.60.24 isButtonBordered as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the combo box button is set to display a border.
Notes:

True if the button has a border; otherwise false.
Available in Mac OS X v10.3 and later
(Read and Write computed property)

35.60.25 itemHeight as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the height of each item in the receiver's pop-up list.
Notes:

The default item height is 16.0.
(Read and Write computed property)

35.60.26 numberOfVisibleItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the maximum number of items visible in the pop-up list.
Notes:

The maximum number of items visible at any one time in the pop-up list.
(Read and Write computed property)

35.60.27 usesDataSource as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver uses an external data source to populate its pop-up list.
Notes:

True if the receiver uses an external data source to populate the receiver's pop-up list, false if it uses an internal item list.
(Read and Write computed property)

35.61 class NSControlMBS

35.61.1 class NSControlMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The Cocoa class for a NSControl.
Notes:

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

35.61.6 Methods

35.61.7 calcSize

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Recomputes any internal sizing information for the receiver, if necessary.
Notes: This method uses the calcDrawInfo method of its cell to perform the calculations. Most controls maintain a flag that informs them if any of their cells have been modified in such a way that the location or size of the cell should be recomputed. If such a modification happens, this method is automatically invoked before the control is displayed. You should never need to invoke it yourself.

35.61.8 ConnectActionEvent

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Connects the action event.
Notes: If you want to use addhandler with this class and the action event, you need to call ConnectActionEvent after addhandler to actually have the plugin put things in place for handling the event.

35.61.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with size 100/100 and position 0/0
Example:

```
dim t as new NSControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.61.10 Constructor(Handle as Integer) 8139
- 35.61.11 Constructor(left as Double, top as Double, width as Double, height as Double) 8139

35.61.10 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSControl handle.
Example:

```
dim t as new NSControlMBS(0, 0, 100, 100)
dim v as new NSControlMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSControl and the plugin retains this handle.
See also:

- 35.61.9 Constructor 8138
- 35.61.11 Constructor(left as Double, top as Double, width as Double, height as Double) 8139

35.61.11 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new control with the given size and position.
Example:

```
dim x as new NSControlMBS(0, 0, 100, 20)
```

Notes: On success the handle property is not zero.
See also:

- 35.61.9 Constructor 8138
- 35.61.10 Constructor(Handle as Integer) 8139

35.61.12 Destructor

MBS MacCocoa Plugin, Plugin Version: 13.0, Platform: macOS, Targets: Desktop only.

Function: The destructor.

35.61.13 EnableEvents

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: Enables events after you assigned methods to them with AddHandler.

35.61.14 performClick

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Simulates a single mouse click on the receiver.
Notes: This method calls the performClick method of the receiver's cell. This method raises an exception if the action message cannot be successfully sent.

35.61.15 selectCell(Cell as NSCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Selects the specified cell and redraws the control as needed.
Notes:

Cell: The cell to select. The cell must belong to the receiver.

If the cell is already selected (or does not belong to the receiver), this method does nothing. If the cell belongs to the receiver and is not selected, this method changes its state to NSOnState and redraws the cell.

35.61.16 setNeedsDisplay

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Marks the receiver as needing redisplay (assuming automatic display is enabled).
Notes: This method also recalculates the dimensions of the control as needed.

35.61.17 sizeToFit

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Resizes the receiver's frame so that it is the minimum size needed to contain its cell.
Notes: If you want a multiple-cell custom subclass of NSControl to size itself to fit its cells, you must override this method. This method neither redisplays the receiver nor marks it as needing display. You must do this yourself with either thedisplay or setNeedsDisplay method.

35.61.18 validateEditing

MBS MacCocoa Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Validates changes to any user-typed text.
Notes: Validation sets the object value of the cell to the current contents of the cell's editor (the NSText object used for editing), storing it as a simple string or an attributed string object based on the attributes of the editor.

35.61.19 Properties

35.61.20 ActionSelector as String

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The name of the selector.
Notes:

The new action-message selector to associate with the receiver's cell. Specify NULL to prevent action messages from being sent to the receiver's target.
(Read and Write property)

35.61.21 alignment as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The alignment mode of the text in the view's cell.
Example:

```
dim n as NSControlMBS // your control
n.alignment=3
```

Notes:

One of the following constants: NSLeftTextAlignment, NSRightTextAlignment,NSCenterTextAlignment, NSJustifiedTextAlignment, or NSNaturalTextAlignment. The default value is NSNaturalTextAlignment.

Constants:

NSLeftTextAlignment = 0
Text is visually left aligned.

NSRightTextAlignment = 1
Text is visually right aligned.

NSCenterTextAlignment = 2
Text is visually center aligned.

NSJustifiedTextAlignment = 3
Text is justified.

NSNaturalTextAlignment = 4
Use the natural alignment of the text's script.
(Read and Write property)

35.61.22 attributedStringValue as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The value of the view's cell as an attributed string.
Notes:

The value of the cell interpreted as an attributed string, or an empty attributed string if the receiver has no cell.

If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing method before extracting and returning the value.
(Read and Write property)

35.61.23 baseWritingDirection as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The initial writing direction used to determine the actual writing direction for text.

Notes:

One of the following values: NSWritingDirectionNatural, NSWritingDirectionLeftToRight, or NSWritingDirectionRightToLeft. The default value is NSWritingDirectionNatural.

The Text system uses this value as a hint for calculating the actual direction for displaying Unicode characters. You should not need to call this method directly.
(Read and Write property)

35.61.24 cell as Variant

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The receiver's cell object.
Notes:

Cocoa controls often have a frame control and inside a Cell which implements the raw functionality. This way you can for example have a table which embeds such cell controls inside the table cells.

Use this method with great care as it can irrevocably damage the affected control; specifically, you should only use this method in initializers for subclasses of NSControl.
(Read and Write property)

35.61.25 controlSize as Integer

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The size of the cell.
Notes:

Use this property to change the rendered size of the cell and its control.

Changing the cell,Äôs control size does not change the font used by the cell. Use the systemFontSize class method of NSFontMBS to obtain an appropriate font based on the new control size.

If you set this property for Xojo's controls, you may need to set it again in Resized events as it may reset to the default.
(Read and Write property)

35.61.26 currentEditor as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the current field editor for the control.
Notes:

Returns the field editor for the current control, or nil if the receiver does not have a field editor.

When the receiver is a control displaying editable text (for example, a text field) and it is the first responder, it has a field editor, which is returned by this method. The field editor is a single NSTextView object that is shared among all the controls in a window for light text-editing needs. It is automatically instantiated when needed.
(Read only property)

35.61.27 doubleValue as Double

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The double value of the control.
Notes: (Read and Write property)

35.61.28 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: The font used to draw text in the receiver's cell.
Notes:

f the cell is being edited, the text in the cell is redrawn in the new font, and the cell's editor (the NSText object used globally for editing) is updated with the new font object.
(Read and Write property)

35.61.29 ignoresMultiClick as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver ignores multiple clicks made in rapid succession.
Example:

```
dim n as NSControlMBS // your control
n.ignoresMultiClick=True
```

Notes:

True if the view ignores multiple clicks; otherwise, false.
(Read and Write property)

35.61.30 integerValue as Integer

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: The value of the receiver's cell as an Integer value.
Notes:

If the control contains many cells (for example, NSMatrix), then the value of the currently selected cell is returned. If the control is in the process of editing the affected cell, then it invokes the validateEditing method before extracting and returning the value.

Available in OS X v10.5 and later.
(Read and Write property)

35.61.31 intValue as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The integer value of the control.
Example:

```
dim n as new nsbuttonMBS(0,0,100,100)

n.intValue=1
MsgBox str(n.intValue) // shows 1
n.intValue=0
MsgBox str(n.intValue) // shows 0
```

Notes: (Read and Write property)

35.61.32 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver's cell sends its action message continuously to its target during mouse tracking.
Notes:

True if the action message should be sent continuously; otherwise, false.
(Read and Write property)

35.61.33 isEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver reacts to mouse events.
Notes:

True if the view responds to mouse events; otherwise, false.
(Read and Write property)

35.61.34 refusesFirstResponder as boolean

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver refuses the first responder role.
Notes:

By default, the user can advance the focus of keyboard events between controls by pressing the Tab key; when this focus,Äîor first responder status,Äîis indicated for a control (by the insertion point or, for nontext controls, a faint rectangle), the user can activate the control by pressing the Space bar.
(Read and Write property)

35.61.35 selectedCell as NSCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's selected cell.
Notes:

The default implementation of this method simply returns the control's associated cell (or nil if no cell has been set). Subclasses of NSControl that manage multiple cells (such as NSMatrix and NSForm) must override this method to return the cell selected by the user.
(Read only property)

35.61.36 selectedTag as Integer

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: Desktop only.

Function: The tag of the views's selected cell.

Notes: (Read only property)

35.61.37 stringValue as string

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The string value of the control.
Notes: (Read and Write property)

35.61.38 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The tag identifying the object.
Notes:

You can set this property to the value you need.
(Read and Write property)

35.61.39 Events

35.61.40 Action

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: .

Function: The control's action was triggered.
Notes: For a button if it was pressed.

35.61.41 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass imple-

ments this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

35.61.42 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.61.43 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

35.61.44 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.61.45 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 8.0, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.61.46 Constants

35.61.47 ControlSizeLarge = 3

MBS MacCocoa Plugin, Plugin Version: 22.1.

Function: One of the constants to specify a cell,Äôs size.
Notes: A size larger than the default control size.

35.61.48 ControlSizeMini = 2

MBS MacCocoa Plugin, Plugin Version: 22.1.

Function: One of the constants to specify a cell,Äôs size.
Notes: The smallest control size.

35.61.49 ControlSizeRegular = 0

MBS MacCocoa Plugin, Plugin Version: 22.1.

Function: One of the constants to specify a cell,Äôs size.
Notes: The default control size.

35.61.50 ControlSizeSmall = 1

MBS MacCocoa Plugin, Plugin Version: 22.1.

Function: One of the constants to specify a cell,Äôs size.
Notes:

A size smaller than the default control size.
This constant is for controls that can,Äôt be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. Use a small system font with a small control.

35.62 control NSDatePickerControlMBS

35.62.1 control NSDatePickerControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control to put a Mac OS X date picker on a Xojo window.
Notes:

This control embeds a special NSDatePicker subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

- MBS Xojo / Real Studio Plugins, version 15.0pr7

35.62.4 Properties

35.62.5 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 19.2, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

35.62.6 View as NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSDatePicker.
Notes: (Read only property)

35.62.7 Events

35.62.8 Action

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: This event is called when user clicks on a date/time and changes something.

35.62.9 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.62.10 Close

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.62.11 Closing

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.62.12 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.62.13 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.62.14 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.62.15 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.62.16 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.

Notes: This only fires if the control itself got focus and not a sub control.

35.62.17 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.62.18 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.62.19 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.62.20 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.62.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.62.22 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.62.23 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.62.24 Open

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.62.25 Opening

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.62.26 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.63 class NSDatePickerMBS

35.63.1 class NSDatePickerMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The plugin class for a Cocoa date picker.
Notes:

NSDatePicker is a subclass of NSControl that provides a user interface for displaying and editing an NSDate object.
Subclass of the NSControlMBS class.

35.63.4 Methods

35.63.5 Constructor

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new date picker with size 100/100 and position 0/0
Example:

```
dim t as new NSDatePickerMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.63.6 Constructor(Handle as Integer) 8158
- 35.63.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8158

35.63.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSDatePicker handle.
Example:

```
dim t as new NSDatePickerMBS(0, 0, 100, 100)
dim v as new NSDatePickerMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSDatePicker and the plugin retains this handle.
See also:

- 35.63.5 Constructor 8157
- 35.63.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8158

35.63.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new date picker with the given size and position.
Example:

```
dim x as new NSDatePickerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.63.5 Constructor 8157
- 35.63.6 Constructor(Handle as Integer) 8158

35.63.8 Properties

35.63.9 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes:

See also drawsBackground property.
(Read and Write property)

35.63.10 Bezeled as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver has a bezeled border.
Notes:

True if the receiver has a bezeled border, false otherwise.
(Read and Write property)

35.63.11 Bordered as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver has a plain border.
Notes:

True if the receiver has a plain border, false otherwise.
(Read and Write property)

35.63.12 calendar as NSCalendarMBS

MBS MacControls Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The calendar.
Notes: (Read and Write property)

35.63.13 datePickerElements as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: A bitmask that indicates which visual elements of the date picker are currently shown, and which won't be usable because they are hidden.
Notes: (Read and Write property)

35.63.14 datePickerMode as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The date picker mode.
Notes: (Read and Write property)

35.63.15 datePickerStyle as Integer

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The date picker style.
Notes: (Read and Write property)

35.63.16 dateTimeValue as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The current date value.
Notes: (Read and Write property)

35.63.17 dateValue as date

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The current date value.
Notes:

For a range of dates, this is start date and you use timeInterval to get the second one.
(Read and Write property)

35.63.18 drawsBackground as Boolean

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver draws the background.
Notes:

True if the receiver draws the background, false otherwise.
(Read and Write property)

35.63.19 locale as NSLocaleMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The locale.
Notes: (Read and Write property)

35.63.20 maxDate as date

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The maximum date.
Notes:

nil indicates no maximum date.
(Read and Write property)

35.63.21 maxDateTime as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The maximum date.
Notes:

nil indicates no maximum date.
(Read and Write property)

35.63.22 minDate as date

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The minimum date.
Notes:

nil indicates no minimum date.
(Read and Write property)

35.63.23 minDateTime as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: The minimum date.
Notes:

nil indicates no minimum date.
(Read and Write property)

35.63.24 textColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The text color.
Notes: (Read and Write property)

35.63.25 timeInterval as Double

MBS MacControls Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: The time interval that represents the date range.
Notes:

The time interval that represents the receiver's date range. The date range begins at the date returned by dateValue. This method returns 0 when the receiver is not in the NSRangeDateMode mode.
(Read and Write property)

35.63.26 timeZone as NSTimeZoneMBS

MBS MacControls Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The time zone.
Notes: (Read and Write property)

35.63.27 Constants

35.63.28 NSClockAndCalendarDatePickerStyle = 1

MBS MacControls Plugin, Plugin Version: 12.2.

Function: A constants for a date picker style.
Notes: Provide a visual clock and calendar style interface.

35.63.29 NSEraDatePickerElementFlag = & h100

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants which allows you to specify the date and time elements.
Notes:

Display and allow editing of the era of the date, if applicable.
This flag has been declared for possible future use, and does not yet have any effect.

35.63.30 NSHourMinuteDatePickerElementFlag = & hC

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the hour and minute elements of the date.

35.63.31 NSHourMinuteSecondDatePickerElementFlag = & hE

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the hour, minute and second elements of the date.

35.63.32 NSRangeDateMode = 1

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants to define whether the control provides a single date, or a range of dates.
Notes: Allow selection of a range of dates. (First implemented in Mac OS X v 10.5.)

35.63.33 NSSingleDateMode = 0

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants to define whether the control provides a single date, or a range of dates.
Notes: Allow selection of a single date.

35.63.34 NSTextFieldAndStepperDatePickerStyle = 0

MBS MacControls Plugin, Plugin Version: 12.2.

Function: A constants for a date picker style.
Notes: Provide a text field and stepper style interface.

35.63.35 NSTextFieldDatePickerStyle = 2

MBS MacControls Plugin, Plugin Version: 12.2.

Function: A constants for a date picker style.
Notes: Provide a text field interface.

35.63.36 NSTimeZoneDatePickerElementFlag = & h10

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants which allows you to specify the date and time elements.
Notes:

Display and allow editing of the time zone.
This flag has been declared for possible future use, and does not yet have any effect.

35.63.37 NSYearMonthDatePickerElementFlag = & hC0

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the year and month elements of the date.

35.63.38 NSYearMonthDayDatePickerElementFlag = & hE0

MBS MacControls Plugin, Plugin Version: 12.2.

Function: One of the constants which allows you to specify the date and time elements.
Notes: Display and allow editing of the year, month and day elements of the date.

35.64 class NSImageCellMBS

35.64.1 class NSImageCellMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: An NSImageCell object displays a single image (encapsulated in an NSImage object) in a frame.
Notes:

This class provides methods for choosing the frame and for aligning and scaling the image to fit the frame.

The object value of an NSImageCell object must be an NSImage object, so if you use the setObjectValue: method of NSCell, be sure to supply an NSImage object as an argument. Because an NSImage object does not need to be converted for display, do not use the NSCell methods relating to formatters.

An NSImageCell object is usually associated with some kind of control object,Äîan NSImageView, an NSMatrix, or an NSTableView.
Subclass of the NSCellMBS class.

35.64.4 Methods

35.64.5 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with an image.
Example:

```
dim pic as Picture = LogoMBS(500)
dim n as NSImageMBS = new NSImageMBS(pic)
dim c as new NSImageCellMBS(n)

Backdrop = c.image.CopyPictureWithMask
Title = c.classPath
```

See also:

- 35.64.6 Constructor(text as string) 8166

35.64.6 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSImageCellMBS("Hello")
MsgBox c.StringValue
```

See also:

- 35.64.5 Constructor(image as NSImageMBS) 8165

35.64.7 Properties

35.64.8 imageAlignment as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The alignment of the receiver's image relative to its frame.
Notes:

For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.
(Read and Write property)

35.64.9 imageFrameStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The style of the frame that borders the image.
Notes:

Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write property)

35.64.10 imageScaling as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The scaling mode used to fit the receiver's image into the frame.
Notes:

Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write property)

35.64.11 Constants

35.64.12 NSImageAlignBottom = 5

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom edge of the cell.

35.64.13 NSImageAlignBottomLeft = 6

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and left edges of the cell.

35.64.14 NSImageAlignBottomRight = 7

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and right edges of the cell.

35.64.15 NSImageAlignCenter = 0

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.

Notes: Center the image in the cell.

35.64.16 NSImageAlignLeft = 4

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the left edge of the cell.

35.64.17 NSImageAlignRight = 8

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the right edge of the cell.

35.64.18 NSImageAlignTop = 1

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the top edge of the cell.

35.64.19 NSImageAlignTopLeft = 2

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and left edges of the cell.

35.64.20 NSImageAlignTopRight = 3

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.

Notes: Align the image with the top and right edges of the cell.

35.64.21 NSImageFrameButton = 4

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: A convex bezel that makes the image stand out in relief, like a button

35.64.22 NSImageFrameGrayBezel = 2

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: A gray, concave bezel that makes the image look sunken

35.64.23 NSImageFrameGroove = 3

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: A thin groove that looks etched around the image

35.64.24 NSImageFrameNone = 0

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: An invisible frame

35.64.25 NSImageFramePhoto = 1

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: A thin black outline and a dropped shadow

35.64.26 NSImageScaleAxesIndependently = 1

MBS MacCocoa Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image.

35.64.27 NSImageScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: Do not scale the image.

35.64.28 NSImageScaleProportionallyDown = 0

MBS MacCocoa Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: If it is too large for the destination, scale the image down while preserving the aspect ratio.

35.64.29 NSImageScaleProportionallyUpOrDown = 3

MBS MacCocoa Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.

35.64.30 NSScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the scale constants.
Notes: Do not scale the image.

35.64.31 NSScaleProportionally = 0

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the scale constants.
Notes: If it is too large for the destination, scale the image down while preserving the aspect ratio.

35.64.32 NSScaleToFit = 1

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the scale constants.
Notes: Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image.

35.65 class NSImageViewMBS

35.65.1 class NSImageViewMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: An NSImageView object displays a single image from an NSImage object in a frame and can optionally allow a user to drag an image to it.
Example:

ImageWell1.NSImageViewMBS.alphaValue = 0.5

Notes:

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSControlMBS class.

35.65.4 Methods

35.65.5 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new imageview with size 100/100 and position 0/0
Example:

```
dim t as new NSImageViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.65.6 Constructor(Handle as Integer) 8173
- 35.65.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8173

35.65.6 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSImageView handle.
Example:

```
dim t as new NSImageViewMBS(0, 0, 100, 100)
dim v as new NSImageViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSImageView and the plugin retains this handle.
See also:

- 35.65.5 Constructor 8172
- 35.65.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8173

35.65.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new image view with the given size and position.
Example:

```
dim x as new NSImageViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.65.5 Constructor 8172

35.65.8 Properties

35.65.9 allowsCutCopyPaste as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows the user to cut, copy and paste the image contents.
Notes:

True if the user can cut, copy, and paste the image contents; otherwise, false to prevent the use of pasteboard operations.
(Read and Write computed property)

35.65.10 animates as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver automatically plays animated images.
Notes:

True if the receiver automatically plays animated images; otherwise, false. The default value is true for NSImageView objects you create programmatically. For NSImageView objects loaded from a nib file, the control takes the value set in Interface Builder.

The timing and looping characteristics of the animation are taken from the image data. If this method returns false, the receiver displays the first frame of the animation only.
(Read and Write computed property)

35.65.11 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the NSImage object displayed by the receiver.
Notes: (Read and Write computed property)

35.65.12 imageAlignment as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The alignment of the receiver's image relative to its frame.
Notes:

For a list of possible values, see NSImageAlign* constants. The default value is NSImageAlignCenter.

(Read and Write computed property)

35.65.13 imageFrameStyle as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The style of the frame that borders the image.
Example:

ImageWell1.NSImageViewMBS.imageFrameStyle = NSImageViewMBS.NSImageFramePhoto

Notes:

Value is one of the frame style constants. For a list of frame styles, see NSImageFrame* constants.
(Read and Write computed property)

35.65.14 imageScaling as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The scaling mode used to fit the receiver's image into the frame.
Example:

ImageWell1.NSImageViewMBS.imageScaling = NSImageViewMBS.NSScaleNone

Notes:

Value is one of the image scaling constants. For a list of possible values, see NSScale* constants.
(Read and Write computed property)

35.65.15 isEditable as Boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the user can drag a new image into the frame.
Notes:

True if the user can drag an image into the receiver's frame; otherwise, false.
(Read and Write computed property)

35.65.16 Constants

35.65.17 NSImageAlignBottom = 5

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom edge of the cell.

35.65.18 NSImageAlignBottomLeft = 6

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and left edges of the cell.

35.65.19 NSImageAlignBottomRight = 7

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the bottom and right edges of the cell.

35.65.20 NSImageAlignCenter = 0

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Center the image in the cell.

35.65.21 NSImageAlignLeft = 4

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.

Notes: Align the image with the left edge of the cell.

35.65.22 NSImageAlignRight = 8

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the right edge of the cell.

35.65.23 NSImageAlignTop = 1

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Position the image along the top edge of the cell.

35.65.24 NSImageAlignTopLeft = 2

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and left edges of the cell.

35.65.25 NSImageAlignTopRight = 3

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the location of the image in the frame using the imageAlignment property.
Notes: Align the image with the top and right edges of the cell.

35.65.26 NSImageFrameButton = 4

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: A convex bezel that makes the image stand out in relief, like a button

35.65.27 NSImageFrameGrayBezel = 2

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: A gray, concave bezel that makes the image look sunken

35.65.28 NSImageFrameGroove = 3

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Example:

ImageWell1.NSImageViewMBS.imageFrameStyle = NSImageViewMBS.NSImageFrameGroove

Notes: A thin groove that looks etched around the image

35.65.29 NSImageFrameNone = 0

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: An invisible frame

35.65.30 NSImageFramePhoto = 1

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the frame constants for the imageFrameStyle property.
Notes: A thin black outline and a dropped shadow

35.65.31 NSImageScaleAxesIndependently = 1

MBS MacControls Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of

the image.

35.65.32 NSImageScaleNone = 2

MBS MacControls Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: Do not scale the image.

35.65.33 NSImageScaleProportionallyDown = 0

MBS MacControls Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: If it is too large for the destination, scale the image down while preserving the aspect ratio.

35.65.34 NSImageScaleProportionallyUpOrDown = 3

MBS MacControls Plugin, Plugin Version: 21.2.

Function: One of the scale constants.
Notes: Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.

35.65.35 NSScaleNone = 2

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the scale constants.
Notes: Do not scale the image.

35.65.36 NSScaleProportionally = 0

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the scale constants.
Notes: If it is too large for the destination, scale the image down while preserving the aspect ratio.

35.65.37 NSScaleToFit = 1

MBS MacControls Plugin, Plugin Version: 10.0.

Function: One of the scale constants.
Notes: Scale each dimension to exactly fit destination. This setting does not preserve the aspect ratio of the image.

35.66 class NSMenuItemCellMBS

35.66.1 class NSMenuItemCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: NSMenuItemCell is a class that handles the measurement and display of a single menu item in its encompassing frame.
Notes:

Instances of NSMenuItemCell work in conjunction with an NSMenuView object to control the overall appearance of the menu.
Subclass of the NSButtonCellMBS class.

35.66.3 Blog Entries

- MBS Xojo Plugins, version 17.1pr5

35.66.4 Methods

35.66.5 calcSize

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Calculates the minimum required width and height of the receiver,Äôs menu item.
Notes:

The calculated values are cached for future use. This method also calculates the sizes of individual components of the cell,Äôs menu item and caches those values.
This method is invoked automatically when necessary. You should not need to invoke it directly.

35.66.6 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
Notes: Don't use it.
See also:

- 35.66.7 Constructor(text as string) 8182

35.66.7 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.
See also:

- 35.66.6 Constructor(image as NSImageMBS) 8181

35.66.8 Properties

35.66.9 menuItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The menu item object associated with the cell.
Notes: (Read and Write property)

35.66.10 needsDisplay as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the menu item needs to be displayed.
Notes:

Set this property to true when you want the menu item to be drawn.
(Read and Write property)

35.66.11 needsSizing as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the size of the menu needs to be calculated.
Notes:

When the value of this property is true, the next attempt to obtain size information about the menu cause the calcSize method to be called. When the value of the property is false, the size information is obtained from the currently cached values.
Subclasses that drastically change the way a menu item is drawn can change the value of this property to update the menu item information. Other parts of your application should not need to change this property directly. The cell checks this value of this property as necessary when the content of its menu item changes.
(Read and Write property)

35.66.12 tag as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The integer tag of the selected menu item.
Notes:

If no item is selected, the value in this property is 0.
(Read and Write property)

35.67 control NSOutlineControlMBS

35.67.1 control NSOutlineControlMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The control for a NSOutlineView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

35.67.8 Properties

35.67.9 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

35.67.10 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes:

The default value of this property is true, which allows the user to rearrange the table view,Äôs columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

35.67.11 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes:

The default of this property is true, which allows the user to resize the table view,Äôs columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

35.67.12 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes:

The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

35.67.13 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes:

The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

35.67.14 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes:

The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

35.67.15 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes:

The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

35.67.16 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

35.67.17 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

35.67.18 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The scroll view used in this control.
Notes: (Read only property)

35.67.19 View as NSOutlineViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The outline view used in this control.
Notes: (Read only property)
See also:

- 35.67.104 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS 8213

35.67.20 Events

35.67.21 acceptDrop(info as NSDraggingInfoMBS, item as NSOutlineViewItemMBS, index as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether a drop operation was successful.
Notes:

info: An object that contains more information about this dragging operation.
item: The parent of the item over which the cursor was placed when the mouse button was released.
index: The index of the child of item over which the cursor was placed when the mouse button was released.

Return true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can get the data for the drop operation from info using the draggingPasteboard method.
The return value indicates success or failure of the drag operation to the system.

35.67.22 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.67.23 childOfItem(index as Integer, item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns the child item at the specified index of a given item.
Notes:

index: The index of the child item from item to return.
item: An item in the data source.

Return the child item at index of item. If item is nil, returns the appropriate child item of the root object.

Children of a given parent item are accessed sequentially. In order for the collapsed state of the outline view to remain consistent when it is reloaded you must always return the same object for a specified child and item.

Do not call reloadData from this method.

This event is called very frequently, so it must be efficient.

35.67.24 Close

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.67.25 Closing

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.67.26 ColumnDidMove(notification as NSNotificationMBS, OldColumn as Integer, NewColumn as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked whenever the user moves a column in the outline view.

35.67.27 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked whenever the user resizes a column in the outline view.

35.67.28 concludeDragOperation(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

35.67.29 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.67.30 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.67.31 dataCell(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns the cell to use in a given column for a given item.
Notes:

tableColumn: The table column for which the cell is required. This value may be nil.
item: The item for which the cell is required.

Return the cell to use in column tableColumn for item item, or nil. The cell must properly implement copyWithZone (since it may be copied by by the outline view).

You can return a different data cell for any particular combination of table column and item, or a cell that

will be used for the entire row (a full-width cell). If tableColumn is non-nil, you should return a cell. Typically, you should default to returning the result from [tableColumn dataCellForRow:row] .
When each row (identified by the item) is being drawn, this method is first called with a nil value for tableColumn. At this time, you can return a cell that is used to draw the entire row, acting like a group. If you do return a cell for the nil table column, your implementations of the other corresponding data source and delegate methods must be prepared to be invoked with a nil value for tableColumn. If do not return a cell for the nil table column, the method is called once for each column in the outline view, as usual.

35.67.32 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implemented to know when a new row view is added to the table.
Notes:

rowView: The new row view.
row: The row to which the view was added.

This evemt is for NSView-based outline views. At this point, you can choose to add in extra views or modify any properties on rowView.

35.67.33 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Sent at the time the mouse button subsequently goes up in outlineView and tableColumn has been ‚Äúclicked‚Äù without having been dragged anywhere.

35.67.34 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Sent at the time the mouse button goes up in outlineView and tableColumn has been dragged during the time the mouse button was down.

35.67.35 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implemented to know when a row view is removed from the table
Notes:

rowView: The row view that was removed.
row: The number of the row that was removed due to being moved offscreen, or -1 if the row was removed from the table so it is no longer valid.

The removed rowView may be reused by the table, so any additionally inserted views should be removed at this point.

35.67.36 didTile

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

35.67.37 DoubleClick

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse made a double click.

35.67.38 draggingEnded(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

35.67.39 draggingExited(info as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

35.67.40 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method to know when the given dragging session has ended.
Notes:

session: The dragging session that ended.
screenPoint: The point onscreen at which the drag ended.
operation: A mask specifying the types of drag operations permitted by the dragging source.

You can implement this optional delegate method to know when the dragging source operation ended at a specific location, such as the trash (by checking for an operation of NSDragOperationDelete).

35.67.41 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, draggedItems() as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method know when the given dragging session is about to begin and potentially modify the dragging session.

Notes:

session: The dragging session that is about to begin.
screenPoint: The point onscreen at which the drag is to begin.
draggedItems: A array of items to be dragged, excluding items for which pasteboardWriterForItem returns nil.

The draggedItems array directly matches the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo protocol's pasteboard classes.

35.67.42 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.67.43 FocusLost

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.67.44 FocusReceived

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.67.45 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.67.46 GotFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.67.47 heightOfRowByItem(item as NSOutlineViewItemMBS) as Double

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns the height in points of the row containing item.
Notes:

item: The row item.

Return the height of the row.

Values returned by this method should not include intercell spacing and must be greater than 0.
Implement this event to support an outline view with varying row heights.

For large tables in particular, you should make sure that this method is efficient. NSOutlineView may cache the values this method returns, so if you would like to change a row's height make sure to invalidate the row height by calling noteHeightOfRowsWithIndexesChanged. NSOutlineView automatically invalidates its entire row height cache in reloadData and noteNumberOfRowsChanged.

If you call viewAtColumn or rowViewAtRow within your implementation of this method, an exception is thrown.

To avoid the possibility of a hang due to unexpected recursion, don,Äôt call geometry-calculating methods such as bounds, rectOfColumn, or any NSTableView method that calls tile within your implementation of this method.

35.67.48 isGroupItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean that indicates whether a given row should be drawn in the ‚Äúgroup row‚Äù style.
Notes:

item: An item in the outline view.

Return true to indicate a particular row should have the "group row" style drawn for that row, otherwise false.

If the cell in that row is an instance of NSTextFieldCell and contains only a string value, the ‚Äúgroup row‚Äù style attributes are automatically applied for that cell.

35.67.49 isItemExpandable(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether the a given item is expandable.
Notes:

item: An item in the data source.

Returns true if item can be expanded to display its children, otherwise NO.

This method may be called quite often, so it must be efficient.

Do not call reloadData from this method.

35.67.50 ItemDidCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when the did collapse notification is posted,‚Äîthat is, whenever the user collapses an item in the outline view.

35.67.51 ItemDidExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when notification is posted,Äîthat is, whenever the user expands an item in the outline view.

35.67.52 itemForPersistentObject(PersistentObject as Variant) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by outlineView to return the item for the archived object.
Notes:

object: An archived representation of an item in outlineView's data source.

Return the unarchived item corresponding to object. If the item is an archived object, this method may return the object.

When the outline view is restoring the saved expanded items, this method is called for each expanded item, to translate the archived object to an outline view item.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

35.67.53 ItemWillCollapse(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when notification is posted,Äîthat is, whenever the user is about to collapse an item in the outline view.

35.67.54 ItemWillExpand(notification as NSNotificationMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when notification is posted,Äîthat is, whenever the user is about to expand an item in the outline view.

35.67.55 LeftMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.56 LeftMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.57 LeftMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.58 LostFocus

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.67.59 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.67.60 MouseDown(x as Integer, y as Integer, Modifiers as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.67.61 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Event sent whenever the mouse button is clicked in outlineView while the cursor is in a column header tableColumn.

35.67.62 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.67.63 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.67.64 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedItems() as NSOutlineViewItemMBS) as string()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns an array of filenames for the created files that the receiver promises to create.
Notes:

dropDestination: The drop location where the files are created.
items: The items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

For more information on file promise dragging, see documentation on the NSDraggingSource protocol and namesOfPromisedFilesDroppedAtDestination.

35.67.65 nextTypeSelectMatchFromItem(startItem as NSOutlineViewItemMBS, endItem as NSOutlineViewItemMBS, searchString as String) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns the first item that matches the searchString from within the range of startItem to endItem.
Notes:

startItem: The first item to search.
endItem: The item before which to stop searching. It is possible for endItem to be less than startItem if the search will wrap.
searchString: The string for which to search.

Returns the first item,Äîfrom within the range of startItem to endItem,Äîthat matches the searchString, or nil if there is no match.

Implement this method if you want to control how type selection works. You should include startItem as a

possible match, but do not include endItem.
It is not necessary to implement this event in order to support type select.

35.67.66 numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns the number of child items encompassed by a given item.
Notes:

item: An item in the data source.

Returns the number of child items encompassed by item. If item is nil, this method should return the number of children for the top-level item.

The numberOfChildrenOfItem method is called very frequently, so it must be efficient.

Do not call reloadData from this method.

35.67.67 objectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by outlineView to return the data object associated with the specified item.
Notes:

tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

Returns the item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

35.67.68 Open

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.67.69 Opening

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.67.70 OtherMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.71 OtherMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.72 OtherMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.73 pasteboardWriterForItem(item as NSOutlineViewItemMBS) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method to enable the table to be an NSDraggingSource that supports dragging multiple items.
Notes:

item: The item for which to return a pasteboard writer.

Returns a NSPasteboardItem object.

If this method is implemented, then writeItems is not called.

35.67.74 persistentObjectForItem(item as NSOutlineViewItemMBS) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by outlineView to return an archived object for item.
Notes:

item: The item for which to return an archived object.

Returns an archived representation of item. If the item is an archived object, this method may return the item.

When the outline view is saving the expanded items, this method is called for each expanded item, to translate the outline view item to an archived object.

You must implement this method if you are automatically saving expanded items (that is, if autosaveExpandedItems returns true).

35.67.75 RightMouseDown(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.76 RightMouseDragged(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.77 RightMouseUp(e as NSEventMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.67.78 rowViewForItem(item as NSOutlineViewItemMBS) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method to return a custom NSTableRowView for a particular item.
Notes:

item: The item displayed by the returned table row view.

Return an instance or subclass of NSTableRowView. If nil is returned, a NSTableRowView instance is created and used.

This method, if implemented, is only invoked for NSView-based outline views.

35.67.79 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.67.80 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when the selection did change notification is posted,Äîthat is, immediately after the outline view,Äôs selection has changed.

35.67.81 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.
Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view,Äôs existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of willDisplayOutlineCell.

If not implemented or returns nil, the plugin will return proposedSelectionIndexes.

35.67.82 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked when notification is posted,Äîthat is, whenever the outline view,Äôs selection changes.

35.67.83 selectionShouldChangeInOutlineView as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether the outline view should change its selection.
Notes:

Return true to permit outlineView to change its selection (typically a row being edited), false to deny permission.

For example, if the user is editing a cell and enters an improper value, the delegate can prevent the user

from selecting or editing any other cells until a proper value has been entered into the original cell. You can implement this method for complex validation of edited rows based on the values of any of their cells.

35.67.84 setObjectValue(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Set the data object for a given item in a given column.
Notes:

object: The new value for the item.
tableColumn: A column in outlineView.
item: An item in the data source in the specified tableColumn of the view.

The item is located in the specified tableColumn of the view.

Do not call reloadData from this method.

35.67.85 shouldCollapseAutoExpandedItemsForDeposited(deposited as Boolean, superResult as Boolean) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether auto-expanded items should return to their original collapsed state.
Notes:

deposited: If true, the drop terminated successfully; if false the drop failed.

Return true if auto-expanded items should return to their original collapsed state; otherwise false.

Implement this event to provide custom behavior. If the target of a drop is not auto-expanded (by hovering long enough) the drop target still gets expanded after a successful drop unless this method returns true. The default implementation returns false after a successful drop.
This method is called in a variety of situations. For example, it is called shortly after the acceptDrop method is called and also if the drag exits the outline view (exiting the view is treated the same as a failed drop). The return value of the acceptDrop method determines the incoming value of the deposited parameter.

35.67.86 shouldCollapseItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether the outline view should collapse a given item.
Notes:

item: The item that should collapse.

Return true to permit outlineView to collapse item, false to deny permission.

You can implement this method to disallow collapsing of specific items. For example, if the first row of your outline view should not be collapsed, your delegate method could contain this line of code:

return rowForItem(item) <>0

35.67.87 shouldEdit(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMB as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether the outline view should allow editing of a given item in a given table column.
Notes:

tableColumn: The table column.
item: The item.

Returns true to permit outlineView to edit the cell specified by tableColumn and item, false to deny permission.
If this method returns true, the cell may still not be editable,Äîfor example, if you have set up a custom NSTextFieldCell as a data cell, it must return true for isEditable to allow editing.

You can implement this method to disallow editing of specific cells.

35.67.88 shouldExpandItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether the outline view should expand a given item.
Notes:

item: The item that should expand.

Returns true to permit outlineView to expand item, false to deny permission.
You can implement this method to disallow expanding of specific items.

35.67.89 shouldReorderColumn(columnIndex as Integer, newColumnIndex as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Sent to the delegate to allow or prohibit the specified column to be dragged to a new location.
Notes:

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Returns true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.
If this method is not implemented, all columns are considered reorderable.

35.67.90 shouldSelectItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether the outline view should select a given item.
Notes:

item: The item.

Return true to permit outlineView to select item, false to deny permission.

You implement this event to disallow selection of particular items.
For better performance and finer grain control over the selection, use dataCell.

35.67.91 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether the outline view should select a given table column.
Notes:

tableColumn: The table column.

Return true to permit outlineView to select tableColumn, false to deny permission.

You can implement this method to disallow selection of specific columns.

35.67.92 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to control cell expansion for a specific column and item.
Notes:

tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true to allow an expansion tooltip to appear in the column tableColumn for item item, otherwise false.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

35.67.93 shouldShowOutlineCellForItem(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns whether the specified item should display the outline cell (the disclosure triangle).
Notes:

item: An item in the outline view.

Returns true if the outline cell should be displayed, otherwise false.

Returning false causes frameOfOutlineCellAtRow to return NSZeroRect, hiding the cell. In addition, the row will not be collapsible by keyboard shortcuts.
This method is called only for expandable rows.

35.67.94 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether a given cell should be tracked.
Notes:

cell: The cell used to display item item in column tableColumn
tableColumn: A table column in the outline view.
item: An item in the outline view.

Returns true if the cell should be tracked for the item item in column tableColumn, otherwise false.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked (and vice-versa). For example, this allows you to have a button cell in a table which does not change the selection, but can still be clicked on and tracked.

35.67.95 shouldTypeSelectForEvent(e as NSEventMBS, searchString as String) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether type select should proceed for a given event and search string.
Notes:

e: The event that caused the message to be sent.
searchString: The string for which searching is to proceed. The search string is nil if no type select has begun.

Return true if type select should proceed, otherwise false.

Generally, this method will be called from keyDown and the event will be a key event.

35.67.96 sizeToFitWidthOfColumn(Column as Integer) as Double

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to provide custom sizing behavior when a column,Äôs resize divider is double clicked.
Notes:

column: The index of the column.

Returns the width of the specified column.

By default, NSOutlineView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.
For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

35.67.97 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by an outline view to notify the data source that the descriptors changed and the data may need to be resorted.
Notes:

oldDescriptors: An array that contains the previous descriptors.

The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source does not itself manage them, you can get outlineView's current sort descriptors by sending it a sortDescriptors message.

35.67.98 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

35.67.99 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

35.67.100 toolTipForCell(cell as NSCellMBS, byref rect as NSRectMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS, mouseLocation as NSPointMBS) as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: When the cursor pauses over a given cell, the value returned from this method is displayed in a tooltip.
Notes:

cell: The cell for which to generate a tooltip.
rect: The proposed active area of the tooltip. To control the default active area, you can modify the rect parameter. By default, rect is computed as cell.drawingRectForBounds(cellFrame).
tc: The table column that contains cell.
item: The item for which to display a tooltip.
mouseLocation: The current mouse location in view coordinates.

If you don,Äôt want a tooltip at that location, return nil or the empty string.

35.67.101 typeSelectString(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns the string that is used for type selection for a given column and item.
Notes:

tableColumn: A table column in the outline view.
item: An item in the outline view.

Return the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil for that row and/or column to not be searched

Implement this method if you want to control the string that is used for type selection. You may want to change what is searched for based on what is displayed, or simply return nil to specify that the given row

and/or column should not be searched. By default, all cells with text in them are searched.

The default value when this delegate method is not implemented is:
outlineView.preparedCellAtColumn(tableColumn, outlineView.rowForItem(item)).stringValue
and you can return this value from the event if you wish.

35.67.102 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method to enable the table to update dragging items as they are dragged over the view.
Notes: draggingInfo: The dragging info object.

35.67.103 validateDrop(info as NSDraggingInfoMBS, proposedItem as NSOutlineViewItemMBS, proposedChildIndex as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Used by an outline view to determine a valid drop target.
Notes:

info: An object that contains more information about this dragging operation.
item: The proposed parent.
index: The proposed child location.

Returns a value that indicates which dragging operation the data source will perform.

Based on the mouse position, the outline view will suggest a proposed drop location. The data source may ‚Äúretarget‚Äù a drop if desired by calling setDropItem and returning something other than NSDragOperationNone. You may choose to retarget for various reasons (for example, for better visual feedback when inserting into a sorted position).
Implementation of this method is optional.

35.67.104 view(tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implemented to return the view used to display the specified item and column.
Notes:

tableColumn: The table column, or nil if the row is a group row.
item: The item displayed by the returned view.

Return the view to display the specified column and row. Returning nil is acceptable, in which case a view is not shown at that location.

This method is required if you wish to use NSView objects instead of NSCell objects for the cells within an outline view. Cells and views cannot be mixed within the same outline view.
It is recommended that the implementation of this method first call the NSTableView method makeViewWithIdentifier passing, respectively, the tableColumn parameter,Äôs identifier and self as the owner to attempt to reuse a view that is no longer visible. The frame of the view returned by this method is not important, and is automatically set by the outline view.
The view's properties should be properly set up before returning the result.
When using Cocoa bindings, this method is optional if at least one identifier has been associated with the table view at design time. If this method is not implemented, the outline view automatically calls makeViewWithIdentifier with the tableColumn parameter,Äôs identifier and the outline view,Äôs delegate as parameters, to attempt to reuse a previous view or automatically unarchive a prototype associated with the table view.
The autoresizingMask of the returned view is automatically set to NSViewHeightSizable to resize properly on row height changes.
See also:

- 35.67.19 View as NSOutlineViewMBS 8187

35.67.105 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the delegate that the cell specified by the column and item will be displayed.
Notes:

cell: The cell.
tableColumn: The table column.
item: The item.

You can implement this method to modify cell to provide further setup for the cell in tableColumn and item. It is not safe to do drawing inside this method,Äîyou should only set up state for cell.

35.67.106 willDisplayOutlineCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the delegate that an outline view is about to display a cell used to draw the expansion symbol.
Notes:

cell: The cell.
tableColumn: The table column.
item: The item.

Informs the event that outlineView is about to display cell,Äîan expandable cell (a cell that has the expansion symbol),Äîfor the column and item specified by tableColumn and item. The delegate can modify cell to alter its display attributes.
This method is not invoked when outlineView is about to display a non-expandable cell.

35.67.107 willTile

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

35.67.108 writeItems(items() as NSOutlineViewItemMBS, pasteboard as NSPasteboardMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes:

items: An array of the items participating in the drag.
pasteboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, otherwise false.

Invoked by outlineView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto the pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the outline view once this call returns with true.

35.68 class NSOutlineViewItemMBS

35.68.1 class NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to subclass for your items.

35.68.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr4

35.68.3 Blog Entries

- MBS Xojo Plugins, version 17.1pr4

35.68.4 Methods

35.68.5 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.

35.68.6 sortedArrayUsingDescriptor(values() as NSOutlineViewItemMBS, sortDescriptor as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a copy of the receiving array sorted as specified by a given a sort descriptor.
Notes:

sortDescriptor: The NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptor.

35.68.7 sortedArrayUsingDescriptors(values() as NSOutlineViewItemMBS, sortDescriptor() as NSSortDescriptorMBS) as NSOutlineViewItemMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a copy of the receiving array sorted as specified by a given array of sort descriptors.
Notes:

sortDescriptors: An array of NSSortDescriptor objects.

Returns a copy of the receiving array sorted as specified by sortDescriptors.

The first descriptor specifies the primary key path to be used in sorting the receiving array,Äôs contents. Any subsequent descriptors are used to further refine sorting of objects with duplicate values. See NSSortDescriptor for additional information.

35.68.8 Properties

35.68.9 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The description text property.
Notes: (Read only property)
See also:

- 35.68.13 Description as String 8218

35.68.10 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

35.68.11 valueForKey(key as String) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Get/set the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.
(Read and Write computed property)
See also:

- 35.68.16 valueForKey(key as string) as Variant 8219

35.68.12 Events

35.68.13 Description as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event when system queries description for object.
See also:

- 35.68.9 Description as String 8217

35.68.14 setValueForKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Sets the property of the receiver specified by a given key to a given value.
Notes:

value: The value for the property identified by key.
key: The name of one of the receiver's properties.

If key identifies a to-one relationship, relate the object specified by value to the receiver, unrelating the previously related object if there was one. Given a collection object and a key that identifies a to-many relationship, relate the objects contained in the collection to the receiver, unrelating previously related objects if there were any.
The search pattern that setValueForKey uses is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
In a reference-counted environment, if the instance variable is accessed directly, value is retained.

35.68.15 setValueForUndefinedKey(key as string, value as Variant)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by setValueForKey when it finds no property for a given key.
Notes:

value: The value for the key identified by key.
key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to handle the request in some other way. The default implementation raises an NSUndefinedKeyException.

35.68.16 valueForKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Return the value for the property identified by a given key.
Notes:

key: The name of one of the receiver's properties.

Returns the value for the property identified by key.

If event is not implemented, the search pattern that valueForKey uses to find the correct value to return is described in Accessor Search Patterns in Key-Value Coding Programming Guide.
See also:

- 35.68.11 valueForKey(key as String) as Variant 8217

35.68.17 valueForUndefinedKey(key as string) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Invoked by valueForKey when it finds no property corresponding to a given key.
Notes:

key: A string that is not equal to the name of any of the receiver's properties.

Subclasses can override this method to return an alternate value for undefined keys. The default implementation raises an NSUndefinedKeyException.

35.69 class NSOutlineViewMBS

35.69.1 class NSOutlineViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The class for a hierarchical list.
Notes:

NSOutlineView is a subclass of NSTableView that uses a row-and-column format to display hierarchical data that can be expanded and collapsed, such as directories and files in a file system. A user can expand and collapse rows, edit values, and resize and rearrange columns.

Like a table view, an outline view does not store its own data, instead it retrieves data values as needed from a data source to which it has a weak reference.

MBS Plugin provides all events in NSOutlineControlMBS control.

An outline view has the following features:

- A user can expand and collapse rows.
- Each item in the outline view must be unique. In order for the collapsed state to remain consistent between reloads the item's pointer must remain the same and the item must maintain isEqual: sameness.
- The view gets data from a data source (see NSOutlineControlMBS).
- The view retrieves only the data that needs to be displayed.

Subclass of the NSTableViewMBS class.

35.69.4 Methods

35.69.5 child(index as Integer, ofItem as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the specified child of an item.
Notes:

index: The index of the child item in the parent.
item: The parent item whose child item you want to retrieve.

Returns the child item or nil if the item could not be found.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the child event of the associated data source.

35.69.6 childIndexForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the child index of the specified item within its parent.
Notes: The performance of this method is O(1) at best and O(n) at worst.

35.69.7 collapseItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Collapses a given item.
Notes:

If item is not expanded or not expandable, does nothing
If collapsing takes place, posts item collapse notification.
See also:

- 35.69.8 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean) 8221

35.69.8 collapseItem(item as NSOutlineViewItemMBS, collapseChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Collapses a given item and, optionally, its children.
Notes:

item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will collapse each item under the root in the outline view.
collapseChildren: If true, recursively collapses item and its children. If NO, collapses item only (identical to collapseItem:).

For example, this method is invoked with the collapseChildren parameter set to true when a user Option-clicks the disclosure triangle for an item in the outline view (to collapse the item and all its contained items).
For each item collapsed, posts an item collapsed notification.
See also:

- 35.69.7 collapseItem(item as NSOutlineViewItemMBS) 8221

35.69.9 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new outline view with size 100/100 and position 0/0
Example:

```
dim t as new NSOutlineViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.69.10 Constructor(Handle as Integer) 8222
- 35.69.11 Constructor(left as Double, top as Double, width as Double, height as Double) 8223

35.69.10 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSOutlineView handle.
Example:

```
dim t as new NSOutlineViewMBS(0, 0, 100, 100)
dim v as new NSOutlineViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSOutlineViewMBS and the plugin retains this handle.
See also:

- 35.69.9 Constructor 8222
- 35.69.11 Constructor(left as Double, top as Double, width as Double, height as Double) 8223

35.69.11 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new outline view with the given size and position.
Example:

```
dim x as new NSOutlineViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.69.9 Constructor 8222
- 35.69.10 Constructor(Handle as Integer) 8222

35.69.12 expandItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Expands a given item.
Notes:

If item is not expandable or is already expanded, does nothing.
If expanding takes place, posts an item expanded notification.
See also:

- 35.69.13 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean) 8223

35.69.13 expandItem(item as NSOutlineViewItemMBS, expandChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Expands a specified item and, optionally, its children.
Notes:

item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will expand each item under the root in the outline view.

expandChildren: If true, recursively expands item and its children. If false, expands item only (identical to expandItem).

For example, this method is invoked with the expandChildren parameter set to YES when a user Option-clicks the disclosure triangle for an item in the outline view (to expand the item and all its contained items). For each item expanded, posts an item expanded notification.
See also:

- 35.69.12 expandItem(item as NSOutlineViewItemMBS) 8223

35.69.14 frameOfOutlineCellAtRow(row as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the frame of the outline cell for a given row.
Notes:

row: The index of the row for which to return the frame.

Returns the frame of the outline cell for the row at index row, considering the current indentation and the value in the indentationMarkerFollowsCell property. If the row at index row is not an expandable row, returns NSZeroRect.

You can override this method in a subclass to return a custom frame for the outline button cell. If your override returns an empty rect, no outline cell is drawn for that row. You might do that, for example, so that the disclosure triangle will not be shown for a row that should never be expanded.

35.69.15 insertItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Inserts new items at the given indexes in the given parent with the specified optional animations.
Notes:

indexes: Indexes at which to insert items.
parent: The parent for the items, or nil if the parent is the root.
animationOptions: Animated slide effects used when inserting items.

This method parallels the insertRowsAtIndexes method of NSTableView and is used in a way similar to the insertObjects method of NSMutableArray. The method does nothing if parent is not expanded. The actual item values are determined by the data source,Äôs child event (which is called only after endUpdates to ensure data source integrity).

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; new insertions move previously inserted new items, just like modifying an array. Inserting an index beyond what is available throws an exception.

35.69.16 insertRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Private method to block you from calling this method in NSTableViewMBS.

35.69.17 isExpandable(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a given item is expandable.
Notes: True if item is expandable,Äîthat is, item can contain other items, otherwise false.

35.69.18 isItemExpanded(item as NSOutlineViewItemMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether a given item is expanded.
Notes: True if item is expanded, otherwise false.

35.69.19 itemAtRow(row as Integer) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the item associated with a given row.
Notes:

row: The index of a row in the receiver.

Returns the item associated with row.

35.69.20 levelForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the indentation level for a given item.
Notes:

The indentation level for item. If item is nil (which is the root item), returns -1.
The levels are zero-based,Äîthat is, the first level of displayed items is level 0.

35.69.21 levelForRow(row as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the indentation level for a given row.
Notes:

The indentation level for row. For an invalid row, returns -1.
The levels are zero-based,Äîthat is, the first level of displayed items is level 0.

35.69.22 moveItemAtIndex(oldIndex as Integer, oldParent as NSOutlineViewItemMBS, newIndex as Integer, newParent as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Moves an item at a given index in the given parent to a new index in a new parent.
Notes:

fromIndex: Index of the item to be moved.
oldParent: The parent of the item to be moved.
toIndex: Index in the new parent to which the item is moved.
newParent: The parent of the item after it is moved.

This method parallels the moveRowAtIndex method of NSTableView. The newParent can be the same as oldParent to reorder an item within the same parent.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block. Moving from an invalid index, or to an invalid index, throws an exception.

35.69.23 moveRowAtIndex(oldIndex as Integer, newIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Private method to block you from calling this method in NSTableViewMBS.

35.69.24 NSOutlineViewColumnDidMoveNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever a column is moved by user action in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which a column moved. The userInfo dictionary contains the following information:

NSOldColumn: An NSNumber object containing the integer value of the column,Äôs original index
NSNewColumn: An NSNumber object containing the integer value of the column,Äôs present index

35.69.25 NSOutlineViewColumnDidResizeNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever a column is resized in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which a column was resized. The userInfo dictionary contains the following information:

NSTableColumn: The column that was resized.
NSOldWidth: An NSNumber object containing the column,Äôs original width

35.69.26 NSOutlineViewDisclosureButtonKey as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: These key is used by the outline view to create disclosure buttons that collapse and expand items.
Notes: The normal triangle disclosure button.

35.69.27 NSOutlineViewItemDidCollapseNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever an item is collapsed in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which an item was collapsed. A collapsed item,Äôs children lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item that was collapsed (an id)

35.69.28 NSOutlineViewItemDidExpandNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted whenever an item is expanded in an NSOutlineView object.
Notes:

The notification object is the NSOutlineView object in which an item was expanded. The userInfo dictionary contains the following information:

NSObject: The item that was expanded (an id)

35.69.29 NSOutlineViewItemWillCollapseNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted before an item is collapsed (after the user clicks the arrow but before the item is collapsed).
Notes:

The notification object is the NSOutlineView object that contains the item about to be collapsed. A collapsed item,Äôs children will lose their status as being selected. The userInfo dictionary contains the following information:

NSObject: The item about to be collapsed (an id)

35.69.30 NSOutlineViewItemWillExpandNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted before an item is expanded (after the user clicks the arrow but before the item is collapsed).
Notes:

The notification object is the outline view that contains an item about to be expanded. The userInfo dictionary contains the following information:

NSObject: The item that is to be expanded (an id)

35.69.31 NSOutlineViewSelectionDidChangeNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted after the outline view's selection changes.
Notes: The notification object is the outline view whose selection changed. This notification does not contain a userInfo dictionary.

35.69.32 NSOutlineViewSelectionIsChangingNotification as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Posted as the outline view,Äôs selection changes (while the mouse button is still down).
Notes: The notification object is the outline view whose selection is changing. This notification does not contain a userInfo dictionary.

35.69.33 NSOutlineViewShowHideButtonKey as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: These key is used by the outline view to create disclosure buttons that collapse and expand items.
Notes: The Show/Hide button.

35.69.34 numberOfChildrenOfItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of children for the specified parent item.
Notes:

item: The parent item.

Returns the number of children associated with the parent.

You can call this method on an outline view with either a static or dynamic data source. For an outline view whose contents are dynamic, this method may call out to the numberOfChildrenOfItem event of the associated data source.

35.69.35 parentForItem(item as NSOutlineViewItemMBS) as NSOutlineViewItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the parent for a given item.
Notes:

item: The item for which to return the parent.

Returns the parent for item, or nil if the parent is the root.

35.69.36 reloadItem(item as NSOutlineViewItemMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Reloads and redisplays the data for the given item.
Notes:

Reloading the cell views associated with item occurs only in apps that link against macOS 10.12 and later.
This method may cause the outline view to change its selection without calling the SelectionDidChange event.
See also:

- 35.69.37 reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean) 8230

35.69.37 reloadItem(item as NSOutlineViewItemMBS, reloadChildren as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Reloads a given item and, optionally, its children.
Notes:

item: An item in the receiver.
Starting in OS X version 10.5, passing 'nil' will reload everything under the root in the outline view.

reloadChildren: If true, recursively reloads item and its children. If false, reloads item only (identical to reloadItem).

It is not necessary, or efficient, to reload children if the item is not expanded.
See also:

- 35.69.36 reloadItem(item as NSOutlineViewItemMBS) 8230

35.69.38 removeItemsAtIndexes(indexes as NSIndexSetMBS, Parent as NSOutlineViewItemMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes items at the given indexes in the given parent with the specified optional animations.
Notes:

indexes: Indexes of the items to be removed.
parent: The parent of the items to be removed.
animationOptions: Animated slide effects used when removing items.

This method parallels the removeRowsAtIndexes method of NSTableView and is used in a way similar to the removeObjectsAtIndexes method of NSMutableArray. The method does nothing if parent is not expanded. If any of the child items is expanded, then all of its child rows are also be removed.

NSCell-based outline views must first call beginUpdates before calling this method.

You can call this method multiple times within the same beginUpdates/endUpdates block; changes work just like modifying an array. Removing an item at an index beyond what is available throws an exception.

35.69.39 removeRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Private method to block you from calling this method in NSTableViewMBS.

35.69.40 rowForItem(item as NSOutlineViewItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the row associated with a given item.
Notes: The row associated with item, or -1 if item is nil or cannot be found.

35.69.41 setDropItem(item as NSOutlineViewItemMBS, dropChildIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Used to ,Äúretarget,Äù a proposed drop.
Notes:

item: The target item.
index: The drop index.

For example, to specify a drop on someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex. To specify a drop between child 2 and 3 of someOutlineItem, you specify item as someOutlineItem and index as 3 (children are a zero-based index). To specify a drop on an un-expandable someOutlineItem, you specify item as someOutlineItem and index as NSOutlineViewDropOnItemIndex.

35.69.42 Properties

35.69.43 autoresizesOutlineColumn as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the outline view resizes its outline column when the user expands or collapses items.
Notes:

The outline column contains the cells with the expansion symbols and is generally the first column. The default value of this property is true, which causes the outline column to be resized.
The outline column is resized based on how many indentation levels are exposed or hidden. For example, if expanding a row exposes a single indentation level, the outline column width is increased by one indentationPerLevel.
(Read and Write property)

35.69.44 autosaveExpandedItems as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the expanded items are automatically saved across launches of the app.
Notes:

When the value of this property is true, the outline view saves the state of its expanded items and restores that state the next time the user launches the app. (If the outline view,Äôs autosaveName property is nil, or if you have not implemented the itemForPersistentObject and persistentObjectForItem events, this setting

is ignored and outline information is not saved.) The configuration data is saved separately for each user and for each app. The default value of this property is NO.
You can have separate settings for the autosaveExpandedItems and autosaveTableColumns properties, so you could, for example, save expanded item information, but not table column positions.
(Read and Write property)

35.69.45 indentationMarkerFollowsCell as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the indentation marker symbol displayed in the outline column should be indented along with the cell contents.
Notes:

When the value of this property is true, the indentation marker is indented along with the cell contents. When the value is false, the marker is always displayed left-justified in the column. The default value of this property is true.
(Read and Write property)

35.69.46 indentationPerLevel as Double

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The per-level indentation, measured in points.
Notes: (Read and Write property)

35.69.47 outlinetableColumn as NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The table column in which hierarchical data is displayed.
Notes:

Each level of hierarchical data is indented by the amount specified by the indentationPerLevel property (the default is 16.0), and decorated with the indentation marker (disclosure triangle) on rows that are expandable.
Outline table column data is archived with the rest of the outline view,Äôs state information.
Attempts to set the value of this property to nil are silently ignored.
(Read and Write property)

35.69.48 stronglyReferencesItems as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the outline view retains and releases the objects returned from its data source.
Notes:

For Xojo applications we highly recommend to keep all items in arrays in Xojo, so they are not released by Xojo too early!

When the value of this property is true, the outline view retains and releases the objects returned to it from dataSource. When the value is NO, the outline view treats the objects as opaque items and assumes that the client has a retain on them. The default value is YES for applications linked on macOS 10.12 and later, and false for applications linked on earlier versions of macOS. If you require the legacy behavior and your app links in macOS 10.12 or later, the value of this property must be explicitly set toNO in code, because it is not encoded in the nib. In general, this is required if the items themselves create a retain cycle.
(Read and Write property)

35.69.49 userInterfaceLayoutDirection as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The user interface layout direction.
Notes:

When set to NSUserInterfaceLayoutDirectionRightToLeft, the outline view displays the disclosure triangle to the right of the cell instead of the left. The default value is NSUserInterfaceLayoutDirectionLeftToRight.
(Read and Write property)

35.69.50 Constants

35.69.51 NSOutlineViewDropOnItemIndex = -1

MBS MacControls Plugin, Plugin Version: 17.1.

Function: May be used as a valid child index of a drop target item.
Notes: In this case, the drop will happen directly on the target item.

35.70 class NSPathComponentCellMBS

35.70.1 class NSPathComponentCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The NSPathComponentCell class displays a component of a path.
Notes:

An NSPathCell object manages a collection of NSPathComponentCell objects, in conjunction with an NSPathControl object, to represent a path.
Subclass of the NSTextFieldCellMBS class.

35.70.2 Blog Entries

35.70.3 Blog Entries

- MBS Real Studio Plugins, version 12.0pr6

35.70.4 Methods

35.70.5 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.

35.70.6 Properties

35.70.7 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The value of the portion of the path from the root through the component represented by the receiver.
Notes: (Read and Write computed property)

35.70.8 Image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The image displayed for this component cell.
Notes:

Generally, a 16-by-16,Äìpoint image fits best when the path style is NSPathStyleStandard or NSPathStyle-PopUp, and a 14-by-14,Äìpoint image is best when the path style is NSPathStyleNavigationBar.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

35.70.9 URL as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The value of the portion of the path from the root through the component represented by the receiver.
Notes: (Read and Write computed property)

35.71 class NSPathControlMBS

35.71.1 class NSPathControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: NSPathControl is a subclass of NSControl that represents a file system path or virtual path.
Notes:

The NSPathControl class uses NSPathCell to implement its user interface. NSPathControl provides cover methods for most NSPathCell methods,Äîthe cover method simply invokes the corresponding cell method. See also NSPathComponentCell, which represents individual components of the path, and two associated protocols: NSPathCellDelegate and NSPathControlDelegate.

NSPathControl has three styles represented by the NSPathStyle enumeration constants NSPathStyleStandard, NSPathStyleNavigationBar, and NSPathStylePopUp. The represented path can be a file system path or any other type of path leading through a sequence of nodes or components, as defined by the programmer.

NSPathControl automatically supports drag and drop, which can be further customized via delegate methods. To accept drag and drop, NSPathControl calls registerForDraggedTypes: with NSFilenamesPboardType and NSURLPboardType. When the URL value in the NSPathControl object changes because of an automatic drag and drop operation or the user selecting a new path via the open panel, the action is sent. On Mac OS X v10.5 the value returned by clickedPathComponentCell is nil, on Mac OS X v10.6 and later, clickedPathComponentCell returns the clicked cell.
Subclass of the NSControlMBS class.

35.71.6 Methods

35.71.7 clickedPathComponentCell as NSPathComponentCellMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns component cell that was clicked.
Notes:

The value returned is generally valid only when the action or double action is being sent.
Note: In Mac OS X 10.5 and earlier the returned value was nil if no cell had been clicked. In Mac OS X 10.6, the folder of the cell that the user selected is returned instead.

35.71.8 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with size 100/100 and position 0/0
Example:

```
dim t as new NSPathControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.71.9 Constructor(Handle as Integer) 8238
- 35.71.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8239

35.71.9 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSPathControl handle.
Example:

```
dim t as new NSPathControlMBS(0, 0, 100, 100)
dim v as new NSPathControlMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSPathControl and the plugin retains this handle.
See also:

- 35.71.8 Constructor 8238
- 35.71.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8239

35.71.10 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with the given size and position.
Example:

```
dim x as new NSPathControlMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.71.8 Constructor 8238
- 35.71.9 Constructor(Handle as Integer) 8238

35.71.11 pathComponentCells as NSPathComponentCellMBS()

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Returns an array of the NSPathComponentCell objects currently being displayed.
Notes: Available in Mac OS X v10.5 and later.

35.71.12 setDraggingSourceOperationMask(mask as Integer, local as boolean)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Configures the default value returned from draggingSourceOperationMaskForLocal.
Notes:

mask: The types of drag operations allowed.
isLocal: If true, mask applies when the drag destination object is in the same application as the receiver; if false, mask applies when the destination object is outside the receiver's application.

By default, draggingSourceOperationMaskForLocal returns NSDragOperationEvery when isLocal is true and NSDragOperationNone when isLocal is false.

Available in Mac OS X v10.5 and later.

35.71.13 setPathComponentCells(cells() as NSPathComponentCellMBS)

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: Sets the array of NSPathComponentCell objects currently being displayed.
Notes:

cells: An array of NSPathComponentCell objects.

Each item in the array must be an instance of NSPathComponentCell or a subclass thereof. You cannot set this value to nil, but you can set it to an empty array.

Available in Mac OS X v10.5 and later.

35.71.14 Properties

35.71.15 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes:

By default, the background is set to a light blue color for NSPathStyleStandard and nil for the other styles. You can use NSColorMBS.clearColor to make the background transparent.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

35.71.16 File as folderitem

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The path property.
Notes:

When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the

path exists. The URL value itself is stored in the objectValue property of the cell.

See also URL property.
(Read and Write computed property)

35.71.17 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The menu used for the path control's cells.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write computed property)

35.71.18 pathStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The path style.
Notes:

Either NSPathStyleStandard or NSPathStylePopUp.
(Read and Write computed property)

35.71.19 URL as string

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The path property.
Notes:

When setting, an array of NSPathComponentCell objects is automatically set based on the path in url. If url is a file URL (returns true from isFileURL), the images are automatically filled with file icons, if the path exists. The URL value itself is stored in the objectValue property of the cell.

See also File property.
(Read and Write computed property)

35.71.20 Events

35.71.21 DoubleClick

MBS MacCocoa Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Called on a double click.

35.71.22 Constants

35.71.23 NSPathStyleNavigationBar = 1

MBS MacCocoa Plugin, Plugin Version: 12.0.

Function: One of the path style constants.
Notes:

The navigation bar display style and behavior. Similar to the NSPathStyleStandard with the navigation bar drawing style. Also known as the breadcrumb style.
Available in Mac OS X v10.5 and later.

35.71.24 NSPathStylePopUp = 2

MBS MacCocoa Plugin, Plugin Version: 12.0.

Function: One of the path style constants.
Notes:

The pop-up display style and behavior. Only the last path component is displayed with an icon image and component name. The full path is shown when the user clicks on the cell. If the cell is editable, a Choose item is included to enable selecting a different path.
Available in Mac OS X v10.5 and later.

35.71.25 NSPathStyleStandard = 0

MBS MacCocoa Plugin, Plugin Version: 12.0.

Function: One of the path style constants.
Notes:

The standard display style and behavior. All path component cells are displayed with an icon image and component name. If the path can not fully be displayed, the middle parts are truncated as required.
Available in Mac OS X v10.5 and later.

35.72 class NSPopUpButtonCellMBS

35.72.1 class NSPopUpButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The NSPopUpButtonCell class defines the visual appearance of pop-up buttons that display pop-up or pull-down menus.
Notes:

Pop-up menus present the user with a set of choices, much the way radio buttons do, but using much less space. Pull-down menus also provide a set of choices but present the information in a slightly different way, usually to provide a set of commands from which the user can choose.

The NSPopUpButtonCellMBS class implements the user interface for the NSPopUpButtonMBS class.
Changes made to a menu (such as adding, removing, or changing the items) are not apparent while the menu is being displayed or interacted with.
Subclass of the NSMenuItemCellMBS class.

35.72.4 Methods

35.72.5 addItemsWithTitles(itemTitles() as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Adds multiple items to the end of the menu.
Notes:

itemTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The new menu items use the pop-up button,Äôs default action and target, but you can change these using the setAction: and setTarget: methods of the corresponding NSMenuItem object.

If you want to move an item, it,Äôs better to invoke removeItemWithTitle: explicitly and then call this method. After adding the items, this method uses the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Because this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the receiver's menu instead.

35.72.6 addItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Adds an item with the specified title to the end of the menu.
Notes:

title: The title of the new menu item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

The menu item uses the pop-up button,Äôs default action and target, but you can change these using the setAction: and setTarget: methods of the corresponding NSMenuItemMBS object.
Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button's menu instead.

35.72.7 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The private constructor.
See also:

- 35.72.8 Constructor(text as string, pullsDown as boolean) 8244

35.72.8 Constructor(text as string, pullsDown as boolean)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns an NSPopUpButtonCell object initialized with the specified title.
See also:

- 35.72.7 Constructor(image as NSImageMBS) 8244

35.72.9 dismissPopUp

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Dismisses the pop-up button,Äôs menu by ordering its window out.
Notes:

If the pop-up button was not displaying its menu, this method does nothing.
You normally do not call this method explicitly. It is called by the Application Kit automatically to dismiss the menu for the pop-up button.

35.72.10 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the specified menu item.
Notes:

item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.

35.72.11 indexOfItemWithTag(tag as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the menu item with the specified tag.
Notes:

tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

Tags are values your application assigns to an object to identify it. You can assign tags to menu items using the tag property of NSMenuItemMBS.

35.72.12 indexOfItemWithTitle(title as String) as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item with the specified title.
Notes:

title: The title of the item you want. You must not pass nil for this parameter.

Returns the index of the item or -1 if no item with the specified title was found.

35.72.13 insertItemWithTitle(title as string, atIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Inserts an item at the specified position in the menu.
Notes:

title: The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added
index: The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

The value in index must represent a valid position in the array. The menu item at index and all those that follow it are shifted down one slot to make room for the new menu item.
This method assigns the pop-up button,Äôs default action and target to the new menu item. This triggers the action event of the NSActionCellMBS.

Because this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. In a situation like this, add items directly to the button's menu instead.

35.72.14 itemArray as NSMenuItemMBS()

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: An array of NSMenuItemMBS objects that represent the items in the menu.

35.72.15 itemAtIndex(Index as Integer) as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item at the specified index.
Notes:

index: The index of the item you want. The specified index must refer to an existing menu item.

Returns the menu item, or nil if no item exists at the specified index.

35.72.16 itemTitleAtIndex(Index as Integer) as String

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the title of the item at the specified index.
Notes:

index: The index of the item you want.

Returns the title of the item, or an empty string if no item exists at the specified index.

35.72.17 itemTitles as String()

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: An array of strings containing the titles of every item in the menu.
Notes: The titles appear in the order in which the items appear in the menu. If the menu contains separator items, the array contains an empty string ("") for each separator item.

35.72.18 itemWithTitle(title as String) as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item with the specified title.
Notes:

title: The title of the menu item you want.

Returns the menu item, or nil if no item with the specified title exists in the menu.

35.72.19 removeAllItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes all items in the receiver,Äôs item menu.

35.72.20 removeItemAtIndex(Index as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes the item at the specified index.

Notes: index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu. The index must be valid and non-negative.

35.72.21 removeItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes the item with the specified title from the menu.
Notes: title: The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

35.72.22 selectItem(item as NSMenuItemMBS)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the specified menu item.
Notes:

item: The menu item to select, or nil if you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to NO.

35.72.23 selectItemAtIndex(Index as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the item in the menu at the specified index.
Notes:

index: The index of the item you want to select, or -1 you want to deselect all menu items.

By default, selecting or deselecting a menu item from a pop-up menu changes its state. Selecting a menu item from a pull-down menu does not automatically alter the state of the item. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to false.
Subclassers can override this method to catch all select calls.

35.72.24 selectItemWithTag(tag as Integer) as boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the menu item with the specified tag.
Notes:

tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged. You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the tag property of NSMenuItemMBS.

35.72.25 selectItemWithTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Selects the item with the specified title.
Notes:

title: The title of the item to select. If you specify nil, an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

By default, selecting or deselecting a menu item changes its state. To disassociate the current selection from the state of menu items, set the altersStateOfSelectedItem property to false.

35.72.26 setTitle(title as string)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Sets the string displayed in the receiver when the user isn,Äôt pressing the mouse button.
Notes:

title: The string to display.

For pull-down menus that get their titles from a menu item, this method simply sets the pop-up button cell,Äôs menu item to the first item in the menu. For pop-up menus, if a menu item whose title matches aString exists, this method makes that menu item the current selection; otherwise, it creates a new menu item with the title aString, adds it to the pop-up menu, and selects it.

35.72.27 synchronizeTitleAndSelectedItem

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Synchronizes the the pop-up button,Äôs displayed item with the currently selected menu item.
Notes:

If no item is currently selected, this method synchronizes the pop-up buttons displayed item with the first menu item. If the pop-up button cell does not get its displayed item from a menu item, this method does nothing.
For pull-down menus, this method sets the displayed item to the title first menu item.
If the pop-up button,Äôs menu does not contain any menu items, this method sets the pop-up button,Äôs displayed item to nil, resulting in nothing being displayed in the control.

35.72.28 Properties

35.72.29 altersStateOfSelectedItem as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates if the pop-up button links the state of the selected menu item to the current selection.
Notes:

When the value of this property is true (which is the default value), the state of the selected item is set to NSOnState. When the value of this property is false, the items in the menu are left alone. When you change the value of this property, the state of the currently selected item is updated appropriately.
Note that this property affects only pop-up buttons (it is ignored for pull-down menus).
(Read and Write property)

35.72.30 arrowPosition as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The position of the arrow displayed on the button.
Notes:

When the value of this property is NSPopUpNoArrow, the control displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell and NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This property is used with preferredEdge to determine the exact location and orientation of the arrow.
This property applies to only bezel style and borderless pop-up buttons.
(Read and Write property)

35.72.31 autoenablesItems as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates if the button automatically enables and disables its items every time a user event occurs.
Notes:

When the value of this property is true, the button automatically enables and disables items. The default value is true. For more information about enabling and disabling menu items, see NSMenuValidation.
(Read and Write property)

35.72.32 indexOfSelectedItem as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The index of the item last selected by the user.
Notes:

The value of this property is the index of the selected item, or -1 if no item is selected.
(Read only property)

35.72.33 lastItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The last item in the menu.
Notes: (Read only property)

35.72.34 menu as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The pop-up button,Äôs associated menu.
Notes: (Read and Write property)

35.72.35 numberOfItems as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The number of items in the menu.
Notes: (Read only property)

35.72.36 preferredEdge as Integer

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The edge of the cell from which the menu should pop out when screen conditions are restrictive.
Notes:

At display time, if attaching the menu to the preferred edge would cause part of the menu to be obscured, the pop-up button may use a different edge. If no preferred edge is set, the pop-up button uses the bottom edge by default, which is NSMaxYEdge for flipped views or NSMinYEdge for unflipped views. Additional values for this property include NSMinXEdge and NSMaxXEdge.
The exact location of the arrow is determined by examining the value of this property and arrowPosition.

If the arrow position is NSPopUpArrowAtCenter, the arrow stays in the center of the button and the value of this property determines which edge the arrow points to: NSMinXEdge points to the left, NSMaxYEdge points to the top, NSMaxXEdge points to the right, and NSMinYEdge points to the bottom.

If the arrow position is NSPopUpArrowAtBottom, the value of this property determines which edge at which the arrow is placed: NSMinXEdge places the arrow at the center of the left side, pointing to the left, NSMinYEdge places the arrow at bottom right corner, pointing up, NSMaxXEdge places the arrow at the center of the right side, pointing to the right, and NSMaxYEdge places the arrow at the bottom right corner, pointing down.
(Read and Write property)

35.72.37 pullsDown as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates the behavior of the button,Äôs menu.
Notes:

When the value of this property is true, the menu behaves like a pull-down menu; when the value is false, it behaves like a pop-up menu. If you use this property to change the menu type from a pop-up menu to a pull-down menu, and the cell alters the state of its selected items, the state of the currently selected item is set to NSOffState before the menu type is changed.
(Read and Write property)

35.72.38 selectedItem as NSMenuItemMBS

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The menu item last selected by the user.
Notes:

The value of this property is the menu item that is currently selected, or nil if no item is selected. The last

selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu,Äôs selected item to be its first item.
(Read only property)

35.72.39 titleOfSelectedItem as String

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The title of the item last selected by the user.
Notes:

The value of this property is the title of the selected menu item, or an empty string if no item is selected.
(Read only property)

35.72.40 usesItemFromMenu as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates if the control uses an item from the menu for its own title.
Notes:

When the value of this property is true, a pull-down menu uses the title of the first menu item, and a pop-up menu uses the title of the currently selected menu (if no menu item is selected, the pop-up button displays no item and is drawn empty). When the value is false, the menu item set with menuItem (NSMenuItemMBS) is always displayed. The default value is true.
(Read and Write property)

35.72.41 Constants

35.72.42 NSPopUpArrowAtBottom = 2

MBS MacCocoa Plugin, Plugin Version: 17.1.

Function: One of the arrowPosition constants.
Notes: Arrow is drawn at the edge of the button, pointing toward the preferredEdge.

35.72.43 NSPopUpArrowAtCenter = 1

MBS MacCocoa Plugin, Plugin Version: 17.1.

Function: One of the arrowPosition constants.
Notes: Arrow is centered vertically, pointing toward the preferredEdge.

35.72.44 NSPopUpNoArrow = 0

MBS MacCocoa Plugin, Plugin Version: 17.1.

Function: One of the arrowPosition constants.
Notes: Does not display any arrow in the control.

35.73 control NSPopUpButtonControlMBS

35.73.1 control NSPopUpButtonControlMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSPopUpButtonControl.
Notes:

This control embeds a special NSPopUpButtonControl subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.

35.73.4 Properties

35.73.5 View as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.73.6 Events

35.73.7 Action

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: .

Function: The action event.

35.73.8 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.73.9 Close

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.73.10 Closing

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.73.11 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.73.12 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or

false to give others a chance.

35.73.13 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.73.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.73.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.73.16 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.73.17 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.73.18 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.73.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.73.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.73.21 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.73.22 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.73.23 Open

MBS MacControls Plugin, Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.73.24 Opening

Plugin Version: 13.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.73.25 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.74 class NSPopUpButtonMBS

35.74.1 class NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: An NSPopUpButton object controls a pop-up menu or a pull-down menu from which a user can select an item.
Example:

```
// get cocoa view for the popupmenu
dim p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
dim it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
dim pic as Picture = LogoMBS(500)
dim img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes:

The NSPopUpButton class defines objects that implement the pop-up and pull-down menus of the graphical user interface.

An NSPopUpButton object uses an NSPopUpButtonCell object to implement its user interface.

Note that while a menu is tracking, adding, removing, or changing items on the menu is not reflected.
Subclass of the NSButtonMBS class.

35.74.4 Methods

35.74.5 addItemsWithTitles(titles() as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Adds multiple items to the end of the menu.
Notes:

temTitles: An array of strings containing the titles of the items you want to add. Each string in the array should be unique. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

If you want to move an item, it's better to invoke removeItemWithTitle: explicitly and then send this method. After adding the items, this method uses the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding items to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

35.74.6 addItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Adds an item with the specified title to the end of the menu.
Notes:

title: The title of the menu-item entry. If an item with the same title already exists in the menu, the existing item is removed and the new one is added.

If you want to move an item, it's better to invoke removeItemWithTitle explicitly and then send this method. After adding the item, this method calls the synchronizeTitleAndSelectedItem method to make sure the item being displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

35.74.7 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSPopUpButtonMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.74.8 Constructor(Handle as Integer) 8263
- 35.74.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8263
- 35.74.10 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 8264

35.74.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSPopUpButton handle.
Example:

```
dim t as new NSPopUpButtonMBS(0, 0, 100, 100)
dim v as new NSPopUpButtonMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSPopUpButton and the plugin retains this handle.
See also:

- 35.74.7 Constructor 8263
- 35.74.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8263
- 35.74.10 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 8264

35.74.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new popup button with the given size and position.
Example:

```
dim x as new NSPopUpButtonMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.74.7 Constructor 8263
- 35.74.8 Constructor(Handle as Integer) 8263
- 35.74.10 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean) 8264

35.74.10 Constructor(left as Double, top as Double, width as Double, height as Double, pullsDown as boolean)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates an NSPopUpButton object initialized to the specified dimensions.
Notes:

left,top,width,height: The frame rectangle for the button, specified in the parent view's coordinate system.

pullsDown: true if you want the receiver to display a pull-down menu; otherwise, false if you want it to display a pop-up menu.
See also:

- 35.74.7 Constructor 8263
- 35.74.8 Constructor(Handle as Integer) 8263
- 35.74.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8263

35.74.11 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the specified menu item.
Notes:

item: The menu item whose index you want.

Returns the index of the item or -1 if no such item was found.
This method invokes the method of the same name of its NSPopUpButtonCell object.

35.74.12 indexOfItemWithTag(tag as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the menu item with the specified tag.
Notes:

tag: The tag of the menu item you want.

Returns the index of the item or -1 if no item with the specified tag was found.

This method invokes the method of the same name of its NSPopUpButtonCell object.

35.74.13 indexOfItemWithTitle(title as string) as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item with the specified title.
Notes:

title: The title of the item you want.

Returns the index of the item or -1 if no item with the specified title was found.

35.74.14 indexOfSelectedItem as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item last selected by the user.
Notes: The index of the selected item, or -1 if no item is selected.

35.74.15 insertItemWithTitle(title as string, atIndex as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Inserts an item at the specified position in the menu.
Notes:

title: The title of the new item. If an item with the same title already exists in the menu, the existing item is removed and the new one is added

index: The zero-based index at which to insert the item. Specifying 0 inserts the item at the top of the menu.

If you want to move an item, it's better to invoke removeItemWithTitle: explicitly and then send this method. After adding the item, this method uses the synchronizeTitleAndSelectedItem method to make sure the item displayed matches the currently selected item.

Since this method searches for duplicate items, it should not be used if you are adding an item to an already populated menu with more than a few hundred items. Add items directly to the receiver's menu instead.

35.74.16 itemAtIndex(index as Integer) as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item at the specified index.
Notes:

index: The index of the item you want.

Returns the menu item, or nil if no item exists at the specified index.

35.74.17 itemWithTitle(title as string) as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item with the specified title.
Notes:

title: The title of the menu item you want.

The menu item, or nil if no item with the specified title exists in the menu.

35.74.18 lastItem as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the last item in the menu.

35.74.19 removeAllItems

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes all items in the receiver's item menu.
Notes: After removing the items, this method uses the synchronizeTitleAndSelectedItem method to refresh the menu.

35.74.20 removeItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes the item at the specified index.
Notes:

index: The zero-based index indicating which item to remove. Specifying 0 removes the item at the top of the menu.

After removing the item, this method uses the synchronizeTitleAndSelectedItem method to make sure the title displayed matches the currently selected item.

35.74.21 removeItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes the item with the specified title from the menu.
Notes:

title: The title of the item you want to remove. If no menu item exists with the specified title, this method triggers an assertion.

This method removes the first item it finds with the specified name. This method then uses synchronizeTitleAndSelectedItem to refresh the menu.

35.74.22 selectItem(item as NSMenuItemMBS)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the specified menu item.
Notes: item: The menu item to select, or nil if you want to deselect all menu items.

35.74.23 selectItemAtIndex(index as Integer)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the item in the menu at the specified index.
Notes: index: The index of the item you want to select, or -1 you want to deselect all menu items.

35.74.24 selectItemWithTag(tag as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the menu item with the specified tag.
Notes:

tag: The tag of the item you want to select.

Returns true if the item was successfully selected; otherwise, false.

If no item with the specified tag is found, this method returns false and leaves the menu state unchanged.

You typically assign tags to menu items from Interface Builder, but you can also assign them programmatically using the setTag: method of NSMenuItem.

Available in Mac OS X v10.4 and later.

35.74.25 selectItemWithTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the item with the specified title.
Notes: title: The title of the item to select. If you specify an empty string, or a string that does not match the title of a menu item, this method deselects the currently selected item.

35.74.26 setTitle(title as string)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Sets the string displayed in the receiver when the user isn't pressing the mouse button.
Notes: If the receiver displays a pop-up menu, this method changes the current item to be the item with the specified title, adding a new item by that name if one does not already exist. If the receiver displays a

pull-down list, this method sets its title to the specified string.

35.74.27 synchronizeTitleAndSelectedItem

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Ensures that the item being displayed by the receiver agrees with the selected item.
Notes: If there's no selected item, this method selects the first item in the item menu and sets the receiver's item to match. For pull-down menus, this method makes sure that the first item is being displayed (the NSPopUpButtonCell object must be set to use the selected menu item, which happens by default).

35.74.28 titleOfSelectedItem as string

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the title of the item last selected by the user.
Notes: Returns the title of the selected menu item, or an empty string if no item is selected.

35.74.29 Properties

35.74.30 arrowPosition as Integer

MBS MacControls Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop only.

Function: The position of the arrow displayed.
Notes:

If you specify NSPopUpNoArrow, the receiver displays no arrow. NSPopUpArrowAtCenter displays the arrow centered horizontally within the cell. NSPopUpArrowAtBottom displays the arrow at the edge of the cell. This method works with setPreferredEdge: to determine the exact location and orientation of the arrow. For more information, see setPreferredEdge:.

This method is ignored unless the receiver is a pull-down list with a beveled border.
(Read and Write property)

35.74.31 autoenablesItems as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver automatically enables and disables its items every time a user event occurs.
Notes:

true if the receiver automatically enables and disables items; otherwise, false. The default value is true.
(Read and Write property)

35.74.32 menu as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the pop-up button's associated menu.
Notes: (Read and Write property)

35.74.33 numberOfItems as Integer

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the number of items in the menu.
Notes: (Read only property)

35.74.34 pullsDown as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating the behavior of the control's menu.
Notes:

True if the menu behaves like a pull-down menu; otherwise, false if it behaves like a pop-up menu.
(Read and Write property)

35.74.35 selectedItem as NSMenuItemMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item last selected by the user.
Notes:

Returns the menu item that is currently selected, or nil if no item is selected.

The last selected menu item is the one that was highlighted when the user released the mouse button. It is possible for a pull-down menu's selected item to be its first item.
(Read and Write computed property)

35.74.36 Constants

35.74.37 NSPopUpArrowAtBottom = 2

MBS MacControls Plugin, Plugin Version: 14.3.

Function: One of the constants for the arrow positions.
Notes: Arrow is drawn at the edge of the button, pointing toward the preferredEdge.

35.74.38 NSPopUpArrowAtCenter = 1

MBS MacControls Plugin, Plugin Version: 14.3.

Function: One of the constants for the arrow positions.
Notes: Arrow is centered vertically, pointing toward the preferredEdge.

35.74.39 NSPopUpNoArrow = 0

MBS MacControls Plugin, Plugin Version: 14.3.

Function: One of the constants for the arrow positions.
Notes: Does not display any arrow in the receiver.

35.75 class NSProgressIndicatorMBS

35.75.1 class NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The NSProgressIndicator class lets an application display a progress indicator to show that a lengthy task is under way.
Notes:

Some progress indicators are indeterminate and do nothing more than spin to show that the application is busy. Others are determinate and show the percentage of the task that has been completed.

This also eliminates the hung appearance is you move the window or open a menu. Unlike the RB progress controls that pause when you do these things, the Cocoa version continues to update.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

35.75.6 Methods

35.75.7 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with size 100/100 and position 0/0
Example:

```
dim t as new NSProgressIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.75.8 Constructor(Handle as Integer) 8273
- 35.75.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8273

35.75.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSProgressIndicator handle.
Example:

```
dim t as new NSProgressIndicatorMBS(0, 0, 100, 100)
dim v as new NSProgressIndicatorMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSProgressIndicator and the plugin retains this handle.
See also:

- 35.75.7 Constructor 8272
- 35.75.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8273

35.75.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with the given size and position.
Example:

```
dim x as new NSProgressIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.75.7 Constructor 8272
- 35.75.8 Constructor(Handle as Integer) 8273

35.75.10 incrementBy(delta as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Advances the progress bar of a determinate progress indicator by the specified amount.
Notes: The amount by which to increment the progress bar. For example, if you want to advance a progress bar from 0.0 to 100.0 in 20 steps, you would invoke incrementBy 20 times with a delta value of 5.0.

35.75.11 sizeToFit

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: This action method resizes the receiver to an appropriate size depending on what style returns.
Notes: Use this after you set style to re-size the receiver.

35.75.12 startAnimation

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Starts the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

35.75.13 stopAnimation

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Stops the animation of an indeterminate progress indicator.
Notes: Does nothing for a determinate progress indicator.

35.75.14 Properties

35.75.15 controlSize as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver.
Notes: (Read and Write computed property)

35.75.16 controlTint as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's control tint.
Notes: (Read and Write computed property)

35.75.17 doubleValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A value that indicates the current extent of the progress bar of a determinate progress indicator.
Notes:

The value representing the current extent of a determinate progress bar. For example, a determinate progress indicator goes from 0.0 to 100.0 by default. If the progress bar has advanced halfway across the view, the value returned by doubleValue would be 50.0. An indeterminate progress indicator does not use this value.
(Read and Write computed property)

35.75.18 isBezeled as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver's frame has a bezel.
Notes:

True if the receiver's frame has a three-dimensional bezel; otherwise, false.
(Read and Write computed property)

35.75.19 isDisplayedWhenStopped as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver shows itself even when it's not animating.
Notes:

True if the progress indicator shows itself even when it's not animating. By default, this returns returns true if style is NSProgressIndicatorBarStyle and false if style isNSProgressIndicatorSpinningStyle.
(Read and Write computed property)

35.75.20 isIndeterminate as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver is indeterminate.
Notes:

This method only has an effect if style returns NSProgressIndicatorBarStyle. If style returns NSProgressIndicatorSpinningStyle, the indicator is always indeterminate, regardless of what you pass to this method.
(Read and Write computed property)

35.75.21 maxValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The maximum value for the receiver.
Notes:

The maximum value of the progress indicator. An indeterminate progress indicator does not use this value.
(Read and Write computed property)

35.75.22 minValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The minimum value for the receiver.
Notes:

An indeterminate progress indicator does not use this value.
(Read and Write computed property)

35.75.23 style as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The style of the progress indicator (bar or spinning).
Notes:

Either NSProgressIndicatorBarStyle or NSProgressIndicatorSpinningStyle.
(Read and Write computed property)

35.75.24 usesThreadedAnimation as boolean

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A hint as to whether the receiver should implement animation of the progress indicator in a separate thread.
Notes:

Value is true to indicate that animation of the progress indicator should occur in a separate thread; otherwise, false. This value is only a hint and may be ignored.

If the application becomes multithreaded as a result of an invocation of this method, the application's performance could become noticeably slower.
(Read and Write computed property)

35.75.25 Constants

35.75.26 NSBlueControlTint=1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: Aqua control tint

35.75.27 NSClearControlTint=7

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: Clear control tint

35.75.28 NSDefaultControlTint=0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: The current default tint setting

35.75.29 NSGraphiteControlTint=6

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: Graphite control tint

35.75.30 NSMiniControlSize=2

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the ControlSize property.
Notes: The control has a smaller size than NSSmallControlSize.

35.75.31 NSProgressIndicatorBarStyle=0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants for the style property.
Notes: A rectangular indicator that can be determinate or indeterminate.

35.75.32 NSProgressIndicatorPreferredAquaThickness=12

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the height of a progress indicator.

35.75.33 NSProgressIndicatorPreferredLargeThickness=18

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the height of a progress indicator.

35.75.34 NSProgressIndicatorPreferredSmallThickness=10

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the height of a progress indicator.

35.75.35 NSProgressIndicatorPreferredThickness=14

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the height of a progress indicator.

35.75.36 NSProgressIndicatorSpinningStyle=1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants for the style property.
Notes: A small square indicator that can be indeterminate only .

35.75.37 NSRegularControlSize=0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the ControlSize property.
Notes: The control is sized as regular.

35.75.38 NSSmallControlSize=1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the ControlSize property.
Notes: This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

35.76 class NSScrollerMBS

35.76.1 class NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: An NSScroller object controls scrolling of a document view within an NSScrollView's clip view (or potentially another kind of container view).
Notes:

It typically displays a pair of buttons that the user can click to scroll by a small amount (called a line increment or decrement) and Alt-click to scroll by a large amount (called a page increment or decrement), plus a slot containing a knob that the user can drag directly to the desired location. The knob indicates both the position within the document view and, by varying in size within the slot, the amount visible relative to the size of the document view. You can configure whether an NSScroller object uses scroll buttons, but it always draws the knob when there's room for it.

Don't use an NSScroller when an NSSlider would be better. A slider represents a range of values for something in the application and lets the user choose a setting. A scroller represents the relative position of the visible portion of a view and lets the user choose which portion to view.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSControlMBS class.

35.76.6 Methods

35.76.7 checkSpaceForParts

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Checks to see if there is enough room in the receiver to display the knob and buttons.
Notes: usableParts returns the state calculated by this method. You should never need to invoke this method; it's invoked automatically whenever the NSScroller's size changes.

35.76.8 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new scroller with size 100/100 and position 0/0
Example:

```
dim t as new NSScrollerMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.76.9 Constructor(Handle as Integer) 8281
- 35.76.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8282

35.76.9 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSScroller handle.
Example:

```
dim t as new NSScrollerMBS(0, 0, 100, 100)
dim v as new NSScrollerMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSScroller and the plugin retains this handle.
See also:

- 35.76.8 Constructor 8281
- 35.76.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8282

35.76.10 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new scroller with the given size and position.
Example:

```
dim x as new NSScrollerMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.76.8 Constructor 8281
- 35.76.9 Constructor(Handle as Integer) 8281

35.76.11 drawArrow(Arrow as Integer, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Draws the scroll button indicated by arrow, which is either NSScrollerIncrementArrow (the down or right scroll button) or NSScrollerDecrementArrow (up or left).
Notes:

If flag is true, the button is drawn highlighted; otherwise it's drawn normally. You should never need to invoke this method directly, but may wish to override it to customize the appearance of scroll buttons.
Calling this method on CustomNSScrollerMBS objects does not trigger the drawArrow event.

35.76.12 drawKnob

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Draws the knob.
Notes:

You should never need to invoke this method directly, but may wish to override it to customize the appearance of the knob.

Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnob event.

35.76.13 drawKnobSlotInRect(slotRect as NSRectMBS, highlight as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Draws the knob slow in the rectangle.
Notes: Calling this method on CustomNSScrollerMBS objects does not trigger the drawKnobSlotInRect event.

35.76.14 drawParts

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Caches images for the scroll buttons and knob.
Notes:

It's invoked only once when the NSScroller is created. You may want to override this method if you alter the look of the NSScroller, but you should never invoke it directly.

Calling this method on CustomNSScrollerMBS objects does not trigger the drawParts event.

35.76.15 highlight(flag as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Highlights or unhighlights the scroll button the user clicked.
Notes: The receiver invokes this method while tracking the mouse; you should not invoke it directly. If flag is true, the appropriate part is drawn highlighted; otherwise it's drawn normally.

35.76.16 hitPart as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns a part code indicating the manner in which the scrolling should be performed.
Notes: This method is typically invoked by an NSScrollView to determine how to scroll its document view when it receives an action message from the NSScroller.

35.76.17 isCompatibleWithOverlayScrollers as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the class is compatible with overlay scroller style and behavior.
Notes:

Returns true if the the class is compatible with overlay scroller style and behavior, otherwise false.
The plugin implements this so you can query the value.

35.76.18 NSPreferredScrollerStyleDidChangeNotification as string

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: A notification name.
Notes:

Posted if the preferred scroller style changes.
Available in Mac OS X v10.7 and later.

35.76.19 preferredScrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the style of scrollers that applications should use wherever possible.
Notes:

The preferred scroller style is determined by the Appearance preference panel's "Show scroll bars" setting for the current user, and,Äîwhen the user's preference is set to "Automatically based on input device",Äîby the set of built-in and connected pointing devices and the user's scroll capability preference settings for them. The preferred scroller style may therefore change over time, and applications should be prepared to adapt their user interfaces to the new scroller style if needed.

In most cases, updating to a new scroller style is automatic: When the preferred scroller style changes, AppKit notifies all NSScrollView instances, sending setScrollerStyle to each with the new style, which causes each scroll view to automatically re-tile (update its layout) to adapt to the new scroller style. Some NSScrollView instances may refuse the new scroller style setting if they cannot accommodate it for compatibility reasons (the presence of accessory views or legacy scroller subclasses prevent use of overlay scrollers), but most instances will switch to the specified new preferred scroller style.

If you need to be notified of changes to the preferred scroller style, you can register to receive NSPreferredScrollerStyleDidChangeNotification notifications.

Available in Mac OS X v10.7 and later.

35.76.20 rectForPart(part as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle occupied by aPart, which for this method is interpreted literally rather than as an indicator of scrolling direction.
Notes:

Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

Returns NSRectMBS.Zero if the part requested isn't present on the receiver.

35.76.21 scrollerWidth as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the width of "normal-sized" instances.
Notes: NSScrollView uses this value to lay out its components. Subclasses that use a different width should override this method.

35.76.22 scrollerWidthForControlSize(controlsize as Integer) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the width of the scroller based on controlSize.

35.76.23 setFloatValue(aFloat as Double, proportion as Double)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Sets the position of the knob to aFloat, which is a value from 0.0 (indicating the top or left end) to 1.0 (the bottom or right end).
Notes:

Also sets the proportion of the knob slot filled by the knob to knobProp, also a value from 0.0 (minimal size) to 1.0 (fills the slot).

Available in Mac OS X v10.0 and later.
Deprecated in Mac OS X v10.5.

35.76.24 testPart(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the part that would be hit by a mouse-down event at p (expressed in the window's coordinate system).
Notes: Note the interpretations of NSScrollerDecrementPage and NSScrollerIncrementPage. The actual part of an NSScroller that causes page-by-page scrolling varies, so as a convenience these part codes refer to useful parts different from the scroll buttons.

35.76.25 trackKnob(theEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Tracks the knob and sends action messages to the receiver's target.
Notes: This method is invoked automatically when the receiver receives theEvent mouse-down event in the knob; you should not invoke it directly.

35.76.26 trackScrollButtons(theEvent as NSEventMBS)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Tracks the scroll buttons and sends action messages to the receiver's target.
Notes: This method is invoked automatically when the receiver receives theEvent mouse-down event in a scroll button; you should not invoke this method directly.

35.76.27 usableParts as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns a value indicating which parts of the receiver are displayed and usable.

35.76.28 Properties

35.76.29 arrowsPosition as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The location of the scroll buttons within the receiver.
Notes:

Can be NSScrollerArrowsMaxEnd, NSScrollerArrowsMinEnd, NSScrollerArrowsDefaultSetting or NSScroller-ArrowsNone.
(Read and Write computed property)

35.76.30 controlSize as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver.
Notes:

Can be NSRegularControlSize, NSMiniControlSize or NSSmallControlSize.
(Read and Write computed property)

35.76.31 controlTint as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's control tint.
Notes:

Can be NSGraphiteControlTint, NSBlueControlTint, NSClearControlTint or NSDefaultControlTint.
(Read and Write computed property)

35.76.32 knobProportion as Double

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: The portion of the knob slot the knob should fill, as a floating-point value from 0.0 (minimal size) to 1.0 (fills the slot).
Notes:

Can be set on Mac OS X 10.5 directly.
(Read and Write computed property)

35.76.33 knobStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The knob style.
Notes:

The value of this property does not affect legacy scrollers. NSScrollerKnobStyleDefault is appropriate for a wide range of content, but in some cases choosing an alternative knob style may enhance visibility of the scroller knob atop some kinds of content.

Available in Mac OS X v10.7 and later.

use constants: NSScrollerKnobStyleDefault, NSScrollerKnobStyleDark or NSScrollerKnobStyleLight.
(Read and Write computed property)

35.76.34 scrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroller style.
Notes:

or a scroller that's managed by an NSScrollView object, the setter is automatically invoked by the scroll view with the appropriate setting, according to the user's Appearance preference settings and possibly what pointing device(s) are present (see preferredScrollerStyle).
Available in Mac OS X v10.7 and later.
(Read and Write computed property)

35.76.35 Constants

35.76.36 NSAllScrollerParts = 2

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify which parts of the scroller are visible.
Notes: Scroller has at least a knob, possibly also scroll buttons.

35.76.37 NSBlueControlTint = 1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: Aqua control tint

35.76.38 NSClearControlTint = 7

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: Clear control tint

35.76.39 NSDefaultControlTint = 0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: The current default tint setting

35.76.40 NSGraphiteControlTint = 6

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify a the control tint.
Notes: Graphite control tint

35.76.41 NSMiniControlSize = 2

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the ControlSize property.
Notes: The control has a smaller size than NSSmallControlSize.

35.76.42 NSNoScrollerParts = 0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify which parts of the scroller are visible.
Notes: Scroller has neither a knob nor scroll buttons, only the knob slot.

35.76.43 NSOnlyScrollerArrows = 1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify which parts of the scroller are visible.
Notes: Scroller has only scroll buttons, no knob.

35.76.44 NSRegularControlSize = 0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the ControlSize property.
Notes: The control is sized as regular.

35.76.45 NSScrollerArrowsDefaultSetting = 0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: Contains the information from the AppleScrollBarVariant default value.

35.76.46 NSScrollerArrowsMaxEnd = 0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: Buttons at bottom or right. This constant has been deprecated.

35.76.47 NSScrollerArrowsMinEnd = 1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: Buttons at top or left. This has been deprecated.

35.76.48 NSScrollerArrowsNone = 2

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify where the scroller's buttons appear with the arrowsPosition property.
Notes: No buttons.

35.76.49 NSScrollerDecrementArrow = 1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants describe the two scroller buttons and are used by drawArrow.
Notes: The down or right scroll button.

35.76.50 NSScrollerDecrementLine = 4

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the different parts of the scroller.
Notes: Up or left by a small amount.

35.76.51 NSScrollerDecrementPage = 1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the different parts of the scroller.
Notes: Up or left by a large amount.

35.76.52 NSScrollerIncrementArrow = 0

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants describe the two scroller buttons and are used by drawArrow.
Notes: The up or left scroll button.

35.76.53 NSScrollerIncrementLine = 5

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the different parts of the scroller.
Notes: Down or right by a small amount.

35.76.54 NSScrollerIncrementPage = 3

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the different parts of the scroller.
Notes: Down or right by a large amount.

35.76.55 NSScrollerKnob = 2

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the different parts of the scroller.
Notes: Directly to the NSScroller's value, as given by floatValue.

35.76.56 NSScrollerKnobSlot = 6

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the different parts of the scroller.
Notes: Directly to the NSScroller's value, as given by floatValue.

35.76.57 NSScrollerKnobStyleDark = 1

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the knob style constants.
Notes:

Specifies a dark knob.
This style is particularly good against a light background.
Available in Mac OS X v10.7 and later.

35.76.58 NSScrollerKnobStyleDefault = 0

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the knob style constants.
Notes:

Specifies a dark knob with a light border.
This is the default style; it is good against any background.
Available in Mac OS X v10.7 and later.

35.76.59 NSScrollerKnobStyleLight = 2

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the knob style constants.
Notes:

Specifies a light knob.
This style is particularly good against a dark background.
Available in Mac OS X v10.7 and later.

35.76.60 NSScrollerNoPart = 0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the constants to specify the different parts of the scroller.
Notes: Don't scroll at all.

35.76.61 NSScrollerStyleLegacy = 0

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to specify the scroller style.
Notes:

Specifies legacy-style scrollers as prior to Mac OS X v10.7.
Available in Mac OS X v10.7 and later.

35.76.62 NSScrollerStyleOverlay = 1

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants to specify the scroller style.
Notes:

Specifies overlay-style scrollers in Mac OS X v10.7 and later.
Available in Mac OS X v10.7 and later.

35.76.63 NSSmallControlSize = 1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the ControlSize property.
Notes: This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

35.77 class NSScrollViewMBS

35.77.1 class NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The Cocoa class for a view which has scrollbars.
Notes:

Embed another view inside it to add scrolling.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

35.77.6 Methods

35.77.7 Constructor

MBS MacControls Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new scrollview with size 100/100 and position 0/0
Example:

```
dim t as new NSScrollViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.77.8 Constructor(Handle as Integer) 8296
- 35.77.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8297

35.77.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSScrollView handle.
Example:

```
dim t as new NSScrollViewMBS(0, 0, 100, 100)
dim v as new NSScrollViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSScrollView and the plugin retains this handle.
See also:

- 35.77.7 Constructor 8296
- 35.77.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8297

35.77.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new scrollview with the given size and position.
Example:

```
dim x as new NSScrollViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.77.7 Constructor 8296
- 35.77.8 Constructor(Handle as Integer) 8296

35.77.10 flashScrollers

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Flash the overlay scroll bars.
Notes:

This method is only to scroll views that use overlay scrollers.

This method can be invoked to cause the overlay scroller knobs to be momentarily shown. This may be desirable when changing a document view's size or swapping new content into the view, or to give the user a sense of the current position within the scrollable range at each step of an incremental search or similar operation.

Available in Mac OS X v10.7 and later.

35.77.11 reflectScrolledClipView(clipView as NSClipViewMBS)

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Adjusts the receiver's scrollers to reflect the size and positioning of its content view.
Notes:

ClipView: The clip view being adjusted to. If aClipView is any view object other than the receiver's content view, the method does nothing.

This method is invoked automatically during scrolling and when an NSClipView object's relationship to its document view changes; you should rarely need to invoke it yourself, but may wish to override it for custom updating or other behavior. If you override this method, be sure to call the superclass implementation. If you do not, other controls (such as the current scrollers) may not be updated properly.

Available in Mac OS X v10.0 and later.

35.77.12 tile

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Lays out the components of the receiver: the content view, the scrollers, and the ruler views.
Notes: You rarely need to invoke this method, but subclasses may override it to manage additional components.

35.77.13 Properties

35.77.14 autohidesScrollers as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True when autohiding is set for scroll bars in the scrollview.
Notes: (Read and Write property)

35.77.15 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: (Read and Write property)

35.77.16 borderType as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The border type.
Notes:

Specifies the appearance of the style of the scroll view's border. See NSBorderType for a list of possible values.
Use constants NSNoBorder = 0, NSLineBorder = 1, NSBezelBorder = 2 or NSGrooveBorder = 3.
(Read and Write property)

35.77.17 contentSize as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the size of the receiver's content view.
Notes: (Read only property)

35.77.18 contentView as NSClipViewMBS

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The content view.
Notes:

If view has a document view, this method also sets the receiver's document view to be the document view of view. The original content view retains its document view.
(Read and Write property)

35.77.19 documentCursor as Variant

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The cursor used when the cursor is over the content view.
Notes:

Value is an NSCursorMBS object.
(Read and Write property)

35.77.20 documentView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The view the receiver scrolls within its content view.
Notes: (Read and Write property)

35.77.21 documentVisibleRect as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the portion of the document view, in its own coordinate system, visible through the receiver's content view.
Notes: (Read only property)

35.77.22 drawsBackground as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the scrollview draws its background.
Notes: (Read and Write property)

35.77.23 FindBarPosition as Integer

MBS MacControls Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: The position of the find bar.
Notes:

See NSScrollViewFindBarPosition* constants for possible values.
(Read and Write property)

35.77.24 FindBarView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: The view assigned by the text bar as the find bar view for the container.
Notes:

This property is managed by NSTextFinderMBS and you must not set this property.
The container may freely modify the view's width, but should not modify its height.

(Read only property)

35.77.25 FindBarVisible as Boolean

MBS MacControls Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Whether the container should display its find bar.
Notes:

When this property is true and the findBarView property is set, then the find bar is displayed by the container. Otherwise, the find bar is not displayed.
The default value should be false.
(Read and Write property)

35.77.26 hasHorizontalRuler as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the receiver maintains a horizontal ruler view, false if it doesn't.
Notes: (Read and Write property)

35.77.27 hasHorizontalScroller as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver keeps a horizontal scroller
Notes: (Read and Write property)

35.77.28 hasVerticalRuler as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Determines whether the scrollview keeps a vertical ruler object.
Notes: (Read and Write property)

35.77.29 hasVerticalScroller as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the scrollview displays a vertical scroller, false if it doesn't.
Notes: (Read and Write property)

35.77.30 horizontalLineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount by which the receiver scrolls itself horizontally when scrolling line by line to aFloat, expressed in the content view's coordinate system.
Notes:

This amount is the amount used when the user clicks the scroll arrows on the horizontal scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this amount to the height of a single line of text in the default font.
(Read and Write property)

35.77.31 horizontalPageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount of the document view kept visible when scrolling horizontally page by page, expressed in the content view's coordinate system.
Notes:

This amount is used when the user clicks the scroll arrows on the horizontal scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.
(Read and Write property)

35.77.32 horizontalScrollElasticity as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroll view's horizontal elasticity mode.
Notes:

A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the horizontal axis beyond its document bounds only

occurs if the document width is greater than the view width or, the vertical scroller is hidden and the horizontal scroller is visible.

The default value is NSScrollElasticityAutomatic.

Available in Mac OS X v10.7 and later.
(Read and Write property)

35.77.33 horizontalScroller as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's horizontal scroller, regardless of whether the receiver is currently displaying it, or nil if the receiver has none.
Notes: (Read and Write property)

35.77.34 lineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The horizontal and vertical line scroll amounts to aFloat.
Notes:

The line scroll is the amount by which the receiver scrolls itself when scrolling line by line, expressed in the content view's coordinate system. It's used when the user clicks the scroll arrows without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height of a single line of text in the default font.

As part of its implementation, this method sets VerticalLineScroll and HorizontalLineScroll.
(Read and Write property)

35.77.35 pageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The vertical page scroll amount: the amount of the document view kept visible when scrolling vertically page by page, expressed in the content view's coordinate system.
Notes:

This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key. As part of its implementation, this method calls verticalPageScroll.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page.

Note that a scroll view can have two different page scroll amounts: verticalPageScroll and horizontalPageScroll. Use this method only if you can be sure they're both the same.
(Read and Write property)

35.77.36 rulersVisible as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Whether rulers should be visible.
Notes: (Read and Write property)

35.77.37 scrollerKnobStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The knob style of scroll views that use the overlay scroller style.
Notes:

Applicable only to scroll views that use overlay scrollers.
Available in Mac OS X v10.7 and later.
(Read and Write property)

35.77.38 scrollerStyle as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroller style used by the scroll view.
Notes:

This setting is automatically set at runtime, based on the user's preference setting and, if relevant, the set of connected pointing devices and their configured scroll capabilities, as determined by the NSScroller method preferredScrollerStyle.

Setting an scroll view's scroller style sets the style of both the horizontal and vertical scrollers. If the scroll view subsequently creates or is assigned a new horizontal or vertical scroller, they will be assigned the same scroller style that was assigned to the scroll view..

Available in Mac OS X v10.7 and later.
(Read and Write property)

35.77.39 scrollsDynamically as boolean

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: True if the scrollview redraws its document view while tracking the knob, false if it redraws only when the scroller knob is released.
Notes:

NSScrollView scrolls dynamically by default.
(Read and Write property)

35.77.40 usesPredominantAxisScrolling as boolean

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether the scroll view uses a predominant scrolling axis for content.
Notes:

Whether the scroll view supports a predominant scrolling direction. true if there is a predominant scrolling direction; otherwise false.

Some content is scrollable in both the horizontal and vertical axes, but is predominantly scrolled one axis at a time. Other content (such as a drawing canvas) should scroll freely in both axes.

Traditionally this is not an issue with scroll wheels since they can only scroll in one direction at a time. With scroll balls and touch surfaces, it becomes more difficult to determine the user's intention.

This property helps a scroll view determine the user's intention by specifying if there is a predominant scrolling axis for content.

The default value is true.

Available in Mac OS X v10.7 and later.
(Read and Write property)

35.77.41 verticalLineScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount by which the view scrolls itself vertically when scrolling line by line to aFloat, expressed in the content view's coordinate system.
Notes:

This value is the amount used when the user clicks the scroll arrows on the vertical scroll bar without holding down a modifier key. When displaying text in an NSScrollView, for example, you might set this value to the height of a single line of text in the default font.
(Read and Write property)

35.77.42 verticalPageScroll as Double

MBS MacControls Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The amount of the document view kept visible when scrolling vertically page by page to aFloat, expressed in the content view's coordinate system.
Notes:

This amount is used when the user clicks the scroll arrows on the vertical scroll bar while holding down the Option key.

This amount expresses the context that remains when the receiver scrolls by one page, allowing the user to orient to the new display. It differs from the line scroll amount, which indicates how far the document view moves. The page scroll amount is the amount common to the content view before and after the document view is scrolled by one page. Thus, setting the page scroll amount to 0.0 implies that the entire visible portion of the document view is replaced when a page scroll occurs.
(Read and Write property)

35.77.43 verticalScrollElasticity as Integer

MBS MacControls Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The scroll view's vertical elasticity mode.
Notes:

A scroll view can scroll its contents past its bounds to achieve an elastic effect.

When set to NSScrollElasticityAutomatic, scrolling the vertical axis beyond its document bounds occurs if any of the following are true: the vertical scroller is visible, the content height is greater than view height, or the horizontal scroller hidden.

Available in Mac OS X v10.7 and later.
(Read and Write property)

35.77.44 verticalScroller as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's vertical scroller, regardless of whether the receiver is currently displaying it, or nil if the receiver has none.
Notes: (Read and Write property)

35.77.45 Constants

35.77.46 NSScrollElasticityAllowed = 2

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants used to determine the elasticity behavior for an axis of the scrollview..
Notes:

Allow content to be scrolled past its bounds on this axis in an elastic fashion.
Available in Mac OS X v10.7 and later.

35.77.47 NSScrollElasticityAutomatic = 0

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants used to determine the elasticity behavior for an axis of the scrollview..
Notes:

Automatically determine whether to allow elasticity on this axis.
Available in Mac OS X v10.7 and later.

35.77.48 NSScrollElasticityNone = 1

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants used to determine the elasticity behavior for an axis of the scrollview..
Notes:

Disallow scrolling beyond document bounds on this axis.
Available in Mac OS X v10.7 and later.

35.77.49 NSScrollViewFindBarPositionAboveContent = 1

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the scroll view content.
Available in Mac OS X v10.7 and later.

35.77.50 NSScrollViewFindBarPositionAboveHorizontalRuler = 0

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed above the horizontal ruler, if visible.
Available in Mac OS X v10.7 and later.

35.77.51 NSScrollViewFindBarPositionBelowContent = 2

MBS MacControls Plugin, Plugin Version: 11.3.

Function: One of the constants used to define the position of the find bar in relation to the scroll view.
Notes:

The find bar is displayed below the scroll view content.
Available in Mac OS X v10.7 and later.

35.78 class NSSearchFieldCellMBS

35.78.1 class NSSearchFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The programmatic interface for text fields that are used for text-based searches.
Notes:

The NSSearchFieldCell class defines the programmatic interface for text fields that are optimized for text-based searches. An NSSearchFieldCell object is ‚Äúwrapped‚Äù by an NSSearchFieldMBS control object, which directly inherits from the NSTextFieldMBS class. The search field implemented by these classes presents a standard user interface for searches, including a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

When the user types and then pauses, the cell‚Äôs action message is sent to its target. You can query the cell‚Äôs string value for the current text to search for. Do not rely on the sender of the action to be an NSMenuMBS object because the menu may change. If you need to change the menu, modify the search menu template and update the value in the searchMenuTemplate property.
Subclass of the NSTextFieldCellMBS class.

35.78.2 Blog Entries

35.78.4 Methods

35.78.5 Constructor(image as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The private constructor not to use.
See also:

• 35.78.6 Constructor(text as string) 8310

35.78.6 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The constructor.
See also:

• 35.78.5 Constructor(image as NSImageMBS) 8309

35.78.7 recentSearches as String()

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: An array of the recent search strings to display in the pop-up icon menu of the search field.
Notes: This property contains an array of string objects, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty. When loading your interface, you might set the value of this property to a set of saved search strings.

35.78.8 resetCancelButtonCell

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Resets the cancel button cell to its default attributes.
Notes: This method resets the target, action, regular image, and pressed image for the cancel button cell. By default, when users click the cancel button, the delete: action message is sent up the responder chain to the first NSText object that can handle it. This method gives you a way to customize the cancel button for specific situations and then reset the button defaults without having to undo changes individually.

35.78.9 resetSearchButtonCell

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Resets the search button cell to its default attributes.
Notes: This method resets the target, action, regular image, and pressed image for the search button cell. By default, when users click the search button or press the Return key, the action defined for the receiver is sent to its designated target. This method gives you a way to customize the search button for specific situations and then reset the button defaults without having to undo changes individually.

35.78.10 setRecentSearches(RecentSearches() as String = nil)

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: An array of the recent search strings to display in the pop-up icon menu of the search field.
Notes: This property contains an array of string objects, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty. When loading your interface, you might set the value of this property to a set of saved search strings.

35.78.11 Properties

35.78.12 cancelButtonCell as NSButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The button cell used to display the cancel-button image.
Notes: (Read and Write property)

35.78.13 maximumRecents as Integer

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The maximum number of search strings that can appear in the search menu.
Notes:

The value of this property must be between 0 and 254. Specifying a negative value for the property sets it to the default value, which is 10. Specifying a value greater than 254 sets the property to 254.
When the maximum number of search strings is exceeded, the oldest search string on the menu is dropped.
(Read and Write property)

35.78.14 recentsAutosaveName as String

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The autosave name under which the search field automatically saves the list of recent search strings.
Notes:

The autosave name is used as a key in the standard user defaults to save the recent searches. If you specify nil or an empty string for this parameter, no autosave name is set and searches are not automatically saved.
(Read and Write property)

35.78.15 searchButtonCell as NSButtonCellMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The button cell used to display the search-button image.
Notes: (Read and Write property)

35.78.16 searchMenuTemplate as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: The menu object used to dynamically construct the search field,Äôs pop-up icon menu.
Notes:

The cell looks for the tag constants described in Menu tags to determine how to populate the menu with items related to recent searches. For an example of how you might set up the search menu template, see Configuring a Search Menu:
https://developer.apple.com/library/archive/documentation/Cocoa/Conceptual/SearchFields/Articles/MenuTemplate.html# //apple_ref/doc/uid/20002245
(Read and Write property)

35.78.17 sendsSearchStringImmediately as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the cell calls its action method immediately when an appropriate action occurs.
Notes:

When the value of this property is true, the cell calls its action method immediately upon notification of any changes to the search field. When the value is NO, the cell pauses briefly after receiving a notification and then calls its action method. Pausing gives the user an opportunity to type more text into the search field and minimize the number of searches that are performed.
(Read and Write property)

35.78.18 sendsWholeSearchString as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the cell calls its search action method when the user clicks the search button (or presses Return) or after each keystroke.
Notes:

When the value of this property is true, the cell calls its action method when the user clicks the search

button or presses Return. When the value is false, the cell calls the action method after each keystroke. The default value of this property is false.
(Read and Write property)

35.78.19 Constants

35.78.20 ClearRecentsMenuItemTag = 1002

MBS MacCocoa Plugin, Plugin Version: 22.3.

Function: One of the menu tag constants.
Notes: The menu item for clearing the current set of recent string searches in the menu.

35.78.21 NoRecentsMenuItemTag = 1003

MBS MacCocoa Plugin, Plugin Version: 22.3.

Function: One of the menu tag constants.
Notes: The menu item that describes a lack of recent search strings.

35.78.22 RecentsMenuItemTag = 1001

MBS MacCocoa Plugin, Plugin Version: 22.3.

Function: One of the menu tag constants.
Notes: The location of recent search strings in the ,Äúrecents,Äù menu group.

35.78.23 RecentsTitleMenuItemTag = 1000

MBS MacCocoa Plugin, Plugin Version: 22.3.

Function: One of the menu tag constants.
Notes: The menu item that provides the title of the menu group for recent search strings.

35.79 control NSSearchFieldControlMBS

35.79.1 control NSSearchFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSSearchField.
Notes:

This control embeds a special NSSearchField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

35.79.4 Properties

35.79.5 View as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.79.6 Events

35.79.7 Action

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: The action event run, when e.g. return key is pressed.

35.79.8 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.79.9 Close

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.79.10 Closing

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.79.11 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.79.12 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.79.13 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.79.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.79.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.79.16 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.79.17 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.79.18 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.79.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.79.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.79.21 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.79.22 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.79.23 Open

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.79.24 Opening

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.79.25 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.79.26 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

35.79.27 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.79.28 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

35.79.29 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.79.30 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.

Be aware that an event in Xojo without return will cause false to be returned.

35.80 class NSSearchFieldMBS

35.80.1 class NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: An NSSearchField object implements a text field control that is optimized for performing text-based searches.
Example:

```
// create searchfield
dim n as new NSSearchFieldMBS(0,0,100,20)

// set placeholder
dim x as NSTextFieldCellMBS = n.cell
x.placeholderString = "Test"
```

Notes:

The control provides a customized text field for entering search data, a search button, a cancel button, and a pop-up icon menu for listing recent search strings and custom search categories.

An NSSearchField object wraps an NSSearchFieldCell object. Access to most search field attributes occurs through the cell, which provides a more comprehensive programmatic interface for manipulating the search field. You can use an NSSearchField object though to manipulate some aspects of the search field. For additional information about search fields and how to manipulate them, see the NSSearchFieldCell class.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSTextFieldMBS class.

35.80.4 Methods

35.80.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new search field with size 100/100 and position 0/0
Example:

```
dim t as new NSSearchFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.80.6 Constructor(Handle as Integer) 8323
- 35.80.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8324

35.80.6 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSSearchField handle.
Example:

```
dim t as new NSSearchFieldMBS(0, 0, 100, 100)
dim v as new NSSearchFieldMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSearchField and the plugin retains this handle.
See also:

- 35.80.5 Constructor 8323
- 35.80.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8324

35.80.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new search field with the given size and position.
Example:

```
dim x as new NSSearchFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.80.5 Constructor 8323
- 35.80.6 Constructor(Handle as Integer) 8323

35.80.8 recentSearches as string()

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Returns the list of recent search strings for the control.
Notes: An array of strings, each of which contains a search string either displayed in the search menu or from a recent autosave archive. If there have been no recent searches and no prior searches saved under an autosave name, this array may be empty.

35.80.9 setRecentSearches(values() as string)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Sets the list of recent search strings to list in the pop-up icon menu of the receiver.
Notes: You might use this method to set the recent list of searches from an archived copy.

35.80.10 Properties

35.80.11 maximumRecents as Integer

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The maximum number of search strings that can appear in the search menu.
Notes:

The maximum number of search strings that can appear in the menu. This value can be between 0 and 254. Specifying a value less than 0 sets the value to the default, which is 10. Specifying a value greater than 254

sets the maximum to 254.

When the limit is exceeded, the oldest search string on the menu is dropped.
(Read and Write computed property)

35.80.12 recentsAutosaveName as string

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: The key under which the prior list of recent search strings has been archived.
Notes:

The autosave name, which is used as a key in the standard user defaults to save the recent searches. The default value is "", which causes searches not to be autosaved.
(Read and Write computed property)

35.80.13 searchMenuTemplate as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: The menu template object used to dynamically construct the search pop-up icon menu.
Notes:

The receiver looks for the tag constants described in Menu tags to determine how to populate the menu with items related to recent searches. (See constants)

To modify the actual menu shown, please use NSMenuItemMBS.validateMenuItem event. There you can for example set the state of the menu item shown. The SearchField makes a copy of the NSMenuItem, so the menuitem where the event is called, is not the one shown. It's the one passes as parameter.
(Read and Write computed property)

35.80.14 sendsSearchStringImmediately as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Whether the cell sends its action message to the target immediately upon notification of any changes to the search field text or after a brief pause.
Notes:

True to send the cell's action immediately upon notification of any changes to the search field; otherwise, false if you want the cell to pause briefly before sending its action message. Pausing gives the user the opportunity to type more text into the search field before initiating the search.

(Read and Write computed property)

35.80.15 sendsWholeSearchString as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver sends the search action message when the user clicks the search button (or presses return) or after each keystroke.
Notes:

True to send the action message all at once when the user clicks the search button or presses return; otherwise, False to send the search string after each keystroke.
(Read and Write computed property)

35.80.16 Constants

35.80.17 NSSearchFieldClearRecentsMenuItemTag = 1002

MBS MacCocoa Plugin, Plugin Version: 11.2.

Function: One of the tag values for the search menu template.
Notes:

Identifies the menu item for clearing the current set of recent string searches in the menu.
This item is hidden if there are no recent strings.

35.80.18 NSSearchFieldNoRecentsMenuItemTag = 1003

MBS MacCocoa Plugin, Plugin Version: 11.2.

Function: One of the tag values for the search menu template.
Notes:

Identifies the menu item that describes a lack of recent search strings (for example, "No recent searches").
This item is hidden if there have been recent searches.

35.80.19 NSSearchFieldRecentsMenuItemTag = 1001

MBS MacCocoa Plugin, Plugin Version: 11.2.

Function: One of the tag values for the search menu template.
Notes: Identifies where recent search strings should appear in the "recents" menu group.

35.80.20 NSSearchFieldRecentsTitleMenuItemTag = 1000

MBS MacCocoa Plugin, Plugin Version: 11.2.

Function: One of the tag values for the search menu template.
Notes:

Identifies the menu item that is the title of the menu group for recent search strings.
This item is hidden if there are no recent strings.
You may use this tagged item for separator characters that also do not appear if there are no recent strings to display.

35.81 control NSSecureTextFieldControlMBS

35.81.1 control NSSecureTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSSecureTextField.
Notes:

This control embeds a special NSSecureTextField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

35.81.4 Properties

35.81.5 echosBullets as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:

```
dim t as NSSecureTextFieldControlMBS // your textfield
t.echosBullets = true
```

Notes:

If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed.
(Read and Write property)

35.81.6 View as NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.81.7 Events

35.81.8 Action

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The control's action was triggered.
Notes: The text changed.

35.81.9 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.81.10 Close

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.81.11 Closing

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.81.12 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.81.13 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.81.14 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.81.15 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.81.16 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.

Notes: This only fires if the control itself got focus and not a sub control.

35.81.17 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.81.18 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.81.19 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.81.20 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.81.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.81.22 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.81.23 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.81.24 Open

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.81.25 Opening

Plugin Version: 15.0, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.81.26 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.81.27 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

35.81.28 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.81.29 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

35.81.30 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.81.31 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.82 class NSSecureTextFieldMBS

35.82.1 class NSSecureTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: NSSecureTextField is a subclass of NSTextField that hides its text from display or other access via the user interface.
Notes:

It's suitable for use as a password-entry object or for any item in which a secure value must be kept.

NSSecureTextField uses NSSecureTextFieldCell to implement its user interface.
Subclass of the NSTextFieldMBS class.

35.82.4 Methods

35.82.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new secure text field with size 100/100 and position 0/0
Example:

```
dim t as new NSSecureTextFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.82.6 Constructor(Handle as Integer) 8336
- 35.82.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8336

35.82.6 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSSecureTextField handle.
Example:

```
dim t as new NSSecureTextFieldMBS(0, 0, 100, 100)
dim v as new NSSecureTextFieldMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSecureTextField and the plugin retains this handle.
See also:

- 35.82.5 Constructor 8335
- 35.82.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8336

35.82.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new secure text field with the given size and position.
Example:

```
dim x as new NSSecureTextFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.82.5 Constructor 8335
- 35.82.6 Constructor(Handle as Integer) 8336

35.82.8 Properties

35.82.9 echosBullets as boolean

MBS MacCocoa Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver echoes a bullet character rather than each character typed.
Example:

```
dim t as NSSecureTextFieldMBS // your textfield
t.echosBullets = true
```

Notes:

If true, bullets are echoed. If false, the cursor is moved for each character typed, but nothing is displayed. (Read and Write computed property)

35.83 class NSSegmentedControlMBS

35.83.1 class NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The plugin class for a Cocoa NSSegmentedControl.
Notes:

An NSSegmentedControl object implements a horizontal button made of multiple segments.

The NSSegmentedControl class uses an NSSegmentedCell class to implement much of the control's functionality. Most methods in NSSegmentedControl are simply "cover methods" that call the corresponding method in NSSegmentedCell. The methods of NSSegmentedCell that do not have covers relate to accessing and setting values for tags and tool tips; programatically setting the key segment; and establishing the mode of the control.

The features of a segmented control include:

- Each segment can have an image, text (label), menu, tooltip, and tag
- Either the whole control or individual segments can be enabled or disabled
- There are three tracking modes for segments: select one mode (also known as radio button mode and illustrated by Finder's view mode selection control), momentary mode (as illustrated by Safari's toolbar buttons), or select any mode (where any combination of buttons may be on or off)
- Each segment can be either a fixed width or autosized to fit the contents
- If a segment has text and is marked as autosizing, then the text may be truncated so that the control completely fits
- If an image is too large to fit in a segment, it is clipped
- Full keyboard control of the user interface

Subclass of the NSControlMBS class.

35.83.6 Methods

35.83.7 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with size 100/100 and position 0/0
Example:

```
dim t as new NSSegmentedControlMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.83.8 Constructor(Handle as Integer) 8339
- 35.83.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8340

35.83.8 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSPathControl handle.
Example:

```
dim t as new NSSegmentedControlMBS(0, 0, 100, 100)
dim v as new NSSegmentedControlMBS(t.handle)
```

```
MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSegmentedControl and the plugin retains this handle.
See also:

- 35.83.7 Constructor 8339
- 35.83.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8340

35.83.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new path control with the given size and position.
Example:

```
dim x as new NSSegmentedControlMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.83.7 Constructor 8339
- 35.83.8 Constructor(Handle as Integer) 8339

35.83.10 makeNextSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Selects the next segment.
Notes: The next segment is the one to the right of the currently selected segment. For the last segment, the selection wraps back to the beginning of the control.

35.83.11 makePreviousSegmentKey

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Selects the previous segment.
Notes: The previous segment is the one to the left of the currently selected segment. For the first segment, the selection wraps around to the last segment of the control.

35.83.12 selectSegmentWithTag(Tag as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Selects the segment with the specified tag.
Notes:

tag: The tag associated with the desired segment.
True if the segment was selected successfully; otherwise, false.

Typically, you use Interface Builder to specify the tag for each segment. You may also set this value programmatically using the setTag:forSegment: method of NSSegmentedCell.

35.83.13 Properties

35.83.14 cellTrackingMode as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The tracking mode used for the segments of the receiver.
Notes:

Possible values for trackingMode are described in NSSegmentSwitchTracking. The default value is NSSegmentSwitchTrackingSelectOne.

This property was named only trackingMode in 15.1 and older plugins.
(Read and Write property)

35.83.15 doubleValueForSelectedSegment as Double

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Query the double value for selected segment.
Notes:

This message is valid only for trackingMode = NSSegmentSwitchTrackingMomentaryAccelerator and provides the double value for the selected segment.
Available on Mac OS X 10.10.3.
(Read only property)

35.83.16 segmentCount as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the number of segments in the receiver.
Notes: (Read and Write property)

35.83.17 segmentStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The visual style used to display the receiver.
Notes:

See style constants.
Available in Mac OS X v10.5 and later.
(Read and Write property)

35.83.18 selectedSegment as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The index of the selected segment of the receiver.
Notes:

The index of the currently selected segment or -1 if no segment is selected. If the receiver allows multiple selections, this method returns the most recently selected segment.
(Read and Write property)

35.83.19 springLoaded as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Sends action on deep-press or extended hover while dragging.
Notes:

Defaults to false.
(Read and Write property)

35.83.20 trackingMode as Integer

MBS MacCocoa Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The type of tracking behavior the control exhibits.
Notes:

An NSSegmentSwitchTracking value specifies how the control responds when the user presses a keyboard key or clicks, force clicks (applies pressure in a pressure-sensitive system), releases pressure, and so on.

see NSSegmentSwitchTracking* constants.
Available on Mac OS X 10.10.3 and newer.
(Read and Write property)

35.83.21 imageForSegment(segment as Integer) as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The image for the specified segment.
Notes:

image: The image to apply to the segment or nil if you want to clear the existing image. Images are not scaled to fit inside a segment. If the image is larger than the available space, it is clipped.
segment: The index of the segment whose image you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

35.83.22 imageScalingForSegment(segment as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The scaling mode used to display the specified segment's image.
Notes:

scaling: One of the image scaling constants. For a list of possible values, see constants.
segment: The index of the segment whose enabled state you want to get. This method raises an NSRangeException if the index is out of bounds.
Available in Mac OS X v10.5 and later.
(Read and Write computed property)

35.83.23 isEnabledForSegment(segment as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The enabled state of the specified segment.
Notes:

True to enable the segment; otherwise, false to disable it.
segment: The index of the segment you want to enable or disable. This method raises an NSRangeException if the index is out of bounds.

(Read and Write computed property)

35.83.24 isSelectedForSegment(segment as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The selection state of the specified segment.
Notes:

True if you want to select the segment; otherwise, false.

segment: The index of the segment whose selection state you want to set. This method raises an NSRangeException if the index is out of bounds.

If the receiver allows only a single selection, this method deselects any other selected segments.
(Read and Write computed property)

35.83.25 labelForSegment(segment as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The label for the specified segment.
Notes:

label: The label you want to display in the segment. If the width of the string is greater than the width of the segment, the string's text is truncated during drawing.
segment: The index of the segment whose label you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

35.83.26 menuForSegment(segment as Integer) as NSMenuMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The menu for the specified segment.
Notes:

menu: The menu you want to add to the segment or nil to clear the current menu. This menu is displayed when the user clicks and holds the mouse button while the mouse is over the segment.
segment: The index of the segment whose menu you want to set. This method raises an NSRangeException if the index is out of bounds.

Adding a menu to a segment allows that segment to be used as a pop-up button.
(Read and Write computed property)

35.83.27 tagForSegment(segment as Integer) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The tag value for the segment.
Notes:

segment: The index of the segment whose width you want to get. This method raises an NSRangeException if the index is out of bounds.

The tag is an integer you define to identify your items.
(Read and Write computed property)

35.83.28 ToolTipForSegment(segment as Integer) as string

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The tool tip for the specified segment.
Notes:

segment: The index of the segment whose tool tip you want to set. This method raises an NSRangeException if the index is out of bounds.

Tool tips are currently not displayed. Apple may change that in the future.
(Read and Write computed property)

35.83.29 widthForSegment(segment as Integer) as Double

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: The width of the specified segment.
Notes:

width: The width of the segment, measured in points. Specify the value 0 if you want the segment to be sized to fit the available space automatically.
segment: The index of the segment whose width you want to set. This method raises an NSRangeException if the index is out of bounds.
(Read and Write computed property)

35.83.30 Constants

35.83.31 NSImageScaleAxesIndependently = 1

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

Scale each dimension to exactly fit destination.
This setting does not preserve the aspect ratio of the image.
Available in Mac OS X v10.5 and later.

35.83.32 NSImageScaleNone = 2

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

Do not scale the image.
Available in Mac OS X v10.5 and later.

35.83.33 NSImageScaleProportionallyDown = 0

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

If it is too large for the destination, scale the image down while preserving the aspect ratio.
Available in Mac OS X v10.5 and later.

35.83.34 NSImageScaleProportionallyUpOrDown = 3

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants specify a cell's image scaling behavior.
Notes:

Scale the image to its maximum possible dimensions while both staying within the destination area and preserving its aspect ratio.
Available in Mac OS X v10.5 and later.

35.83.35 NSSegmentStyleAutomatic = 0

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants to specify the visual style used to display the segmented control.
Notes:

The appearance of the segmented control is automatically determined based on the type of window in which the control is displayed and the position within the window.
Available in Mac OS X v10.5 and later.

35.83.36 NSSegmentStyleRounded = 1

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the rounded style.
Available in Mac OS X v10.5 and later.

35.83.37 NSSegmentStyleRoundRect = 2

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the round rect style.
Available in Mac OS X v10.5 and later.

35.83.38 NSSegmentStyleSmallSquare = 6

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the small square style.
Available in Mac OS X v10.5 and later.

35.83.39 NSSegmentStyleTexturedSquare = 4

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants to specify the visual style used to display the segmented control.
Notes:

The control is displayed using the textured square style.
Available in Mac OS X v10.5 and later.

35.83.40 NSSegmentSwitchTrackingMomentary = 2

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants for switch tracking.
Notes: A segment is selected only when tracking.

35.83.41 NSSegmentSwitchTrackingMomentaryAccelerator = 3

MBS MacCocoa Plugin, Plugin Version: 15.2.

Function: One of the constants for switch tracking.
Notes: accelerator behavior, only selected while tracking.

35.83.42 NSSegmentSwitchTrackingSelectAny = 1

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants for switch tracking.
Notes: Any segment can be selected.

35.83.43 NSSegmentSwitchTrackingSelectOne = 0

MBS MacCocoa Plugin, Plugin Version: 12.1.

Function: One of the constants for switch tracking.
Notes: Only one segment may be selected.

35.84 class NSSliderMBS

35.84.1 class NSSliderMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: An NSSlider object displays a range of values for something in the application.
Notes:

Sliders can be vertical or horizontal bars or circular dials. An indicator, or knob, notes the current setting. The user can move the knob in the slider's bar,Äîor rotate the knob in a circular slider,Äîto change the setting.

The NSSlider class uses the NSSliderCell class to implement its user interface.
Subclass of the NSControlMBS class.

- MonkeyBread Software Releases the MBS REALbasic plug-ins 8.4

35.84.4 Methods

35.84.5 acceptsFirstMouse(event as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

35.84.6 closestTickMarkValueToValue(value as Double) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the value of the tick mark closest to the specified value.

35.84.7 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new slider with size 100/100 and position 0/0
Example:

```
dim t as new NSSliderMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.84.8 Constructor(Handle as Integer) 8350
- 35.84.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8351

35.84.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSSlider handle.
Example:

```
dim t as new NSSliderMBS(0, 0, 100, 100)
dim v as new NSSliderMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSlider and the plugin retains this handle.
See also:

- 35.84.7 Constructor 8350
- 35.84.9 Constructor(left as Double, top as Double, width as Double, height as Double) 8351

35.84.9 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new slider with the given size and position.
Example:

```
dim x as new NSSliderMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.84.7 Constructor 8350
- 35.84.8 Constructor(Handle as Integer) 8350

35.84.10 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes:

Returns the index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound.
In its implementation of this method, the receiving NSSlider instance simply invokes the method of the same name of its NSSliderCell instance. This method invokes rectOfTickMarkAtIndex: for each tick mark on the slider until it finds a tick mark containing the point.
See also:

- 35.84.11 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer 8351

35.84.11 indexOfTickMarkAtPoint(x as Double, y as Double) as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the tick mark closest to the location of the receiver represented by the given point.
Notes: The index of the tick mark closest to the location specified by point. If point is not within the bounding rectangle (plus an extra pixel of space) of any tick mark, the method returns NSNotFound (& h7fffffff).
See also:

- 35.84.10 indexOfTickMarkAtPoint(p as NSPointMBS) as Integer 8351

35.84.12 rectOfTickMarkAtIndex(index as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the bounding rectangle of the tick mark at the given index.
Notes: If no tick mark is associated with index, the method raises NSRangeException.

35.84.13 tickMarkValueAtIndex(index as Integer) as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's value represented by the tick mark at the specified index.

35.84.14 Properties

35.84.15 allowsTickMarkValuesOnly as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver fixes its values to those values represented by its tick marks.
Notes:

True if the slider fixes its values to the values represented by its tick marks; otherwise, false.
(Read and Write property)

35.84.16 altIncrementValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The amount by which the receiver changes its value when the user Option,Äìdrags the slider knob.
Notes:

The amount by which the value changes when the user drags the slider knob with the Option key held down. Unless you assign a value to AltIncrementValue, altIncrementValue returns ,Äì1.0, and the receiver behaves no differently with the Option key down than with it up.
(Read and Write property)

35.84.17 image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: This method has been deprecated. Returns nil.
Notes:

The slider may scale and distort barImage to fit inside the bar.

The knob may cover part of the image. If you want the image to be visible all the time, you're better off placing it near the slider.

This method has been deprecated by Apple.
(Read and Write property)

35.84.18 isVertical as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns an integer indicating the orientation (horizontal or vertical) of the slider.
Notes:

1 if the receiver is vertical, 0 if it's horizontal, and ,Äì1 if the orientation can't be determined (for example, if the slider hasn't been displayed yet). A slider is defined as vertical if its height is greater than its width.

Settable with macOS 10.12.
(Read and Write property)

35.84.19 knobThickness as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The knob's thickness, in pixels.
Notes:

The thickness of the slider knob. The thickness is defined to be the extent of the knob along the long dimension of the bar. In a vertical slider, then, a knob's thickness is its height; in a horizontal slider, a knob's thickness is its width.
(Read and Write property)

35.84.20 maxValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The maximum value the receiver can send to its target.
Notes:

The slider's maximum value. A horizontal slider sends its maximum value when the knob is at the right end of the bar; a vertical slider sends it when the knob is at the top.
(Read and Write property)

35.84.21 minValue as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: the minimum value the receiver can send to its target.
Notes:

The slider's minimum value. A vertical slider sends its minimum value when its knob is at the bottom; a horizontal slider, when its knob is all the way to the left.
(Read and Write property)

35.84.22 numberOfTickMarks as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The number of tick marks associated with the receiver.
Notes:

The number of the slider's tick marks.The tick marks assigned to the minimum and maximum values are included.
(Read and Write property)

35.84.23 sliderType as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The slider type.
Notes:

Either NSLinearSlider or NSCircularSlider.
(Read and Write property)

35.84.24 tickMarkPosition as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: How the receiver's tick marks are aligned with it.
Notes:

A constant indicating the position of the tick marks. Possible values are NSTickMarkBelow, NSTickMarkAbove, NSTickMarkLeft, and NSTickMarkRight (the last two are for vertical sliders). The default alignments are NSTickMarkBelow and NSTickMarkLeft.
(Read and Write property)

35.84.25 title as string

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's title.
Notes:

The default title is the empty string.
(Read and Write property)

35.84.26 titleCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the cell used to draw the receiver's title.
Notes:

You only need to invoke this method if the default title cell, NSTextFieldCell, doesn't suit your needs,Äîthat is, you want to display the title in a manner that NSTextFieldCell doesn't permit. When you do choose to override the default, titleCell should be an instance of a subclass of NSTextFieldCell.

This method has been deprecated by Apple.
(Read and Write property)

35.84.27 titleColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the color used to draw the receiver's title.
Notes:

This method has been deprecated by Apple.
(Read and Write property)

35.84.28 titleFont as NSFontMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the font used to draw the receiver's title.
Notes:

This method has been deprecated by Apple.
(Read and Write property)

35.84.29 trackFillColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The color of the filled portion of the slider track, in appearances that support it.
Notes:

Requires macOS 10.12.2 or newer.
(Read and Write property)

35.84.30 Constants

35.84.31 NSCircularSlider=1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the slider type constants.
Notes: A circular slider; that is, a dial.

35.84.32 NSLinearSlider=0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the slider type constants.
Notes: A bar-shaped slider.

35.84.33 NSTickMarkAbove=1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the tickMarkPosition property.
Notes: Tick marks above (for horizontal sliders).

35.84.34 NSTickMarkBelow=0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the tickMarkPosition property.
Notes: Tick marks below (for horizontal sliders); the default for horizontal sliders.

35.84.35 NSTickMarkLeft=1

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the tickMarkPosition property.
Notes: Tick marks to the left (for vertical sliders); the default. for vertical sliders

35.84.36 NSTickMarkRight=0

MBS MacControls Plugin, Plugin Version: 8.4.

Function: One of the values for the tickMarkPosition property.
Notes: Tick marks to the right (for vertical sliders).

35.85 control NSSplitViewControlMBS

35.85.1 control NSSplitViewControlMBS

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Our control to wrap a NSSplitViewMBS object.

35.85.2 Blog Entries

35.85.4 Properties

35.85.5 View as NSSplitViewMBS

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The reference to the underlaying NSSplitView.
Notes: (Read only property)

35.85.6 Events

35.85.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.85.8 canCollapseSubview(subview as NSViewMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to determine whether the user can collapse and expand the specified subview.
Notes:

subview: The subview to collapse.

Returns true if subview collapses when the user drags a divider beyond the halfway mark between its minimum size and its edge; otherwise, false.

The subview expands when the user drags the divider beyond the halfway mark between its minimum size and its edge.

To specify the minimum size, define the constrainMaxCoordinate and constrainMinCoordinate events. A subview can collapse only if you also define constrainMinCoordinate.
A collapsed subview isn,Äôt visible, but the split view object retains it with the same size as before the collapse.
If the events are implemented, the subviews can,Äôt collapse.

35.85.9 Close

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.85.10 Closing

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.85.11 constrainMaxCoordinate(proposedMaximumPosition as double, dividerIndex as Integer) as Double

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to constrain the maximum coordinate limit of a divider when the user drags it.
Notes:

proposedMax: The proposed maximum coordinate limit of the subview in the split view,Äôs flipped coordinate system.
dividerIndex: Specifies the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the maximum coordinate limit of the divider.

The delegate receives this message before the split view begins tracking the mouse to position a divider. You can further constrain the limits, but you can,Äôt extend the divider limits.
If the split bars are horizontal (views are one on top of the other), proposedMax is the bottom limit. If the split bars are vertical (views are side by side), proposedMax is the right limit. The initial value of proposedMax is the bottom (or right side) of the subview after the divider.

35.85.12 constrainMinCoordinate(proposedMinimumPosition as double, dividerIndex as Integer) as Double

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to constrain the minimum coordinate limit of a divider when the user drags it.
Notes:

proposedMin: The proposed minimum coordinate limit of the subview in the split view,Äôs flipped coordinate system.
dividerIndex: Specifies the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the minimum coordinate limit of the divider.

The delegate receives this message before the split view begins tracking the cursor to position a divider. You can further constrain the limits, but you can,Äôt extend the divider limits.
If the split bars are horizontal (views are one on top of the other), proposedMin is the top limit. If the split bars are vertical (views are side by side), proposedMin is the left limit. The initial value of proposedMin is the top (or left side) of the subview before the divider.

35.85.13 constrainSplitPosition(proposedPosition as double, dividerIndex as Integer) as Double

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to constrain the divider to certain positions.
Notes:

proposedPosition: The cursor,Äôs current position, and the proposed position of the divider.
dividerIndex: The index of the divider the user is moving, with the first divider being 0 and increasing from top to bottom (or left to right).

Returns the position for constraining the divider.

If the delegate implements this method, the split view calls it repeatedly as the user moves the divider.
If a subview,Äôs height must be a multiple of a certain number, use this method to return the multiple nearest to proposedPosition.

35.85.14 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.85.15 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.85.16 drawDivider(graphics as NSGraphicsMBS, Rect as NSRectMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Draws a divider between two of the split view,Äôs subviews.
Example:

```
Function drawDivider(graphics as NSGraphicsMBS, Rect as NSRectMBS) Handles drawDivider as Boolean

// draw a red box with blue border
graphics.setFillColor NSColorMBS.redColor
graphics.setStrokeColor NSColorMBS.blueColor

Dim r As New NSRectMBS(rect.X, rect.y + rect.Height/2 - 5, 10, 10)
graphics.fillRect r
graphics.strokeRect r

Return True
End Function
```

Notes:

Rect: The entire divider rectangle in the split view,Äôs flipped coordinate system.

If you override this method to use a custom style for the divider, you may need to change the size of the divider.

35.85.17 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.85.18 FocusLost

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.

Notes: This only fires if the control itself lost focus and not a sub control.

35.85.19 FocusReceived

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.85.20 FrameChanged

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.85.21 GotFocus

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.85.22 LostFocus

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.85.23 MenuBarSelected

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.85.24 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.85.25 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.85.26 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's

boundaries.

35.85.27 Open

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.85.28 Opening

Plugin Version: 23.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.85.29 resizeSubviewsWithOldSize(oldSize as NSSizeMBS)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to specify custom sizing behavior for the subviews of the split view.
Notes:

oldSize: The size of the split view before the user resizes it.

If the delegate implements this method, it receives this message after the split view resizes.

Resize the subviews so that the sum of the sizes of the subviews plus the sum of the thickness of the dividers equals the size of the new frame of the NSSplitView. You can get the thickness of a divider through the dividerThickness method.

If you implement this delegate method to resize subviews on your own, the NSSplitViewMBS doesn,Äôt perform any error checking for you. However, you can invoke adjustSubviews() to perform the default sizing behavior.

35.85.30 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.85.31 shouldAdjustSizeOfSubview(view as NSViewMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to specify whether to resize the subview.
Notes:

subview: The subview to resize.

If adjustSubviews() can change the size of the subview, return true; otherwise, false. By returning false, you lock the size of the split view subview while the split view resizes.

Regardless of the value that this method returns, adjustSubviews() may change the origin of the subview. Nonresizable subviews may resize to prevent an invalid subview layout.
If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if this method returns true.

35.85.32 shouldHideDivider(dividerIndex as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Allows the delegate to determine whether the user can drag a divider or adjust it off the edge of the split view.
Notes:

dividerIndex: The zero-based index of the divider.

Return true if the user can drag the divider off the edge of the split view, resulting in it not being visible.

If a split view has no delegate, or if its delegate doesn,Äôt respond to this message, the split view behaves as if it has a delegate that returns false when it receives this message.

35.85.33 splitViewDidResizeSubviews

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Notifies the delegate when the split view resizes its subviews.
Notes: The control invokes this event after the split view resizes two of its subviews in response to the repositioning of a divider.

35.85.34 splitViewWillResizeSubviews

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: .

Function: Notifies the delegate when the split view is about to resize its subviews.
Notes: The control invokes this method before the split view resizes two of its subviews in response to the repositioning of a divider.

35.86 class NSSplitViewMBS

35.86.1 class NSSplitViewMBS

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: A view that arranges two or more views in a linear stack running horizontally or vertically.
Example:

```
Sub Opening()
// add sub views
Dim view As NSSplitViewMBS = Me.View

view.Vertical = True
view.addArrangedSubview TextArea1.NSViewMBS
view.addArrangedSubview TextArea2.NSViewMBS

End Sub
```

Notes:

By default, dividers have a horizontal orientation so that the split view arranges its panes vertically from top to bottom.

Divider indices are zero-based. If the Vertical property is false, which is the default value, the top divider has an index of 0. If isVertical is true, the leading divider has an index of 0.
Subclass of the NSViewMBS class.

- 21.6, page 8: News

35.86.6 Methods

35.86.7 addArrangedSubview(view as NSViewMBS)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Adds a view as an arranged split pane.
Notes: If the view isn,Äôt a subview of the split view, calling this method adds it to the split view,Äôs subviews array.

35.86.8 adjustSubviews

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Adjusts the sizes of the split view,Äôs subviews so they (plus the dividers) fill the split view.
Notes:

When you call this method, the split view,Äôs subviews resize proportionally; the relative sizes of the subviews don,Äôt change.

The default implementation of this method resizes subviews proportionally so that the ratio of heights (when using horizontal dividers) or widths (when using vertical dividers) doesn,Äôt change, even though the absolute sizes change.

Call this method on split views where you,Äôve added or removed subviews to reestablish the consistency of subview placement.

This method invalidates the cursor when it is over a divider, ensuring the cursor is always of the correct type during and after resizing animations.

35.86.9 Constructor

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new split view with size 100/100 and position 0/0
Example:

```
dim t as new NSDatePickerMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.86.10 Constructor(Handle as Integer) 8370
- 35.86.11 Constructor(left as double, top as double, width as double, height as double) 8370

35.86.10 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSSplitView handle.
Example:

```
dim t as new NSSplitViewMBS(0, 0, 100, 100)
dim v as new NSSplitViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSSplitView and the plugin retains this handle.
See also:

- 35.86.9 Constructor 8370
- 35.86.11 Constructor(left as double, top as double, width as double, height as double) 8370

35.86.11 Constructor(left as double, top as double, width as double, height as double)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new split view with the given size and position.
Example:

```
dim x as new NSSplitViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.86.9 Constructor 8370
- 35.86.10 Constructor(Handle as Integer) 8370

35.86.12 insertArrangedSubview(view as NSViewMBS, index as Integer)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Adds a view as an arranged split pane at the specified index.
Notes:

If the view is already an arranged view, calling this method moves the view to the specified index in the arrangedSubviews array. This change doesn,Äôt affect the view,Äôs index in the split view,Äôs subviews array.
If the view isn,Äôt a subview of the split view, calling this method adds it to the split view,Äôs subviews array.

35.86.13 isSubviewCollapsed(view as NSViewMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Returns whether the specified view is in a collapsed state.
Notes:

subview: The subview in the split view.

Returns true if subview is in a collapsed state; otherwise, false.

35.86.14 maxPossiblePositionOfDividerAtIndex(dividerIndex as Integer) as Double

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Returns the maximum possible position of the divider at the specified index.
Notes:

dividerIndex: The index of the divider.

Returns a number that specifies the maximum possible position of the divider.

The position is possible because the bounds of the split view and the current position of other dividers

dictate it. Allowable positions result from letting the delegate apply constraints to the possible positions.

You can invoke this method to determine the range of values that you can pass to setPosition. You can also invoke it from delegate methods like constrainSplitPosition to implement relatively complex behaviors that depend on the current state of the split view.

The result of invoking this method when you haven,Äôt invoked adjustSubviews, and the subview frames are invalid, is undefined.

35.86.15 minPossiblePositionOfDividerAtIndex(dividerIndex as Integer) as Double

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Returns the minimum possible position of the divider at the specified index.
Notes:

dividerIndex: The index of the divider.

Return a number that specifies the minimum possible position of the divider.

The position is possible because the bounds of the split view and the current position of other dividers dictate it. Allowable positions result from letting the delegate apply constraints to the possible positions.

You can invoke this method to determine the range of values that you can pass to setPosition(). You can also invoke it from delegate methods like constrainSplitPosition to implement relatively complex behaviors that depend on the current state of the split view.

The result of invoking this method when you haven,Äôt invoked adjustSubviews, and the subview frames are invalid, is undefined.

35.86.16 removeArrangedSubview(view as NSViewMBS)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Removes a view as an arranged split pane.
Notes:

If the value of arrangesAllSubviews is false, calling this method doesn,Äôt remove the view as a subview; it remains in the split view,Äôs subviews array.
If you remove a view as a subview (either by calling removeFromSuperview() or removing it from the split view,Äôs subviews array), the system automatically removes the view as an arranged subview.

35.86.17 setPosition(position as double, dividerIndex as Integer)

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: Updates the location of a divider you specify by index.
Notes:

dividerIndex: The index of the divider.

One of the views adjacent to the divider may collapse because the method,Äôs default implementation assumes a person is dragging the divider to the new location. The Auto Layout system collapses the view if it can,Äôt satisfy the view,Äôs constraints ,Äî typically imposed by its delegate ,Äî with the divider,Äôs new location.
NSSplitView doesn,Äôt invoke this method.

35.86.18 Properties

35.86.19 arrangesAllSubviews as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines whether the split view arranges all of its subviews as split panes.
Notes:

If the value of this property is true, the split view arranges all of its subviews automatically. The arrangedSubviews array is identical to the split view,Äôs subviews array, so any change to subviews reflects in the arrangedSubviews array. The default value of this property is true.

If the value of this property is false, you must explicitly add a view as an arranged subview to arrange it as a split pane. You add an arranged subview using addArrangedSubview.

When you change the value of this property from true to false, all existing subviews stay as arranged subviews in arrangedSubviews. When you change the value of this property from false to true, all existing subviews become arranged subviews, and the value of the subviews array becomes the arrangedSubviews array.
(Read and Write property)

35.86.20 autosaveName as String

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The name to use when the system automatically saves the split view,Äôs divider configuration.
Notes:

If this property,Äôs value is empty, autosaving doesn,Äôt occur.
(Read and Write property)

35.86.21 dividerColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The color of the dividers that the split view draws between subviews.
Notes:

The default implementation of this method returns clear when the split view,Äôs dividerStyle is thick, or when dividerStyle is paneSplitter and the split view is in a textured window. The system draws all other thin dividers with a color that provides appropriate contrast between two white panes.

Can be assigned to when you use the NSSplitView from our NSSplitViewControlMBS.
(Read only property)

35.86.22 dividerStyle as Integer

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The style of divider between views.
Notes:

See NSSplitViewDividerStyle* constants.
(Read and Write property)

35.86.23 dividerThickness as Double

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The thickness of the dividers for the split view.
Notes:

Can be assigned to when you use the NSSplitView from our NSSplitViewControlMBS.
(Read and Write property)

35.86.24 Vertical as Boolean

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that determines the geometric orientation of the split view's dividers.
Notes:

The default value of this property is false, which indicates horizontal dividers and views that stack one above the other (top-to-bottom) in the containing split view controller,Äôs view.
To specify vertical dividers and a horizontal (side-by-side) arrangement of views within a split view controller, implement this property to return true.
(Read and Write property)

35.86.25 holdingPriorityForSubview(subviewIndex as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 23.4, Platform: macOS, Targets: Desktop only.

Function: The priority of the subview,Äôs width or height when resizing.
Notes:

The priority is the manner that the split view subviews use to maintain their width (for a vertical split view) or height (for a horizontal split view). During a split view resize, subviews with higher priorities maintain their sizes before subviews with lower priorities. The subview with the lowest priority is the first to gain additional thickness if the split view grows or shrinks.
(Read and Write computed property)

35.86.26 Constants

35.86.27 NSLayoutPriorityDefaultHigh = 750

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the layout priority constants.
Notes: Priority level with which a button resists compressing its content.

35.86.28 NSLayoutPriorityDefaultLow = 250

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the layout priority constants.
Notes: Priority level at which a button hugs its contents horizontally.

35.86.29 NSLayoutPriorityDragThatCannotResizeWindow = 490

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the layout priority constants.
Notes: Priority level at which a split view divider, say, is dragged.

35.86.30 NSLayoutPriorityDragThatCanResizeWindow = 510

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the layout priority constants.
Notes: Appropriate priority level for a drag that may end up resizing the window.

35.86.31 NSLayoutPriorityFittingSizeCompression = 50

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the layout priority constants.
Notes: When you send a fittingSize message to a view, the smallest size that is large enough for the view's contents is computed.

35.86.32 NSLayoutPriorityRequired = 1000

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the layout priority constants.
Notes: A required constraint.

35.86.33 NSLayoutPriorityWindowSizeStayPut = 500

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the layout priority constants.
Notes: Priority level for the window,Äôs current size.

35.86.34 NSSplitViewDividerStylePaneSplitter = 3

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the divider styles.
Notes: A thick style divider with a 3D appearance displays between subviews.

35.86.35 NSSplitViewDividerStyleThick = 1

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the divider styles.
Notes: A thick style divider displays between subviews.

35.86.36 NSSplitViewDividerStyleThin = 2

MBS MacControls Plugin, Plugin Version: 23.4.

Function: One of the divider styles.
Notes: A thin style divider displays between subviews.

35.87 class NSStepperMBS

35.87.1 class NSStepperMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A stepper consists of two small arrows that can increment and decrement a value that appears beside it, such as a date or time.
Notes:

The illustration below shows a stepper to the right of a text field, which would show the stepper's value.
Subclass of the NSControlMBS class.

35.87.2 Methods

35.87.3 Constructor

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new stepper with size 100/100 and position 0/0
Example:

```
dim t as new NSStepperMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.87.4 Constructor(Handle as Integer) 8378
- 35.87.5 Constructor(left as Double, top as Double, width as Double, height as Double) 8379

35.87.4 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSStepper handle.
Example:

```
dim t as new NSStepperMBS(0, 0, 100, 100)
dim v as new NSStepperMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSStepper and the plugin retains this handle.
See also:

- 35.87.3 Constructor 8378
- 35.87.5 Constructor(left as Double, top as Double, width as Double, height as Double) 8379

35.87.5 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new stepper with the given size and position.
Example:

```
dim x as new NSStepperMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.87.3 Constructor 8378
- 35.87.4 Constructor(Handle as Integer) 8378

35.87.6 Properties

35.87.7 autorepeat as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating how the receiver responds to mouse events.
Notes:

True if the first mouse down does one increment (or decrement) and, after a delay of 0.5 seconds, increments (or decrements) at a rate of ten times per second. False if the receiver does one increment (decrement) on a mouse up. The default is true.
(Read and Write computed property)

35.87.8 increment as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The amount by which the receiver will change per increment (decrement).
Notes: (Read and Write computed property)

35.87.9 maxValue as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The maximum value.
Notes: (Read and Write computed property)

35.87.10 minValue as Double

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The minimum value.
Notes: (Read and Write computed property)

35.87.11 valueWraps as boolean

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver wraps around the minimum and maximum values.
Notes:

If true, then when incrementing or decrementing, the value wraps around to the minimum or maximum. If valueWraps is false, the value stays pinned at the minimum or maximum.

For example for an angle where 359 increases to 0.
(Read and Write computed property)

35.88 control NSSwitchControlMBS

35.88.1 control NSSwitchControlMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSSwitch as control in Xojo.
Notes: Available on macOS 10.15 or newer.

35.88.6 Properties

35.88.7 State as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The current state.
Notes:

Set to true for toggle on and set to false for toggle off.
(Read and Write property)

35.88.8 View as NSSwitchMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.88.9 Events

35.88.10 Action

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The action event.

35.88.11 BoundsChanged

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.88.12 Close

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.88.13 Closing

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.88.14 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.88.15 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.88.16 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.88.17 FocusLost

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.88.18 FocusReceived

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.88.19 FrameChanged

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.88.20 GotFocus

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.88.21 LostFocus

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.88.22 MenuBarSelected

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.88.23 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.88.24 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.88.25 MouseUp(x As Integer, y As Integer)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's

boundaries.

35.88.26 Open

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.88.27 Opening

Plugin Version: 22.1, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.88.28 ScaleFactorChanged(NewFactor as double)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.89 class NSSwitchMBS

35.89.1 class NSSwitchMBS

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The switch control class for Xojo.
Notes:

The NSSwitch class provides a simple interface for displaying and toggling a Boolean state, such as on/off. A switch toggles its state and sends its action when clicked, activated through the keyboard, or tapped in the Touch Bar. NSSwitch also allows dragging between states, and if continuous is true, the switch sends its action for each change in position during the drag.

Use a switch to toggle significant preferences, or preferences that provide access to other controls. Avoid creating lists or tables of switches; instead, for general-purpose toggles, use an instance of NSButtonMBS to display a checkbox.

NSSwitch doesn,Äôt use an instance of NSCellMBS to provide its functionality. The cellClass class property and cell instance property both return nil, and they ignore attempts to set a non-nil value.

Available on macOS 10.15 or newer.
Subclass of the NSControlMBS class.

35.89.6 Methods

35.89.7 Constructor

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSSwitchMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.89.8 Constructor(Handle as Integer) 8388
- 35.89.9 Constructor(left as double, top as double, width as double, height as double) 8389

35.89.8 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with size 100/100 and position 0/0
Example:

```
dim t as new NSSwitchMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.89.7 Constructor 8388
- 35.89.9 Constructor(left as double, top as double, width as double, height as double) 8389

35.89.9 Constructor(left as double, top as double, width as double, height as double)

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new button with the given size and position.
Example:

```
dim x as new NSSwitchMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.89.7 Constructor 8388
- 35.89.8 Constructor(Handle as Integer) 8388

35.89.10 Properties

35.89.11 state as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop only.

Function: The current state.
Notes:

Set to true for toggle on and set to false for toggle off.
(Read and Write property)

35.90 class NSTableColumnMBS

35.90.1 class NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: An NSTableColumn stores the display characteristics and attribute identifier for a column in an NSTableView.
Notes: The NSTableColumn determines the width and width limits, resizability, and editability of its column in the NSTableView. It also stores two NSCell objects: the header cell, which is used to draw the column header, and the data cell, used to draw the values for each row. You can control the display of the column by setting the subclasses of NSCell used and by setting the font and other display characteristics for these NSCells. For example, you can use the default NSTextFieldCell for displaying string values or substitute an NSImageCell to display pictures.

35.90.6 Methods

35.90.7 Constructor(identifier as string)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Initializes a NSTableColumn with identifier as its identifier and with an NSTextFieldCell as its data cell.

35.90.8 dataCellForRow(row as Integer) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the NSCell object used by the NSTableView to draw values for the receiver.
Notes: NSTableView always calls this method. By default, this method just calls dataCell. Subclassers can override if they need to potentially use different cells for different rows. Subclasses should expect this method to be invoked with row equal to ,Äì1 in cases where no actual row is involved but the table view needs to get some generic cell info.

35.90.9 sizeToFit

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Resizes the receiver to fit the width of its header cell.
Notes: If the maximum width is less than the width of the header, the maximum is increased to the header's width. Similarly, if the minimum width is greater than the width of the header, the minimum is reduced to the header's width. Marks the NSTableView as needing display if the width actually changes.

35.90.10 Properties

35.90.11 dataCell as NSCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The NSCell object used by the NSTableView to draw values for the receiver.
Notes:

You can use this property to control the font, alignment, and other text attributes for an NSTableColumn. You can also assign a cell to display things other than text,Äîfor example, an NSImageCell to display images.
(Read and Write property)

35.90.12 Editable as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the user can edit cells in the receiver by double-clicking them.
Notes:

If value is true a double click initiates editing; if flag is false it merely sends the double-click event to the NSTableView. You can initiate editing programmatically regardless of this setting with NSTableView's editColumn() method.
(Read and Write property)

35.90.13 headerCell as NSTableHeaderCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The NSCell used to draw the receiver's header to aCell.
Notes: (Read and Write property)

35.90.14 headerToolTip as string

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The tooltip string that is displayed when the cursor pauses over the header cell of the receiver.
Notes: (Read and Write property)

35.90.15 Hidden as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the column is hidden.
Notes: (Read and Write property)

35.90.16 identifier as string

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The object used by the data source to identify the attribute corresponding to the receiver.
Notes: (Read and Write property)

35.90.17 maxWidth as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The maximum width.
Notes:

Setting this value will also adjusting the current width if it's greater than this value.
(Read and Write property)

35.90.18 minWidth as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The minimum width.
Notes:

Setting this value will also adjusting the current width if it's less than this value.
(Read and Write property)

35.90.19 Resizable as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether this column can be resized.
Notes: (Read and Write property)

35.90.20 resizingMask as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Defines the resizing mode for this column.
Notes:

Use kNoResizing, kAutoresizingMask and kUserResizingMask constants.
(Read and Write property)

35.90.21 sortDescriptorPrototype as NSSortDescriptorMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The table column,Äôs sort descriptor prototype.
Notes:

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector that defines how to sort.
(Read and Write property)

35.90.22 tableView as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The owner tableview.
Notes: (Read and Write property)

35.90.23 title as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The title of the table column,Äôs header.
Notes: (Read and Write property)

35.90.24 width as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The width of the column.
Notes: (Read and Write property)

35.90.25 Constants

35.90.26 NSTableColumnAutoresizingMask=1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants specify the resizing modes available for the table column.
Notes:

Allows the table column to resize automatically in response to resizing the tableview. Enabling this option is the same as enabling the "Live Resizable" option in Interface Builder. The resizing behavior for the table view is set using the NSTableView method setColumnAutoresizingStyle:.
Available in Mac OS X v10.4 and later.

35.90.27 NSTableColumnNoResizing=0

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants specify the resizing modes available for the table column.
Notes:

Prevents the table column from resizing.
Available in Mac OS X v10.4 and later.

35.90.28 NSTableColumnUserResizingMask=2

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants specify the resizing modes available for the table column.
Notes:

Allows the table column to be resized explicitly by the user. Enabling this option is the same as enabling the "User Resizable" option in Interface Builder.
Available in Mac OS X v10.4 and later.

35.91 control NSTableControlMBS

35.91.1 control NSTableControlMBS

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The control for a NSTableView.
Notes: Please use NSOutlineControlMBS for hierarchical lists and NSTableControlMBS for normal lists.

35.91.8 Properties

35.91.9 AcceptTabs as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

35.91.10 allowsColumnReordering as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to rearrange columns by dragging their headers.
Notes:

The default value of this property is true, which allows the user to rearrange the table view,Äôs columns. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

35.91.11 allowsColumnResizing as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to resize columns by dragging between their headers.
Notes:

The default of this property is true, which allows the user to resize the table view,Äôs columns. You can resize columns programmatically regardless of this setting.
(Read and Write property)

35.91.12 allowsColumnSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select columns by clicking their headers.
Notes:

The default is false, which prevents the user from selecting columns (if you create the table view in Interface Builder, the default value is true). You can select columns programmatically regardless of this setting.
(Read and Write property)

35.91.13 allowsEmptySelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select zero columns or rows.
Notes:

The default is true, which allows the user to select zero columns or rows.
(Read and Write property)

35.91.14 allowsMultipleSelection as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view allows the user to select more than one column or row at a time.
Notes:

The default is false, which allows the user to select only one column or row at a time. You can select multiple columns or rows programmatically regardless of this setting.

(Read and Write property)

35.91.15 autohidesScrollers as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view automatically hides its scroll bars when they are not needed.
Notes:

The horizontal and vertical scroll bars are hidden independently of each other. When the value of this property is YES and the content of the scroll view doesn't extend beyond the size of the clip view on a given axis, the scroller on that axis is removed to leave more room for the content.
(Read and Write property)

35.91.16 disableCellEvents as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether to disable cell based events.
Notes:

The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable cells and use only views.
(Read and Write property)

35.91.17 disableViewEvents as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether to disable view based events.
Notes:

The table view can work with cell modes and use NSCell to disable cells.
Or since OS X 10.7 it can work with NSView to display cells or rows.
This property lets you explicitly disable views and use only cells.
(Read and Write property)

35.91.18 hasHorizontalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a horizontal scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a horizontal scroller as needed. The default value of this property is false.
(Read and Write property)

35.91.19 hasVerticalScroller as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean that indicates whether the scroll view has a vertical scroller.
Notes:

When the value of this property is true, the scroll view allocates and displays a vertical scroller as needed. The default value of this property is false.
(Read and Write property)

35.91.20 ScrollView as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The scroll view used in this control.
Notes: (Read only property)

35.91.21 View as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The table view used in this control.
Notes: (Read only property)
See also:

- 35.91.92 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS 8421

35.91.22 Events

35.91.23 acceptDrop(info as NSDraggingInfoMBS, row as Integer, dropOperation as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called by TableView when the mouse button is released over a table view that previously decided to allow a drop.
Notes:

info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation.

Returns true if the drop operation was successful, otherwise false.

The data source should incorporate the data from the dragging pasteboard in the implementation of this method. You can use the draggingPasteboard method to get the data for the drop operation from info.
To accept a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To accept a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

35.91.24 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.91.25 Close

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.91.26 Closing

Plugin Version: 15.2, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.91.27 ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: This event informs the delegate that a column was moved by user action in the table view.

35.91.28 ColumnDidResize(notification as NSNotificationMBS, tableColumn as NSTableColumnMBS, OldWidth as Double)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: This event informs you that a column was resized in the table view.

35.91.29 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.91.30 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.91.31 dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Optional return a different cells for each row.
Notes:

A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don't return a cell, the method will be called once for each tableColumn in the tableView, as usual.

35.91.32 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Tells the delegate that a row view was added at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

35.91.33 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Called if a table column was clicked on.

35.91.34 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Sent at the time the mouse button goes up in tableView and tableColumn has been dragged during the time the mouse button was down.
Notes:

tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the dragged column is sent to the subclass. In earlier versions the table column that is currently located at the dragged column's original index is sent.

35.91.35 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Tells the delegate that a row view was removed from the table at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.

35.91.36 didTile

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The tableview did tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

35.91.37 DoubleClick

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse made a double click.

35.91.38 draggingSessionEnded(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method to determine when a dragging session has ended.
Notes:

session: The dragging session.
screenPoint: The ending drag location in screen coordinates.
operation: The drag operation. See NSDragOperation for supported values.

This delegate method can be used to determine when the dragging source operation ended at a specific location, such as the trash, by checking for an operation of NSDragOperationDelete.

35.91.39 draggingSessionWillBegin(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, rowIndexes as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method to determine when a dragging session will begin.
Notes:

session: The dragging session.
screenPoint: The initial drag location in screen coordinates.
rowIndexes: The indexes of the rows to be dragged, excluding rows that were not dragged due to pasteboardItemForRow returning nil.

Implement this method to know when the dragging session is about to begin and to potentially modify the dragging session.
The dragged item order will directly match the pasteboard writer array used to begin the dragging session with the NSView method beginDraggingSessionWithItems. Hence, the order is deterministic, and can be used in acceptDrop when enumerating the NSDraggingInfo pasteboard classes.

35.91.40 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.91.41 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.91.42 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.91.43 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.91.44 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.91.45 heightOfRow(row as Int64) as Double

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Implement this event to support a table with varying row heights.
Notes: The height returned by this method should not include intercell spacing and must be greater than zero. Performance Considerations: For large tables in particular, you should make sure that this method is efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged is called, otherwise unpredicable results will happen. NSTableView automatically invalidates its entire row height cache in reloadData, and noteNumberOfRowsChanged.

35.91.46 isGroupRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to indicate that a specified row is a group row.
Notes:

row: The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually ‚Äòfloat' by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.
Available in Mac OS X v10.5 and later.

35.91.47 LeftMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has pressed the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.48 LeftMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with the left button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.49 LeftMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released the left mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.50 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.91.51 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.91.52 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.91.53 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Sent to the subclass whenever the mouse button is clicked in the table view's header column.
Notes: tableColumn: The table column.

35.91.54 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.91.55 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.91.56 namesOfPromisedFilesDroppedAtDestination(dropDestination as folderItem, DraggedRowsWithIndexes as NSIndexSetMBS) as string()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns an array of filenames that represent the indexSet rows for a drag to dropDestination.
Notes:

dropDestination: The drop location where the files are created.
indexSet: The indexes of the items being dragged.

Returns an array of filenames (not full paths) for the created files that the receiver promises to create.

This method is called when a destination has accepted a promise drag.
For more information on file promise dragging, see documentation on the NSDraggingSource protocol and

namesOfPromisedFilesDroppedAtDestination:.

35.91.57 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to modify how type selection works.
Notes:

startRow: The starting row of the search range.
endRow: The ending row of the search range.
searchString: A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches selectionString. Return -1 if no match is found.

It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

35.91.58 numberOfRowsInTableView as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when the table view needs to know the number of rows.
Notes: numberOfRowsInTableView is called very frequently, so it must be efficient.

35.91.59 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a value is required for a given cell.
Notes: Please implement your own arrays to store values.

35.91.60 Open

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.91.61 Opening

Plugin Version: 15.2, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.91.62 OtherMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has pressed a mouse button other than the left or right one.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.63 OtherMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with a button other than the left or right button pressed.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.64 OtherMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released a mouse button other than the left or right button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.65 pasteboardItemForRow(row as Integer) as NSPasteboardItemMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called to allow the table to support multiple item dragging.
Notes:

row: The row.

Returns an instance of NSPasteboardItem. Returning nil excludes the row from being dragged.

This method is required for multi-image dragging.
If this method is implemented, then writeRowsWithIndexes will not be called.

This is pasteboardWriterForRow method.

35.91.66 RightMouseDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the view that the user has pressed the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.67 RightMouseDragged(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has moved the mouse with the right button pressed .
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.68 RightMouseUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Informs the receiver that the user has released the right mouse button.
Notes: This event is called before the normal event processing from Xojo happens. So return true to hide event from Xojo runtime.

35.91.69 rowActionsForRow(row as Integer, edge as Integer) as NSTableViewRowActionMBS()

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Asks the control to provide an array of row actions to be attached to the specified edge of a table row and displayed when the user swipes horizontally across the row.
Notes:

row: The index of the target row.
edge: The edge (NSTableRowActionEdgeLeading or NSTableRowActionEdgeTrailing) for which row actions are requested. This is based on the direction in which the user swiped on the row. Swiping to the right results in an edge value of leading. Swiping to the left results in an edge value of trailing.

Returns an array of row actions (of class NSTableViewRowActionMBS) to be enabled on the specified edge of the table row.

Implement this method if your table row supports actions that are displayed when the user swipes horizontally across the row. For example, your table view could use this method to implement a swipe left to delete function in your table rows. When called, this method receives the table view, the index of the row the user swiped, and an edge of type NSTableRowActionEdge. The method should return an array of any row actions of class NSTableViewRowAction that are supported for the specified edge. If no row actions are available, an empty array should be returned.
If this method isn,Äôt implemented, then the table row displays no actions when the user swipes horizontally away from the specified edge.

35.91.70 rowViewForRow(row as Integer) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Asks the delegate for a view to display the specified row.
Notes:

row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.
The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before it,Äôs added to the tableView.

This method is only valid for NSView-based table views.

35.91.71 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.91.72 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: This event informs you that the table view's selection has changed.

35.91.73 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view's existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

35.91.74 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: This event informs you that the table view's selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).

35.91.75 selectionShouldChangeInTableView as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Returns whether the selection should change.
Notes:

Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can't select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

35.91.76 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a cell value is saved to the datasource.

35.91.77 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Returns whether the cell at the specified row and column can be edited.
Notes:

TableColumn: The table column.
rowIndex: The row index.
Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.
Note: This method is only valid for cell-based table views.

35.91.78 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.

Notes:

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable.
Available in Mac OS X v10.6 and later.

35.91.79 shouldSelectRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Returns whether the table view should allow selection of the specified row.
Notes:

rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows.
For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

35.91.80 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Returns whether the specified table column can be selected.
Notes:

TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.

35.91.81 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control cell expansion for a specific row and column.
Notes:

TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

35.91.82 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.
Notes:

cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

35.91.83 shouldTypeSelectForEvent(e as NSEventMBS, searchString as string) as Boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control type select for a specific event.
Notes:

event: The event.
searchString: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event.
Available in Mac OS X v10.5 and later.

35.91.84 sizeToFitWidthOfColumn(column as Int64) as Double

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to provide custom sizing behavior when a column's resize divider is double clicked.
Notes:

column: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.

35.91.85 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn,Äôt manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.

35.91.86 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

35.91.87 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

35.91.88 toolTipForCell(cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Returns a string that is displayed as a tooltip for the specified cell in the column and row.
Notes:

Cell: The cell.
r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
TableColumn: The table column.
row: The row index.

mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).
Available in Mac OS X v10.4 and later.

35.91.89 typeSelectString(tableColumn as NSTableColumnMBS, row as Int64) as string

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.
Notes:

tableColumn: The table column.
row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default, all cells with text in them are searched.

If this event is not implemented the string value is the cell string value.
Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

35.91.90 updateDraggingItemsForDrag(draggingInfo as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Implement this method to allow the table to update dragging items as they are dragged over a view.
Notes:

The dragging information.

Required for multi-image dragging. Typically this will involve invoking enumerateDraggingItemsWithOp-

tions on the draggingInfo parameter value and setting the draggingItem object,Äôs imageComponentsProvider to a proper image based on the content.
For view-based table views, you can use the NSTableCellView method draggingImageComponents. For cell-based tables, use the NSCell method draggingImageComponentsWithFrame.

35.91.91 validateDrop(info as NSDraggingInfoMBS, proposedRow as Integer, dropOperation as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Used by aTableView to determine a valid drop target.
Notes:

info: An object that contains more information about this dragging operation.
row: The index of the proposed target row.
operation: The type of dragging operation proposed.

Returns the dragging operation the data source will perform.

The data source may retarget a drop by calling setDropRow and returning something other than NSDragOperationNone. A data source might retarget for various reasons, such as to provide better visual feedback when inserting into a sorted position.
To propose a drop on the second row, row would be 2 and operation would be NSTableViewDropOn. To propose a drop below the last row, row would be TableView.numberOfRows and operation would be NSTableViewDropAbove.

35.91.92 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Asks the delegate for a view to display the specified row and column.
Notes:

see also
https://developer.apple.com/reference/appkit/nstableviewdelegate/1527449-tableview?language=objc
See also:

- 35.91.21 View as NSTableViewMBS 8400

35.91.93 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

MBS MacControls Plugin, Plugin Version: 15.2, Platform: macOS, Targets: .

Function: Informs you that the tableview will display the specified cell at the row in the column.
Notes:

Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.

The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

35.91.94 willTile

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The tableview will tile.
Notes: The internal tile function properly sizes the table view and its header view and marks it as needing display.

35.91.95 writeRowsWithIndexes(rowIndexes as NSIndexSetMBS, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Returns a Boolean value that indicates whether a drag operation is allowed.
Notes:

rowIndexes: An index set of row numbers that will be participating in the drag.
pboard: The pasteboard to which to write the drag data.

Returns true if the drag operation is allowed, false otherwise.

Called by TableView after it has been determined that a drag should begin, but before the drag has been started.
To refuse the drag, return false. To start a drag, return true and place the drag data onto pboard (data, owner, and so on). The drag image and other drag-related information will be set up and provided by the table view once this call returns with true.

35.92 class NSTableDataSourceMBS

35.92.1 class NSTableDataSourceMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The class for a data source of a NSTableView.
Notes:

A listbox stores the data itself, but the NSTableView is just a view.
so you need to handle the storage of the table view yourself by subclassing this class and filling the events.

35.92.6 Events

35.92.7 Close

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: .

Function: The event is called when the datasource is destroyed.

35.92.8 numberOfRowsInTableView as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: .

Function: Called when the table view needs to know the number of rows.
Notes: numberOfRowsInTableView is called very frequently, so it must be efficient.

35.92.9 objectValue(column as NSTableColumnMBS, row as Integer) as Variant

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: .

Function: Called when a value is required for a given cell.
Notes: Please implement your own arrays to store values.

35.92.10 setObjectValue(value as Variant, column as NSTableColumnMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: .

Function: Called when a cell value is saved to the datasource.

35.92.11 sortDescriptorsDidChange(oldDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called by TableView to indicate that sorting may need to be done.
Notes: The data source typically sorts and reloads the data, and adjusts the selections accordingly. If you need to know the current sort descriptors and the data source doesn,Äôt manage them itself, you can get the current sort descriptors by calling TableView.sortDescriptors function.

35.93 class NSTableHeaderCellMBS

35.93.1 class NSTableHeaderCellMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: An NSTableHeaderCell is used by an NSTableHeaderView to draw its column headers.
Notes:

See the NSTableViewMBS class specification for more information on how it's used.

Subclasses of NSTableHeaderCell can override drawInteriorWithFrame, editWithFrame, and highlight:withFrame to change the way headers appear. See the NSCell class specification, and the following description, for information on these methods. (This works in Cocoa, but does not yet work in the plugin. If you need, send in a feature request.)
Subclass of the NSTextFieldCellMBS class.

35.93.6 Methods

35.93.7 drawSortIndicatorWithFrame(cellFrame as NSRectMBS, inView as NSViewMBS, ascending as boolean, priority as Integer)

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Draws a sorting indicator given a cellFrame contained inside controlView.
Notes:

If priority is 0, this is the primary sort indicator. If ascending is true, a "^" indicator will be drawn. Override this method to customize the sorting user interface.
Available in Mac OS X v10.3 and later.

35.93.8 sortIndicatorRectForBounds(r as NSRectMBS) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the location to display the sorting indicator given rectangle.
Notes: Available in Mac OS X v10.3 and later.

35.94 class NSTableHeaderViewMBS

35.94.1 class NSTableHeaderViewMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: An NSTableHeaderView is used by an NSTableView to draw headers over its columns and to handle mouse events in those headers.
Notes:

NSTableHeaderView uses NSTableHeaderCell to implement its user interface.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

35.94.6 Methods

35.94.7 columnAtPoint(point as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the column whose header lies under aPoint in the receiver, or ,Äì1 if no such column is found.

Notes: point: is expressed in the receiver's coordinate system.

35.94.8 Constructor

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new table header view with size 100/100 and position 0/0
Example:

```
dim t as new NSTableHeaderViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.94.9 Constructor(Handle as Integer) 8428
- 35.94.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8428

35.94.9 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSTableHeaderView handle.
Example:

```
dim t as new NSTableHeaderViewMBS(0, 0, 100, 100)
dim v as new NSTableHeaderViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTableHeaderView and the plugin retains this handle.
See also:

- 35.94.8 Constructor 8428
- 35.94.10 Constructor(left as Double, top as Double, width as Double, height as Double) 8428

35.94.10 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new table header view with the given size and position.
Example:

```
dim x as new NSTableHeaderViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.94.8 Constructor 8428
- 35.94.9 Constructor(Handle as Integer) 8428

35.94.11 draggedColumn as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: If the user is dragging a column in the receiver, returns the index of that column.
Notes: Otherwise returns ,Äì1.

35.94.12 draggedDistance as Double

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: If the user is dragging a column in the receiver, returns the column's horizontal distance from its original position.
Notes: Otherwise the return value is meaningless.

35.94.13 headerRectOfColumn(Column as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle containing the header tile for the column at columnIndex.
Notes: Raises an NSInternalInconsistencyException if columnIndex is out of bounds.

35.94.14 resizedColumn as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: If the user is resizing a column in the receiver, returns the index of that column.
Notes: Otherwise returns ,Äì1.

35.94.15 Properties

35.94.16 tableView as NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop only.

Function: The owner tableview.
Notes: (Read and Write computed property)

35.95 class NSTableRowViewMBS

35.95.1 class NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The NSTableRowView class is the view shown for a row in an NSTableView.
Notes:

It is responsible for displaying attributes associated with the row, including the selection highlight, and group row look.
Subclass of the NSViewMBS class.

35.95.2 Blog Entries

- MBS Xojo Plugins, version 17.1pr2

35.95.3 Blog Entries

- MBS Xojo Plugins, version 17.1pr2

35.95.4 Methods

35.95.5 Constructor

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The constructor.

35.95.6 Properties

35.95.7 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The background color of the row.
Notes:

The property defaults to the table view,Äôs backgroundColor, unless usesAlternatingRowBackgroundColors is set to true. In that case, the colors alternate, and are automatically updated as required by insertions and deletions.
The value of the background color can be customized in the NSTableViewMBS.didAddRowView event. The property is animatable.

(Read and Write property)

35.95.8 emphasized as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Determines whether the row will draw with the alternate or secondary color (unless overridden).
Notes:

When emphasized is true, the view will draw with the alternateSelectedControlColor defined by NSColor. When false it will use the secondarySelectedControlColor defined by NSColor.
(Read and Write property)

35.95.9 Floating as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Specifies whether the row is drawn using the floating style.
Notes:

Floating is a temporary attribute that is set when a particular group row is actually floating above other rows. The state may change dynamically based on the position of the group row. Drawing may be different for rows that are currently 'floating'.
(Read and Write property)

35.95.10 groupRowStyle as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Specifies whether this row view is a group row.
Notes:

When true this row is a group row and will draw appropriately.
(Read and Write property)

35.95.11 NextRowSelected as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether next row is selected.
Notes: (Read and Write property)

35.95.12 PreviousRowSelected as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether the previous row is selected.
Notes: (Read and Write property)

35.95.13 selected as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Determines whether the row is selected.
Notes:

True if selected, otherwise false.
(Read and Write property)

35.95.14 selectionHighlightStyle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Specifies the selection highlight style.
Notes:

The possible values are specified in NSTableViewSelectionHighlightStyle in NSTableView.
(Read and Write property)

35.96 class NSTableViewMBS

35.96.1 class NSTableViewMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: An NSTableView object displays record-oriented data in a table and allows the user to edit values and resize and rearrange columns.
Notes:

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

35.96.6 Methods

35.96.7 addTableColumn(column as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Adds a given column as the last column of the receiver.

35.96.8 beginUpdates

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Begins a group of updates for the table view.
Notes:

For NSView-based table views, multiple row changes,Äîthat is, insertions, deletions, and moves,Äîare animated simultaneously by surrounding calls to those method calls with beginUpdates and endUpdates. These methods are nestable.
The selected rows are maintained during the series of insertions, deletions, moves, and scrolling. If a selected row is deleted, a selection changed notification occurs after removeRowsAtIndexes is called.
It is not necessary to call beginUpdates and endUpdates if only one insertion, deletion, or move is occurring and the table view is an NSView-based table view. When using an NSCell-based table view, you must surround any insertion, deletion, or move in an update block for animations to occur.
The main reason for doing a batch update of changes to a table view is to avoid having the table animate unnecessarily.
Note that these methods should be called to reflect changes in your model; they do not make any underlying model changes.

For NSCell-based table views, it is required to call beginUpdates if you want to animate the insertRowsAtIndexes, removeRowsAtIndexes, and moveRowAtIndex.

35.96.9 canDragRowsWithIndexes(rowIndexes as NSIndexSetMBS, mouseDownPoint as NSPointMBS) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the table view allows dragging the rows at with the drag initiated at the specified point.
Notes:

rowIndexes: The row indexes to drag.
mouseDownPoint: The location where the drag was initiated.

Returns no to disallow the drag.

35.96.10 columnAtPoint(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the column a given point lies in.
Notes: Returns the index of the column aPoint lies in, or ,Äì1 if aPoint lies outside the receiver's bounds.
See also:

- 35.96.11 columnAtPoint(x as Double, y as Double) as Integer 8436

35.96.11 columnAtPoint(x as Double, y as Double) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the column a given point lies in.
Notes: Returns the index of the column aPoint lies in, or ,Äì1 if aPoint lies outside the receiver's bounds.
See also:

- 35.96.10 columnAtPoint(p as NSPointMBS) as Integer 8436

35.96.12 columnForView(view as NSViewMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the column index for the specified view.
Notes:

view: The view for which to retrieve the column.

Returns the index of the column containing view in the tableColumns array. This method returns -1 if the view is not in the table view. This method may also return -1 if the row containing the view is being animated away, such as during the deletion of a row.

This method is typically called in the action method of an NSButton (or NSControl) to find out what row (and column) the action should be performed on.
The implementation is O(n) where n is the number of visible rows, so this method should generally not be called within a loop.

35.96.13 columnIndexesInRect(rect as NSRectMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the indexes of the receiver's columns that intersect the specified rectangle.
Notes: Available in Mac OS X v10.5 and later.

35.96.14 columnWithIdentifier(identifier as string) as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the first column in the receiver whose identifier is equal to a given identifier.
Notes: Returns the index of the first column in the receiver whose identifier is equal to anObject (when compared using isEqual:) or ,Äì1 if no columns are found with the specified identifier.

35.96.15 Constructor

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new table view with size 100/100 and position 0/0
Example:

```
dim t as new NSTableViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.96.16 Constructor(Handle as Integer) 8438
- 35.96.17 Constructor(left as Double, top as Double, width as Double, height as Double) 8438

35.96.16 Constructor(Handle as Integer)

MBS MacControls Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSTableView handle.
Example:

```
dim t as new NSTableViewMBS(0, 0, 100, 100)
dim v as new NSTableViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTableView and the plugin retains this handle.
See also:

- 35.96.15 Constructor 8437
- 35.96.17 Constructor(left as Double, top as Double, width as Double, height as Double) 8438

35.96.17 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Creates a new table view with the given size and position.
Example:

```
dim x as new NSTableViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.96.15 Constructor 8437
- 35.96.16 Constructor(Handle as Integer) 8438

35.96.18 deselectAll

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Deselects all selected rows or columns if empty selection is allowed; otherwise does nothing.

35.96.19 deselectColumn(column as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Deselects the column at a given index if it's selected.
Notes: Colunn is from 0 to numberOfColumns-1.

35.96.20 deselectRow(row as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Deselects the row at a given index if it's selected.
Notes: Deselects the row at rowIndex if it's selected, regardless of whether empty selection is allowed.

35.96.21 Destructor

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: The destructor.
Notes: Xojo calls this destructor automatically.

35.96.22 dragImageForRowsWithIndexes(dragRows as NSIndexSetMBS, tableColumns() as NSTableColumnMBS, theEvent as NSEventMBS, byref dragImageOffset as NSPointMBS) as NSImageMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Computes and returns an image to use for dragging.
Notes:

dragRows: An index set containing the row indexes that should be in the image.
tableColumns: An array of table columns that should be in the image.
dragEvent: The event that initiated the drag.
dragImageOffset: An in/out parameter specifying the offset of the cursor in the image, the default value is NSZeroPoint. Returning NSZeroPoint causes the cursor to be centered.

Returns an NSImage containing a custom image for the specified rows and columns participating in the drag.

35.96.23 edit(column as Integer, row as Integer, selectit as boolean)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Edits the cell at columnIndex and rowIndex, selecting its entire contents if flag is true.
Notes:

This method is invoked automatically in response to user actions; you should rarely need to invoke it directly.

This method scrolls the receiver so that the cell is visible, sets up the field editor, and sends selectWithFrame() and editWithFrame() to the field editor's NSCell object with the NSTableView as the text delegate.

The row at rowIndex must be selected prior to calling editColumn:row:withEvent:select:, or an exception will be raised.

35.96.24 endUpdates

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Ends the group of updates for the table view.
Notes: Ends the group of updates for the table view. This method, like beginUpdates, is nestable. See beginUpdates for details.

35.96.25 frameOfCellAtColumnRow(column as Integer, row as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a rectangle locating the cell that lies at the intersection of the specified column and row.
Notes:

column: The index in the tableColumns array of the column containing the cell whose rectangle you want.
row: The index of the row containing the cell whose rectangle you want.

Returns a rectangle locating the cell that lies at the intersection of columnIndex and rowIndex. This method returns NSRectMBS.Zero if columnIndex or rowIndex is greater than the number of columns or rows in the table view.

You can use this method to update a single cell more efficiently than sending the table view a reloadData message using reloadData function.
The result of this method is used in a drawWithFrame:inView: message to the table column's data cell. You can subclass and override this method to customize the frame of a particular cell. However, never return a frame larger than the default implementation returns.
The default frame is computed to have a height equal to the rectOfRow: for rowIndex, minus the half intercellSpacing height on the top and half on the bottom. The width of frame is equal to the with of the table column minus half the intercellSpacing width on the left, and half on the right.

35.96.26 hiddenRowIndexes as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The indexes of all hidden table rows.
Notes: The value of this property is an index set containing the indexes of any hidden table rows. Table rows may be hidden by invoking the hideRowsAtIndexes method. Some drag-and-drop operations also result in hidden rows.

35.96.27 hideRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Hides the specified table rows.
Notes:

indexes: An index set containing indexes of the rows to be hidden.
rowAnimation: An animation effect to be applied when the rows are hidden.

Use this method when you no longer want the data to be visible to the user, but you don,Äôt want to permanently remove the data. Hidden table rows have a height of zero and cannot be selected by the user. However, if a selected table row is hidden, it will remain selected.
Hiding a table row causes the didRemoveRowView delegate method to be invoked.

35.96.28 insertRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Inserts the rows using the specified animation.
Notes:

indexes: The final positions of the new rows to be inserted.
animationOptions: The animation displayed during the insert. See NSTableViewAnimationOptions for the possible values that can be combined using the bitwise OR operator.

The numberOfRows in the table view is automatically increased by the count of indexes.
Calling this method multiple times within the same beginUpdates and endUpdates block is allowed, and changes are processed incrementally.

NSCell-based table views must first call beginUpdates before calling this method.

35.96.29 isColumnSelected(column as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the column at a given index is selected.
Notes: column is from 0 to to numberOfColumns.

35.96.30 isRowSelected(row as Integer) as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the row at a given index is selected.
Notes: row is from 0 to to numberOfRows.

35.96.31 moveColumn(column as Integer, toIndex as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: Moves the column and heading at a given index to a new given index.
Notes:

columnIndex: The current index of the column to move.
newIndex: The new index for the moved column.

This method raises the ColumnDidMove event.

35.96.32 moveRowAtIndex(oldIndex as Integer, newIndex as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Moves the specified row to the new row location using animation.
Notes:

oldIndex: Initial row index.
newIndex: New row index.

This is similar to removing a row at oldIndex and inserting it at newIndex, except the same view is used and simply has its position updated to the new location.
Changes happen incrementally as they are sent to the table, so as soon as this method is called the row can be considered moved. However the underlying view is not moved until endUpdates has been called.
This method can be called multiple times within the same beginUpdates and endUpdates block.

NSCell-based table views must first call beginUpdates before calling this method.

35.96.33 noteHeightOfRowsWithIndexesChanged(indexSet as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop only.

Function: Informs the table view that the rows specified in indexSet have changed height.
Notes:

indexSet: Index set of rows that have changed their height.

If you implement heightOfRow event this method immediately retiles the table view using the row heights the event provides.

For NSView-based tables, this method will animate. To turn off the animation, create an NSAnimationContext grouping and set the duration to 0. Then call this method and end the grouping.

For NSCell-based tables, this method normally doesn't animate. However, it will animate if you call it inside a beginUpdates/endUpdates block.

35.96.34 noteNumberOfRowsChanged

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that the number of records in its data source has changed.
Notes: This method allows the receiver to update the scrollers in its scroll view without actually reloading data into the receiver. It's useful for a data source that continually receives data in the background over a period of time, in which case the table view can remain responsive to the user while the data is received.

35.96.35 rectOfColumn(column as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle containing the column at at a given index.
Notes:

The rectangle containing the column at columnIndex. Returns NSRectMBS.Zero (an empty rectangle) if columnIndex lies outside the range of valid column indices for the receiver.

You can use this method to update a single column more efficiently than sending the table view a reloadData message.

aTableView.setNeedsDisplayInRect(aTableView.rectOfColumn(column))

35.96.36 rectOfRow(row as Integer) as NSRectMBS

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle containing the row at a given index.
Notes: Returns the rectangle containing the row at rowIndex. Returns NSRectMBS.Zero (an empty rectangle) if rowIndex lies outside the range of valid row indices for the receiver.

35.96.37 reloadData

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Marks the receiver as needing redisplay, so it will reload the data for visible cells and draw the new values.
Notes: This method forces redraw of all the visible cells in the receiver. If you want to update the value in a single cell, column, or row, it is more efficient to use frameOfCellAtColumn(), rectOfColumn(), or rectOfRow() in conjunction with setNeedsDisplayInRect(). If you just want to update the scroller, use noteNumberOfRowsChanged; if the height of a set of rows changes, use noteHeightOfRowsWithIndexesChanged().
See also:

- 35.96.38 reloadData(rowIndexes as NSIndexSetMBS, columnIndexes as NSIndexSetMBS) 8444

35.96.38 reloadData(rowIndexes as NSIndexSetMBS, columnIndexes as NSIndexSetMBS)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Reloads the data for only the specified rows and columns.
Notes:

rowIndexes: The indexes of the rows to update.
columnIndexes: The indexes of the columns to update.

For cells that are visible, the appropriate dataSource and delegate methods are called and the cells are redrawn.
For tables that support variable row heights, the row height is not re-queried from the delegate; it is your responsibility to invoke noteHeightOfRowsWithIndexesChanged if a row height change is required.

For NSView-based table views, this method drops the view-cells in the table row, but not the NSTableRowView instances.
See also:

- 35.96.37 reloadData 8444

35.96.39 removeRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Removes the rows using the specified animation.
Notes:

indexes: An index set containing the rows to remove.
animationOptions: The animation displayed during the insert. See NSTableViewAnimationOptions for the possible values that can be combined using the bitwise OR operator.

This method deletes from the table the rows represented at indexes and automatically decreases numberOfRows by the count of indexes.
The row indexes should be with respect to the current state displayed in the table view, and not the final state, because the specified rows do not exist in the final state.
Calling this method multiple times within the same beginUpdates and endUpdates block is allowed, and changes are processed incrementally.
Changes are processed incrementally as the insertRowsAtIndexes, removeRowsAtIndexes, and the moveRowAtIndex methods are called. It is acceptable to delete row 0 multiple times, as long as there is still a row available.

NSCell-based table views must first call beginUpdates before calling this method.

35.96.40 removeTableColumn(column as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Removes a given column from the receiver.

35.96.41 rowAtPoint(p as NSPointMBS) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the row a given point lies in.
Notes: Returns the index of the row aPoint lies in, or ,Äì1 if aPoint lies outside the receiver's bounds.
See also:

• 35.96.42 rowAtPoint(x as Double, y as Double) as Integer 8446

35.96.42 rowAtPoint(x as Double, y as Double) as Integer

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the row a given point lies in.
Notes: Returns the index of the row aPoint lies in, or ,Äì1 if aPoint lies outside the receiver's bounds.
See also:

• 35.96.41 rowAtPoint(p as NSPointMBS) as Integer 8445

35.96.43 rowForView(view as NSViewMBS) as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the row for the specified view.
Notes:

view: The view for which to retrieve the row.

Returns the index of the row containing to view. This method returns -1 if the view is not in the table view. This method may also return -1 if the row containing the view is being animated away, such as during the deletion of a row.

This method is typically called in the action method for an NSButton (or NSControl) to find out what row (and column) the action should be performed on.
The implementation is O(n) where n is the number of visible rows, so this method should generally not be called within a loop.

35.96.44 rowsInRect(rect as NSRectMBS) as NSRangeMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a range of indexes for the rows that lie wholly or partially within the vertical boundaries of the specified rectangle.
Notes:

Rect: A rectangle in the coordinate system of the table view.

Returns a range of indexes for the table view,Äôs rows that lie wholly or partially within the horizontal boundaries of aRect. If the width or height of aRect is 0, this method returns an NSRange whose length is 0.

The location of the range is the index of the first row in the rectangle, and the length is the number of rows that lie in the rectangle.

35.96.45 rowViewAtRow(row as Integer, makeIfNecessary as Boolean) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a row view at the specified index, creating one if necessary.
Notes:

row: The row index.
makeIfNecessary: True if a view is required, NO if you want to update properties on a view, if one is available.

Returns an instance, or subclass, of NSTableRowView. Returning nil is also valid if makeIfNecessary is false and the view did not exist.

This method first attempts to return a currently displayed view in the visible area. If there is no visible view, and makeIfNecessary is true, a prepared temporary view is returned. If makeIfNecessary is false, and the view is not visible, nil is returned.
In general, makeIfNecessary should be true if you require a resulting view, and false if you want to update properties on a view only if it is available (generally this means it is visible).
An exception is thrown if row falls outside of the number of rows in the table (numberOfRows). The returned result should generally not be held onto for longer than the current run loop cycle. It,Äôs better to call rowViewAtRow whenever a view is required.

35.96.46 scrollColumnToVisible(column as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver and header view horizontally in an enclosing NSClipView so the column specified by columnIndex is visible.

35.96.47 scrollRowToVisible(row as Integer)

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Scrolls the receiver vertically in an enclosing NSClipView so the row specified by rowIndex is visible.

35.96.48 ScrollToLine(Line as Integer, Animated as Boolean)

MBS MacControls Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop only.

Function: Scrolls to line.
Notes:

If animated is true, the scroll is animated.
The line is centered in the middle of the viewable area if possible.

35.96.49 selectAll

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Selects all rows or all columns, according to whether rows or columns were most recently selected.
Notes: If the table allows multiple selection, this action method selects all rows or all columns, according to whether rows or columns were most recently selected. If nothing has been recently selected, this method selects all rows. If this table doesn't allow multiple selection, this method does nothing.

35.96.50 selectColumnIndexes(indexes as NSIndexSetMBS, extend as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Sets the column selection using indexes.
Notes: f the extend flag is false the selected columns are specified by indexes. If extend is true, the columns indicated by indexes are added to the collection of already selected columns, providing multiple selection.

35.96.51 selectedColumnIndexes as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns an index set containing the indexes of the selected columns.
Notes: Returns an index set containing the indexes of the selected columns.

35.96.52 selectedRowIndexes as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Returns an index set containing the indexes of the selected rows.
Notes: Available in Mac OS X v10.3 and later.

35.96.53 selectRowIndexes(indexes as NSIndexSetMBS, extend as boolean)

MBS MacControls Plugin, Plugin Version: 9.1, Platform: macOS, Targets: Desktop only.

Function: Sets the row selection using indexes.
Notes:

If the extend flag is false the selected rows are specified by indexes. If extend is true, the rows indicated by indexes are added to the collection of already selected rows, providing multiple selection.

Available in Mac OS X v10.3 and later.

35.96.54 setDraggingSourceOperationMask(mask as Integer, isLocal as Boolean)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Sets the default operation mask returned by draggingSourceOperationMaskForLocal to mask.
Notes:

mask: The drag operation mask. See NSDragOperation for the supported values.
isLocal: True if the destination is the same application, otherwise false. In either case the specified mask value is archived and used.

35.96.55 setDropRow(row as Integer, dropOperation as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Retargets the proposed drop operation.
Notes:

row: The target row index.
dropOperation: The drop operation. Supported values are specified by NSTableViewDropOperation.

For example, to specify a drop on the second row, specify row as 1, and operation as NSTableViewDropOn. To specify a drop below the last row, specify row as [self numberOfRows] and operation as NSTableView-DropAbove.
Passing a value of ,Äì1 for row and NSTableViewDropOn as the operation causes the entire table view to be highlighted rather than a specific row. This is useful if the data displayed by the table view does not allow the user to drop items at a specific row location.

35.96.56 setSortDescriptor(sortDescriptor as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver's sort descriptors.
Notes:

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort.

The array of sort descriptors is archived. Sort descriptors persist along with other column information if an autosave name is set.

Calling setSortDescriptors may have the side effect of invoking the data source method tableViewSortDescriptorsDidChange.

35.96.57 setSortDescriptors(sortDescriptors() as NSSortDescriptorMBS)

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver's sort descriptors.
Notes:

A table column is considered sortable if it has a sort descriptor that specifies the sorting direction, a key to sort by, and a selector defining how to sort.

The array of sort descriptors is archived. Sort descriptors persist along with other column information if an autosave name is set.

Calling setSortDescriptors may have the side effect of invoking the data source method tableViewSortDescriptorsDidChange.

35.96.58 sizeLastColumnToFit

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Resizes the last column if there's room so the receiver fits exactly within its enclosing clip view.

35.96.59 sizeToFit

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Changes the width of columns in the receiver so all columns are visible.
Notes: All columns are resized to the same size, up to a column's maximum size. This method then invokes tile.

35.96.60 sortDescriptors as NSSortDescriptorMBS()

MBS MacControls Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver,Äôs sort descriptors.

35.96.61 tableColumns as NSTableColumnMBS()

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns an array containing the the NSTableColumn objects in the receiver.
Notes: The array returned by tableColumns contains all receiver's columns, including those that are hidden.

35.96.62 tableColumnWithIdentifier(identifier as string) as NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the NSTableColumn object for the first column whose identifier is equal to a given object.
Notes: Returns the NSTableColumn object for the first column whose identifier is equal to anObject, as compared using isEqual:, or nil if no columns are found with the specified identifier.

35.96.63 tile

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Properly sizes the receiver and its header view and marks it as needing display.
Notes: Also resets cursor rectangles for the header view and line scroll amounts for the NSScrollView object.

35.96.64 unhideRowsAtIndexes(indexes as NSIndexSetMBS, animationOptions as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Unhides the specified table rows.
Notes:

indexes: An index set containing indexes of the hidden rows to be shown again.
rowAnimation: An animation effect to be applied when the rows are hidden.

Unhiding a table row causes the didAddRowView event to be invoked.

35.96.65 viewAtColumn(column as Integer, row as Integer, makeIfNecessary as Boolean) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Returns a view at the specified row and column indexes, creating one if necessary.
Notes:

column: The index of the column in the tableColumns array.
row: The row index.
makeIfNecessary: true if a view is required, false if you want to update properties on a view, if one is available.

Returns an instance of NSView.

This method first attempts to return an available view, which is generally in the visible area. If there is no available view, and makeIfNecessary is true, a prepared temporary view is returned. If makeIfNecessary is false, and the view is not available, nil will be returned.
In general, makeIfNecessary should be true if you require a resulting view, and false if you only want to update properties on a view only if it is available (generally this means it is visible).
An exception will be thrown if row is not within the numberOfRows. The returned result should generally not be held onto for longer than the current run loop cycle. Instead they should re-query the table view for the row view.

35.96.66 Properties

35.96.67 allowsColumnReordering as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the user can drag column headers to reorder columns.
Notes:

The default is true. You can rearrange columns programmatically regardless of this setting.
(Read and Write property)

35.96.68 allowsColumnResizing as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver allows the user to resize columns by dragging between their headers.
Notes: (Read and Write property)

35.96.69 allowsColumnSelection as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the user can select an entire column by clicking its header.
Notes:

The default is false. You can select columns programmatically regardless of this setting.
(Read and Write property)

35.96.70 allowsEmptySelection as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the receiver allows zero rows or columns to be selected.
Notes:

Unlike with the other settings that affect selection behavior, you cannot set an empty selection programmatically if empty selection is disallowed.
(Read and Write property)

35.96.71 allowsMultipleSelection as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the user can select more than one row or column at a time.
Notes:

The default is false. You can select multiple columns or rows programmatically regardless of this setting.
(Read and Write property)

35.96.72 allowsTypeSelect as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows the user to type characters to select rows.
Notes:

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.96.73 autosaveName as string

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The name under which table information is automatically saved.
Notes:

The table information is saved separately for each user and for each application that user uses.

Note that even when a table view has an autosave name, it may not be saving table information automatically.
(Read and Write property)

35.96.74 autosaveTableColumns as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the order and width of this table view's columns are automatically saved.
Notes:

If flag is different from the current value, this method also reads in the saved information and sets the table options to match.

The table information is saved separately for each user and for each application that user uses. Note that if autosaveName returns nil, this setting is ignored and table information isn't saved.
(Read and Write property)

35.96.75 backgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The color used to draw the background of the receiver.
Notes:

The default background color is light gray.
(Read and Write property)

35.96.76 clickedColumn as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the column the user clicked to trigger an action message.
Notes:

The index of the column the user clicked to trigger an action message. Returns ,Äì1 if the user clicked in an area of the table view not occupied by columns.

Index is zero based.
(Read only property)

35.96.77 clickedRow as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the row the user clicked to trigger an action message.
Notes:

The index of the row the user clicked to trigger an action message. Returns ,Äì1 if the user clicked in an area of the table view not occupied by table rows.

Index is zero based.
(Read only property)

35.96.78 columnAutoresizingStyle as Integer

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: The table's column autoresizing style.
Notes:

Use the following constants:

NSTableViewMBS.kFirstColumnOnlyAutoresizingStyle
NSTableViewMBS.kUniformColumnAutoresizingStyle
NSTableViewMBS.kSequentialColumnAutoresizingStyle
NSTableViewMBS.kReverseSequentialColumnAutoresizingStyle
NSTableViewMBS.kNoColumnAutoresizing
NSTableViewMBS.kLastColumnOnlyAutoresizingStyle

Available in Mac OS X v10.4 and later.
(Read and Write property)

35.96.79 cornerView as NSViewMBS

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: The view used to draw the area to the right of the column headers and above the vertical scroller of the enclosing scroll view.
Notes:

This is by default a simple view that merely fills in its frame, but you can replace it with a custom view using this property.
(Read and Write property)

35.96.80 dataSource as NSTableDataSourceMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The object that provides the data displayed in the table view.
Notes: (Read and Write property)

35.96.81 draggingDestinationFeedbackStyle as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The feedback style displayed when the user drags over the table view.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

35.96.82 editedColumn as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the column being edited.
Notes:

First column has index zero.
If sent during editColumn(), the index of the row being edited; otherwise ,Äì1.
(Read only property)

35.96.83 editedRow as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the row being edited.
Notes:

The first row index is zero.
If sent during editColumn(), the index of the row being edited; otherwise ,Äì1.
(Read only property)

35.96.84 effectiveRowSizeStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: Returns the effective row size style for the table.
Notes:

If the rowSizeStyle is NSTableViewRowSizeStyleDefault, then this method returns the default size for this table.
The default size is currently set in the System Preferences by the users.
Available in OS X v10.7 and later.
(Read only property)

35.96.85 effectiveStyle as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The effective style when style is NSTableViewStyleAutomatic.
Notes:

Otherwise, it returns the same value as style.
(Read only property)

35.96.86 floatsGroupRows as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table view draws grouped rows as if they are floating.
Notes:

Group rows are rows for which the table view delegate,Äôs isGroupRow method returns true. These rows can be displayed as if they are floating in a view-based table view.
The default value of this property is true.

(Read and Write property)

35.96.87 focusedColumn as Integer

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The currently focused column.
Notes:

Returns the index of the column, or -1 if there is no focused column
The focus interaction will always be on the selectedRow of the table. If the selectedRow is a full width cell, then focusedColumn will return 1 when focused..
Available in Mac OS X v10.6 and later.
(Read and Write property)

35.96.88 gridColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The color used to draw grid lines.
Notes:

The default color is gray.
(Read and Write property)

35.96.89 gridStyleMask as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's grid style mask.
Notes:

use the constants;

```
kGridNone                    = 0,
 kSolidVerticalGridLineMask  = 1
 kSolidHorizontalGridLineMask = 2
```

(Read and Write property)

35.96.90 headerView as NSTableHeaderViewMBS

MBS MacControls Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The NSTableHeaderView object used to draw headers over columns.
Notes:

The NSTableHeaderView object used to draw headers over columns, or nil if the receiver has no header view
(Read and Write property)

35.96.91 highlightedtableColumn as NSTableColumnMBS

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: The table column highlighted in the receiver.
Notes:

A highlightable column header can be used in conjunction with row selection to highlight a particular column of the table. An example of this is how the Mail application indicates the currently sorted column.
(Read and Write property)

35.96.92 intercellSpacing as NSSizeMBS

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: The horizontal and vertical spacing between cells.
Notes:

The default spacing is (3.0, 2.0).
(Read and Write property)

35.96.93 numberOfColumns as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the number of columns in the receiver.
Notes:

The value returned includes table columns that are currently hidden.
(Read only property)

35.96.94 numberOfRows as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the number of rows in the receiver.
Notes:

Typically you should not ask the table view how many rows it has; instead you should interrogate the table view's data source.
(Read only property)

35.96.95 numberOfSelectedColumns as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the number of selected columns.
Notes: (Read only property)

35.96.96 numberOfSelectedRows as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the number of selected rows.
Notes: (Read only property)

35.96.97 rowActionsVisible as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether a table row,Äôs actions are visible.
Notes:

This property contains a Boolean value indicating whether a table row,Äôs actions are visible or not,Äîthe user has swiped the row to reveal the row actions. Set the value of this property to false to hide any visible row actions. Setting the value of this property to true is not supported, and will result in an exception.
(Read and Write property)

35.96.98 rowHeight as Double

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the height of each row in the receiver.
Notes:

The default row height is 16.0.
(Read and Write property)

35.96.99 rowSizeStyle as Integer

MBS MacControls Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The row size used by the tableview: small, medium, large, or on a custom row by row basis.
Notes:

The row size style can be modified on a row by row basis by invoking the event heightOfRow, if implemented.

The rowSizeStyle defaults to NSTableViewRowSizeStyleCustom. NSTableViewRowSizeStyleCustom indicates to use the rowHeight of the table, instead of the pre-determined system values.

Generally, rowSizeStyle should always be NSTableViewRowSizeStyleCustom except for "source lists". To implement variable row heights, set the value to NSTableViewRowSizeStyleCustom and implement tableView:heightOfRow: in the delegate.

Available in OS X v10.7 and later.
(Read and Write property)

35.96.100 selectedColumn as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the last column selected or added to the selection.
Notes:

Returns the index of the last column selected or added to the selection, or ,Äì1 if no column is selected.
(Read only property)

35.96.101 selectedRow as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the last row selected or added to the selection.
Notes:

Returns the index of the last row selected or added to the selection, or ,Äì1 if no row is selected.

(Read only property)

35.96.102 selectionHighlightStyle as Integer

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The selection highlight style used by the receiver to indicate row and column selection.
Notes:

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.96.103 style as Integer

MBS MacControls Plugin, Plugin Version: 21.0, Platform: macOS, Targets: Desktop only.

Function: The table view style.
Example:

```
dim tableView as NSTableViewMBS // your table view

tableView.style = NSTableViewMBS.NSTableViewStyleFullWidth
```

Notes:

Defaults to NSTableViewStyleAutomatic.
For macOS 11.0 or newer.

Available styles:

NSTableViewStyleFullWidth	The table view style resolves to a full-width style.
NSTableViewStyleInset	The table view style resolves to an inset style.
NSTableViewStyleSourceList	The table view style resolves to a source-list style.
NSTableViewStylePlain	The table view style resolves to a plain style.

(Read and Write property)

35.96.104 usesAlternatingRowBackgroundColors as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver uses the standard alternating row colors for its background.
Notes:

Available in Mac OS X v10.3 and later.
(Read and Write property)

35.96.105 usesStaticContents as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the table uses static data.
Notes:

A static table does not rely on a data source to provide the number of rows. A static table view,Äôs contents are set at design time and can be changed programmatically as needed. Typically, you do not change the contents of a static table view after setting them.
In Xcode, any rows you add to a static table are saved in the corresponding nib or storyboard file and loaded with the rest of the table at runtime. You can add table rows programmatically to a static table view using the insertRowsAtIndexes method. When adding rows programmatically, your table view delegate must implement the view method to provide the corresponding view for any new rows. You can also remove rows at any time using the removeRowsAtIndexes method.

A table with static contents must be an NSView-based table view.

Available in macOS 10.10 or later.
(Read and Write property)

35.96.106 verticalMotionCanBeginDrag as boolean

MBS MacControls Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether vertical motion is treated as a drag or selection change to flag.
Notes:

If flag is false then vertical motion will not start a drag. The default is true.

Note that horizontal motion is always a valid motion to begin a drag. Most often, you would want to disable vertical dragging when it's expected that horizontal dragging is the natural motion.
(Read and Write property)

35.96.107 indicatorImageInTableColumn(column as NSTableColumnMBS) as NSImageMBS

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: Desktop only.

Function: The indicator image of a given table column.
Notes:

An indicator image is an arbitrary (small) image that is rendered on the right side of the column header. An example of its use is in Mail to indicate the sorting direction of the currently sorted column in a mailbox. (Read and Write computed property)

35.96.108 Events

35.96.109 ColumnDidMove(notification as NSNotificationMBS, oldColumn as Integer, newColumn as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: .

Function: This event informs the delegate that a column was moved by user action in the table view.

35.96.110 ColumnDidResize(notification as NSNotificationMBS, column as NSTableColumnMBS, index as Integer)

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: .

Function: This event informs you that a column was resized in the table view.

35.96.111 dataCell(tableColumn as NSTableColumnMBS, row as Int64) as NSCellMBS

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Optional return a different cells for each row.
Notes:

A different data cell can be returned for any particular tableColumn and row, or a cell that will be used for the entire row (a full width cell). The returned cell should properly implement copyWithZone:, since the cell may be copied by NSTableView. If the tableColumn is non-nil, and nil is returned, then the table will use the default cell from tableColumn.dataCellForRow(Row).

When each row is being drawn, this method will first be called with a nil tableColumn. At this time, you can return a cell that will be used to draw the entire row, acting like a group. If you do return a cell for the 'nil' tableColumn, be prepared to have the other corresponding datasource and delegate methods to be called with a 'nil' tableColumn value. If don't return a cell, the method will be called once for each tableColumn in the tableView, as usual.

35.96.112 didAddRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Tells the delegate that a row view was added at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

At this point, the delegate can add extra views, or modify the properties of rowView.

This method is only valid for NSView-based table views.

35.96.113 didClickTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Called if a table column was clicked on.

35.96.114 didDragTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Sent at the time the mouse button goes up in tableView and tableColumn has been dragged during the time the mouse button was down.
Notes:

tableColumn: The table column.

The behavior of this method on Mac OS X v10.5 is different from prior versions. On Mac OS X v 10.5 the dragged column is sent to the subclass. In earlier versions the table column that is currently located at the dragged column's original index is sent.

35.96.115 didRemoveRowView(rowView as NSTableRowViewMBS, row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Tells the delegate that a row view was removed from the table at the specified row.
Notes:

rowView: The row view.
row: The index of the row.

If row equals -1, the row is being deleted from the table and is no longer a valid row; otherwise row is a valid row that is being removed by being moved off screen.

This method is only valid for NSView-based table views.

35.96.116 DoubleClick

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: A double click was recognized.

35.96.117 heightOfRow(row as Int64) as Double

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Implement this event to support a table with varying row heights.
Notes: The height returned by this method should not include intercell spacing and must be greater than zero. Performance Considerations: For large tables in particular, you should make sure that this method is efficient. NSTableView may cache the values this method returns, but this should NOT be depended on, as all values may not be cached. To signal a row height change, call noteHeightOfRowsWithIndexesChanged. For a given row, the same row height should always be returned until noteHeightOfRowsWithIndexesChanged is called, otherwise unpredicable results will happen. NSTableView automatically invalidates its entire row height cache in reloadData, and noteNumberOfRowsChanged.

35.96.118 isGroupRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to indicate that a specified row is a group row.
Notes:

row: The row index.

Return true if the specified row should have the group row style drawn, false otherwise.

If the cell in row is an NSTextFieldCell and contains only a string, the group row style attributes will automatically be applied to the cell.

Group rows in view-based table views can be made to visually ‚Äòfloat' by setting the tableview method setFloatsGroupRows to true.

Note: When configured as a source list style table view, rows identified as group rows draw with a specific style unique for source lists.

Available in Mac OS X v10.5 and later.

35.96.119 mouseDownInHeaderOfTableColumn(tableColumn as NSTableColumnMBS)

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Sent to the subclass whenever the mouse button is clicked in the table view's header column.
Notes: tableColumn: The table column.

35.96.120 nextTypeSelectMatchFromRow(startRow as Int64, endRow as Int64, searchString as string) as Int64

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to modify how type selection works.
Notes:

startRow: The starting row of the search range.
endRow: The ending row of the search range.
searchString: A string containing the typed selection.

Return the first row in the range of startRow through endRow (excluding endRow itself) that matches selectionString. Return -1 if no match is found.

It is possible for endRow to be less than startRow if the search will wrap.
Available in Mac OS X v10.5 and later.

35.96.121 rowViewForRow(row as Integer) as NSTableRowViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Asks the delegate for a view to display the specified row.
Notes:

row: The row index.

Return an instance or subclass of NSTableRowView. If nil is returned, an NSTableRowView instance will be created and used.

You can implement this event to return a custom NSTableRowView for row.

The reuse queue can be used in the same way as documented in tableView:view:row:. The returned view will have attributes properly set to it before it,Äôs added to the tableView.

This method is only valid for NSView-based table views.

35.96.122 SelectionDidChange(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: .

Function: This event informs you that the table view's selection has changed.

35.96.123 selectionIndexesForProposedSelection(proposedSelectionIndexes as NSIndexSetMBS) as NSIndexSetMBS

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the delegate to modify the proposed selection.
Notes:

proposedSelectionIndexes: An index set containing the indexes of the proposed selection.

Return an NSIndexSet instance containing the indexes of the new selection. Return proposedSelectionIndexes if the proposed selection is acceptable, or the value of the table view's existing selection to avoid changing the selection.

This method may be called multiple times with one new index added to the existing selection to find out if a particular index can be selected when the user is extending the selection with the keyboard or mouse.

Implementation of this method is optional. If implemented, this method will be called instead of shouldSelectRow.
Available in Mac OS X v10.5 and later.

35.96.124 SelectionIsChanging(notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 9.2, Platform: macOS, Targets: .

Function: This event informs you that the table view's selection is in the process of changing (typically because the user is dragging the mouse across a number of rows).

35.96.125 selectionShouldChangeInTableView as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Returns whether the selection should change.
Notes:

Return true to allow the table view to change its selection (typically a row being edited), false to deny selection change.

The user can select and edit different cells within the same row, but can't select another row unless the delegate approves. The subclass can implement this method for complex validation of edited rows based on the values of any of their cells.

35.96.126 shouldEditTableColumn(tableColumn as NSTableColumnMBS, row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Returns whether the cell at the specified row and column can be edited.
Notes:

TableColumn: The table column.
rowIndex: The row index.
Return true to allow editing the cell, false to deny editing.

The subclass can implement this method to disallow editing of specific cells.
Note: This method is only valid for cell-based table views.

35.96.127 shouldReorderColumn(columnIndex as Int64, newColumnIndex as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Sent to the subclass to allow or prohibit the specified column to be dragged to a new location.
Notes:

columnIndex: The index of the column being dragged.
newColumnIndex: The proposed target index of the column.

Return true if the column reordering should be allowed, otherwise false.

When a column is initially dragged by the user, the delegate is first called with a newColumnIndex value

of -1. Returning false will disallow that column from being reordered at all. Returning true allows it to be reordered, and the delegate will be called again when the column reaches a new location.

The actual NSTableColumn instance can be retrieved from the tableColumns array.

If this method is not implemented, all columns are considered reorderable.
Available in Mac OS X v10.6 and later.

35.96.128 shouldSelectRow(row as Int64) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Returns whether the table view should allow selection of the specified row.
Notes:

rowIndex: The row index.

Return true to permit selection of the row, false to deny selection.

The delegate can implement this method to disallow selection of particular rows.
For better performance and finer-grain control over the selection, use selectionIndexesForProposedSelection.

35.96.129 shouldSelectTableColumn(tableColumn as NSTableColumnMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Returns whether the specified table column can be selected.
Notes:

TableColumn: The table column.

Return true to permit selection, otherwise false.

The subclass can implement this event to disallow selection of particular columns.

35.96.130 shouldShowCellExpansion(tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control cell expansion for a specific row and column.
Notes:

TableColumn: The table column.
row: The row index.

Return true if the tooltip cell should expand, false otherwise.

Cell expansion can occur when the mouse hovers over the specified cell and the cell contents are unable to be fully displayed within the cell. If this method returns true, the full cell contents will be shown in a special floating tool tip view, otherwise the content is truncated.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

35.96.131 shouldTrackCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64) as Boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control the tracking behavior for a specific cell.
Notes:

cell: The cell to track.
tableColumn: The table column.
row: A row in tableView.

Returns true if the cell should track, false otherwise.

Normally, only selectable or selected cells can be tracked. If you implement this method, cells which are not selectable or selected can be tracked, and vice-versa.

For example, this allows you to have an NSButtonCell in a table which does not change the selection, but can still be clicked on and tracked.

Note: This method is only valid for cell-based table views.

Available in Mac OS X v10.5 and later.

35.96.132 shouldTypeSelectForEvent(e as NSEventMBS, searchString as string) as Boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to control type select for a specific event.
Notes:

event: The event.
searchString: The search string or nil if no type select has began.

Return true to allow type select for event, false otherwise.

Typically, this is called from the table view keyDown implementation and the event will be a key event.
Available in Mac OS X v10.5 and later.

35.96.133 sizeToFitWidthOfColumn(column as Int64) as Double

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to provide custom sizing behavior when a column's resize divider is double clicked.
Notes:

column: The index of the column.

Returns the width of the specified column.

By default, NSTableView iterates every row in the table, accesses a cell via preparedCellAtColumn, and requests the cellSize to find the appropriate largest width to use.

For accurate results and performance, it is recommended that this method is implemented when using large tables. By default, large tables use a monte carlo simulation instead of iterating every row.

Available in Mac OS X v10.6 and later.

35.96.134 textShouldBeginEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow.

35.96.135 textShouldEndEditing(control as NSControlMBS, fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow.

35.96.136 toolTipForCell(cell as NSCellMBS, r as NSRectMBS, tableColumn as NSTableColumnMBS, row as Int64, mouseLocation as NSPointMBS) as string

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Returns a string that is displayed as a tooltip for the specified cell in the column and row.
Notes:

Cell: The cell.
r: The proposed active area of the tooltip. You can modify rect to provide an alternative active area.
TableColumn: The table column.
row: The row index.
mouseLocation: The mouse location.

Return a string containing the tooltip. Return empty string if no tooltip is desired.

By default, rect is computed as cell.drawingRectForBounds(cellFrame).
Available in Mac OS X v10.4 and later.

35.96.137 typeSelectString(tableColumn as NSTableColumnMBS, row as Int64) as string

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Invoked to allow the subclass to provide an alternate text value used for type selection for a specified row and column.
Notes:

tableColumn: The table column.
row: The row index.

Returns a string that is used in type select comparison for row and tableColumn. Return "" if the row or tableColumn should not be searched.

Implement this method to change the string value that is searched for based on what is displayed. By default, all cells with text in them are searched.

If this event is not implemented the string value is the cell string value.
Implementation of this event is optional.

Available in Mac OS X v10.5 and later.

35.96.138 view(tableColumn as NSTableColumnMBS, row as Integer) as NSViewMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Asks the delegate for a view to display the specified row and column.
Notes:

see also
https://developer.apple.com/reference/appkit/nstableviewdelegate/1527449-tableview?language=objc

35.96.139 willDisplayCell(cell as NSCellMBS, tableColumn as NSTableColumnMBS, row as Int64)

MBS MacControls Plugin, Plugin Version: 12.0, Platform: macOS, Targets: .

Function: Informs you that the tableview will display the specified cell at the row in the column.
Notes:

Cell: The cell to be displayed.
TableColumn: The table column.
row: The row index.

The event can modify the display attributes of cell to alter the appearance of the cell.

Because cell is reused for every row in tableColumn, the event must set the display attributes both when drawing special cells and when drawing normal cells.

Note: The implementation of this method must not draw portions of the cell. It should only alter the state of the passed in cell.

35.96.140 Constants

35.96.141 NSTableRowActionEdgeLeading = 0

MBS MacControls Plugin, Plugin Version: 17.1.

Function: One of the constants to define table row edges on which row actions are attached.
Notes: Denotes the leading, or left, edge of an table row view.

35.96.142 NSTableRowActionEdgeTrailing = 1

MBS MacControls Plugin, Plugin Version: 17.1.

Function: One of the constants to define table row edges on which row actions are attached.
Notes: Denotes the trailing, or right, edge of an table row view.

35.96.143 NSTableViewAnimationEffectFade = 1

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Specifies the animation effects to apply when inserting or removing rows.
Notes: Use a fade for row or column removal. The effect can be combined with any of the slide constants.

35.96.144 NSTableViewAnimationEffectGap = 2

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Specifies the animation effects to apply when inserting or removing rows.
Notes: Creates a gap for newly inserted rows. This is useful for drag and drop animations that animate to a newly opened gap and should be used in the acceptDrop event.

35.96.145 NSTableViewAnimationEffectNone = 0

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Specifies the animation effects to apply when inserting or removing rows.
Notes: Use no animation effects.

35.96.146 NSTableViewAnimationSlideDown = & h20

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion or removal by sliding downward.

35.96.147 NSTableViewAnimationSlideLeft = & h30

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion by sliding from the left. Animates a row removal by sliding towards the left.

35.96.148 NSTableViewAnimationSlideRight = & h40

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion by sliding from the right. Animates a row removal by sliding towards the right.

35.96.149 NSTableViewAnimationSlideUp = & h10

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Specifies the animation effects to apply when inserting or removing rows.
Notes: Animates a row insertion or removal by sliding upward.

35.96.150 NSTableViewDashedHorizontalGridLineMask=8

MBS MacControls Plugin, Plugin Version: 17.1.

Function: One of the constants to specify grid styles.
Notes: Specifies that the horizontal grid lines should be drawn dashed.

35.96.151 NSTableViewDraggingDestinationFeedbackStyleGap=2

MBS MacControls Plugin, Plugin Version: 17.1.

Function: One of the dragging styles.
Notes: Provides a gap insertion when dragging over the table. Note that this style is only officially supported for View Based TableViews, but may partially work in Cell Based TableViews. The decision to use the gap style (compared to another style) can be made in draggingSessionWillBeginAtPoint, or it can dynamically be changed.

35.96.152 NSTableViewDraggingDestinationFeedbackStyleNone=-1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the drag styles displayed by the table view.
Notes:

Provides no feedback when the user drags over the table view. This option exists to allow subclasses to implement their dragging destination highlighting, or to make it not show anything all.

Available in Mac OS X v10.6 and later.

35.96.153 NSTableViewDraggingDestinationFeedbackStyleRegular=0

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the drag styles displayed by the table view.
Notes:

Draws a solid round-rect background on drop target rows, and an insertion marker between rows. This style should be used in most cases.

Available in Mac OS X v10.6 and later.

35.96.154 NSTableViewDraggingDestinationFeedbackStyleSourceList=1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the drag styles displayed by the table view.
Notes:

Draws an outline on drop target rows, and an insertion marker between rows. This style will automatically be set for source lists when the table's setSelectionHighlightStyle: is set to NSTableViewSelectionHighlightStyleSourceList. This is the standard look for Source Lists, but may be used in other areas as needed.

Available in Mac OS X v10.6 and later.

35.96.155 NSTableViewDropAbove=1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify drop operations.
Notes:

Specifies that the drop should occur above the specified row.

For example, given a table with n rows (numbered with row 0 at the top visually), a row of n,Äì1 and operation of NSTableViewDropOn would specify a drop on the last row. To specify a drop below the last row, you use a row of n and NSTableViewDropAbove for the operation.

35.96.156 NSTableViewDropOn=0

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify drop operations.
Notes:

Specifies that the drop should occur on the specified row.

For example, given a table with n rows (numbered with row 0 at the top visually), a row of n,Äì1 and operation of NSTableViewDropOn would specify a drop on the last row. To specify a drop below the last row, you use a row of n and NSTableViewDropAbove for the operation.

35.96.157 NSTableViewFirstColumnOnlyAutoresizingStyle=5

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the autoresizing style.
Notes:

Autoresize only the first table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.

35.96.158 NSTableViewGridNone=0

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants for the grid styles.
Notes: Specifies that no grid lines should be displayed.

35.96.159 NSTableViewLastColumnOnlyAutoresizingStyle=4

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the autoresizing style.
Notes:

Autoresize only the last table column.

When that table column can no longer be resized, stop autoresizing. Normally you should use one of the sequential autoresizing modes instead.

Available in Mac OS X v10.4 and later.

35.96.160 NSTableViewNoColumnAutoresizing=0

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the autoresizing style.
Notes:

Disable table column autoresizing.
Available in Mac OS X v10.4 and later.

35.96.161 NSTableViewReverseSequentialColumnAutoresizingStyle=3

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the autoresizing style.
Notes:

Autoresize each table column sequentially, from the first auto-resizable column to the last auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.

35.96.162 NSTableViewRowSizeStyleCustom = 0

MBS MacControls Plugin, Plugin Version: 13.4.

Function: One of the row size style constants.
Notes:

The table will use the rowHeight or invoke the delegate method tableView:heightOfRow:, if implemented. The cell layout is not changed.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

35.96.163 NSTableViewRowSizeStyleDefault = -1

MBS MacControls Plugin, Plugin Version: 13.4.

Function: One of the row size style constants.
Notes:

The table will use the system default layout size: small, medium or large.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

35.96.164 NSTableViewRowSizeStyleLarge = 3

MBS MacControls Plugin, Plugin Version: 13.4.

Function: One of the row size style constants.
Notes:

The table will use a row height specified for a small table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

35.96.165 NSTableViewRowSizeStyleMedium = 2

MBS MacControls Plugin, Plugin Version: 13.4.

Function: One of the row size style constants.
Notes:

The table will use a row height specified for a medium table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

35.96.166 NSTableViewRowSizeStyleSmall = 1

MBS MacControls Plugin, Plugin Version: 13.4.

Function: One of the row size style constants.
Notes:

The table will use a row height specified for a small table. It is required that the size be fully tested and supported if NSTableViewRowSizeStyleCustom is not used.
Available in OS X v10.7 and later.
The row size style constants define the size of the rows in the table view. They are used by the effectiveRowSizeStyle and rowSizeStyle methods. You can also query the row size in the NSTableCellView class' property rowSizeStyle.

35.96.167 NSTableViewSelectionHighlightStyleNone=-1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the selection highlight styles.
Notes:

Displays no highlight style at all.
Available in Mac OS X v10.6 and later.

35.96.168 NSTableViewSelectionHighlightStyleRegular=0

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants for the selectionHighlightStyle property.
Notes:

The regular highlight style of NSTableView. On Mac OS X v10.5 a light blue (returned by sending NSColor a alternateSelectedControlColor message) or light gray color (returned by sending NSColor a secondarySelectedControlColor message).

Available in Mac OS X v10.5 and later.

35.96.169 NSTableViewSelectionHighlightStyleSourceList=1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants for the selectionHighlightStyle property.
Notes:

The source list style of NSTableView. On 10.5, a light blue gradient is used to highlight selected rows.

Note: When using this style, cell subclasses that implement drawsBackground must set the value to false. Otherwise, the cells will draw over the tableview's highlighting.

35.96.170 NSTableViewSequentialColumnAutoresizingStyle=2

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the autoresizing style.
Notes:

Autoresize each table column sequentially, from the last auto-resizable column to the first auto-resizable column; proceed to the next column when the current column has reached its minimum or maximum size.

Available in Mac OS X v10.4 and later.

35.96.171 NSTableViewSolidHorizontalGridLineMask=2

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify grid styles.
Notes:

Specifies that horizontal grid lines should be displayed.

Available in Mac OS X v10.3 and later.

You can combine NSTableViewSolidVerticalGridLineMask and NSTableViewSolidHorizontalGridLineMask with bitwiseor.

35.96.172 NSTableViewSolidVerticalGridLineMask=1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify grid styles.
Notes:

Specifies that vertical grid lines should be displayed.

Available in Mac OS X v10.3 and later.

You can combine NSTableViewSolidVerticalGridLineMask and NSTableViewSolidHorizontalGridLineMask with bitwiseor.

35.96.173 NSTableViewStyleAutomatic = 0

MBS MacControls Plugin, Plugin Version: 21.0.

Function: One of the style constants.
Notes: Automatically infers the effectiveStyle from the table view hierarchy.

35.96.174 NSTableViewStyleFullWidth = 1

MBS MacControls Plugin, Plugin Version: 21.0.

Function: One of the style constants.
Notes: Edge-to-edge style with standard content padding at the ends of each row. This content padding is

constant and independent of intercellSpacing.

35.96.175 NSTableViewStyleInset = 2

MBS MacControls Plugin, Plugin Version: 21.0.

Function: One of the style constants.
Notes: Inset style with rounded corners selection

35.96.176 NSTableViewStylePlain = 4

MBS MacControls Plugin, Plugin Version: 21.0.

Function: One of the style constants.
Notes: A plain style. No insets, padding or any other kind of decoration applied to the row or its background. The cells are equally spaced in the row using intercellSpacing.width.

35.96.177 NSTableViewStyleSourceList = 3

MBS MacControls Plugin, Plugin Version: 21.0.

Function: One of the style constants.
Notes:

The source list style of NSTableView. Setting this style will have the side effect of setting the background color to "source list".
Additionally in NSOutlineView, the following properties may change to get the standard "source list" look: indentationPerLevel, rowHeight and intercellSpacing. After setting the style it is possible to change any of the other properties as required.
In 10.11, if the background color has been changed from the "source list" background color to something else, the table will no longer draw the selection as a source list blur style, and instead will draw a normal selection highlight.
This replaces NSTableViewSelectionHighlightStyleSourceList which is to be deprecated.

35.96.178 NSTableViewUniformColumnAutoresizingStyle=1

MBS MacControls Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the autoresizing style.
Notes:

Autoresize all columns by distributing space equally, simultaneously.

Available in Mac OS X v10.4 and later.

35.97 class NSTableViewRowActionMBS

35.97.1 class NSTableViewRowActionMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: An NSTableViewRowAction object defines a single action to present when the user swipes horizontally on a table row.
Notes:

In an editable table, performing a horizontal swipe on a row reveals a button to delete the row by default. This class lets you define one or more custom actions to display for a given row in your table. Each instance of this class represents a single action to perform and includes the text, formatting information, and behavior for the corresponding button.

To add custom actions to your table view,Äôs rows, implement the rowActionsForRow event in your table view,Äôs delegate object. In that method, create and return an array of actions for the specified row. The table handles the remaining work of displaying the action buttons and executing the appropriate handler block when the user clicks the button.

35.97.2 Blog Entries

35.97.3 Blog Entries

- MBS Xojo Plugins, version 17.1pr3

35.97.4 Methods

35.97.5 available as boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Check whether this class is available.
Notes: Returns true on macOS 10.11.

35.97.6 Constructor(Style as Integer, Title as String)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new table view row action object.
Notes:

style: The style characteristics to apply to the button. Use this value to apply default appearance characteristics to the button. These characteristics visually communicate, such as by color, information about what the button does. For example, specify a style of NSTableViewRowActionStyleDestructive to indicate an action is destructive to the underlying data. For a list of possible style values, see NSTableViewRowActionStyle.
title: The string to display in the button. Specify a string localized for the user,Äôs current language.

Returns a new table row action object that you can return from your table view,Äôs event.

The style you specify cannot be changed later. You can change the title of the action button. You can also configure other appearance-related properties of the button using the properties of this class.
You can assign the same row action object to multiple rows of your table.

35.97.7 Properties

35.97.8 BackgroundColor as NSColorMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The background color of the action button.
Notes:

Use this property to specify the background color for your button. If you do not specify a value for this property, AppKit assigns a default color based on the value in the style property. Generally, this color is red for destructive actions and blue for nondestructive actions.
(Read and Write property)

35.97.9 Handle as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

35.97.10 Image as NSImageMBS

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The image.

Notes:

Available in macOS 10.12 or later.
(Read and Write property)

35.97.11 Style as Integer

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The style applied to the action button.
Notes:

The value of this property is set at creation time and cannot be changed later.
(Read only property)

35.97.12 Title as String

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: The title of the action button.
Notes: (Read and Write property)

35.97.13 Events

35.97.14 Action(row as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when action is invoked.
Notes: The event to execute when the user clicks the button associated with this action. When the user selects the action represented by this object, AppKit executes your event on the app,Äôs main thread.

35.97.15 Constants

35.97.16 NSTableViewRowActionStyleDestructive = 1

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Constants that help define the appearance and behavior of action buttons.
Notes: Apply a style that indicates that the action might change or delete data. This style changes the value of the backgroundColor property to an appropriate value to reflect the destructive action. After creating the

action object, you can change the background color as needed. Destructive actions require a longer swipe to activate, and trigger an animation when a table row is deleted.

35.97.17 NSTableViewRowActionStyleRegular = 0

MBS MacControls Plugin, Plugin Version: 17.1.

Function: Constants that help define the appearance and behavior of action buttons.
Notes: Apply the default style to the button. This style does not apply any special coloring to the button.

35.98 class NSTabViewItemMBS

35.98.1 class NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The Cocoa class for items on the tabview.
Notes: An NSTabViewItem is a convenient way for presenting information in multiple pages. A tab view is usually distinguished by a row of tabs that give the visual appearance of folder tabs. When the user clicks a tab, the tab view displays a view page provided by your application. A tab view keeps a zero-based array of NSTabViewItems, one for each tab in the view.

35.98.2 Blog Entries

- Disable tab panel item in Xojo
- MBS Xojo / Real Studio Plugins, version 15.1pr4

35.98.3 Blog Entries

35.98.4 Methods

35.98.5 Constructor(identifier as Variant)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new tabview item with the identifier.

35.98.6 Properties

35.98.7 color as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The color of the tab view item.
Notes:

May not be used by the control.
(Read and Write property)

35.98.8 Enabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The enabled state of the tab view item.
Example:

```
dim n as NSTabViewMBS = TabPanel1.NSTabViewMBS
dim t as NSTabViewItemMBS = n.tabViewItemAtIndex(0)
t.Enabled = false
```

Notes: (Read and Write property)

35.98.9 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The internal reference to the NSTabViewItem object.
Notes: (Read and Write property)

35.98.10 identifier as Variant

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The identifier for this item.
Notes: (Read and Write property)

35.98.11 image as NSImageMBS

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: Desktop only.

Function: The image for the tab panel item.
Notes:

Available in Mac OS X 10.10.
(Read and Write property)

35.98.12 initialFirstResponder as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The initial first responder for the view associated with the receiver.
Notes:

Sets the initial first responder for the view associated with the receiver (the view that is displayed when a user clicks on the tab) to view.
(Read and Write property)

35.98.13 label as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The label text for the receiver.
Notes: (Read and Write property)

35.98.14 tabState as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the current display state of the tab associated with the receiver.
Notes:

The possible values are NSSelectedTab, NSBackgroundTab, or NSPressedTab. Your application does not directly set the tab state.
(Read only property)

35.98.15 tabView as NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the parent tab view for the receiver.
Notes:

Note that this is the tab view itself, not the view displayed when a user clicks the tab.

A tab view item normally learns about its parent tab view when it is inserted into the view's array of items. The NSTabView methods addTabViewItem and insertTabViewItem set the tab view for the added or inserted item.
(Read only property)

35.98.16 toolTip as string

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The tooltip displayed for the tab view item.
Notes: (Read and Write property)

35.98.17 view as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The view associated with the receiver to view.
Notes:

This is the view displayed when a user clicks the tab. When you set a new view, the old view is released. (Read and Write property)

35.98.18 Constants

35.98.19 NSBackgroundTab = 1

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants describing the current display state of a tab.
Notes: A tab that's not being displayed.

35.98.20 NSPressedTab = 2

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants describing the current display state of a tab.
Notes: A tab that the user is in the process of clicking. That is, the user has pressed the mouse button while the cursor is over the tab but has not released the mouse button.

35.98.21 NSSelectedTab = 0

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants describing the current display state of a tab.
Notes: The tab that's being displayed.

35.99 class NSTabViewMBS

35.99.1 class NSTabViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The Cocoa tabpanel control.
Notes:

An NSTabView object provides a convenient way to present information in multiple pages. The view contains a row of tabs that give the appearance of folder tabs, as shown in the following figure. The user selects the desired page by clicking the appropriate tab or using the arrow keys to move between pages. Each page displays a view hierarchy provided by your application.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSViewMBS class.

35.99.2 Blog Entries

- Disable tab panel item in Xojo

35.99.3 Blog Entries

- Disable tab panel item in Xojo

35.99.4 Methods

35.99.5 addTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Adds the tab item specified by tabViewItem.
Notes:

tabViewItem: The tab view item to be added.

The item is added at the end of the array of tab items, so the new tab appears on the right side of the view.

35.99.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new tab view with size 100/100 and position 0/0
Example:

```
dim t as new NSTabViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.99.7 Constructor(Handle as Integer) 8496
- 35.99.8 Constructor(left as Double, top as Double, width as Double, height as Double) 8496

35.99.7 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSTabView handle.
Example:

```
dim t as new NSTabViewMBS(0, 0, 100, 100)
dim v as new NSTabViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTabView and the plugin retains this handle.
See also:

- 35.99.6 Constructor 8495
- 35.99.8 Constructor(left as Double, top as Double, width as Double, height as Double) 8496

35.99.8 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new tab view with the given size and position.
Example:

```
dim x as new NSTabViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.99.6 Constructor 8495
- 35.99.7 Constructor(Handle as Integer) 8496

35.99.9 contentRect as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the rectangle describing the content area of the receiver.
Notes: This area does not include the space required for the receiver's tabs or borders (if any).

35.99.10 indexOfTabViewItem(tabViewItem as NSTabViewItemMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the specified item in the tab view.
Notes: The zero-based index of tabViewItem, or [NSNotFound] if the item is not found.

35.99.11 indexOfTabViewItemWithIdentifier(identifier as Variant) as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the item that matches the specified identifier. identifier, or NSNotFound (-1) if the item is not found.
Notes: Returns nil on any error.

35.99.12 insertTabViewItem(tabViewItem as NSTabViewItemMBS, atIndex as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Inserts tabViewItem into the receiver's array of tab view items at index.
Notes:

tabViewItem: The tab view item to be added.
index: The index at which to insert the tab view item. The index parameter is zero-based.

35.99.13 minimumSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the minimum size necessary for the receiver to display tabs in a useful way.
Notes: You can use the value returned by this method to limit how much a user can resize a tab view.

35.99.14 numberOfTabViewItems as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the number of items in the receiver's array of tab view items.

35.99.15 removeTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Removes the item specified by tabViewItem from the receiver's array of tab view items.

35.99.16 selectedTabViewItem as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the specified tab view item.

35.99.17 selectFirstTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: This action method selects the first tab view item.

35.99.18 selectLastTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: This action method selects the last tab view item.

35.99.19 selectNextTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: This action method selects the next tab view item in the sequence.
Notes: If the currently visible item is the last item in the sequence, this method does nothing, and the last page remains displayed.

35.99.20 selectPreviousTabViewItem

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: This action method selects the previous tab view item in the sequence.
Notes: If the currently visible item is the first item in the sequence, this method does nothing, and the first page remains displayed.

35.99.21 selectTabViewItem(tabViewItem as NSTabViewItemMBS)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the tab view item for the currently selected tab.
Notes: Returns the currently selected tab view item, or nil if no item is selected.

35.99.22 selectTabViewItemAtIndex(index as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the tab view item specified by index.
Notes: The index parameter is base 0.

35.99.23 selectTabViewItemWithIdentifier(identifier as Variant)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Selects the tab view item specified by identifier.

35.99.24 tabViewItemAtIndex(index as Integer) as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the tab view item at index in the tab view's array of items.
Notes:

index: The index at which to insert the tab view item. The index parameter is zero-based.

Returns the tab view item at the specified index.

35.99.25 tabViewItemAtPoint(x as Double, y as Double) as NSTabViewItemMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the tab view item at the specified point.
Notes:

Returns the tab view item under the hit point, or nil if no tab view item is under that location.
You can use this method to find a tab view item based on a user's mouse click.

35.99.26 tabViewItems as NSTabViewItemMBS()

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's array of tab view items.
Notes: A tab view keeps an array containing one tab view item for each tab in the view.

35.99.27 Properties

35.99.28 allowsTruncatedLabels as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether if the receiver allows truncating for labels that don't fit on a tab.
Notes:

Value is true if the receiver allows truncating for labels that don't fit on a tab, otherwise false.

The default is true.
When truncating is allowed, the tab view inserts an ellipsis, if necessary, to fit a label in the tab.
(Read and Write computed property)

35.99.29 controlSize as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The size of the receiver.
Notes:

Use NSRegularControlSize, NSSmallControlSize or NSMiniControlSize.
(Read and Write computed property)

35.99.30 controlTint as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The tab view's control tint.
Notes:

Use NSDefaultControlTint, NSBlueControlTint, NSGraphiteControlTint or NSClearControlTint.
(Read and Write computed property)

35.99.31 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether if the receiver draws a background color when the tab view type is NSNoTabsNoBorder.
Notes:

True if the receiver draws a background color when the tab view type is NSNoTabsNoBorder, otherwise false.

If the receiver uses bezeled edges or a line border, the appropriate background color for that border is used.
(Read and Write computed property)

35.99.32 font as NSFontMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The font for tab label text.
Notes:

Tab height is adjusted automatically to accommodate a new font size. If the view allows truncating, tab labels are truncated as needed.
(Read and Write computed property)

35.99.33 tabViewType as Integer

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The tab type for the receiver.
Notes:

Use constants: NSTopTabsBezelBorder, NSLeftTabsBezelBorder, NSBottomTabsBezelBorder, NSRightTabsBezelBorder, NSNoTabsBezelBorder, NSNoTabsLineBorder or NSNoTabsNoBorder.
(Read and Write computed property)

35.99.34 Constants

35.99.35 NSBlueControlTint=1

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify a the control tint.
Notes: Aqua control tint

35.99.36 NSBottomTabsBezelBorder = 2

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the tab view's type as used by tabViewType.
Notes: Tabs are on the bottom of the view with a bezeled border.

35.99.37 NSClearControlTint=7

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify a the control tint.
Notes: Clear control tint

35.99.38 NSDefaultControlTint=0

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify a the control tint.
Notes: The current default tint setting

35.99.39 NSGraphiteControlTint=6

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify a the control tint.
Notes: Graphite control tint

35.99.40 NSLeftTabsBezelBorder = 1

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the tab view's type as used by tabViewType.
Notes: Tabs are on the left of the view with a bezeled border.

35.99.41 NSMiniControlSize=2

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the values for the ControlSize property.
Notes: The control has a smaller size than NSSmallControlSize.

35.99.42 NSNoTabsBezelBorder = 4

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the tab view's type as used by tabViewType.
Notes: The view does not include tabs and has a bezeled border.

35.99.43 NSNoTabsLineBorder = 5

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the tab view's type as used by tabViewType.
Notes: The view does not include tabs and has a lined border.

35.99.44 NSNoTabsNoBorder = 6

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the tab view's type as used by tabViewType.
Notes: The view does not include tabs and has no border.

35.99.45 NSRegularControlSize=0

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the values for the ControlSize property.
Notes: The control is sized as regular.

35.99.46 NSRightTabsBezelBorder = 3

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the tab view's type as used by tabViewType.
Notes: Tabs are on the right of the view with a bezeled border.

35.99.47 NSSmallControlSize=1

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the values for the ControlSize property.
Notes: This constant is for controls that cannot be resized in one direction, such as push buttons, radio buttons, checkboxes, sliders, scroll bars, pop-up buttons, tabs, and progress indicators. You should use a small system font with a small control.

35.99.48 NSTopTabsBezelBorder = 0

MBS MacCocoa Plugin, Plugin Version: 10.0.

Function: One of the constants to specify the tab view's type as used by tabViewType.
Notes: The view includes tabs on the top of the view and has a bezeled border (the default).

35.100 class NSTextFieldCellMBS

35.100.1 class NSTextFieldCellMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The text field class for using as NSCell.
Example:

```
// ask for the textfield behind the label
dim n as NSTextFieldMBS = NSTextFieldMBS(label1.NSViewMBS)

// query cell
dim c as NSTextFieldCellMBS = n.cell

// and set background style
c.backgroundStyle = NSTextFieldCellMBS.NSBackgroundStyleRaised
```

Notes:

The NSTextFieldCell class adds to the text display capabilities of the NSCell class by allowing you to set the color of both the text and its background. You can also specify whether the cell draws its background at all.

All of the methods declared by this class are also declared by the NSTextField class, which uses NSTextFieldCell objects to draw and edit text. These NSTextField cover methods call the corresponding NSTextFieldCell methods.

Placeholder strings, set using PlaceholderString or PlaceholderAttributedString, now appear in the text field cell if the actual string is "". They are drawn in grey on the cell.
Subclass of the NSActionCellMBS class.

35.100.6 Methods

35.100.7 allowedInputSourceLocales as string()

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.
Notes: Available in Mac OS X v10.5 and later.

35.100.8 Constructor(text as string)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new Cell object with a text.
Example:

```
dim c as new NSTextFieldCellMBS("Hello")
MsgBox c.StringValue
```

35.100.9 setAllowedInputSourceLocales(Identifiers() as string)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets an array of locale identifiers representing input sources that are allowed to be enabled when the receiver has the keyboard focus.
Notes:

You can use the meta-locale identifier, NSAllRomanInputSourcesLocaleIdentifier, to specify input sources that are limited for Roman script editing.

Available in Mac OS X v10.5 and later.

35.100.10 setUpFieldEditorAttributes(textobj as NSTextMBS) as NSTextMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets up the field editor. You never invoke this method directly; by overriding it, however, you can customize the field editor.

35.100.11 setWantsNotificationForMarkedText(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Directs the cell's associated field editor to post text change notifications.
Notes:

If true, the field editor posts text change notifications (NSTextDidChangeNotification) while editing marked text; if false, notifications are delayed until the marked text confirmation.

Available in Mac OS X v10.5 and later.

35.100.12 Properties

35.100.13 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The color of the background the receiver draws behind the text.
Notes: (Read and Write property)

35.100.14 bezelStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The receiver's bezel style.
Notes:

To set the bezel style, you must have already set Bezeled to true.
(Read and Write property)

35.100.15 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether the receiver draws its background color.
Notes:

In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.
(Read and Write property)

35.100.16 placeholderAttributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The placeholder of the cell as an attributed string.
Notes:

Note that invoking this successfully will clear out any plain text string set by PlaceholderString.

Available in Mac OS X v10.3 and later.
(Read and Write property)

35.100.17 placeholderString as string

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The placeholder of the cell as a plain text string.
Notes:

Note that invoking this successfully will clear out any attributed string set by setPlaceholderAttributed-String.
(Read and Write property)

35.100.18 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The color used to draw the receiver's text.
Notes: (Read and Write property)

35.100.19 Constants

35.100.20 NSTextFieldRoundedBezel=1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the bezel style of the text field cell.
Notes:

Corners are rounded.
Available in Mac OS X v10.2 and later.

35.100.21 NSTextFieldSquareBezel=0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the bezel style of the text field cell.
Notes:

Corners are square.
Available in Mac OS X v10.2 and later.

35.101 control NSTextFieldControlMBS

35.101.1 control NSTextFieldControlMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSTextField.
Notes:

This control embeds a special NSTextField subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

35.101.4 Properties

35.101.5 View as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.101.6 Events

35.101.7 Action

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: The control's action was triggered.
Notes: The text changed.

35.101.8 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.101.9 Close

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.101.10 Closing

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.101.11 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.101.12 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.101.13 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.101.14 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.101.15 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.101.16 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.101.17 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.101.18 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.101.19 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.101.20 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.101.21 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.101.22 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.101.23 Open

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.101.24 Opening

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.101.25 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.101.26 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

35.101.27 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.101.28 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditing-Notification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

35.101.29 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.101.30 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacCocoa Plugin, Plugin Version: 14.0, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.102 class NSTextFieldMBS

35.102.1 class NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: An NSTextField object is a kind of NSControl that displays text that the user can select or edit and that sends its action message to its target when the user presses the Return key while editing.
Notes: Subclass of the NSControlMBS class.

35.102.4 Methods

35.102.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new text field with size 100/100 and position 0/0
Example:

```
dim t as new NSTextFieldMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.102.6 Constructor(Handle as Integer) 8518
- 35.102.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8518

35.102.6 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSTextField handle.
Example:

```
dim t as new NSTextFieldMBS(0, 0, 100, 100)
dim v as new NSTextFieldMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTextField and the plugin retains this handle.
See also:

- 35.102.5 Constructor 8517
- 35.102.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8518

35.102.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new text field with the given size and position.
Example:

```
dim x as new NSTextFieldMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.102.5 Constructor 8517
- 35.102.6 Constructor(Handle as Integer) 8518

35.102.8 selectText

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Ends editing and selects the entire contents of the receiver if it's selectable.
Notes: If the receiver isn't in some window's view hierarchy, this method has no effect.

35.102.9 Properties

35.102.10 AllowsCharacterPickerTouchBarItem as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether to allow character picker in touch bar.
Notes:

Available in macOS 10.12.2.
(Read and Write property)

35.102.11 allowsEditingTextAttributes as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows the user to change font attributes of the receiver's text.
Notes:

If true, the user is permitted to change font attributes of the receiver's text; if flag is false, the user isn't so permitted. You can change text attributes programmatically regardless of this setting.
(Read and Write property)

35.102.12 AutomaticTextCompletionEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Whether automatic text completion is enabled.
Notes:

Available in macOS 10.12.2.
(Read and Write property)

35.102.13 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The color of the background that the receiver's cell draws behind the text.
Notes: (Read and Write property)

35.102.14 Bezeled as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver draws a bezeled frame.
Notes: (Read and Write property)

35.102.15 bezelStyle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.4, Platform: macOS, Targets: Desktop only.

Function: The receiver's bezel style.
Notes:

You must have already sent the receiver Bezeled with true to make this property take affect.
(Read and Write property)

35.102.16 Bordered as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: A Boolean value indicating whether the receiver draws a black border around its contents.
Notes:

True if the receiver draws a solid black border around its contents; otherwise false.
(Read and Write property)

35.102.17 drawsBackground as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Controls whether the receiver's cell draws its background color behind its text.
Notes:

In order to prevent inconsistent rendering, background color rendering is disabled for rounded-bezel text fields.

To really make the background go away, also set bordered=false.
(Read and Write property)

35.102.18 Editable as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the user can edit the receiver's text.
Notes:

If true, then the user is allowed to both select and edit text. If flag is false, then the user isn't permitted to edit text, and the receiver's selectability is restored to its previous value.

For example, if an NSTextField object is selectable but not editable, then made editable for a time, then made not editable, it remains selectable. To guarantee that text is neither editable nor selectable, simply use setSelectable to turn off selectability.
(Read and Write property)

35.102.19 importsGraphics as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Controls whether the receiver allows the user to drag image files into it.
Notes:

If true, the receiver accepts dragged images; if false, it doesn't. You can add images programmatically regardless of this setting.
(Read and Write property)

35.102.20 placeholderAttributedString as NSAttributedStringMBS

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: The attributed placeholder string.
Notes: (Read and Write property)

35.102.21 placeholderString as String

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: The plain text placeholder string.
Notes: (Read and Write property)

35.102.22 Selectable as boolean

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver is selectable (but not editable).
Notes:

If true, the receiver is made selectable but not editable (use Editable to make text both selectable and editable). If false, the text is neither editable nor selectable.
(Read and Write property)

35.102.23 textColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The color used to draw the receiver's text.
Notes: (Read and Write property)

35.102.24 Constants

35.102.25 NSTextFieldRoundedBezel = 1

MBS MacCocoa Plugin, Plugin Version: 10.4.

Function: One of the constants for the bezelStyle property.
Notes: Corners are rounded.

35.102.26 NSTextFieldSquareBezel = 0

MBS MacCocoa Plugin, Plugin Version: 10.4.

Function: One of the constants for the bezelStyle property.
Notes: Corners are square.

35.103 class NSTextFinderMBS

35.103.1 class NSTextFinderMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: An optional search-and-replace find interface inside a view, usually a scroll view.
Notes:

The class serves as a controller for the standard Cocoa find bar. The NSTextFinder class interacts heavily with a client object which supports the NSTextFinderClient protocol. The client object provides access to the content being searched and provides visual feedback for a search operation.
All menu items related to finding (Find,Ä¶, Find Next, Find Previous, Use Selection for Find, etc.) should have the same action, performTextFinderAction:, which gets sent down the responder chain in the standard method.

see
https://developer.apple.com/documentation/appkit/nstextfinder

35.103.6 Methods

35.103.7 cancelFindIndicator

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Cancels the find indicator immediately.
Notes:

There may be some circumstances where the find indicator should be immediately cancelled or hidden, such as when the view's content or selection is changed without the knowledge of the text finder. This method will immediately cancel the current find indicator.
The NSTextFinderMBS and NSViewMBS classes will handle the find indicator correctly when a content view is resized, moved, or removed from the view hierarchy. If your content view's scrolling is done by an NSScrollViewMBS, the find indicator will also be handled for you during scrolling.

35.103.8 Constructor

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Creates a new object.

35.103.9 performAction(operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Performs the specified text finding action.
Notes:

operation: The text finding action. See NSTextFinderAction for the possible values.

Objects that respond to performTextFinderAction typically call validateAction: to ensure that the action is valid and then invoke performAction if validation is successful.

When invoking the validateAction and performAction the item or sender,Äôs tag should be passed as the parameter. By convention, the sender parameter for this method will have an kAction* constants set as its tag. The responder that receives this method should pass the tag as the action for this method:

35.103.10 validateAction(operation as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Allows validation of the find action before performing.
Notes: Returns true if the operation is valid; otherwise false.

35.103.11 Properties

35.103.12 client as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: The object that provides the target search string, find bar location, and feedback methods.
Notes:

The NSTextFinderMBS instance class must be associated with a client object that implements the NSTextFinderClient protocol in order to function. The client is responsible for providing the string to be searched, the location for the find bar, and the methods which control feedback to the user about the search results.
(Read and Write property)

35.103.13 findBarContainer as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Specifies the find bar container.
Notes:

This property must be set to support the find bar.
When the find bar is to be shown, NSTextFinderMBS invokes showFindBarView on the findBarContainer object, passing the view for the find bar, which it should display somewhere that is associated appropriately with the content being searched.
The NSScrollViewMBS class implements NSTextFinderBarContainer protocol and is the correct place to display the find bar in most circumstances. The container may freely modify the find bar view's width and origin, but not its height.
If this property is not set, then the find bar cannot be shown.
(Read and Write property)

35.103.14 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: The internal reference number.

Notes: (Read and Write property)

35.103.15 incrementalSearchingEnabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Determines if incremental searching is enabled.
Notes:

If true, then the find bar will do incremental searches. If it returns false, then the find bar will behave regularly.
The default value is false.
(Read and Write property)

35.103.16 incrementalSearchingShouldDimContentView as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: Determines the type of incremental search feedback to be presented.
Notes:

If true, then when an incremental search begins, the findBarContainer instance,Äôs parent contentView will be dimmed, except for the locations of the incremental matches. If false, then the incremental matches will not be highlighted automatically, but you can use incrementalMatchRanges to highlight the matches yourself.
The default value is true.
(Read and Write property)

35.103.17 Constants

35.103.18 kActionHideFindInterface = 11

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Hides the find bar interface.

35.103.19 kActionHideReplaceInterface = 13

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Displays the find bar interface including the replace functionality.

35.103.20 kActionNextMatch = 2

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: The next match, if any, is displayed.

35.103.21 kActionPreviousMatch = 3

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: The previous match, if any, is displayed.

35.103.22 kActionReplace = 5

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Replaces a single instance of the string.

35.103.23 kActionReplaceAll = 4

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: All occurrences of the string are replaced.

35.103.24 kActionReplaceAllInSelection = 8

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Selects all matching search strings within the current selection.

35.103.25 kActionReplaceAndFind = 6

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Replaces a single instance of the string and searches for the next match.

35.103.26 kActionSelectAll = 9

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Selects all matching search strings.

35.103.27 kActionSelectAllInSelection = 10

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Replaces all occurrences of the string within the current selection.

35.103.28 kActionSetSearchString = 7

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Sets the search string.

35.103.29 kActionShowFindInterface = 1

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: The find bar interface is displayed.

35.103.30 kActionShowReplaceInterface = 12

MBS MacCocoa Plugin, Plugin Version: 18.5.

Function: One of the action constants.
Notes: Displays the find bar interface including the replace functionality.

35.104 control NSTextViewControlMBS

35.104.1 control NSTextViewControlMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The Xojo control for a NSTextView.
Notes:

This control embeds a special NSTextView subclass.
Designed for Xojo 2013r1 and newer. May work on Xojo 2012, but not perfectly.
Please use view property to access the underlaying object and set properties.

35.104.4 Properties

35.104.5 AcceptTabs as Boolean

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: Whether the control should accept tab keys.
Notes:

If true, the plugin will not forward the tab keydown/keyup events to Xojo, because Xojo would do switch to next control.
(Read and Write property)

35.104.6 Scrollview as Variant

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: The scrollview for this textview.
Notes: (Read only property)

35.104.7 View as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.104.8 Events

35.104.9 BoundsChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.104.10 Close

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.104.11 Closing

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.104.12 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacCocoa Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.104.13 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.104.14 EnableMenuItems

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.104.15 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.104.16 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.104.17 FrameChanged

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.104.18 GotFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.104.19 LostFocus

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.104.20 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.104.21 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.104.22 MouseDrag(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.104.23 MouseUp(x as Integer, y as Integer)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.104.24 Open

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.104.25 Opening

Plugin Version: 13.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.104.26 ScaleFactorChanged(NewFactor as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.104.27 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: Sent when a text view needs to determine if text in a specified range should be changed.
Notes:

affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.

35.104.28 textDidBeginEditing

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: Informs you that the text object has begun editing (that the user has begun changing it).

35.104.29 textDidChange

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: Informs you that the text object has changed its characters or formatting attributes.

35.104.30 textDidEndEditing

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: Informs you that the text object has finished editing (that it has resigned first responder status).

35.104.31 textShouldBeginEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: Invoked when a text object begins to change its text, this method requests permission to begin editing.
Notes: If the delegate returns false, the text object proceeds to make changes. If the delegate returns true, the text object abandons the editing operation. This method is also invoked when the user drags and drops a file onto the text object.

35.104.32 textShouldEndEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: Invoked from a text object's implementation of resignFirstResponder, this method requests permission to end editing.
Notes: If the delegate returns false, the text object proceeds to finish editing and resign first responder status. If the delegate returns true, the text object selects all of its text and remains the first responder.

35.104.33 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 13.4, Platform: macOS, Targets: .

Function: Sent when the selection changes in the text view.

35.105 class NSTextViewMBS

35.105.1 class NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: The cocoa text view class.
Notes:

Like the editfield in Xojo.
Should be placed in a scrollview.

You can embed this view in a CustomNSViewMBS to get more events for mouse and keyboard.
Subclass of the NSTextMBS class.

35.105.8 Methods

35.105.9 alignJustified

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Applies full justification to selected paragraphs (or all text, if the receiver is a plain text object).

35.105.10 breakUndoCoalescing

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Informs the receiver that it should begin coalescing successive typing operations in a new undo grouping.
Notes: This method should be invoked when saving the receiver's contents to preserve proper tracking of unsaved changes and the document's dirty state.

35.105.11 changeAttributes

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Changes the attributes of the current selection.
Notes:

This method changes the attributes by invoking convertAttributes: on sender and applying the returned attributes to the appropriate text. See the NSFontManager class reference for more information on attribute conversion.

Available in Mac OS X v10.3 and later.

35.105.12 changeColor

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the color of the selected text.

35.105.13 changeDocumentBackgroundColor

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: An action method used to set the background color.
Notes:

This method gets the new color by sending a color message to sender.
This will only set the background color if allowsDocumentBackgroundColorChangereturns true.

35.105.14 checkTextInDocument

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Check text in document.
Notes: Available in Mac OS X v10.6 and later.

35.105.15 checkTextInSelection

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Check text in selection.
Notes: Available in Mac OS X v10.6 and later.

35.105.16 complete

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Invokes completion in a text view.
Notes: By default invoked using the Escape key, this method provides users with a choice of completions for the word currently being typed. May be invoked programmatically if autocompletion is desired by a client of the text system. You can change the key invoking this method using the text system's key bindings mechanism; see "Text System Defaults and Key Bindings" for an explanation of the procedure (on Apple website).

35.105.17 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new text view with size 100/100 and position 0/0
Example:

```
dim t as new NSTextViewMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.105.18 Constructor(Handle as Integer) 8540
- 35.105.19 Constructor(left as Double, top as Double, width as Double, height as Double) 8541

35.105.18 Constructor(Handle as Integer)

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given NSTextView handle.
Example:

```
dim t as new NSTextViewMBS(0, 0, 100, 100)
dim v as new NSTextViewMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a NSTextView and the plugin retains this handle.
See also:

- 35.105.17 Constructor 8540
- 35.105.19 Constructor(left as Double, top as Double, width as Double, height as Double) 8541

35.105.19 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacCocoa Plugin, Plugin Version: 7.8, Platform: macOS, Targets: Desktop only.

Function: Creates a new text view with the given size and position.
Example:

```
dim x as new NSTextViewMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.105.17 Constructor 8540
- 35.105.18 Constructor(Handle as Integer) 8540

35.105.20 didChangeText

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Sends out necessary notifications when a text change completes.
Notes:

Invoked automatically at the end of a series of changes, this method posts an NSTextDidChangeNotification to the default notification center, which also results in the delegate receiving an NSText delegate textDidChange message.

Subclasses implementing methods that change their text should invoke this method at the end of those methods. See Subclassing NSTextView for more information.

35.105.21 insertText(attributedString as NSAttributedStringMBS)

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Inserts text into the receiver's text at the insertion point if there is one, otherwise replacing the selection.
Example:

```
dim textView as NSTextViewMBS // your view
dim a as new NSMutableAttributedStringMBS
```

```
if a.initWithString( "Hello World. This is just a little test." ) then

Dim NSFont as NSFontMBS = NSFontMBS.fontWithName("Arial", 24.0)
Dim NSColor as NSColorMBS = NSColorMBS.blueColor
Dim NSRange as NSRangeMBS = NSMakeRangeMBS( 0, 20)
Dim NSAttributes as New Dictionary

NSAttributes.value(NSAttributedStringMBS.NSFontAttributeName) = NSFont
NSAttributes.value(NSAttributedStringMBS.NSForegroundColorAttributeName) = NSColor

a.addAttributes( NSAttributes, NSRange)

textView.insertText a

// replace text with new one:
'textView.textStorage.setAttributedString a

end if
```

Notes:

text: The string to insert. Can be either an string or an NSAttributedStringMBS object.

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the NSInputManager class and NSTextInput protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.
See also:

- 35.105.22 insertText(text as string) 8542

35.105.22 insertText(text as string)

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Inserts text into the receiver's text at the insertion point if there is one, otherwise replacing the selection.
Notes:

text: The string to insert. Can be either an string or an NSAttributedStringMBS object.

The inserted text is assigned the current typing attributes.

This method is the means by which text typed by the user enters an NSTextView. See the NSInputManager class and NSTextInput protocol specifications for more information.

This method is the entry point for inserting text typed by the user and is generally not suitable for other purposes. Programmatic modification of the text is best done by operating on the text storage directly. Because this method pertains to the actions of the user, the text view must be editable for the insertion to work.
See also:

- 35.105.21 insertText(attributedString as NSAttributedStringMBS) 8541

35.105.23 invalidateTextContainerOrigin

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Invalidates the calculated origin of the text container.
Notes: This method is invoked automatically; you should never need to invoke it directly. Usually called because the text view has been resized or the contents of the text container have changed.

35.105.24 loosenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Increases the space between glyphs in the receiver's selection, or in all text if the receiver is a plain text view.
Notes: Kerning values are determined by the point size of the fonts in the selection.

35.105.25 lowerBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Lowers the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
Notes: As such, this method defines a more primitive operation than subscripting.

35.105.26 orderFrontLinkPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate links in the text view.
Notes: Available in Mac OS X v10.4 and later.

35.105.27 orderFrontListPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate text lists in the text view.
Notes: Available in Mac OS X v10.4 and later.

35.105.28 orderFrontSpacingPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate text line heights, interline spacing, and paragraph spacing, in the text view.
Notes: Available in Mac OS X v10.4 and later.

35.105.29 orderFrontSubstitutionsPanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Orders the substitution panel to the front.
Notes: Available on Mac OS X 10.6 or newer.

35.105.30 orderFrontTablePanel

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Brings forward a panel allowing the user to manipulate text tables in the text view.

35.105.31 outline

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Adds the outline attribute to the selected text attributes if absent; removes the attribute if present.
Notes:

If there is a selection and the first character of the selected range has a non-zero stroke width, or if there is no selection and the typing attributes have a non-zero stroke width, then the stroke width is removed; otherwise the value of NSStrokeWidthAttributeName is set to the default value for outline (3.0).

Operates on the selected range if the receiver contains rich text. For plain text the range is the entire contents of the receiver.

35.105.32 pasteAsPlainText

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Inserts the contents of the pasteboard into the receiver's text as plain text.
Notes: This method behaves analogously to insertText.

35.105.33 pasteAsRichText

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: This action method inserts the contents of the pasteboard into the receiver's text as rich text, maintaining its attributes.
Notes: The text is inserted at the insertion point if there is one, otherwise replacing the selection.

35.105.34 performFindPanelAction(FindAction as Integer)

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Performs a find panel action specified by the sender's tag.
Example:

```
const NSFindPanelActionShowFindPanel = 1

dim n as NSTextViewMBS = TextArea1.NSTextViewMBS
n.usesFindPanel = true
n.performFindPanelAction(NSFindPanelActionShowFindPanel)
```

Notes:

This is the generic action method for the find menu and find panel, and can be overridden to implement a

custom find panel.

Possible values:
NSFindPanelActionShowFindPanel = 1
NSFindPanelActionNext = 2
NSFindPanelActionPrevious = 3
NSFindPanelActionReplaceAll = 4
NSFindPanelActionReplace = 5
NSFindPanelActionReplaceAndFind = 6
NSFindPanelActionSetFindString = 7
NSFindPanelActionReplaceAllInSelection = 8
NSFindPanelActionSelectAll = 9
NSFindPanelActionSelectAllInSelection = 10
See also:

- 35.105.35 performFindPanelAction(sender as object) 8546

35.105.35 performFindPanelAction(sender as object)

MBS MacCocoa Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Performs a find panel action specified by the sender.
Notes:

This is the generic action method for the find menu and find panel, and can be overridden to implement a custom find panel.
Sender could be a NSMenuItem or maybe also a NSView.
See also:

- 35.105.34 performFindPanelAction(FindAction as Integer) 8545

35.105.36 raiseBaseline

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Raises the baseline offset of selected text by 1 point, or of all text if the receiver is a plain text view.
Notes: As such, this method defines a more primitive operation than superscripting.

35.105.37 replaceTextContainer(textContainer as NSTextContainerMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Replaces the text container for the group of text system objects containing the receiver, keeping the association between the receiver and its layout manager intact.

Notes: textContainer: The new text container. This method raises NSInvalidArgumentException if TextContainer is nil.

35.105.38 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop only.

Function: Initiates a series of delegate messages (and general notifications) to determine whether modifications can be made to the characters and attributes of the receiver,Äôs text.
Notes:

affectedCharRange: The range of characters affected by the proposed change.
replacementString: The characters that will replace those in affectedCharRange. If only text attributes are being changed, replacementString is "".

Returns true to allow the change, false to prohibit it.

This method checks with the delegate as needed using textShouldBeginEditing and shouldChangeTextInRange.
This method must be invoked at the start of any sequence of user-initiated editing changes. If your subclass of NSTextView implements methods that modify the text, make sure to invoke this method to determine whether the change should be made. If the change is allowed, complete the change by invoking the didChangeText method.

If the receiver is not editable, this method automatically returns false. This result prevents instances in which a text view could be changed by user actions even though it had been set to be non-editable.
In macOS 10.4 and later, if there are multiple selections, this method acts on the first selected subrange.
See also:

- 35.105.103 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean 8566

35.105.39 showFindIndicatorForRange(charRange as NSRangeMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Causes a temporary highlighting effect to appear around the visible portion (or portions) of the specified range.
Notes:

charRange: The character range around which indicators appear.

This method supports lozenge-style indication of find results. The indicators automatically disappear after

a certain period of time, or when the method is called again, or when any of a number of changes occur to the view (such as changes to text, view size, or view position).

This method does not itself scroll the specified range to be visible; any desired scrolling should be done before this method is called, first, because the method acts only on the visible portion of the specified range, and, second, because scrolling causes the indicators to disappear. Calling this method with a zero-length range always removes any existing indicators.

Available in OS X v10.5 and later.

35.105.40 startSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Speaks the selected text, or all text if no selection.

35.105.41 stopSpeaking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Stops the speaking of text.

35.105.42 tightenKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Decreases the space between glyphs in the receiver's selection, or for all glyphs if the receiver is a plain text view.
Notes: Kerning values are determined by the point size of the fonts in the selection.

35.105.43 toggleAutomaticDashSubstitution

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic dash substitution.
Notes: Available on Mac OS X 10.6 or newer.

35.105.44 toggleAutomaticDataDetection

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic data detection.
Notes: Available on Mac OS X 10.6 or newer.

35.105.45 toggleAutomaticLinkDetection

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Changes the state of automatic link detection from enabled to disabled and vice versa.
Notes:

Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Available in Mac OS X v10.5 and later.

35.105.46 toggleAutomaticQuoteSubstitution

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Changes the state of automatic quotation mark substitution from enabled to disabled and vice versa.
Notes:

Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Available in Mac OS X v10.5 and later.

35.105.47 toggleAutomaticSpellingCorrection

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic spelling correction.
Notes: Available on Mac OS X 10.6 or newer.

35.105.48 toggleAutomaticTextReplacement

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Toggles automatic text replacements.
Notes: Available on Mac OS X 10.6 or newer.

35.105.49 toggleBold

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Toggles the use of a bold/non-bold font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch between bold and non bold
textview.toggleBold
```

Notes:

You can set this to continue typing with/without bold or change current selection.
Can only provide bold if the font supports it.

35.105.50 toggleContinuousSpellChecking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Toggles whether continuous spell checking is enabled for the receiver.

35.105.51 toggleGrammarChecking

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Changes the state of grammar checking from enabled to disabled and vice versa.
Notes: Available in Mac OS X v10.5 and later.

35.105.52 toggleItalic

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Toggles the use of an italic/non-italic font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch between italic and non italic
textview.toggleItalic
```

Notes:

You can set this to continue typing with/without bold or change current selection.
Can only provide italic if the font supports it.

35.105.53 toggleSmartInsertDelete

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Changes the state of smart insert and delete from enabled to disabled and vice versa.
Notes:

Controls whether the receiver inserts or deletes space around selected words so as to preserve proper spacing and punctuation.

Available in Mac OS X v10.5 and later.

35.105.54 toggleTraditionalCharacterShape

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Toggles the NSCharacterShapeAttributeName attribute at the current selection.

35.105.55 turnOffKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use nominal glyph spacing for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

35.105.56 turnOffLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use only required ligatures when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

35.105.57 updateDragTypeRegistration

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Updates the acceptable drag types of all text views associated with the receiver's layout manager.
Notes:

If the receiver is editable and is a rich text view, causes all text views associated with the receiver's layout manager to register their acceptable drag types. If the text view isn't editable or isn't rich text, causes those text views to unregister their dragged types.

Subclasses can override this method to change the conditions for registering and unregistering drag types, whether as a group or individually based on the current state of the text view. They should invoke this method when that state changes to perform the necessary update.

35.105.58 updateFontPanel

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Updates the Font panel to contain the font attributes of the selection.
Notes: Does nothing if the receiver doesn't use the Font panel. You should never need to invoke this method directly, but you can override it if needed to handle additional font attributes.

35.105.59 updateRuler

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Updates the ruler view in the receiver's enclosing scroll view to reflect the selection's paragraph and marker attributes.
Notes: Does nothing if the ruler isn't visible or if the receiver doesn't use the ruler. You should never need to invoke this method directly, but you can override this method if needed to handle additional ruler attributes.

35.105.60 useAllLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use all ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

35.105.61 useStandardKerning

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Set the receiver to use pair kerning data for the glyphs in its selection, or for all glyphs if the receiver is a plain text view.

35.105.62 useStandardLigatures

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Sets the receiver to use the standard ligatures available for the fonts and languages used when setting text, for the glyphs in the selection if the receiver is a rich text view, or for all glyphs if it's a plain text view.

35.105.63 Properties

35.105.64 acceptsGlyphInfo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver accepts the glyph info attribute.
Notes:

True if the receiver should accept the NSGlyphInfoAttributeName attribute from text input sources such as input methods and the pasteboard, false otherwise.
(Read and Write property)

35.105.65 allowsDocumentBackgroundColorChange as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Sets whether the receiver allows its background color to change.
Notes:

This corresponds to the background color of the entirety of the text view, not just to a selected range of text.
(Read and Write property)

35.105.66 allowsImageEditing as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether image attachments should permit editing of their images.
Notes:

True if image editing is allowed; otherwise, false.

For image editing to be allowed, the text view must be editable and the text attachment cell must support image editing.

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.105.67 allowsUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether undo support is enabled.
Notes: (Read and Write property)

35.105.68 AutomaticDashSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic dash substitution is enabled.
Example:

```
Sub CellGotFocus(row as Integer, column as Integer) Handles CellGotFocus
// disable dash subsitution for current cell
Dim v As Variant = Me.ActiveCell
if v isa TextArea then
Dim t As TextArea = v
Dim n As NSTextViewMBS = t.NSTextViewMBS
n.AutomaticDashSubstitutionEnabled = False
End If
End
```

Notes:

Turning on automatic dash substitution enables automatic conversion of sequences of ASCII hyphen (-) characters to typographic dashes.
Available in Mac OS X v10.6 and later.
(Read and Write property)

35.105.69 AutomaticDataDetectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic data detection is enabled.
Notes:

Automatic data detection enables detection of dates, addresses, and phone numbers.
Available in Mac OS X v10.6 and later.
(Read and Write property)

35.105.70 AutomaticLinkDetectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Enables or disables automatic link detection.
Notes:

If true, automatic link detection is enabled; if false, it is disabled.

Automatic link detection causes strings representing URLs typed in the view to be automatically made into links to those URLs.

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.105.71 AutomaticQuoteSubstitutionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether automatic quotation mark substitution is enabled.
Notes:

True if automatic quotation mark substitution is enabled; otherwise, false.

Automatic quote substitution causes ASCII quotation marks and apostrophes to be automatically replaced, on a context-dependent basis, with more typographically accurate symbols.

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.105.72 AutomaticSpellingCorrectionEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic spelling correction is enabled.
Notes:

Available in Mac OS X v10.6 and later.
(Read and Write property)

35.105.73 AutomaticTextReplacementEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether automatic text replacement is enabled.
Notes:

Turning on automatic text replacement enables automatic substitution of a variety of static text items based on user preferences.
Available in Mac OS X v10.6 and later.
(Read and Write property)

35.105.74 backgroundColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes: (Read and Write property)

35.105.75 Bold as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether the current typing uses a bold font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS

// switch to bold font
textview.Bold = true
```

Notes:

You can set this to continue typing with/without bold or change current selection.
Can only provide bold if the font supports it.
(Read and Write property)

35.105.76 ContinuousSpellCheckingEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver has continuous spell checking enabled.
Notes:

True if the receiver has continuous spell checking enabled, otherwise, false.

See Textarea.WinSpellcheckingMBS property for Windows.
(Read and Write property)

35.105.77 defaultParagraphStyle as Variant

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets or sets the receiver's default paragraph style.
Example:

```
Dim n As NSTextViewMBS = TextArea1.NSTextViewMBS
Dim a As NSTextStorageMBS = n.textStorage

// get first paragraph style
Dim m As New NSMutableParagraphStyleMBS

// get old tab stops
Dim tabs() As NSTextTabMBS

For i As Integer = 0 To 11
```

```
Dim options As New Dictionary
Dim neu As New NSTextTabMBS(n.NSLeftTextAlignment, i * 50.0, options)
tabs.append neu
next

m.setTabStops tabs

// change for current text
a.addAttribute(a.NSParagraphStyleAttributeName, m, New NSRangeMBS(0, a.Length))

// and for future text
n.defaultParagraphStyle = m
```

Notes:

Use with NSParagraphStyleMBS class.
(Read and Write property)

35.105.78 displaysLinkToolTips as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the text view automatically supplies the destination of a link as a tooltip for text that has a link attribute.
Notes:

True if link tooltips are automatically displayed; otherwise, false.

The default value for this feature is true; clients who do not wish tooltips to be displayed automatically must explicitly disable it.

Available in Mac OS X v10.5 and later.
(Read and Write property)

35.105.79 enabledTextCheckingTypes as Int64

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The default text checking types.
Notes:

Available in Mac OS X v10.6 and later.

Can be NSTextCheckingAllSystemTypes (& hffffffff) or NSTextCheckingAllCustomTypes (& hffffffff00000000) or NSTextCheckingAllTypes (& hffffffffffffffff).
(Read and Write property)

35.105.80 GrammarCheckingEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Whether or not grammar checking is enabled.
Notes:

Available on Mac OS X 10.5 or newer.
If grammar checking is enabled, then it is performed alongside spell checking, whenever the text view checks spelling, whether continuously or manually.
(Read and Write property)

35.105.81 insertionPointColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The color used to draw the insertion point.
Notes: (Read and Write property)

35.105.82 isCoalescingUndo as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns whether undo coalescing is in progress.
Notes:

True if undo coalescing is in progress, otherwise false.
Available in OS X v10.6 and later.
(Read only property)

35.105.83 Italic as Boolean

MBS MacCocoa Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop only.

Function: Whether the current typing uses a italic font.
Example:

```
// some textview
dim textview as NSTextView = TextArea1.NSTextViewMBS
```

```
// switch to italic font
textview.Italic = true
```

Notes:

You can set this to continue typing with/without italic or change current selection.
Can only provide italic if the font supports it.
(Read and Write property)

35.105.84 layoutManager as NSLayoutManagerMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Returns the layout manager that lays out text for the receiver's text container.
Notes:

The layout manager that lays out text for the receiver's text container, or nil if there's no such object, such as when a text view isn't linked into a group of text objects.
(Read only property)

35.105.85 linkTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets and sets the attributes used to draw the onscreen presentation of link text.
Notes:

A dictionary of attributes corresponding to the onscreen presentation of link text.

Link text attributes are applied as temporary attributes to any text with a link attribute. Candidates include those attributes that do not affect layout.

In applications created prior to OS X v10.3, the default value is an empty dictionary. In applications created with OS X v10.3 or greater, the default attributes specify blue text with a single underline and the pointing hand cursor.
(Read and Write property)

35.105.86 markedTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets or sets the attributes used to draw marked text.
Notes:

A dictionary of attributes used to draw marked text. Text color, background color, and underline are the only supported attributes for marked text.
(Read and Write property)

35.105.87 RTFData as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Get or set the textview content as RTF data.
Notes:

Works only for Cocoa and uses RTF parser/generator from Apple.

See also RTFDataMBS in StyledText, RTFDataMBS and WinRTFDataMBS in TextArea and Desktop-TextArea controls.
(Read and Write property)

35.105.88 RulerVisible as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler.
Notes:

True if the scroll view enclosing the text views sharing the receiver's layout manager shows its ruler, false otherwise. The default is false.
(Read and Write property)

35.105.89 selectedTextAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Gets or sets the attributes used to indicate the selection.
Example:

```
// underline selected text in TextArea1

dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
dim s as NSTextStorageMBS = t.textStorage
```

```
dim d as Dictionary = t.selectedTextAttributes
d.Value(NSAttributedStringMBS.NSStrikethroughStyleAttributeName) = s.NSUnderlineStyleSingle
t.selectedTextAttributes = d
```

Notes:

A dictionary of attributes used to indicate the selection. Text color, background color, and underline are the only supported attributes for selected text.
(Read and Write property)

35.105.90 smartInsertDeleteEnabled as boolean

MBS MacCocoa Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop only.

Function: Whether the view inserts or deletes space around selected words so as to preserve proper spacing and punctuation.
Notes: (Read and Write property)

35.105.91 spellCheckerDocumentTag as Integer

MBS MacCocoa Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a tag identifying the text view's text as a document for the spell checker server.
Notes:

The document tag is obtained by sending a uniqueSpellDocumentTag message to the spell server the first time this method is invoked for a particular group of text views. See the NSSpellChecker and NSSpellServer class specifications for more information on how this tag is used.
(Read only property)

35.105.92 textContainer as NSTextContainerMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: The text container.
Notes:

The receiver uses the layout manager and text storage of aTextContainer.

Special Considerations
This method is invoked automatically when you create a text view; you should never invoke it directly, but might want to override it. To change the text view for an established group of text system objects, use

TextView setter on the text container. To replace the text container for a text view and maintain the view's association with the existing layout manager and text storage, use replaceTextContainer.
(Read and Write property)

35.105.93 textContainerInset as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: The empty space the receiver leaves around its text container.
Example:

```
dim n as NSTextViewMBS = TextArea1.NSTextViewMBS

n.textContainerInset = NSMakeSizeMBS(-3,0)
```

Notes:

It is possible to set the text container and view sizes and resizing behavior so that the inset cannot be maintained exactly, although the text system tries to maintain the inset wherever possible. In any case, the textContainerOrigin and size of the text container are authoritative as to the location of the text container within the view.

The text itself can have an additional inset, inside the text container, specified by the setLineFragmentPadding method of NSTextContainer.
(Read and Write property)

35.105.94 textContainerOrigin as NSPointMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Returns the origin of the receiver's text container.
Notes:

The origin of the receiver's text container, which is calculated from the receiver's bounds rectangle, container inset, and the container's used rect.
(Read only property)

35.105.95 textStorage as NSTextStorageMBS

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's text storage object.

Example:

```
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: (Read only property)

35.105.96 typingAttributes as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Get or set typing attributes.
Notes:

Typing attributes are reset automatically whenever the selection changes. However, if you add any user actions that change text attributes, the action should use this method to apply those attributes afterwards. User actions that change attributes should always set the typing attributes because there might not be a subsequent change in selection before the next typing.
(Read and Write property)

35.105.97 usesFindBar as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop only.

Function: A Boolean value that indicates whether to use the find bar for this text view.
Notes:

The value of this property is true if the find bar is used for this text view; otherwise false.
See NSTextFinderMBS class for information about the find bar.
A text view can use either a find panel or a find bar. If usesFindBar is set to true, usesFindPanel is set to false and vice versa.
(Read and Write property)

35.105.98 usesFindPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the receiver allows for a find panel.
Notes: (Read and Write property)

35.105.99 usesFontPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Controls whether the text views sharing the receiver's layout manager use the Font panel and Font menu.
Notes: (Read and Write property)

35.105.100 usesInspectorBar as Boolean

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Whether this text view uses the inspector bar.
Example:

```
dim t as NSTextViewMBS = textarea1.NSTextViewMBS
t.usesInspectorBar = true
```

Notes:

Available in OS X v10.7 and later.
(Read and Write property)

35.105.101 usesRuler as boolean

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: Whether the text views sharing the receiver's layout manager use a ruler.
Notes:

True to cause text views sharing the receiver's layout manager to respond to NSRulerView client messages and to paragraph-related menu actions, and update the ruler (when visible) as the selection changes with its paragraph and tab attributes, otherwise false.

Text views must use a ruler to respond to Format menu commands. If a set of text views don't use the ruler, the ruler is hidden, and the text views disallow paragraph attribute changes. By default, text view objects use the ruler.
(Read and Write property)

35.105.102 Events

35.105.103 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 10.1, Platform: macOS, Targets: .

Function: Sent when a text view needs to determine if text in a specified range should be changed.
Notes:

affectedCharRange: The range of characters to be replaced.
replacementString: The characters that will replace the characters in affectedCharRange; nil if only text attributes are being changed.

Return true to allow the replacement, or false to reject the change.
See also:

- 35.105.38 shouldChangeTextInRange(affectedCharRange as NSRangeMBS, replacementString as string = "") as Boolean 8547

35.105.104 textViewDidChangeSelection

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: .

Function: Sent when the selection changes in the text view.

35.105.105 Constants

35.105.106 NSFindPanelSubstringMatchTypeContains=0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word containing the search string.
Available in Mac OS X v10.5 and later.

35.105.107 NSFindPanelSubstringMatchTypeEndsWith=3

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word ending with the search string.
Available in Mac OS X v10.5 and later.

35.105.108 NSFindPanelSubstringMatchTypeFullWord=2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word exactly matching the search string.
Available in Mac OS X v10.5 and later.

35.105.109 NSFindPanelSubstringMatchTypeStartsWith=1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the type of substring matching used by the Find panel.
Notes:

Finds a word starting with the search string.
Available in Mac OS X v10.5 and later.

35.105.110 NSSelectByCharacter=0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify how much the text view extends the selection when the user drags the mouse.
Notes: Extends the selection character by character.

35.105.111 NSSelectByParagraph=2

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify how much the text view extends the selection when the user drags the mouse.
Notes: Extends the selection paragraph by paragraph.

35.105.112 NSSelectByWord=1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify how much the text view extends the selection when the user drags the mouse.
Notes: Extends the selection word by word.

35.105.113 NSSelectionAffinityDownstream=1

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the preferred direction of selection.
Notes: The selection is moving toward the bottom of the document.

35.105.114 NSSelectionAffinityUpstream=0

MBS MacCocoa Plugin, Plugin Version: 9.6.

Function: One of the constants to specify the preferred direction of selection.
Notes: The selection is moving toward the top of the document.

35.106 control NSTokenFieldControlMBS

35.106.1 control NSTokenFieldControlMBS

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The control to host a NSTokenField.

35.106.2 Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- New desktop controls
- MBS Xojo Plugins, version 21.4pr1

35.106.4 Properties

35.106.5 View as NSTokenFieldMBS

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: Desktop only.

Function: The view used for the control.
Notes: (Read only property)

35.106.6 Events

35.106.7 BoundsChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the bounds, but not the frame, changed.

35.106.8 Close

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In Xojo version 2021r3 and newer this event is named Closing.

35.106.9 Closing

Plugin Version: 15.4, Platform: macOS, Targets: .

Function:

The control is about to close.
In older Xojo versions, this event is named Close.

35.106.10 completionsForSubstring(substring as string, tokenIndex as Integer, byref selectedIndex as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to provide an array of appropriate completions for the contents of the receiver.
Notes:

substring: The partial string that is to be completed.
tokenIndex: The index of the token being edited.
selectedIndex: Optionally, you can return by-reference an index into the returned array that specifies which of the completions should be initially selected. If none are to be selected, return by reference -1.

Returns an array of strings that are possible completions.

If the delegate does not implement this method, no completions are provided.
Available in OS X v10.4 and later.

35.106.11 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.106.12 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.106.13 displayStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to provide a string to be displayed as a proxy for the given represented object.
Notes:

representedObject: A represented object of the token field.

Returns the string to be used as a proxy for representedObject. If you return nil or do not implement this method, then representedObject is displayed as the string.

35.106.14 editingStringForRepresentedObject(representedObject as Variant) as string

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to provide a string to be edited as a proxy for a represented object.
Notes:

representedObject: A represented object of the token field.

Returns a string that's an editable proxy of the represented object, or nil if the token should not be editable.

35.106.15 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

35.106.16 FocusLost

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In older Xojo versions, this event is named LostFocus.
Notes: This only fires if the control itself lost focus and not a sub control.

35.106.17 FocusReceived

Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In older Xojo versions, this event is named GotFocus.
Notes: This only fires if the control itself got focus and not a sub control.

35.106.18 FrameChanged

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event called when the frame changed.
Notes: This event notifies you, that the control changed it's bounding frame, which is position and/or size.

35.106.19 GotFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control itself got focus.
In Xojo version 2021r3 and newer this event is named FocusReceived.
Notes: This only fires if the control itself got focus and not a sub control.

35.106.20 hasMenuForRepresentedObject(representedObject as Variant) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to specify whether the given represented object provides a menu.
Notes:

representedObject: A represented object of the token field.

Returns true if the represented object has a menu, false otherwise.
By default tokens in a token field have no menus.

35.106.21 LostFocus

MBS MacControls Plugin, Plugin Version: 16.5, Platform: macOS, Targets: .

Function:

The control lost focus.
In Xojo version 2021r3 and newer this event is named FocusLost.
Notes: This only fires if the control itself lost focus and not a sub control.

35.106.22 MenuBarSelected

Plugin Version: 17.1, Platform: macOS, Targets: .

Function:

The event where you can enable menu items.
In older Xojo versions, this event is named EnableMenuItems.

35.106.23 menuForRepresentedObject(representedObject as Variant) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to provide a menu for the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the menu associated with the represented object.
By default tokens in a token field do not return menus.

35.106.24 MouseDown(x as Integer, y as Integer, Modifiers as Integer) As Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was pressed inside the control,Äôs region at the location passed in to x, y.
Notes:

The coordinates x and y are local to the control, i.e. they represent the position of the mouse click relative to the upper-left corner or the Control.
Return True if you are going to handle the MouseDown. In such a case:

- The Action event, if any, will not execute and the state of the object will not change.
- You will receive the MouseDrag and MouseUp events.

If you return False, the system handles the MouseDown so the above event handlers do not get called.

35.106.25 MouseDrag(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: This event fires continuously after the mouse button was pressed inside the Control.
Notes:

Mouse location is local to the control passed in to x, y.
As this event is fired continuously (hundreds of time per second), it is your responsibility to determine if the mouse has really moved.

35.106.26 MouseUp(x as Integer, y as Integer)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The mouse button was released.
Notes: Use the x and y parameters to determine if the mouse button was released within the control's boundaries.

35.106.27 Open

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In Xojo version 2021r3 and newer this event is named Opening.

35.106.28 Opening

Plugin Version: 15.4, Platform: macOS, Targets: .

Function:

The control is about to was created and you can initialize it.
In older Xojo versions, this event is named Open.

35.106.29 readFromPasteboard(pboard as NSPasteboardMBS) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to return an array of objects representing the data read from the specified pasteboard.
Notes:

pboard: The pasteboard from which to read the represented objects.

Returns an array of represented objects created from the pasteboard data.

35.106.30 representedObjectForEditingString(editingString as string) as Variant

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to provide a represented object for the given editing string.
Notes:

editingString: The edited string representation of a represented object.

Returns a represented object that is displayed rather than the editing string.

Note: In OS X v10.4, NSTokenField trims whitespace around tokens but it does not trim whitespace in OS X versions 10.5.0 and 10.5.1. In OS X v10.5.2, you get whitespace-trimming behavior by either linking against the v10.4 binary or linking against the v10.5 binary and not implementing the this method. If you do not want the whitespace-trimming behavior, link against the v10.5 binary and implement this method, returning the editing string if you have no represented object.

35.106.31 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.106.32 shouldAddObjects(tokens() as Variant, index as Integer) as Variant()

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows to validate the tokens to be added to the receiver at a particular location.
Notes:

tokens: An array of tokens to be inserted in the receiver at index.
index: The index of the receiver in which the array of tokens to be validated (tokens) will be inserted.

Returns an array of validated tokens.

The event can return the array unchanged or return a modified array of tokens. To reject the add completely, return an empty array. Returning nil causes an error.

35.106.33 styleForRepresentedObject(representedObject as Variant) as Integer

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Allows the delegate to return the token style for editing the specified represented object.
Notes:

representedObject: A represented object of the token field.

Returns the style that should be used to display the representedObject. Possible values are shown in NSTokenStyle Values.

If the event implements this method and returns an NSTokenStyle that differs from the style set by setTokenStyle:, the value the event returns is preferred.

If you don't implement this method, the token field's tokenStyle is used.

35.106.34 TextDidBeginEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Sent when a control with editable text begins an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidBeginEditingNotification.

This event is invoked when the user begins editing text in a control such as a text field or a form field. The control posts a NSControlTextDidBeginEditingNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is also delivered for inspection.

See TextDidEndEditing for an explanation of why you may not always get one invocation of TextDidBeginEditing for each invocation of TextDidEndEditing.

35.106.35 TextDidChange(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Sent when the text in the receiving control changes.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidChangeNotification.

This event is invoked when text in a control such as a text field or form changes. The control posts a NSControlTextDidChangeNotification notification, and if the control's subclass implements this event, it is automatically registered to receive the notification. The field editor is provided as parameter for inspection.

35.106.36 TextDidEndEditing(fieldEditor as NSTextMBS, notification as NSNotificationMBS)

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Sent when a control with editable text ends an editing session.
Notes:

Notification: The notification object. The name of the notification is always NSControlTextDidEndEditingNotification.

This event is invoked when the user stops editing text in a control such as a text field or form. The control posts a NSControlTextDidEndEditingNotification notification, and if the control' subclass implements this event, it is automatically registered to receive the notification. The field editor is also provided for inspection.

Warning: In some cases, such as when editing within an instance of NSOutlineView, this method may be invoked without a previous invocation of TextDidBeginEditing. You will only get the TextDidBeginEditing: notification if the user actually types something, but you can get the TextDidEndEditing notification if the user just double-clicks the field and then clicks outside the field, without typing.

35.106.37 textShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes:

Return true to allow text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.106.38 textShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes:

Return true to allow end of text editing or false to deny.
Be aware that an event in Xojo without return will cause false to be returned.

35.106.39 tokenFieldAction

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: The control's action was triggered.
Notes: For a button if it was pressed.

35.106.40 tokenFieldTextShouldBeginEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: The event called to decide whether text editing should be allowed.
Notes: Return true to allow text editing.

35.106.41 tokenFieldTextShouldEndEditing(fieldEditor as NSTextMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: The event called to decide whether ending text editing should be allowed.
Notes: Return true to allow text editing.

35.106.42 writeRepresentedObjects(objects() as Variant, pboard as NSPasteboardMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.4, Platform: macOS, Targets: .

Function: Sent so the delegate can write represented objects to the pasteboard corresponding to a given array of display strings.
Notes:

objects: An array of represented objects associated with the token field.
pboard: The pasteboard to which to write the represented objects.

Return true if you writes the represented objects to the pasteboard, false otherwise. If false, the token field writes the display strings to the NSStringPboardType pasteboard.

35.107 control NSViewControlMBS

35.107.1 control NSViewControlMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The control to host a generic NSView.

35.107.2 Blog Entries

- MBS Xojo Plugins, version 20.5pr6
- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.2
- MBS Xojo / Real Studio Plugins, version 15.0pr10

35.107.3 Blog Entries

- MBS Xojo Plugins, version 20.5pr6
- MonkeyBread Software Releases the MBS Xojo Plugins in version 18.2
- MBS Xojo / Real Studio Plugins, version 15.0pr10

35.107.4 Properties

35.107.5 View as NSViewMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop only.

Function: The view used in the control.
Notes:

Use this object to set more options on the control.
(Read only property)

35.107.6 Events

35.107.7 acceptsFirstMouse(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Overridden by subclasses to return true if the receiver should be sent a mouseDown event for an initial mouse-down event, false if not.
Notes:

The receiver can either return a value unconditionally or use the location of event e to determine whether or not it wants the event. The default implementation ignores the event and returns false.

Implement this event in a subclass to allow instances to respond to click-through. This allows the user to click on a view in an inactive window, activating the view with one click, instead of clicking first to make the window active and then clicking the view. Most view objects refuse a click-through attempt, so the event simply activates the window. Many control objects, however, such as instances of NSButton and NSSlider, do accept them, so the user can immediately manipulate the control without having to release the mouse button.

35.107.8 acceptsFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Whether to accept first responder.
Notes: Return true if your control can have the focus and false if not.

35.107.9 becomeFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Called when the object gets focus.
Notes: Return true to accept.

35.107.10 beginGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a touch gesture.
Notes:

e: An event object representing the gesture beginning.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

35.107.11 canBecomeKeyView as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Returns whether the receiver can become key view.
Notes: Returns true if the receiver can become key view, false otherwise.

35.107.12 Close

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The control is about to close.

35.107.13 Closed

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The event called when the custom view is destroyed.
Notes: Renamed to Closed in plugin version 20.5. Used to be named Close.

35.107.14 concludeDragOperation(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the dragging operation is complete, signaling the receiver to perform any necessary clean-up.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

For this method to be invoked, the previous performDragOperation must have returned true.

The destination implements this method to perform any tidying up that it needs to do, such as updating its visual representation now that it has incorporated the dragged data. This message is the last message sent from sender to the destination during a dragging session.

If the sender object's animatesToDestination property was set to true in prepareForDragOperation, then the drag image is still visible. At this point you should draw the final visual representation in the view. When this method returns, the drag image is removed form the screen. If your final visual representation matches the visual representation in the drag, this is a seamless transition.

35.107.15 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS MacControls Plugin, Plugin Version: 22.1, Platform: macOS, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

35.107.16 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

35.107.17 draggingEnded(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Implement this event to be notified when a drag operation ends in some other destination.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

This method might be used by a destination doing auto-expansion in order to collapse any auto-expands.

35.107.18 draggingEntered(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the dragged image enters destination bounds or frame; delegate returns dragging operation to perform.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NSDraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

Invoked when a dragged image enters the destination but only if the destination has registered for the pasteboard data type involved in the drag operation. Specifically, this method is invoked when the mouse pointer

enters the destination's bounds rectangle (if it is a view object) or its frame rectangle (if it is a window object).

This method must return a value that indicates which dragging operation the destination will perform when the image is released. In deciding which dragging operation to return, the method should evaluate the overlap between both the dragging operations allowed by the source (obtained from sender with the draggingSourceOperationMask method) and the dragging operations and pasteboard data types the destination itself supports.

If none of the operations is appropriate, this method should return NSDragOperationNone (this is the default response if the method is not implemented by the destination). A destination will still receive draggingUpdated and draggingExited even if NSDragOperationNone is returned by this method.

35.107.19 draggingExited(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the dragged image exits the destination's bounds rectangle (in the case of a view object) or its frame rectangle (in the case of a window object).
Notes: sender: The object sending the message; use it to get details about the dragging operation.

35.107.20 draggingSessionEndedAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS, operation as Integer)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the dragging session has completed.
Notes:

session: The dragging session.
screenPoint: The point where the drag ended, in screen coordinates.
operation: The drag operation. See constants for drag operation types.

Available in OS X v10.7 and later.

35.107.21 draggingSessionMovedToPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the drag moves on the screen.
Notes:

session: The dragging session.
screenPoint: The point where the drag moved to, in screen coordinates.

Available in OS X v10.7 and later.

35.107.22 draggingSessionSourceOperationMaskForDraggingContext(session as NSDraggingSessionMBS, context as Integer) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Declares the types of operations the source allows to be performed. (required)
Notes:

session: The dragging session.
context: The dragging context. See NSDraggingContext constants for the supported values.

Return the appropriate dragging operation as defined in constants.

In the future Apple may provide more specific "within" values in the future. To account for this, for unrecognized localities, return the operation mask for the most specific context that you are concerned with.

35.107.23 draggingSessionWillBeginAtPoint(session as NSDraggingSessionMBS, screenPoint as NSPointMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the drag will begin.
Notes:

session: The dragging session.
screenPoint: The point where the drag will begin, in screen coordinates.

Available in OS X v10.7 and later.

35.107.24 draggingUpdated(sender as NSDraggingInfoMBS) as Integer

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked periodically as the image is held within the destination area, allowing modification of the dragging operation or mouse-pointer position.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return one (and only one) of the dragging operation constants described in NSDragOperation in the NS-DraggingInfo reference. The default return value (if this method is not implemented by the destination) is the value returned by the previous draggingEntered message.

For this to be invoked, the destination must have registered for the pasteboard data type involved in the drag operation. The messages continue until the image is either released or dragged out of the window or view.

This method provides the destination with an opportunity to modify the dragging operation depending on the position of the mouse pointer inside of the destination view or window object. For example, you may have several graphics or areas of text contained within the same view and wish to tailor the dragging operation, or to ignore the drag event completely, depending upon which object is underneath the mouse pointer at the time when the user releases the dragged image and the performDragOperation method is invoked.

You typically examine the contents of the pasteboard in the draggingEntered method, where this examination is performed only once, rather than in the draggingUpdated method, which is invoked multiple times.

Only one destination at a time receives a sequence of draggingUpdated messages. If the mouse pointer is within the bounds of two overlapping views that are both valid destinations, the uppermost view receives these messages until the image is either released or dragged out.

35.107.25 drawFocusRingMask(g as NSGraphicsMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Draw the focus ring mask for the view.
Notes:

If false is returned, the default method from NSView class runs.

This method provides the shape of the focus ring mask by drawing the focus ring mask. An implementation of this method should draw in the view's interior (bounds) coordinate space, that the focus ring style has been set (it will be set it to NSFocusRingOnly to capture the focus ring itself), and that the fill and stroke colors have been set to an arbitrary fully opaque color.

Subclasses that find the default behavior insufficient should only draw the focus ring shape.

The NSView default implementation of this method simply fills self.bounds.
Available in Mac OS X v10.7 and later.

Please use NSGraphicsMBS class for drawing.

35.107.26 DrawRect(g as NSGraphicsMBS, left as Double, top as Double, width as Double, height as Double)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The paint event with the rectangle which needs to be redrawn.

35.107.27 EnableMenuItems

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The event where you can enable menu items.

35.107.28 endGestureWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Informs the receiver that the user has ended a touch gesture.
Notes:

e: An event object representing the gesture end.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

35.107.29 focusRingMaskBounds as NSRectMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Returns the focus ring mask bounds.
Notes:

Return nil to run default NSView method.

Return a rectangle containing the mask in the view's interior (bounds) coordinate space.

The mask bounds allows the focus ring's overall size and position to be determined before it is drawn.
Subclasses must override this method if they require the display of a focus ring.
The NSView default implementation of this method simply returns NSRectMBS.Zero.

Note: The information provided by focusRingMaskBounds will enable Accessibility to identify selected subelements for zoom tracking, so it is important that this method provide a reasonably tight bounding box and that noteFocusRingMaskChanged is invoked as described.

35.107.30 ignoreModifierKeysForDraggingSession(session as NSDraggingSession-MBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Returns whether the modifier keys will be ignored for this dragging session.
Notes:

session: The dragging session.

Return true if the modifier keys will be ignored, false otherwise.
Available in OS X v10.7 and later.

35.107.31 isOpaque as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Whether this view is opaque.

35.107.32 keyDown(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

35.107.33 keyUp(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the key events.
Notes:

Return true if you handled this event.
Please return true in becomeFirstResponder and acceptsFirstResponder, so your nsview can become first responder and receive key events.

35.107.34 magnifyWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a pinch gesture.
Notes:

e: An event object representing the magnify gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

35.107.35 menuForEvent(e as NSEventMBS, defaultMenu as NSMenuMBS) as NSMenuMBS

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Overridden by subclasses to return a context-sensitive pop-up menu for a given mouse-down event.
Notes:

theEvent: An object representing a mouse-down event.
defaultMenu: The menu as constructed by super class.

The receiver can use information in the mouse event, such as its location over a particular element of the receiver, to determine what kind of menu to return. For example, a text object might display a text-editing menu when the cursor lies over text and a menu for changing graphics attributes when the cursor lies over an embedded image.

The default implementation returns the default menu.

35.107.36 mouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.37 mouseDownCanMoveWindow as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: This event is called so you can decide what happens with mouse down.
Notes:

Return true if you do not need to handle a mouse down and it can pass through to superviews; False if you need to handle the mouse down.

This allows iApp-type applications to determine the region by which a window can be moved. By default, this method returns false if the view is opaque; otherwise, it returns true. Subclasses can override this method to return a different value.

35.107.38 mouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.39 mouseEntered(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.40 mouseExited(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.41 mouseMoved(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.

Notes: Return true if you handled this event.

35.107.42 mouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.43 Open

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The control is about to was created and you can initialize it.

35.107.44 Opened

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: The event called when the custom NSView is created.
Notes: Renamed to Opened in plugin version 20.5. Used to be named Open.

35.107.45 otherMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

35.107.46 otherMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

35.107.47 otherMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes:

Return true if you handled this event.
Third mouse button.

35.107.48 performDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked after the released image has been removed from the screen, signaling the receiver to import the pasteboard data.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.

Return if the destination accepts the data, it returns true; otherwise it returns false. The default is to return false.

For this method to be invoked, the previous prepareForDragOperation message must have returned true. The destination should implement this method to do the real work of importing the pasteboard data represented by the image.

If the sender object's animatesToDestination was set to true in prepareForDragOperation, then setup any animation to arrange space for the drag items to animate to. Also at this time, enumerate through the dragging items to set their destination frames and destination images.

35.107.49 prepareForDragOperation(sender as NSDraggingInfoMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the image is released, allowing the receiver to agree to or refuse drag operation.
Notes:

sender: The object sending the message; use it to get details about the dragging operation.
Returns true if the receiver agrees to perform the drag operation and false if not.
This method is invoked only if the most recent draggingEntered or draggingUpdated message returned an acceptable drag-operation value.
If you want the drag items to animate from their current location on screen to their final location in your view, set the sender object's animatesToDestination property to true in your implementation of this method.

35.107.50 pressureChange(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.1, Platform: macOS, Targets: .

Function: Informs the current object that a pressure change occurred on a system that supports pressure sensitivity.
Notes:

This method is invoked automatically in response to user actions. event is the event that initiated the change in pressure.
Available in OS X v10.10.3 and later.

35.107.51 resignFirstResponder as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Focus is going away.
Notes: Return true to accept.

35.107.52 rightMouseDown(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.53 rightMouseDragged(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.54 rightMouseUp(e as NSEventMBS, x as Double, y as Double) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: One of the mouse events.
Notes: Return true if you handled this event.

35.107.55 rotateWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a rotation gesture.
Notes:

e: An event object representing the rotate gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

35.107.56 ScaleFactorChanged(NewFactor as Double)

MBS MacControls Plugin, Plugin Version: 17.1, Platform: macOS, Targets: .

Function: The backing store scale factor has changed.
Notes: Please invalidate any cached bitmaps or other relevant state.

35.107.57 scrollWheel(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Informs the subclass that the mouse's scroll wheel has moved.
Notes:

e: An object encapsulating information about the wheel-scrolling event.

The default implementation simply passes this message to the next responder.
Return true to not pass the event.

35.107.58 swipeWithEvent(e as NSEventMBS) as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Informs the receiver that the user has begun a swipe gesture.
Notes:

e: An event object representing the swipe gesture.
The event will be sent to the view under the touch in the key window.
Available in Mac OS X v10.6 and later.
Return true if you handled this event.

35.107.59 updateDraggingItemsForDrag(sender as NSDraggingInfoMBS)

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Invoked when the dragging images should be changed.
Notes:

sender: The object sending the message; use this object to get details about the dragging operation.

While a destination may change the dragging images at any time, it is recommended to wait until this method is called before updating the dragging images.

This allows the system to delay changing the dragging images until it is likely that the user will drop on this destination. Otherwise, the dragging images will change too often during the drag which would be distracting to the user.

35.107.60 viewDidMoveToWindow

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Informs the receiver that it has been added to a new view hierarchy.
Notes:

The default implementation does nothing; subclasses can implement this event to perform whatever actions are necessary.

window may return nil when this method is invoked, indicating that the receiver does not currently reside in any window. This occurs when the receiver has just been removed from its superview or when the receiver has just been added to a superview that does not itself have a window. Overrides of this method may choose to ignore such cases if they are not of interest.

35.107.61 wantsPeriodicDraggingUpdates as boolean

MBS MacControls Plugin, Plugin Version: 15.0, Platform: macOS, Targets: .

Function: Asks the destination object whether it wants to receive periodic draggingUpdated messages.
Notes:

Return true if the destination wants to receive periodic draggingUpdated messages, false otherwise.

If the destination returns false, these messages are sent only when the mouse moves or a modifier flag changes. Otherwise the destination gets the default behavior, where it receives periodic dragging-updated messages even if nothing changes.

35.108 class PopupMenu

35.108.1 class PopupMenu

Platform: macOS, Targets: Desktop only.

Function: Gives access to the NSMenuMBS of the PopupMenu.

35.108.2 Methods

35.108.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox PopupMenu1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.108.4 NSPopUpButtonMBS as NSPopUpButtonMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSPopUpButtonMBS object for the given control.
Example:

```
// get cocoa view for the popupmenu
dim p as NSPopUpButtonMBS = PopupMenu1.NSPopUpButtonMBS

// find a menu entry
dim it as NSMenuItemMBS = p.itemAtIndex(0)

// get a picture
dim pic as Picture = LogoMBS(500)
dim img as new NSImageMBS(pic)
img.setSize 16,16

// and assign icon
it.image = img
```

Notes: This way you can manipulate Cocoa controls directly.

35.109 class ProgressWheel

35.109.1 class ProgressWheel

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in ProgressWheel class in Xojo.

35.109.2 Methods

35.109.3 NSProgressIndicatorMBS as NSProgressIndicatorMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSProgressIndicatorMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.110 class PushButton

35.110.1 class PushButton

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in Button class in Xojo.

35.110.2 Methods

35.110.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox PushButton1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.111 class Radiobutton

35.111.1 class Radiobutton

Plugin Version: 2.9, Platform: macOS, Targets: Desktop only.

Function: An extension of Xojo's internal control.

35.111.2 Methods

35.111.3 NSButtonMBS as NSButtonMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSButtonMBS object for the given control.
Example:

MsgBox RadioButton1.NSButtonMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.112 class ScrollBar

35.112.1 class ScrollBar

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in Scrollbar class in Xojo.

35.112.2 Methods

35.112.3 NSScrollerMBS as NSScrollerMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollerMBS object for the given control.
Example:

MsgBox ScrollBar1.NSScrollerMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.113 class SearchField

35.113.1 class SearchField

Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built-in search field control in Xojo.
Notes: Only for Xojo 2020r2 or newer.

35.113.2 Methods

35.113.3 NSSearchFieldMBS as NSSearchFieldMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop only.

Function: Queries search field object for the control.
Notes: Only for Xojo 2020r2 or newer.

35.114 class SegmentedControl

35.114.1 class SegmentedControl

Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Build in Segmented Control class in Xojo.

35.114.2 Methods

35.114.3 NSSegmentedControlMBS as NSSegmentedControlMBS

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSegmentedControlMBS object for the given control.
Example:

SegmentedControl1.NSSegmentedControlMBS.selectedSegment = 0

Notes: This way you can manipulate Cocoa controls directly.

35.115 class Separator

35.115.1 class Separator

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in Separator class in Xojo.

35.115.2 Methods

35.115.3 NSBoxMBS as NSBoxMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSBoxMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.116 class Slider

35.116.1 class Slider

Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: The built in slider class in Xojo.

35.116.2 Methods

35.116.3 NSSliderMBS as NSSliderMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSSliderMBS object for the given control.
Example:

MsgBox Slider1.NSSliderMBS.className

Notes: This way you can manipulate Cocoa controls directly.

35.117 class SpinningProgressIndicatorMBS

35.117.1 class SpinningProgressIndicatorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: A resizable, recolorable clone of the spinning NSProgressIndicator.
Notes:

Based on YRKSpinningProgressIndicator from Kelan Champagne.
See also https://github.com/kelan/yrk-spinning-progress-indicator
Subclass of the NSViewMBS class.

- MonkeyBread Software Releases the MBS Real Studio plug-ins in version 13.2
- MBS Xojo / Real Studio Plugins, version 13.2pr1

35.117.4 Methods

35.117.5 Constructor

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with size 100/100 and position 0/0
Example:

```
dim t as new SpinningProgressIndicatorMBS
```

Notes: On success the handle property is not zero.
See also:

- 35.117.6 Constructor(Handle as Integer) 8608
- 35.117.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8608

35.117.6 Constructor(Handle as Integer)

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Creates an object based on the given SpinningProgressIndicator handle.
Example:

```
dim t as new SpinningProgressIndicatorMBS(0, 0, 100, 100)
dim v as new SpinningProgressIndicatorMBS(t.handle)

MsgBox str(v.Bounds.Width)+" x "+str(v.Bounds.Height)
```

Notes: The handle is casted to a SpinningProgressIndicator and the plugin retains this handle.
See also:

- 35.117.5 Constructor 8607
- 35.117.7 Constructor(left as Double, top as Double, width as Double, height as Double) 8608

35.117.7 Constructor(left as Double, top as Double, width as Double, height as Double)

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new progress indicator with the given size and position.
Example:

```
dim x as new SpinningProgressIndicatorMBS(0, 0, 100, 100)
```

Notes: On success the handle property is not zero.
See also:

- 35.117.5 Constructor 8607
- 35.117.6 Constructor(Handle as Integer) 8608

35.117.8 startAnimation

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Starts animation.
Notes: If you see no animation, you can maybe add a timer with short period (50ms) and set needsDisplay to true.

35.117.9 stopAnimation

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Stops the animation.

35.117.10 Properties

35.117.11 backgroundColor as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The background color.
Notes:

Default color is NSColorMBS.clearColor.
(Read and Write computed property)

35.117.12 colorValue as NSColorMBS

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The color for drawing.
Notes:

Default color is NSColorMBS.blackColor.
(Read and Write computed property)

35.117.13 doubleValue as Double

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The current value.
Notes:

Default is 0.0.
(Read and Write computed property)

35.117.14 drawsBackground as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether to draw background.
Notes:

Default is false.
(Read and Write computed property)

35.117.15 isDisplayedWhenStopped as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether this control is visible without animation turned on.
Notes:

Default is true.
(Read and Write computed property)

35.117.16 isIndeterminate as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether progress is indeterminated.
Notes:

Default is true.
(Read and Write computed property)

35.117.17 maxValue as Double

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: The maximum value.
Notes:

Default is 100.0.
(Read and Write computed property)

35.117.18 usesThreadedAnimation as boolean

MBS MacExtras Plugin, Plugin Version: 13.2, Platform: macOS, Targets: Desktop only.

Function: Whether to use a thread for the animation.
Notes:

Default is true.
(Read and Write computed property)

35.118 class Statictext

35.118.1 class Statictext

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The built in Statictext class in Xojo.

35.118.2 Methods

35.118.3 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

35.119 class TextArea

35.119.1 class TextArea

Plugin Version: 9.7, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The built in textarea class in Xojo.
Example:

```
// make a PDF from a textarea in Cocoa Xojo target:

// find view
dim n as NSViewMBS = TextArea1.NSViewMBS
if n = nil then
MsgBox "Only in Cocoa!"
Return
end if

// make pdf data
dim s as string = n.dataWithPDFInsideRect(0,0,n.frame.Width, n.frame.Height)

// save
dim f as FolderItem = GetSaveFolderItem("", "test.pdf")

if f<>Nil then

dim b as BinaryStream = BinaryStream.Create(f, true)

b.Write s

end if
```

Notes: Requires RB 2009r4 or newer.

35.119.2 Methods

35.119.3 NSScrollViewMBS as NSScrollViewMBS

MBS MacControls Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop only.

Function: Creates a NSScrollViewMBS object for the given control.
Example:

```
MsgBox TextArea1.NSScrollViewMBS.className
```

Notes: This way you can manipulate Cocoa controls directly.

35.119.4 NSTextFieldMBS as NSTextFieldMBS

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextFieldMBS object for the given control.
Notes:

This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

35.119.5 NSTextViewMBS as NSTextViewMBS

MBS MacCocoa Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSTextViewMBS object for the given control.
Example:

```
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes:

This way you can manipulate Cocoa controls directly.
Xojo uses a NSTextField for text areas without style and without multiline.

35.119.6 SetTextThreadSafeMBS(text as string)

MBS Util Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: Sets text property on main thread.
Example:

```
// called im a thread:
TextArea1.SetTextThreadSafeMBS "Hello World"
```

Notes:

This method is to allow you to set the text property of a label in a thread without a problem.

If called on main thread, the plugin will simply set text property directly.
If called on other threads the plugin will schedule to set the property a short time later on the main thread.

It may be better to call an update method you created on your window with CallDelegatesMBS.CallDelegateOnMainThreadMBS instead to do several update steps on one.

35.119.7 WinInsertImageMBS(data as string, Width as Integer, Height as Integer)

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop only.

Function: Inserts image to file.
Example:

```
Dim pic As Picture = LogoMBS(500)
Dim data As String = pic.GetData(pic.SaveAsJPEG)

call TextArea1.WinInsertImageMBS(data, 500, 500)
```

Notes:

Specify size in pixels and image data.
Image data works with JPEG and other data types.
Requires Windows 8 or newer.

35.119.9 WinShowFontPanelMBS as Boolean

MBS Win Plugin, Plugin Version: 19.2, Platform: Windows, Targets: Desktop only.

Function: Shows font dialog.
Example:

```
If TextArea1.WinShowFontPanelMBS Then
// update controls as font may have been changed?

End If
```

Notes:

You can make changes and apply them with OK button.
Returns true when OK is selected.

- 17.5, page 43: What's New in the MBS Plugins, With the Plugins growing every year, here are new capabilities you may have missed by Stefanie Juchmes

35.119.13 Properties

35.119.14 RTFDataMBS as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop only.

Function: Get or set the textview content as RTF data.
Example:

```
dim rtf as MemoryBlock = TextArea1.RTFDataMBS
TextArea2.RTFDataMBS = rtf
```

Notes:

Works only for Cocoa and uses RTF parser/generator from Apple.

See also RTFDataMBS in StyledText, WinRTFDataMBS in TextArea and DesktopTextArea controls and RTFData in NSTextViewMBS class.
(Read and Write computed property)

35.119.15 WinAutoCorrectionMBS as Boolean

MBS Win Plugin, Plugin Version: 19.2, Platform: Windows, Targets: Desktop only.

Function: Enables auto correction for Textarea.
Example:

```
# If TargetWindows Then
TextArea1.WinAutoCorrectionMBS = True
# ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.AutomaticSpellingCorrectionEnabled = True
# EndIf
```

Notes:

Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS for MacOS.
(Read and Write computed property)

35.119.16 WinAutoHorizontalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll horizontally.
Notes:

Automatically scrolls text to the right by 10 characters when the user types a character at the end of the line. When the user presses the ENTER key, the control scrolls all text back to position zero.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

35.119.17 WinAutoVerticalScrollMBS as Boolean

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Whether to auto scroll vertically.
Notes:

Automatically scrolls text up one page when the user presses the ENTER key on the last line.

This property controls an option of the RichEdit control used by Xojo for the Textarea control on Windows.
(Read and Write computed property)

35.119.18 WinRTFDataMBS(SelectionOnly as boolean = false) as string

MBS Win Plugin, Plugin Version: 14.3, Platform: Windows, Targets: Desktop only.

Function: Get or set the RTF data for the text area.
Example:

```
Dim rtfData As String

# If TargetWindows Then
rtfData = TextArea1.WinRTFDataMBS
# ElseIf TargetMacOS Then
rtfData = TextArea1.RTFDataMBS
# EndIf
```

Notes:

Including images and probably faster as StyledText.RTFData.

See also RTFDataMBS in StyledText, RTFDataMBS in TextArea and DesktopTextArea controls and RTFData in NSTextViewMBS class.
(Read and Write computed property)

35.119.19 WinSelHasTextBackColorMBS as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: Whether a custom background color is in used for the selection.
Example:

```
textArea1.WinSelHasTextBackColorMBS = false
```

Notes:

If false, standard background color is used.
(Read and Write computed property)

35.119.20 WinSelHasTextColorMBS as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: Whether a custom text color is in used for the selection.
Example:

textArea1.WinSelHasTextColorMBS = false

Notes:

If false, standard text color is used.
(Read and Write computed property)

35.119.21 WinSelStrikeThroughMBS as Boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop only.

Function: Get or set StrikeThrough text style.
Example:

TextArea1.WinSelStrikeThroughMBS = True

Notes:

See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

35.119.22 WinSelSubScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Get or set subscript text style.
Example:

TextArea1.WinSelSubScriptMBS = True

Notes:

Subscript text has a lower base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

35.119.23 WinSelSuperScriptMBS as Boolean

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Get or set superscript text style.
Example:

TextArea1.WinSelSuperScriptMBS = True

Notes:

Superscript text has a higher base line and is smaller.
See example project for how to do this for both Mac and Windows.
(Read and Write computed property)

35.119.24 WinSelTextBackColorMBS as Color

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: The current background text color.
Example:

textArea1.WinSelTextBackColorMBS = & cFF0000

Notes:

If set also sets WinSelHasTextBackColorMBS to true internally.
(Read and Write computed property)

35.119.25 WinSelTextColorMBS as Color

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop only.

Function: The current foreground text color.
Example:

```
textArea1.WinSelTextColorMBS = & cFF0000
```

Notes:

If set also sets WinSelHasTextColorMBS to true internally.
(Read and Write computed property)

35.119.26 WinSpellcheckingMBS as Boolean

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop only.

Function: Enables spellchecking for Textarea.
Example:

```
# If TargetWindows Then
TextArea1.WinSpellcheckingMBS = True
# ElseIf TargetMacOS Then
TextArea1.NSTextViewMBS.continuousSpellCheckingEnabled = True
# EndIf
```

Notes:

Only for Windows 8 and newer.
Uses current language from user.

See AutomaticSpellingCorrectionEnabled and ContinuousSpellCheckingEnabled properties in NSTextViewMBS for MacOS.
(Read and Write computed property)

35.120 class UpDownArrows

35.120.1 class UpDownArrows

Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: The build in control class in Xojo.

35.120.2 Methods

35.120.3 NSStepperMBS as NSStepperMBS

MBS MacControls Plugin, Plugin Version: 10.0, Platform: macOS, Targets: Desktop only.

Function: Creates a NSStepperMBS object for the given control.
Notes: This way you can manipulate Cocoa controls directly.

Chapter 36

Cocoa Drawing

36.1 class NSBezierPathMBS

36.1.1 class NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The plugin class for a Cocoa NSBezierPath.
Notes:

An NSBezierPath object allows you to create paths using PostScript-style commands. Paths consist of straight and curved line segments joined together. Paths can form recognizable shapes such as rectangles, ovals, arcs, and glyphs; they can also form complex polygons using either straight or curved line segments. A single path can be closed by connecting its two endpoints, or it can be left open.

An NSBezierPath object can contain multiple disconnected paths, whether they are closed or open. Each of these paths is referred to as a subpath. The subpaths of an NSBezierPath object must be manipulated as a group. The only way to manipulate subpaths individually is to create separate NSBezierPath objects for each.

For a given NSBezierPath object, you can stroke the path's outline or fill the region occupied by the path. You can also use the path as a clipping region for views or other regions. Using methods of NSBezierPath, you can also perform hit detection on the filled or stroked path. Hit detection is needed to implement interactive graphics, as in rubberbanding and dragging operations.

The current graphics context is automatically saved and restored for all drawing operations involving NS-BezierPath objects, so your application does not need to worry about the graphics settings changing across invocations.

36.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr4

36.1.3 Blog Entries

- MBS Real Studio Plugins, version 12.5pr4

36.1.4 Methods

36.1.5 appendBezierPath(path as NSBezierPathMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends the contents of the specified path object to the receiver's path.
Notes:

Path: The path to add to the receiver.

This method adds the commands used to create aPath to the end of the receiver's path. This method does not explicitly try to connect the subpaths in the two objects, although the operations in Path may still cause that effect.

36.1.6 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an arc of a circle to the receiver's path.
Notes:

center: Specifies the center point of the circle used to define the arc.
radius: Specifies the radius of the circle used to define the arc.
startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in a counterclockwise direction. If the receiver's path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver's path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 36.1.7 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean) 8625
- 36.1.8 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double) 8625

36.1.7 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an arc of a circle to the receiver's path.
Notes:

center: Specifies the center point of the circle used to define the arc.
radius: Specifies the radius of the circle used to define the arc.
startAngle: Specifies the starting angle of the arc, measured in degrees counterclockwise from the x-axis.
endAngle: Specifies the end angle of the arc, measured in degrees counterclockwise from the x-axis.
clockwise: true if you want the arc to be drawn in a clockwise direction; otherwise false to draw the arc in a counterclockwise direction.

The created arc lies on the perimeter of the circle, between the angles specified by the startAngle and endAngle parameters. The arc is drawn in the direction indicated by the clockwise parameter. If the receiver's path is empty, this method sets the current point to the beginning of the arc before adding the arc segment. If the receiver's path is not empty, a line is drawn from the current point to the starting point of the arc.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 36.1.6 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double) 8624
- 36.1.8 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double) 8625

36.1.8 appendBezierPathWithArc(point1 as NSPointMBS, point2 as NSPointMBS, radius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an arc to the receiver's path.
Notes:

point1: The middle point of the angle.
point2: The end point of the angle.
radius: The radius of the circle inscribed in the angle.

The created arc is defined by a circle inscribed inside the angle specified by three points: the current point, the fromPoint parameter, and the toPoint parameter (in that order). The arc itself lies on the perimeter of the circle, whose radius is specified by the radius parameter. The arc is drawn between the two points of the circle that are tangent to the two legs of the angle.

The arc usually does not contain the points in the fromPoint and toPoint parameters. If the starting point of the arc does not coincide with the current point, a line is drawn between the two points. The starting point of the arc lies on the line defined by the current point and the fromPoint parameter.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

Depending on the length of the arc, this method may add multiple connected curve segments to the path.
See also:

- 36.1.6 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double) 8624
- 36.1.7 appendBezierPathWithArc(center as NSPointMBS, radius as Double, startAngle as Double, endAngle as Double, clockwise as boolean) 8625

36.1.9 appendBezierPathWithGlyph(glyph as Integer, font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an outline of the specified glyph to the receiver's path.
Notes:

Glyph: The glyph to add to the path.
font: The font in which the glyph is encoded.

If the glyph is not encoded in the font specified by the font parameter,Äîthat is, the font does not have an entry for the specified glyph,Äîthen no path is appended to the receiver.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

36.1.10 appendBezierPathWithGlyphs(glyphs() as Integer, font as NSFontMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends the outlines of the specified glyphs to the receiver's path.
Notes:

glyphs: An array of glpyhs to add to the path.
count: The number of glyphs in the glyphs parameter.
font: The font in which the glyphs are encoded.

If the glyphs are not encoded in the font specified by the font parameter,Äîthat is, the font does not have an entry for one of the specified glyphs,Äîthen no path is appended to the receiver.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

36.1.11 appendBezierPathWithOvalInRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends an oval path to the receiver, inscribing the oval in the specified rectangle.
Notes:

rect: The rectangle in which to inscribe the oval.

Before adding the oval, this method moves the current point, which implicitly closes the current subpath. If the aRect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

36.1.12 appendBezierPathWithPoints(points() as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a series of line segments to the receiver's path.
Notes:

points: An array of NSPoint data types, each of which contains the end point of the next line segment.
count :The number of points in the points parameter.

This method interprets the points as a set of connected line segments. If the current path contains an open subpath, a line is created from the last point in that subpath to the first point in the points array. If the current path is empty, the first point in the points array is used to set the starting point of the line segments. Subsequent line segments are added using the remaining points in the array.

This method does not close the path that is created. If you wish to create a closed path, you must do so by

explicitly invoking the receiver's closePath method.

36.1.13 appendBezierPathWithRect(rect as NSRectMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a rectangular path to the receiver's path.
Notes:

rect: The rectangle describing the path to create.

Before adding the rectangle, this method moves the current point to the origin of the rectangle, which implicitly closes the current subpath (if any). The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction. The final segment is added using a closePath message.

36.1.14 appendBezierPathWithRoundedRect(rect as NSRectMBS, xRadius as Double, yRadius as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a rounded rectangular path to the receiver's path.
Notes:

rect: The rectangle that defines the basic shape of the path.
xRadius: The radius of each corner oval along the x-axis. Values larger than half the rectangle's width are clamped to half the width.
yRadius: The radius of each corner oval along the y-axis. Values larger than half the rectangle's height are clamped to half the height.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

36.1.15 bezierPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object.

36.1.16 bezierPathByFlatteningPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a "flattened" copy of the receiver.
Notes:

Returns a new path object whose contents are a flattened version of the receiver's path.

Flattening a path converts all curved line segments into straight line approximations. The granularity of the approximations is controlled by the path's current flatness value, which is set using the DefaultFlatness property.

36.1.17 bezierPathByReversingPath as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object with the reversed contents of the receiver's path.
Notes:

Returns a new path object whose contents are a reversed version of the receiver's path.

Reversing a path does not necessarily change the appearance of the path when rendered. Instead, it changes the direction in which path segments are drawn. For example, reversing the path of a rectangle (whose line segments are normally drawn starting at the origin and proceeding in a counterclockwise direction) causes its line segments to be drawn in a clockwise direction instead. Drawing a reversed path could affect the appearance of a filled pattern, depending on the pattern and the fill rule in use.

This method reverses each whole or partial subpath in the path object individually.

36.1.18 bezierPathWithOvalInRect(r as NSRectMBS) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object initialized with an oval path inscribed in the specified rectangle.
Notes:

r: The rectangle in which to inscribe an oval.

Returns an NSBezierPath new path object with the oval path.

If the rect parameter specifies a square, the inscribed path is a circle. The path is constructed by starting

in the lower-right quadrant of the rectangle and adding arc segments counterclockwise to complete the oval.

36.1.19 bezierPathWithRect(r as NSRectMBS) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates and returns a new NSBezierPath object initialized with a rectangular path.
Notes:

r: The rectangle describing the path to create.

Returns a new path object with the rectangular path.
The path is constructed by starting at the origin of aRect and adding line segments in a counterclockwise direction.

36.1.20 bezierPathWithRoundedRect(r as NSRectMBS, xRadius as Double, yRadius as Double) as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a new NSBezierPath object initialized with a rounded rectangular path.
Notes:

r: The rectangle that defines the basic shape of the path.
xRadius: The radius of each corner oval along the x-axis. Values larger than half the rectangle's width are clamped to half the width.
yRadius: The radius of each corner oval along the y-axis. Values larger than half the rectangle's height are clamped to half the height.

Returns a new path object with the rounded rectangular path.

The path is constructed in a counter-clockwise direction, starting at the top-left corner of the rectangle. If either one of the radius parameters contains the value 0.0, the returned path is a plain rectangle without rounded corners.

36.1.21 closePath

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Closes the most recently added subpath.
Notes: This method closes the current subpath by creating a line segment between the first and last points in the subpath. This method subsequently updates the current point to the end of the newly created line

segment, which is also the first point in the now closed subpath.

36.1.22 Constructor

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Initializes a new empty NSBezierPath object.

36.1.23 containsPoint(p as NSPointMBS) as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the receiver contains the specified point.
Example:

```
dim r as new NSRectMBS(10, 10, 50, 50)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
dim p as new NSPointMBS(20,20)

MsgBox str(b.containsPoint(p))
```

Notes:

p: The point to test against the path, specified in the path object's coordinate system.

Returns true if the path's enclosed area contains the specified point; otherwise, false.

This method checks the point against the path itself and the area it encloses. When determining hits in the enclosed area, this method uses the non-zero winding rule (NSNonZeroWindingRule). It does not take into account the line width used to stroke the path.

36.1.24 copy as NSBezierPathMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Creates a copy of the bezier path.

36.1.25 curveToPoint(endPoint as NSPointMBS, controlPoint1 as NSPointMBS, controlPoint2 as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a Bezier cubic curve to the receiver's path.
Notes:

endPoint: The destination point of the curve segment, specified in the current coordinate system
controlPoint1: The point that determines the shape of the curve near the current point.
controlPoint2: The point that determines the shape of the curve near the destination point.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

36.1.26 elementAtIndex(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the type of path element at the specified index.
Notes:

index: The index of the desired path element.

Returns the type of the path element.
Path elements describe the commands used to define a path and include basic commands such as moving to a specific point, creating a line segment, creating a curve, or closing the path. The elements are stored in the order of their execution.
See also:

- 36.1.27 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer 8632

36.1.27 elementAtIndex(index as Integer, byref associatedPoints() as NSPointMBS) as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Gets the element type and (and optionally) the associated points for the path element at the specified index.
Notes:

index: The index of the desired path element.
associatedPoints: On output, the data points associated with the specified path element.

Returns the type of the path element.

For curve operations, the order of the points is controlPoint1 (associatedPoints(0)), controlPoint2 (associatedPoints(1)), endPoint (associatedPoints(2)).
See also:

- 36.1.26 elementAtIndex(index as Integer) as Integer 8632

36.1.28 elementCount as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the total number of path elements in the receiver's path.
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2

b.removeAllPoints
MsgBox str(b.elementCount) // 0
```

Notes: Each element type corresponds to one of the operations described in constants.

36.1.29 getLineDash(byref pattern() as Double, byref count as Integer, byref phase as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns the line-stroking pattern for the receiver.
Notes:

pattern: On output, this array contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length, followed by the first gap length, followed by the second line segment length, and so on.
count: On output, the number of entries written to pattern.
phase: On output, this value contains the offset at which to start drawing the pattern, measured in points along the dashed-line pattern. For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

36.1.30 isEmpty as boolean

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the receiver is empty.
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
MsgBox "isEmpty: "+str(b.isEmpty)
```

Notes: True if the receiver contains no path elements; otherwise, false.

36.1.31 lineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a straight line to the receiver's path.
Notes:

p: The destination point of the line segment, specified in the current coordinate system.

This method creates a straight line segment starting at the current point and ending at the point specified by the aPoint parameter. The current point is the last point in the receiver's most recently added segment.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

36.1.32 moveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Moves the receiver's current point to the specified location.
Notes:

p: A point in the current coordinate system.

This method implicitly closes the current subpath (if any) and sets the current point to the value in p. When closing the previous subpath, this method does not cause a line to be created from the first and last points in the subpath.

For many path operations, you must invoke this method before issuing any commands that cause a line or

curve segment to be drawn.

36.1.33 relativeCurveToPoint(endPoint as NSPointMBS, controlPoint1 as NSPointMBS, controlPoint2 as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds a Bezier cubic curve to the receiver's path from the current point to a new location, which is specified as a relative distance from the current point.
Notes:

endPoint: The destination point of the curve segment, interpreted as a relative offset from the current point.
controlPoint1: The point that determines the shape of the curve near the current point, interpreted as a relative offset from the current point.
controlPoint2: The point that determines the shape of the curve near the destination point, interpreted as a relative offset from the current point.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

36.1.34 relativeLineToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Appends a straight line segment to the receiver's path starting at the current point and moving towards the specified point, relative to the current location.
Notes:

p: A point whose coordinates are interpreted as a relative offset from the current point.

The destination point is relative to the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), a line segment is created between the points (1, 1) and (2, 3).

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

36.1.35 relativeMoveToPoint(p as NSPointMBS)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Moves the receiver's current point to a new point whose location is the specified distance from the current point.
Notes:

p: A point whose coordinates are interpreted as a relative offset from the current point.

This method implicitly closes the current subpath (if any) and updates the location of the current point. For example, if the current point is (1, 1) and aPoint contains the value (1, 2), the previous subpath would be closed and the current point would become (2, 3). When closing the previous subpath, this method does not cause a line to be created from the first and last points in the subpath.

You must set the path's current point (using the moveToPoint method or through the creation of a preceding line or curve segment) before you invoke this method. If the path is empty, this method raises an NSGenericException exception.

36.1.36 removeAllPoints

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Removes all path elements from the receiver, effectively clearing the path.
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)
MsgBox str(b.elementCount) // 2

b.removeAllPoints
MsgBox str(b.elementCount) // 0
```

36.1.37 setAssociatedPoints(points() as NSPointMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the points associated with the specified path element.
Notes:

points: An array containing up to three NSPointMBS data types. This parameter must contain the correct number of points for the path element at the specified index. Move, close path, and line segment commands require one point. Curve operations require three points.
index: The index of the path element you want to modify.

You can use this method to change the points associated with a path quickly and without recreating the path. You cannot use this method to change the type of the path element.

The following example shows you how you would modify the point associated with a line path element. The path created by this example results in a path with two elements. The first path element specifies a move to point (0, 0) while the second creates a line to point (100, 100). It then changes the line to go only to the point (50,50) using this method:

Note: If you specify too few points for a path element of type NSCurveToBezierPathElement, the behavior of this method is undefined.

36.1.38 setLineDash(pattern() as Double, phase as Double)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Sets the line-stroking pattern for the receiver.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath

b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)

dim pattern() as Double
pattern.Append 5
pattern.Append 2
b.setLineDash pattern, 6

g.stroke(b)

g = nil

window1.Backdrop = n.CopyPicture // red line with dash pattern
```

Notes:

pattern: An array of floating point values that contains the lengths (measured in points) of the line segments and gaps in the pattern. The values in the array alternate, starting with the first line segment length,

followed by the first gap length, followed by the second line segment length, and so on
count: The number of values in pattern.
phase: The offset at which to start drawing the pattern, measured in points along the dashed-line pattern. For example, a phase of 6 in the pattern 5-2-3-2 would cause drawing to begin in the middle of the first gap.

36.1.39 transformUsingAffineTransform(transform as Variant)

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Transforms all points in the receiver using the specified transform.
Example:

```
dim bezierPath as NSBezierPathMBS = NSBezierPathMBS.bezierPath
dim transform as NSAffineTransformMBS = NSAffineTransformMBS.transform

bezierPath.moveToPoint NSMakePointMBS(0.0, 0.0)
bezierPath.lineToPoint NSMakePointMBS(100.0, 100.0)

transform.translate(10,10)
bezierPath.transformUsingAffineTransform(transform)

Break // bezierPath.bounds starts now at 10/10
```

Notes:

Transform: The transform to apply to the path.

This method applies the transform to the path's points immediately. The following code translates a line from 0,0 to 100,100 to a line from 10,10 to 110,110.

transform must be a NSAffineTransformMBS object.

36.1.40 Properties

36.1.41 Bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns the bounding box of the receiver's path.
Example:

```
dim r as new NSRectMBS(10, 10, 50, 50)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
```

```
dim rr as NSRectMBS = b.Bounds
MsgBox rr.String
```

Notes:

The rectangle that encloses the path of the receiver. If the path contains curve segments, the bounding box encloses the curve but may not enclose the control points used to calculate the curve.
(Read only property)

36.1.42 ControlPointBounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bounding box of the receiver's path, including any control points.
Notes:

The rectangle that encloses the receiver's path. If the path contains curve segments, the bounding box encloses the control points of the curves as well as the curves themselves.
(Read only property)

36.1.43 CurrentPoint as NSPointMBS

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Returns the receiver's current point (the trailing point or ending point in the most recently added segment).
Example:

```
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
b.moveToPoint NSMakePointMBS(10,10)

MsgBox b.CurrentPoint.String
```

Notes:

The point from which the next drawn line or curve segment begins.
If the receiver is empty, this method raises NSGenericException.
(Read only property)

36.1.44 defaultFlatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The default flatness value for all paths.
Notes:

The flatness value specifies the accuracy (or smoothness) with which curves are rendered. It is also the maximum error tolerance (measured in pixels) for rendering curves, where smaller numbers give smoother curves at the expense of more computation. The exact interpretation may vary slightly on different rendering devices.

The default flatness value is 0.6, which yields smooth curves.
(Read and Write property)

36.1.45 defaultLineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The default line cap style for all paths.
Notes:

The default line cap style or NSButtLineCapStyle if no other style has been set. For a list of values, see Constants.

The default line cap style can be overridden for individual paths by setting a custom style for that path using the LineCapStyle property.
(Read and Write property)

36.1.46 defaultLineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The default line join style for all paths.
Notes:

The default line join style or NSMiterLineJoinStyle if no other value has been set. For a list of values, see Constants.
(Read and Write property)

36.1.47 defaultLineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default line width for the all paths.
Notes:

The line width defines the thickness of stroked paths. A width of 0 is interpreted as the thinnest line that can be rendered on a particular device. The actual rendered line width may vary from the specified width by as much as 2 device pixels, depending on the position of the line with respect to the pixel grid and the current anti-aliasing settings. The width of the line may also be affected by scaling factors specified in the current transformation matrix of the active graphics context.
(Read and Write property)

36.1.48 defaultMiterLimit as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default miter limit for all paths.
Notes:

The miter limit helps you avoid spikes at the junction of two line segments connected by a miter join (NS-MiterLineJoinStyle). If the ratio of the miter length,Äîthe diagonal length of the miter join,Äîto the line thickness exceeds the miter limit, the joint is converted to a bevel join. The default miter limit value is 10, which converts miters whose angle at the joint is less than 11 degrees.
(Read and Write property)

36.1.49 defaultWindingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default winding rule used to fill all paths.
Notes:

The current default winding rule or NSNonZeroWindingRule if no default rule has been set. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.

Winding rules determine how to paint (or fill) the region enclosed by a path. You use this method to set the default rule that is applied to paths that do not have a custom winding rule assigned.
(Read and Write property)

36.1.50 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

36.1.51 flatness as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The flatness value of the path.
Notes:

If no value is set, this method returns the default flatness value.
(Read and Write computed property)

36.1.52 lineCapStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The line cap style for the receiver's path.
Notes:

If this value is not set for the receiver, the default line cap style is returned.
(Read and Write computed property)

36.1.53 lineJoinStyle as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The receiver's line join style.
Notes:

If this value is not set for the receiver, the default line join style is returned.
(Read and Write computed property)

36.1.54 lineWidth as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The line width of the receiver's path.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPath
```

```
b.moveToPoint NSMakePointMBS(10, 10)
b.lineToPoint NSMakePointMBS(290, 290)

dim pattern() as Double
pattern.Append 10
pattern.Append 4

b.lineWidth = 5
b.setLineDash pattern, 12

g.stroke(b)

g = nil

window1.Backdrop = n.CopyPicture // red line with dash pattern
```

Notes:

The line width of the receiver, measured in points in the user coordinate space.
If no value was set explicitly for the receiver, this method returns the default line width.
(Read and Write computed property)

36.1.55 miterLimit as Double

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: The miter limit of the receiver's path.
Notes:

If no value is set, this method returns the default miter limit.
(Read and Write computed property)

36.1.56 windingRule as Integer

MBS MacBase Plugin, Plugin Version: 12.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the winding rule used to fill the receiver's path.
Notes:

Returns the winding rule for the path. This value may be either NSNonZeroWindingRule or NSEvenOddWindingRule.

This value overrides the default value returned by defaultWindingRule.
For more information on how winding rules affect the appearance of filled paths, see Constants.

(Read and Write computed property)

36.1.57 Constants

36.1.58 NSBevelLineJoinStyle = 2

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants to specify the shape of the joints between connected segments of a stroked path.
Notes:

Specifies a bevel line shape of the joints between connected segments of a stroked path.
See the setDefaultLineJoinStyle method for an example of the appearance.

36.1.59 NSButtLineCapStyle = 0

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants to specify the shape of endpoints for an open path when stroked.
Notes:

Specifies a butt line cap style for endpoints for an open path when stroked.
See the setDefaultLineCapStyle method for an example of the appearance.

36.1.60 NSClosePathBezierPathElement = 3

MBS MacBase Plugin, Plugin Version: 12.5.

Function: Basic path element command constants.
Notes:

Marks the end of the current subpath at the specified point.
Note that the point specified for the Close Path element is essentially the same as the current point.

36.1.61 NSCurveToBezierPathElement = 2

MBS MacBase Plugin, Plugin Version: 12.5.

Function: Basic path element command constants.
Notes:

Creates a curved line segment from the current point to the specified endpoint using two control points to define the curve.
The points are stored in the following order: controlPoint1, controlPoint2, endPoint. Ovals, arcs, and Bezier curves all use curve elements to specify their geometry.
Contains 3 points.

36.1.62 NSEvenOddWindingRule = 1

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants used to specify the winding rule a Bezier path should use.
Notes:

Specifies the even-odd winding rule.
Count the total number of path crossings. If the number of crossings is even, the point is outside the path. If the number of crossings is odd, the point is inside the path and the region containing it should be filled.

36.1.63 NSLineToBezierPathElement = 1

MBS MacBase Plugin, Plugin Version: 12.5.

Function: Basic path element command constants.
Notes:

Creates a straight line from the current drawing point to the specified point.
Lines and rectangles are specified using this path element.
Contains 1 point.

36.1.64 NSMiterLineJoinStyle = 0

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants to specify the shape of the joints between connected segments of a stroked path.
Notes:

Specifies a miter line shape of the joints between connected segments of a stroked path.
See the setDefaultLineJoinStyle method for an example of the appearance.

36.1.65 NSMoveToBezierPathElement = 0

MBS MacBase Plugin, Plugin Version: 12.5.

Function: Basic path element command constants.
Notes:

Moves the path object's current drawing point to the specified point.
This path element does not result in any drawing. Using this command in the middle of a path results in a disconnected line segment.
Contains 1 point.

36.1.66 NSNonZeroWindingRule = 0

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants used to specify the winding rule a Bezier path should use.
Notes:

Specifies the non-zero winding rule.
Count each left-to-right path as +1 and each right-to-left path as -1. If the sum of all crossings is 0, the point is outside the path. If the sum is nonzero, the point is inside the path and the region containing it is filled. This is the default winding rule.

36.1.67 NSRoundLineCapStyle = 1

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants to specify the shape of endpoints for an open path when stroked.
Notes:

Specifies a round line cap style for endpoints for an open path when stroked.
See the setDefaultLineCapStyle method for an example of the appearance.

36.1.68 NSRoundLineJoinStyle = 1

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants to specify the shape of the joints between connected segments of a stroked path.
Notes:

Specifies a round line shape of the joints between connected segments of a stroked path.
See the setDefaultLineJoinStyle method for an example of the appearance.

36.1.69 NSSquareLineCapStyle = 2

MBS MacBase Plugin, Plugin Version: 12.5.

Function: One of the constants to specify the shape of endpoints for an open path when stroked.
Notes:

Specifies a square line cap style for endpoints for an open path when stroked.
See the setDefaultLineCapStyle method for an example of the appearance.

36.2 class NSBitmapImageRepMBS

36.2.1 class NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSBitmapImageRep class renders an image from bitmap data.
Notes:

Bitmap data formats supported include GIF, JPEG, TIFF, PNG, and various permutations of raw bitmap data.

Alpha Premultiplication

If a coverage (alpha) plane exists, a bitmap's color components are premultiplied with it. If you modify the contents of the bitmap, you are therefore responsible for premultiplying the data. For this reason, though, if you want to manipulate the actual data, an NSBitmapImageRep object is not recommended for storage. If you need to work with data that is not premultiplied, you should use Quartz, specifically CGImageCreate with kCGImageAlphaLast.

Note that premultiplying does not affect the output quality. Given source bitmap pixel s, destination pixel d, and alpha value a, a blend is basically

d' = a * s + (1 - a) * d

All premultiplication does is precalculate a * s.
Subclass of the NSImageRepMBS class.

36.2.4 Methods

36.2.5 bitmapImageRepByConvertingToColorSpace(colorSpace as NSColorSpaceMBS, renderingIntent as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: All.

Function: Converts the image rep to the specified colorspace.
Notes:

targetSpace: The new colorSpace
renderingIntent: The rendering intent specifies how to handle colors that are not located within the target color space. The supported values are NSColorRenderingIntent.

Constant	Value
Default	0
AbsoluteColorimetric	1
RelativeColorimetric	2
Perceptual	3
Saturation	4

An NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.

36.2.6 bitmapImageRepByRetaggingWithColorSpace(newSpace as NSColorSpaceMBS) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Changes the colorSpace tag of the receiver.
Notes:

newSpace: The desired colorSpace.

Returns an NSBitmapImageRep, or nil, if the conversion fails. If the original NSBitmapImageRep already uses that colorSpace, it is returned as is.

This method will definitely fail if you pass a colorSpace that has a different color space model than the receiver. That is, if your original image is sRGB, you can only retag with some other RGB colorspace.
Available in Mac OS X v10.6 and later.

36.2.7 BMPRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as bmp data.

36.2.8 canBeCompressedUsing(compression as Integer) as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Tests whether the receiver can be compressed by the specified compression scheme.
Notes:

Returns ture if the receiver's data matches compression with this type, false if the data doesn't match compression or if compression is unsupported..

Legal values for compression can be found in NSBitmapImageRep.h and are described in TIFF Compression in NSBitmapImageReps. This method returns true if the receiver's data matches compression; for example, if compression is NSTIFFCompressionCCITTFAX3, then the data must be 1 bit per sample and 1 sample per pixel.

36.2.9 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated NSBitmapImageRep from the provided data.
Notes:

data: A data object containing image data. The contents of bitmapData can be any supported bitmap format. For TIFF data, the NSBitmapImageRep is initialized from the first header and image data found in bitmapData.

On success the handle property is not zero.
See also:

- 36.2.10 Constructor(pic as Picture) 8651
- 36.2.11 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPer-

Pixel as Integer) 8651

36.2.10 Constructor(pic as Picture)

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Creates an NSBitmapImageRep object created from a Core Graphics image object.
Notes:

pic: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.
See also:

- 36.2.9 Constructor(data as Memoryblock) 8650
- 36.2.11 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer) 8651

36.2.11 Constructor(pixelsWide as Integer, pixelsHigh as Integer, bitsPerSample as Integer, samplesPerPixel as Integer, hasAlpha as boolean, colorSpaceName as string, bytesPerRow as Integer, bitsPerPixel as Integer)

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a newly allocated NSBitmapImageRep object, so it can render the specified image.
Example:

```
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as new NSGraphicsMBS(r)
g.SetColorRGB 1.0,0,0,0.5
```

```
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes:

The image bitmap data is allocated for you.

pixelsWide: The width of the image in pixels. This value must be greater than 0.
pixelsHigh: The height of the image in pixels. This value must be greater than 0.
bitsPerSample: The number of bits used to specify one pixel in a single component of the data. All components are assumed to have the same bits per sample. bps should be one of these values: 1, 2, 4, 8, 12, or 16.
samplesPerPixel: The number of data components, or samples per pixel. This value includes both color components and the coverage component (alpha), if present. Meaningful values range from 1 through 5. An image with cyan, magenta, yellow, and black (CMYK) color components plus a coverage component would have an spp of 5; a grayscale image that lacks a coverage component would have an spp of 1.
hasAlpha: True if one of the components counted in the number of samples per pixel (spp) is a coverage (alpha) component, and false if there is no coverage component. If true, the color components in the bitmap data must be premultiplied with their coverage component.
colorSpaceName: A string constant that indicates how data values are to be interpreted. It should be one of the following values: NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, NSNamedColorSpace or NSCustomColorSpace. (see NSColorSpaceMBS)
If bps is 12, you cannot specify the monochrome color space.
bytesPerRow: The number of bytes that are allocated for each scan line in each plane of data. A scan line is a single row of pixels spanning the width of the image.
Normally, rowBytes can be figured from the width of the image, the number of bits per pixel in each sample (bps), and, if the data is in a meshed configuration, the number of samples per pixel (spp). However, if the data for each row is aligned on word or other boundaries, it may have been necessary to allocate more memory for each row than there is data to fill it. rowBytes lets the object know whether that's the case.
If you pass in a rowBytes value of 0, the bitmap data allocated may be padded to fall on long word or larger boundaries for performance. If your code wants to advance row by row, use bytesPerRow and do not assume the data is packed. Passing in a non-zero value allows you to specify exact row advances.
bitsPerPixel: This integer value informs NSBitmapImageRep how many bits are actually allocated per pixel in each plane of data. If the data is in planar configuration, this normally equals bps (bits per sample). If the data is in meshed configuration, it normally equals bps times spp (samples per pixel). However, it's possible for a pixel specification to be followed by some meaningless bits (empty space), as may happen, for example, if pixel data is aligned on byte boundaries. NSBitmapImageRep supports only a limited number of pixelBits values (other than the default): for RGB images with 4 bps, pixelBits may be 16; for RGB images with 8 bps, pixelBits may be 32. The legal values for pixelBits are system dependent.
If you specify 0 for this parameter, the object interprets the number of bits per pixel using the values in the bps and spp parameters, as described in the preceding paragraph, without any meaningless bits.

On success the handle property is not zero.

You can add several NSBitmapImageRepMBS to NSImage to make a multi page tiff file.
To make a 300 dpi image, the size of the NSImage must be smaller than the size of the bitmap inside by factor 72/300.
See also:

- 36.2.9 Constructor(data as Memoryblock) 8650
- 36.2.10 Constructor(pic as Picture) 8651

36.2.12 GIFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as gif data.

36.2.13 imageRepWithCGImage(CGImage as Variant) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a Core Graphics image object.
Notes:

cgimage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

36.2.14 imageRepWithCGImageRef(CGImageHandle as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a Core Graphics image reference.
Notes:

CGImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the cgImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

36.2.15 imageRepWithCIImage(CIImage as variant) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a CoreImage object.
Notes:

CIImage: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

36.2.16 imageRepWithCIImageRef(CIImageHandle as Integer) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an NSBitmapImageRep object created from a CoreImage reference.

Notes:

CIImageHandle: A Core Graphics image object (an opaque type) from which to create the receiver. This opaque type is retained.

An NSBitmapImageRep object initialized from the contents of the Core Graphics image or nil if the NSBitmapImageRep couldn't be created.

If you use this method, you should treat the resulting bitmap NSBitmapImageRep object as read only. Because it only retains the value in the CIImage parameter, rather than unpacking the data, accessing the pixel data requires the creation of a copy of that data in memory. Changes to that data are not saved back to the Core Graphics image.

Available in OS X v10.5 and later.

36.2.17 imageRepWithData(data as Memoryblock) as NSBitmapImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSBitmapImageRep object initialized with the first image in the supplied data.
Notes:

data: A data object containing one or more bitmapped images. The bitmapData parameter can contain data in any supported bitmap format.

Returns an NSBitmapImageRep instance or nil if the class is unable to create an image representation.

36.2.18 JPEGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as jpeg data.

36.2.19 NSImageColorSyncProfileData as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a memoryblock containing the ColorSync profile data.

It can be used for TIFF, JPEG, GIF, and PNG files. This value is set when reading in and used when writing out image data. You can get the profile data for a particular color space from the corresponding NSColorSpace object or from the ColorSync Manager.

36.2.20 NSImageCompressionFactor as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing the compression factor of the image.
Used only for JPEG files. JPEG compression in TIFF files is not supported, and the factor is ignored. The value is a float between 0.0 and 1.0, with 1.0 resulting in no compression and 0.0 resulting in the maximum compression possible. It's set when reading in and used when writing out the image.

36.2.21 NSImageCompressionMethod as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number identifying the compression method of the image.
Used only for TIFF files. The value corresponds to one of the NSTIFFCompression constants, described below. It's set when reading in and used when writing out.

36.2.22 NSImageCurrentFrame as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing the current frame for an animated GIF file.
The first frame is 0.

36.2.23 NSImageCurrentFrameDuration as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing the duration (in seconds) of the current frame for an animated GIF image. The frame duration can be a floating-point value. It is used when reading in, but not when writing out.

36.2.24 NSImageDitherTransparency as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing a boolean that indicates whether the image is dithered.
Used only when writing GIF files.

36.2.25 NSImageEXIFData as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies an dictionary containing the EXIF data for the image.
This property is used only when reading or writing JPEG files. The dictionary contains the EXIF keys and values. Th standard dictionary keys (that is, those that are not specific to camera vendors) are identical to those for kCGImagePropertyExifDictionary declared in the CGImageSource API. See kCGImagePropertyExifDictionary Keys for details.

36.2.26 NSImageFallbackBackgroundColor as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Specifies the background color to use when writing to an image format (such as JPEG) that doesn't support alpha. The color's alpha value is ignored. The default background color, when this property is not specified, is white. The value of the property should be an NSColorMBS object. This constant corresponds to the kCGImageDestinationBackgroundColor constant in Quartz.
Available in Mac OS X v10.5 and later.

36.2.27 NSImageFrameCount as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing the number of frames in an animated GIF file.
This value is used when reading in data.

36.2.28 NSImageGamma as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing the gamma value for the image.
Used only for PNG files. The gamma values is a floating-point number between 0.0 and 1.0, with 0.0 being black and 1.0 being the maximum color. It's set when reading in and used when writing out.

36.2.29 NSImageInterlaced as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing a Boolean value that indicates whether the image is interlaced.
Used only when writing out PNG files.

36.2.30 NSImageLoopCount as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing the number of loops to make when animating a GIF image.
A value of 0 indicates the animation should loop indefinitely. Values should be specified as Integer numbers.
It is used when reading in but not when writing out the image.

36.2.31 NSImageProgressive as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies a number containing a boolean that indicates whether the image uses progressive encoding.
Used only for JPEG files. It's set when reading in and used when writing out.

36.2.32 NSImageRGBColorTable as string

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the property keys.
Notes:

Identifies an Memoryblock containing the RGB color table.
Used only for GIF files. It's stored as packed RGB. It's set when reading in and used when writing out.

36.2.33 PNGRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as PNG data.

36.2.34 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a TIFF representation of the receiver.
Notes:

This method invokes TIFFRepresentationUsingCompression using the stored compression type and factor retrieved from the initial image data or changed using setCompression. If the stored compression type isn't supported for writing TIFF data (for example, NSTIFFCompressionNEXT), the stored compression is changed to NSTIFFCompressionNone before invoking TIFFRepresentationUsingCompression. receiver, using the compression that's returned by getCompression (if applicable).

If a problem is encountered during generation of the TIFF, TIFFRepresentation raises an NSTIFFException or an NSBadBitmapParametersException.
See also:

- 36.2.35 TIFFRepresentation(properties as dictionary = nil) as Memoryblock 8660

36.2.35 TIFFRepresentation(properties as dictionary = nil) as Memoryblock

MBS MacBase Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap as tiff data.
See also:

- 36.2.34 TIFFRepresentation as Memoryblock 8659

36.2.36 Properties

36.2.37 bitmapData as Ptr

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a pointer to the bitmap data.
Notes:

If the data is planar, returns a pointer to the first plane.
(Read only property)

36.2.38 bitmapFormat as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the bitmap format of the receiver.
Notes:

Returns 0 by default. The return value can indicate several different attributes, which are described in Constants.
(Read only property)

36.2.39 bitsPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of bits allocated for each pixel in each plane of data.
Notes:

This number is normally equal to the number of bits per sample or, if the data is in meshed configuration, the number of bits per sample times the number of samples per pixel. It can be explicitly set to another value (in initWithBitmapDataPlanes) in case extra memory is allocated for each pixel. This may be the case, for example, if pixel data is aligned on byte boundaries.
(Read only property)

36.2.40 bytesPerPlane as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of bytes in each plane or channel of data.
Notes:

This number is calculated from the number of bytes per row and the height of the image.
(Read only property)

36.2.41 bytesPerRow as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the minimum number of bytes required to specify a scan line (a single row of pixels spanning the width of the image) in each data plane.
Notes:

If not explicitly set to another value (in initWithBitmapDataPlanes), this number will be figured from the width of the image, the number of bits per sample, and, if the data is in a meshed configuration, the number of samples per pixel. It can be set to another value to indicate that each row of data is aligned on word or other boundaries.
(Read only property)

36.2.42 CGImage as Variant

MBS MacBase Plugin, Plugin Version: 13.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the CGImageMBS for this image representation.
Notes:

If the image was created using a CGImage, you can get it back.
Else a new CGImage may be created for you.
(Read only property)

36.2.43 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the image rep's colorSpace
Notes:

Available in Mac OS X v10.6 and later.
(Read only property)

36.2.44 isPlanar as Boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns true if image data is a planar configuration and false if its in a meshed configuration.
Notes:

In a planar configuration, the image data is segregated into a separate plane for each color and coverage component. In a meshed configuration, the data is integrated into a single plane.
(Read only property)

36.2.45 numberOfPlanes as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of separate planes image data is organized into.
Notes:

This number is the number of samples per pixel if the data has a separate plane for each component (isPlanar returns true) and 1 if the data is meshed (isPlanar returns false).
(Read only property)

36.2.46 samplesPerPixel as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of components in the data.
Notes:

The returned value includes both color components and the coverage component, if present.
(Read only property)

36.2.47 valueForProperty(key as string) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The value for the specified property.
Notes:

Value can be nil.
(Read and Write computed property)

36.2.48 Constants

36.2.49 NSAlphaFirstBitmapFormat = 1

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the bitmap format constants.
Notes:

If 0, alpha values are the last component.
For example, CMYKA and RGBA.
Available in Mac OS X v10.4 and later.

36.2.50 NSAlphaNonpremultipliedBitmapFormat = 2

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the bitmap format constants.
Notes:

If 0, alpha values are premultiplied.
Available in Mac OS X v10.4 and later.

36.2.51 NSBMPFileType = 1

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Image format file type constants.
Notes: Windows bitmap image (BMP) format

36.2.52 NSFloatingPointSamplesBitmapFormat = 4

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the bitmap format constants.
Notes:

If 0, samples are integer values.
Available in Mac OS X v10.4 and later.

36.2.53 NSGIFFileType = 2

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Image format file type constants.
Notes: Graphics Image Format (GIF), originally created by CompuServe for online downloads

36.2.54 NSImageRepLoadStatusCompleted = -6

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the image loading state constants.
Notes: Enough data has been provided to successfully decompress the image (regardless of the complete: flag).

36.2.55 NSImageRepLoadStatusInvalidData = -4

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the image loading state constants.
Notes: An error occurred during image decompression. The image contains the portions of the data that have already been successfully decompressed, if any.

36.2.56 NSImageRepLoadStatusReadingHeader = -2

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the image loading state constants.
Notes: The image format is known, but not enough data has been read to determine the size, depth, etc., of the image. You should continue to provide more data.

36.2.57 NSImageRepLoadStatusUnexpectedEOF = -5

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the image loading state constants.
Notes: incrementalLoadFromData was called with true, but not enough data was available for decompression. The image contains the portions of the data that have already been successfully decompressed, if any.

36.2.58 NSImageRepLoadStatusUnknownType = -1

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the image loading state constants.
Notes: Not enough data to determine image format. You should continue to provide more data.

36.2.59 NSImageRepLoadStatusWillNeedAllData = -3

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the image loading state constants.
Notes: Incremental loading cannot be supported. Until you call incrementalLoadFromData with true, this status will be returned. You can continue to call the method but no decompression will take place. Once you do call the method with true, then the image will be decompressed and one of the final three status messages will be returned.

36.2.60 NSJPEG2000FileType = 5

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Image format file type constants.
Notes: JPEG 2000 file format.

36.2.61 NSJPEGFileType = 3

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Image format file type constants.
Notes: JPEG format.

36.2.62 NSPNGFileType = 4

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Image format file type constants.
Notes: Portable Network Graphics (PNG) format.

36.2.63 NSTIFFCompressionCCITTFAX3 = 3

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes:

CCITT Fax Group 3 compression.
Used for 1-bit fax images sent over telephone lines.

36.2.64 NSTIFFCompressionCCITTFAX4 = 4

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes:

CCITT Fax Group 4 compression.
Used for 1-bit fax images sent over ISDN lines.

36.2.65 NSTIFFCompressionJPEG = 6

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes: JPEG compression. No longer supported for input or output.

36.2.66 NSTIFFCompressionLZW = 5

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes: LZW compression.

36.2.67 NSTIFFCompressionNEXT = 32766

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes: NeXT compressed. Supported for input only.

36.2.68 NSTIFFCompressionNone = 1

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes: No compression.

36.2.69 NSTIFFCompressionOldJPEG = 32865

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes: Old JPEG compression. No longer supported for input or output.

36.2.70 NSTIFFCompressionPackBits = 32773

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Tiff Compression constants
Notes: PackBits compression.

36.2.71 NSTIFFFileType = 0

MBS MacBase Plugin, Plugin Version: 12.0.

Function: One of the Image format file type constants.
Notes: Tagged Image File Format (TIFF)

36.3 class NSColorListMBS

36.3.1 class NSColorListMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class for a Cocoa ColorList.

36.3.2 Methods

36.3.3 colorWithKey(key as string) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color with the given key.
Notes: Returns nil if key doesn't exist.

36.3.4 Create(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a color list; specify "" if you don't want a name.
Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user's path with writeToFile("").
See also:

- 36.3.5 Create(name as string, path as string) as boolean 8668

36.3.5 Create(name as string, path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a color list; specify "" if you don't want a name.
Notes: Note that this does not add the color list to availableColorLists until the color list is saved into the user's path with writeToFile("").
See also:

- 36.3.4 Create(name as string) as boolean 8668

36.3.6 insertColor(theColor as NSColorMBS, key as string, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Inserts color at the specified location.
Notes: If a color by the same key is already in the list but at a different location it is removed from there.

36.3.7 isEditable as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether this color list is editable.
Notes: True if it is editable.

36.3.8 Load(name as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Loads the named color list from availableColorLists.
Notes: Returns true on success.

36.3.9 name as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Name of the color list.

36.3.10 removeColorWithKey(key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the color with the given key.
Notes: Does nothing if the key does not exist.

36.3.11 removeFile

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: If the color list is in the user's path, removes the corresponding file in user's colorlists directory.
Notes: Also removes the color list from availableColorLists. If there are no outstanding references to the color list this might deallocate the object as well.

36.3.12 setColor(theColor as NSColorMBS, key as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: If key already exists, sets the corresponding color; otherwise inserts the color at the end.

36.3.13 writeToFile(path as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes the color list to the given path.
Notes:

Use "" to save to the user's private colorlists directory. If the color list is named, this method will also insert the color list into availableColorLists.
Returns true for success.

36.4 class NSColorMBS

36.4.1 class NSColorMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The class for a Cocoa color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)
```

36.4.8 Methods

36.4.9 alternateSelectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the face of a selected control.
Example:

```
dim c as NSColorMBS = NSColorMBS.alternateSelectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the face of a selected control,Äîa control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

36.4.10 alternateSelectedControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text in a selected control.
Example:

```
dim c as NSColorMBS = NSColorMBS.alternateSelectedControlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text in a selected control,Äîa control being clicked or dragged. This color can be used where iApp-like highlighting is desired.

36.4.11 alternatingContentBackgroundColors as NSColorMBS()

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background colors for alternating content items: such as table view rows, collection view items.
Notes:

Available on MacOS 10.14 or newer.
This function calls controlAlternatingRowBackgroundColors when alternatingContentBackgroundColors is not available.

36.4.12 blackColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.blackColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.13 blendedColorWithFraction(alpha as Double, c as NSColorMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object whose component values are a weighted sum of the receiver's and the specified color object's.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor
dim r as NSColorMBS = NSColorMBS.redColor
dim c as NSColorMBS = b.blendedColorWithFraction(0.5, r)

MsgBox c.description
```

Notes:

fraction: The amount of the color to blend with the receiver's color. The method converts color and a copy of the receiver to RGB, and then sets each component of the returned color to fraction of color's value plus 1 ,Äì fraction of the receiver's.
color: The color to blend with the receiver's color.

The resulting color object or nil if the colors can't be converted.

36.4.14 blueColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.0, 0.0, 1.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.15 brownColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.6, 0.4, 0.2 and whose alpha value is 1.0.
Notes:

```
dim c as NSColorMBS = NSColorMBS.brownColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.16 CGColorHandle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Converts NSColor to CGColor.

Notes:

Return value may be an approximation in some cases, so there isn't guaranteed round-trip fidelity.
Available on Mac OS X 10.8.

36.4.17 clearColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale and alpha values are both 0.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.clearColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.18 colorFromPasteboard as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the NSColor currently on the given pasteboard.
Notes: The color currently on the pasteboard or nil if pasteBoard doesn't contain color data.

36.4.19 colorNamed(colorName as String) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create catalog colors from values stored with the given name in the Asset Catalog of the main app bundle.

36.4.20 colorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an object representing the color space of the receiver.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor
```

MsgBox b.colorSpace.localizedName

Notes:

An object representing a color space. The returned NSColorSpace object may represent a custom color space.

Calling this method raises an exception if the receiver is not based on a color space represented by an NSColorSpace object,Äîspecifically, colors designated by NSNamedColorSpace and NSPatternColorSpace. If you are unsure about a color object, convert it to an equivalent NSColorSpace-based object before calling this method. Color objects created with color-space names NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSCalibratedRGBColorSpace, NSDeviceWhiteColorSpace, NSDeviceBlackColorSpace, NSDeviceRGBColorSpace, NSDeviceCMYKColorSpace, or NSCustomColorSpace,Äîor with the NSColorSpace class methods corresponding to these names,Äîare safe to use with this method. See "About Color Spaces" in Color Programming Topics for Cocoa for a list of these corresponding methods.

36.4.21 colorUsingColorSpace(colorSpace as NSColorSpaceMBS) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a new color object representing the color of the receiver in the specified color space.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor
dim c as NSColorMBS = b.colorUsingColorSpace(NSColorSpaceMBS.deviceRGBColorSpace)

MsgBox b.description
```

Notes:

space: The color space of the new NSColor object.

Returns the new NSColor object. This method converts the receiver's color to an equivalent one in the new color space. Although the new color might have different component values, it looks the same as the original. Returns nil if conversion is not possible.

If the receiver's color space is the same as that specified in space, this method returns the same NSColor object.

36.4.22 colorUsingColorSpaceName(colorSpace as string) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor whose color is the same as the receiver's, except that the new NSColor is in the specified color space.
Notes:

colorSpace: The name of the color space containing the new NSColor object. If colorSpace is "", the most appropriate color space is used.

The new NSColor object or nil if the specified conversion cannot be done.

36.4.23 colorUsingType(type as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Convert the color to a color of different type.
Notes: Return nil if conversion is not possible.

36.4.24 colorWithAlphaComponent(alpha as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object that has the same color space and component values as the receiver, but the specified alpha component.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor.colorWithAlphaComponent(0.5)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 0 0 1 0.5"
```

Notes:

alpha: The opacity value of the new NSColor object.

Returns a new NSColor object. If the receiver's color space doesn't include an alpha component, the receiver is returned.

A subclass with explicit opacity components should override this method to return a color with the specified alpha.

36.4.25 colorWithCalibratedHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object using the given opacity and HSB color space components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 0.2 0.1 0.1 1"
```

Notes:

hue: The hue component of the color object in the HSB color space.
saturation: The saturation component of the color object in the HSB color space.
brightness: The brightness (or value) component of the color object in the HSB color space.
alpha: The opacity value of the color object,

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

36.4.26 colorWithCalibratedRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity and RGB components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithCalibratedRGB(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSCalibratedRGBColorSpace 1 0.5 0.2 1"
```

Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

36.4.27 colorWithCalibratedWhite(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity and grayscale value.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithCalibratedWhite(1.0, 1.0)
MsgBox b.description // shows "NSCalibratedWhiteColorSpace 1 1"
```

Notes:

white: The grayscale value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

36.4.28 colorWithCatalogName(listName as String, colorName as String) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Look up and return catalog colors from standard color catalogs, or from NSColorList whose name matches the specified catalog name.

36.4.29 colorWithCGColor(CGColorHandle as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Converts CGColor to NSColor.
Notes:

Return value may be an approximation in some cases, so there isn't guaranteed round-trip fidelity.
Available on Mac OS X 10.8.

36.4.30 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object created from the specified components of the given color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName

dim co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
MsgBox co.description
```

Notes:

space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object. The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil.
Raises an NSExceptionMBS if the number of components does not match.
See also:

- 36.4.31 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double) as NSColorMBS 8681

36.4.31 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, paramarray components as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object created from the specified components of the given color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName

dim co as NSColorMBS = NSColorMBS.colorWithColorSpace(n, 1.0, 0, 0, 1.0)
MsgBox co.description
```

Notes:

space: An NSColorSpace object representing a color space. The method raises an exception if this is nil.
components: An array of the components in the specified color space to use to create the NSColor object. The order of these components is determined by the color-space profile, with the alpha component always last. (If you want the created color to be opaque, specify 1.0 for the alpha component.)

Returns the color object. If space represents a color space that cannot cannot be used with NSColor objects (for example, a "pattern" color space) the method returns nil.
Raises an NSExceptionMBS if the number of components does not match.
See also:

- 36.4.30 colorWithColorSpace(ColorSpace as NSColorSpaceMBS, components() as Double) as NSColorMBS 8680

36.4.32 colorWithColorSpaceHSV(ColorSpace as NSColorSpaceMBS, hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object with the specified color space, hue, saturation, brightness, and alpha channel values.
Notes:

ColorSpace: An NSColorSpace object representing a color space. An exception is raised if the color model of the provided color space is not RGB.
hue: The hue (color) component, expressed as a floating-point value in the range 0,Äì1.0.
saturation: The color saturation component, expressed as a floating-point value in the range 0,Äì1.0.
brightness: The brightness component, expressed as a floating-point value in the range 0,Äì1.0.
alpha: The alpha (opacity), expressed as a floating-point value in the range 0 (transparent) to 1.0 (opaque).

Returns the color object.

36.4.33 colorWithDeviceCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object using the given opacity value and CMYK components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.5, 1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceCMYKColorSpace 0.5 1 0.5 0.2 1"
```

Notes:

cyan: The cyan component of the color object.
magenta: The magenta component of the color object.
yellow: The yellow component of the color object.
black: The black component of the color object.

alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setcmykcolor.

36.4.34 colorWithDeviceHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSColor object using the given opacity value and HSB color space components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceHSV(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 0.2 0.1 0.1 1"
```

Notes:

hue: The hue component of the color object.
saturation: The saturation component of the color object.
brightness: The brightness component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.

36.4.35 colorWithDeviceRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity value and RGB components.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceRGB(1.0, 0.5, 0.2, 1.0)
MsgBox b.description // shows "NSDeviceRGBColorSpace 1 0.5 0.2 1"
```

Notes:

red: The red component of the color object.

green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setrgbcolor.

36.4.36 colorWithDeviceWhite(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object using the given opacity and grayscale values.
Example:

```
dim b as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
MsgBox b.description // shows "NSDeviceWhiteColorSpace 1 1"
```

Notes:

white: The grayscale value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0. In PostScript, this color space corresponds directly to the device-dependent operator setgray.

36.4.37 colorWithDisplayP3(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: Returns a color created from the specified components in the Display P3 colorspace.
Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.

36.4.38 colorWithGenericGamma22White(white as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Returns an color created with the specified white and alpha values in the GenericGamma22 colorspace.
Notes:

white: The white value of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.
Available in OS X v10.7 and later.

36.4.39 colorWithHSV(hue as double, saturation as double, brightness as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

36.4.40 colorWithPatternImage(image as Variant) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Creates and returns an NSColor object that uses the specified image pattern.
Example:

```
dim p as Picture = LogoMBS(100)
dim n as new NSImageMBS(p)
dim c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
dim x as NSImageMBS = c.patternImage

Backdrop=x.CopyPictureWithMask
```

Notes:

The image is tiled starting at the bottom of the window. The image is not scaled.

Parameter is a NSImageMBS object. We declare it as a variant to reduce plugin dependencies.

36.4.41 colorWithRGB(red as double, green as double, blue as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

36.4.42 colorWithSRGB(red as Double, green as Double, blue as Double, alpha as Double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a color created from the specified components in the sRGB colorspace.
Notes:

red: The red component of the color object.
green: The green component of the color object.
blue: The blue component of the color object.
alpha: The opacity value of the color object.

Values below 0.0 are interpreted as 0.0, and values above 1.0 are interpreted as 1.0.
Available in OS X v10.7 and later.

36.4.43 colorWithSystemEffect(systemEffect as Integer) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a color representing the base color with a system defined effect applied to it.
Notes:

This color is safe to create before draw time, as the resolution of the final color only happens when being set, retrieving its CGColor, resolving with colorWithType, etc. The return color type is named.
Available on MacOS 10.14 or newer.

36.4.44 colorWithWhite(white as double, alpha as double=1.0) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Create component-based colors that are compatible with sRGB colorspace.
Notes: These methods are effectively same as colorWithSRGBHSV:, but provided for easier reuse of code that uses UIColor on iOS. If red, green, blue, or saturation, brightness, or white values are outside of the 0..1 range, these will create colors in the extended sRGB (or for colorWithWhite:alpha:, extendedGenericGamma22GrayColorSpace) color spaces. This behavior is compatible with iOS UIColor.

36.4.45 Components as Double()

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the components of the receiver as an array.
Example:

```
dim b as NSColorMBS = NSColorMBS.blueColor
dim c(-1) as Double = b.Components
dim lines(-1) as string

for each d as Double in c
lines.Append str(d)
next

MsgBox Join(lines) // shows 0 0 1 1
```

Notes: You can invoke this method on NSColor objects created from custom color spaces to get the individual floating point components, including alpha. Raises an exception if the receiver doesn't have floating-point components. To find out how many components are in the components array, send the receiver a numberOfComponents message.

36.4.46 Constructor(c as color)

MBS MacBase Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Initializes the color with generic colorspace.
Example:

```
dim r as NSColorMBS = NSColorMBS.redColor
dim c as color = & cFF0000
dim n as new NSColorMBS(c)

Break // check debugger
```

See also:

- 36.4.47 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0) 8688

36.4.47 Constructor(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

MBS MacBase Plugin, Plugin Version: 17.1, Platform: macOS, Targets: All.

Function: Initializes the color with generic colorspace.
Notes: Pass values in range from 0.0 to 1.0.
See also:

- 36.4.46 Constructor(c as color) 8687

36.4.48 controlAccentColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: A dynamic color that reflects the user's current preferred accent color.
Notes:

This color automatically updates when the accent color preference changes. Do not make assumptions about the color space of this color, which may change across releases.
Available on MacOS 10.14 or newer.

36.4.49 controlAlternatingRowBackgroundColors as NSColorMBS()

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background colors for alternating content items: such as table view rows, collection view items.
Notes: Available on MacOS 10.3 or newer.

36.4.50 controlBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the background of large controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlBackgroundColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the background of large controls such as browsers, table views, and clip views.

36.4.51 controlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the flat surfaces of a control.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes:

The system color used for the flat surfaces of a control. By default, the control color is a pattern color that will draw the ruled lines for the window background, which is the same as returned by windowBackgroundColor.

If you use controlColor assuming that it is a solid, you may have an incorrect appearance. You should use lightGrayColor in its place.

36.4.52 controlDarkShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the dark edge of the shadow dropped from controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlDarkShadowColor

window1.Title=c.description
window1.HasBackColor=true
```

```
window1.backcolor=c.colorValue
```

Notes: Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the outer, darker border.

36.4.53 controlHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the highlighted bezels of controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the inner, duller border.

36.4.54 controlLightHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for light highlights in controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlLightHighlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two light borders that run along the top and left of controls, representing reflections from a light source in the upper left, the color of the outer, brighter border.

36.4.55 controlShadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the shadows dropped from controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlShadowColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: Of the two dark borders that run along the bottom and right of controls, representing shadows, the color of the inner, lighter border.

36.4.56 controlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text on controls that aren't disabled.
Example:

```
dim c as NSColorMBS = NSColorMBS.controlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.57 currentControlTint as Integer

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns current system control tint.

36.4.58 cyanColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.0, 1.0, 1.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.cyanColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.59 darkGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 1/3 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.darkGrayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.60 disabledControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text on disabled controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.disabledControlTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.61 findHighlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Background color of find indicators: the bubbles that show inline search result hits.
Notes: Requires MacOS 10.13 or newer.

36.4.62 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's CMYK and opacity values.
Example:

```
dim co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8)
dim c,m,y,k as Double

co.getCMYK(c,m,y,k)

MsgBox str(c)+" "+str(m)+" "+str(y)+" "+str(k)
```

Notes:

cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

- 36.4.63 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double) 8693

36.4.63 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's CMYK and opacity values.
Example:

```
dim co as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(1.0, 0.5, 1.0, 0.8, 0.4)
dim c,m,y,k,a as Double

co.getCMYK(c,m,y,k,a)

MsgBox str(c)+" "+str(m)+" "+str(y)+" "+str(k)+" "+str(a)
```

Notes:

cyan: Upon return, contains the cyan component of the color object.
magenta: Upon return, contains the magenta component of the color object.
yellow: Upon return, contains the yellow component of the color object.
black: Upon return, contains the black component of the color object.
alpha: Upon return, contains opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSDeviceCMYKColorSpace. Sending it to other objects raises an exception.
See also:

- 36.4.62 getCMYK(byref cyan as Double, byref magenta as Double, byref yellow as Double, byref black as Double) 8693

36.4.64 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's HSB component and opacity values in the respective arguments.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithCalibratedHSV(1.0, 0.5, 1.0, 0.4)
dim h,s,v,a as Double

c.getHSV(h,s,v,a)

MsgBox str(h)+" "+str(s)+" "+str(v)+" "+str(a)
```

Notes:

hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.
See also:

- 36.4.65 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref alpha as Double) 8695

36.4.65 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's HSB component and opacity values in the respective arguments.
Notes:

hue: Upon return, contains the hue component of the color object.
saturation: Upon return, contains the saturation component of the color object.
brightness: Upon return, contains the brightness component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.
See also:

- 36.4.64 getHSV(byref hue as Double, byref saturation as Double, byref brightness as Double) 8694

36.4.66 getRGB(byref red as Double, byref green as Double, byref blue as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's RGB component and opacity values in the respective arguments.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim r,g,b as Double

c.getRGB(r,g,b)

MsgBox str(r)+" "+str(g)+" "+str(b) // shows "0 0 1"
```

Notes:

red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.

See also:

- 36.4.67 getRGB(byref red as Double, byref green as Double, byref blue as Double, byref alpha as Double) 8696

36.4.67 getRGB(byref red as Double, byref green as Double, byref blue as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's RGB component and opacity values in the respective arguments.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim r,g,b,a as Double

c.getRGB(r,g,b,a)

MsgBox str(r)+" "+str(g)+" "+str(b)+" "+str(a) // shows "0 0 1 1"
```

Notes:

red: Upon return, contains the red component of the color object.
green: Upon return, contains the green component of the color object.
blue: Upon return, contains the blue component of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedRGBColorSpace or NSDeviceRGBColorSpace color space. Sending it to other objects raises an exception.

Plugin converts color to calibrated RGB if needed.
See also:

- 36.4.66 getRGB(byref red as Double, byref green as Double, byref blue as Double) 8695

36.4.68 getWhite(byref white as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's grayscale value and alpha values.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
dim w as Double
```

```
c.getWhite(w)

MsgBox str(w)
```

Notes:

white: Upon return, contains the grayscale value of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.
See also:

- 36.4.69 getWhite(byref white as Double, byref alpha as Double) 8697

36.4.69 getWhite(byref white as Double, byref alpha as Double)

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the receiver's grayscale value and alpha values.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(1.0, 1.0)
dim w,a as Double

c.getWhite(w,a)

MsgBox str(w)+" "+str(a)
```

Notes:

white: Upon return, contains the grayscale value of the color object.
alpha: Upon return, contains the opacity value of the color object. (optionally)

This method works only with objects representing colors in the NSCalibratedWhiteColorSpace, NSCalibratedBlackColorSpace, NSDeviceBlackColorSpace, or NSDeviceWhiteColorSpace color space. Sending it to other objects raises an exception.
See also:

- 36.4.68 getWhite(byref white as Double) 8696

36.4.70 grayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 0.5 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.grayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.71 greenColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.0, 1.0, 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.greenColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.72 gridColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the optional gridlines in, for example, a table view.
Example:

```
dim c as NSColorMBS = NSColorMBS.gridColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.73 headerColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used as the background color for header cells in table views and outline views.
Example:

```
dim c as NSColorMBS = NSColorMBS.headerColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used as the background for header cells in table and outline views.

36.4.74 headerTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text in header cells in table views and outline views.
Example:

```
dim c as NSColorMBS = NSColorMBS.headerTextColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.75 highlightColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color that represents the virtual light source on the screen.
Example:

```
dim c as NSColorMBS = NSColorMBS.highlightColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.76 highlightWithLevel(level as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object that represents a blend between the receiver and the highlight color returned by highlightColor.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim h as NSColorMBS = c.highlightWithLevel(0.5)
MsgBox h.description
```

Notes:

level: The amount of the highlight color that is blended with the receiver's color. This should be a number from 0.0 through 1.0. A highlightLevel below 0.0 is interpreted as 0.0; a highlightLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can't be converted.

Invoke this method when you want to brighten the receiving NSColor for use in highlights.

36.4.77 keyboardFocusIndicatorColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color that represents the keyboard focus ring around controls.
Example:

```
dim c as NSColorMBS = NSColorMBS.keyboardFocusIndicatorColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.78 knobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the flat surface of a slider knob that hasn't been selected.
Example:

```
dim c as NSColorMBS = NSColorMBS.knobColor
```

```
window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The knob's beveled edges, which set it in relief, are drawn in highlighted and shadowed versions of the face color. When a knob is selected, its color changes to selectedKnobColor.

36.4.79 labelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for static text and related elements.
Notes: Requires MacOS 10.10 or newer.

36.4.80 lightGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale value is 2/3 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.lightGrayColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.81 linkColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for standard system links
Notes: Requires MacOS 10.10 or newer.

36.4.82 magentaColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 0.0, 1.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.magentaColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.83 orangeColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 0.5, 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.orangeColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.84 patternImage as Variant

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the image that the receiver is using as a pattern.
Example:

```
dim p as Picture = LogoMBS(100)
dim n as new NSImageMBS(p)
dim c as NSColorMBS = NSColorMBS.colorWithPatternImage(n)
dim x as NSImageMBS = c.patternImage

Backdrop=x.CopyPictureWithMask
```

Notes:

The image used by the color object. If the receiver doesn't have an image, this method raises an exception.

Declared a variant instead of NSImageMBS to reduce plugin dependencies.

36.4.85 placeholderTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for placeholder text in controls or text views.
Notes: Requires MacOS 10.10 or newer.

36.4.86 purpleColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 0.5, 0.0, 0.5 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.purpleColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.87 quaternaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for large secondary or disabled static text, separators, large glyphs/icons, etc.
Notes: Requires MacOS 10.10 or newer.

36.4.88 redColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 0.0, 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.redColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.89 scrollBarColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for scroll "bars",Äîthat is, for the groove in which a scroller's knob moves.
Example:

```
dim c as NSColorMBS = NSColorMBS.scrollBarColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for scroll bars.

36.4.90 scrubberTexturedBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The scrubber texture background color.

36.4.91 secondaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for secondary static text and related elements.
Notes: Requires MacOS 10.10 or newer.

36.4.92 secondarySelectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used in non-key views.
Example:

```
dim c as NSColorMBS = NSColorMBS.secondarySelectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.93 selectedContentBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background color of selected and emphasized (focused) content: table views rows, collection views, etc.
Notes:

Alias for alternateSelectedControlColor
Requires MacOS 10.14 or newer.

36.4.94 selectedControlColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the face of a selected control.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedControlColor

window1.Title=c.description
window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the face of a selected control,Äîa control being dragged or clicked.

36.4.95 selectedControlTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text in a selected control,Äîa control being clicked or dragged.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedControlTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.96 selectedKnobColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the slider knob when it is selected.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedKnobColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for a slider knob that is selected,Äîthat is, dragged.

36.4.97 selectedMenuItemColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the face of selected menu items.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedMenuItemColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for selected menu items.

36.4.98 selectedMenuItemTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the text in menu items.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedMenuItemTextColor

Title=c.description
```

window1.HasBackColor=true
window1.backcolor=c.colorValue

Notes: The system color used for text in selected menu items.

36.4.99 selectedTextBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the background of selected text.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedTextBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.100 selectedTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for selected text.
Example:

```
dim c as NSColorMBS = NSColorMBS.selectedTextColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.101 separatorColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground used for separators between sections of content.
Notes:

Not appropriate for use as split view or window chrome dividers.
Requires MacOS 10.14 or newer.

36.4.102 shadowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color that represents the virtual shadows cast by raised objects on the screen.
Example:

```
dim c as NSColorMBS = NSColorMBS.shadowColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.103 shadowWithLevel(level as Double) as NSColorMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColor object that represents a blend between the receiver and the shadow color returned by shadowColor.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
dim h as NSColorMBS = c.shadowWithLevel(0.5)
MsgBox h.description
```

Notes:

level: The amount of the shadow color used for the blend. This should be a number from 0.0 through 1.0. A shadowLevel below 0.0 is interpreted as 0.0; a shadowLevel above 1.0 is interpreted as 1.0.

Returns the new NSColor object. Returns nil if the colors can't be converted.

Invoke this method when you want to darken the receiving NSColor for use in shadows.

36.4.104 systemBlueColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system blue color.
Notes: Requires MacOS 10.10 or newer.

36.4.105 systemBrownColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system brown color.
Notes: Requires MacOS 10.10 or newer.

36.4.106 systemGrayColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system gray color.
Notes: Requires MacOS 10.10 or newer.

36.4.107 systemGreenColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system green color.
Notes: Requires MacOS 10.10 or newer.

36.4.108 systemIndigoColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system indigo color.
Notes: Available in MacOS 10.15 or later.

36.4.109 systemOrangeColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system orange color.
Notes: Requires MacOS 10.10 or newer.

36.4.110 systemPinkColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system pink color.
Notes: Requires MacOS 10.10 or newer.

36.4.111 systemPurpleColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system purple color.
Notes: Requires MacOS 10.10 or newer.

36.4.112 systemRedColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system red color.
Notes: Requires MacOS 10.10 or newer.

36.4.113 systemTealColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The system teal color.
Notes: Available in MacOS 10.12 or later.

36.4.114 systemYellowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: The system yellow color.
Notes: Requires MacOS 10.10 or newer.

36.4.115 tertiaryLabelColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Foreground color for disabled static text and related elements.
Notes: Requires MacOS 10.10 or newer.

36.4.116 textBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the text background.
Example:

```
dim c as NSColorMBS = NSColorMBS.textBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for the background of text. When text is selected, its background color changes to the return value of selectedTextBackgroundColor.

36.4.117 textColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for text.
Example:

```
dim c as NSColorMBS = NSColorMBS.textColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

Notes: The system color used for text. When text is selected, its color changes to the return value of selectedTextColor.

36.4.118 underPageBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Background areas revealed behind documents. This should not be used for drawing, and NSVisualEffectMaterialUnderPageBackground should be used instead.
Notes: Requires MacOS 10.8 or newer.

36.4.119 unemphasizedSelectedContentBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background color of selected and unemphasized content: table views rows, collection views, etc.
Notes:

Requires MacOS 10.14 or newer.
Alias for secondarySelectedControlColor

36.4.120 unemphasizedSelectedTextBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The background for unemphasized text selection (e.g. when the associated control/view/window is not key)
Notes: Requires MacOS 10.14 or newer.

36.4.121 unemphasizedSelectedTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The foreground for unemphasized text selection (e.g. when the associated control/view/window is not key)
Notes: Requires MacOS 10.14 or newer.

36.4.122 whiteColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose grayscale and alpha values are both 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.whiteColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.123 windowBackgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a pattern color that will draw the ruled lines for the window background.
Example:

```
dim c as NSColorMBS = NSColorMBS.windowBackgroundColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.124 windowFrameColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for window frames, except for their text.
Example:

```
dim c as NSColorMBS = NSColorMBS.windowFrameColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.125 windowFrameTextColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the system color used for the text in window frames.
Example:

```
dim c as NSColorMBS = NSColorMBS.windowFrameTextColor

// convert to Calibrated RGB ColorSpace
c=c.colorUsingColorSpaceName("NSCalibratedRGBColorSpace")

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.126 writeToPasteboard

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Writes the receiver's data to the specified pasteboard.

36.4.127 yellowColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: All.

Function: Returns an NSColor object whose RGB value is 1.0, 1.0, 0.0 and whose alpha value is 1.0.
Example:

```
dim c as NSColorMBS = NSColorMBS.yellowColor

Title=c.description

window1.HasBackColor=true
window1.backcolor=c.colorValue
```

36.4.128 Properties

36.4.129 alphaComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The alpha value of the color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.alphaComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.130 blackComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.blackComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.131 blueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a RGB color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.blueComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.132 brightnessComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a HSV color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.brightnessComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.133 catalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the catalog containing the receiver's name.
Notes:

This method raises an exception if the receiver's color space isn't NSNamedColorSpace.
(Read only property)

36.4.134 colorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's name.
Notes:

This method raises an exception if the receiver's color space isn't NSNamedColorSpace.
(Read only property)

36.4.135 colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Get the color space of the color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)

MsgBox c.colorSpaceName
```

Notes: (Read only property)

36.4.136 colorValue as color

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Returns the color value of this color (ignoring color space).
Notes:

The alphaComponent is ignored.
Returns RGB(RedComponent*255, GreenComponent*255, BlueComponent*255).

Plugin converts color to calibrated RGB if needed.
The color is converted to generic RGB Colorspace if needed as that is the one Xojo uses for pictures.
(Read only property)

36.4.137 cyanComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.cyanComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.138 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: The description of the color object.
Example:

```
dim n as NSColorMBS = NSColorMBS.blueColor

MsgBox n.description // shows "NSCalibratedRGBColorSpace 0 0 1 1"
```

Notes: (Read only property)

36.4.139 greenComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a RGB color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.greenComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.140 Handle as Integer

MBS MacBase Plugin, Plugin Version: 16.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes:

Useful for declares. Value is a NSColor pointer.
(Read and Write property)

36.4.141 hueComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a HSV color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.hueComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.142 localizedCatalogNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the catalog containing the receiver's name as a localized string.
Notes:

This string may be displayed in user interface items like color pickers.
(Read only property)

36.4.143 localizedColorNameComponent as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the name of the receiver as a localized string.
Notes:

The name of color object as a localized string. This string may be displayed in user interface items like color pickers.
(Read only property)

36.4.144 magentaComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.magentaComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.145 numberOfComponents as Integer

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Returns the number of components in the receiver.
Example:

```
dim n as NSColorMBS = NSColorMBS.blueColor

MsgBox str(n.numberOfComponents) // shows 4
```

Notes:

The number of components in the color object. The floating-point components counted include alpha. This method raises an exception if the receiver doesn't have floating-point components.

Available in Mac OS X v10.4 and later.
(Read only property)

36.4.146 redComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a RGB color.
Example:

```
dim c as NSColorMBS = NSColorMBS.blueColor
MsgBox str(c.redComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.147 saturationComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a HSV color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceHSV(0.1, 0.2, 0.3)
MsgBox str(c.saturationComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.148 Type as Integer

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Return the type of the color, which in turn determines which accessors are valid for this color.
Notes:

It's an exception-raising error to use properties that are not valid for a color; so, before using a given accessor on a color, call colorUsingType to convert the color to the appropriate type. Or, if wanting to use colorSpace-specific accessors such as redComponent, convert to the desired colorSpace with colorUsingColorSpace.

Note that as of macOS 10.13, the new APIs type and colorUsingType replace colorSpaceName and colorUsingColorSpaceName as the funnel APIs for determining the type of color. In code destined to run on 10.13 and newer systems, subclassers are encouraged to implement these two rather than the older colorSpaceName based methods.

Requires MacOS 10.13 or newer.
(Read only property)

36.4.149 whiteComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a Gray color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceWhite(0.1)
MsgBox str(c.whiteComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.150 yellowComponent as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The color value from a CMYK color.
Example:

```
dim c as NSColorMBS = NSColorMBS.colorWithDeviceCMYK(0.1, 0.2, 0.3, 0.4)
MsgBox str(c.yellowComponent)
```

Notes:

Value is from 0.0 to 1.0.
(Read only property)

36.4.151 Constants

36.4.152 SystemEffectDeepPressed = 2

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the system effect constants.
Notes: Deep Pressed

36.4.153 SystemEffectDisabled = 3

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the system effect constants.
Notes: Disabled

36.4.154 SystemEffectNone = 0

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the system effect constants.
Notes: No

36.4.155 SystemEffectPressed = 1

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the system effect constants.
Notes: Pressed

36.4.156 SystemEffectRollover = 4

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the system effect constants.
Notes: Rollover

36.4.157 TypeCatalog = 2

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the color type constants.
Notes: nColor with a catalog name and a color name. These colors can be dynamic and have multiple underlying color values.one

36.4.158 TypeComponentBased = 0

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the color type constants.
Notes: Colors which have a color space (specified as NSColorSpace) and appropriate number of CGFloat components.

36.4.159 TypePattern = 1

MBS MacBase Plugin, Plugin Version: 18.4.

Function: One of the color type constants.
Notes: Colors that draw a pattern, specified as an NSImage.

36.5 class NSColorPanelMBS

36.5.1 class NSColorPanelMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to control a Color Panel (floating window).
Notes:

If you use SelectColor in your application, this color panel will be converted in a dialog which makes this class useless.

You should only have one instance of this class in your application.

If you compile for Cocoa, a TextField/TextArea automatically registers for color panel. So in order to avoid them updating text color with color panel selection, clear the focus by calling window.clearfocus method.

This class does only work on desktop computers, not in a webbrowser.

See WinColorPickerMBS class for Windows.
Subclass of the NSPanelMBS class.

36.5.4 Methods

36.5.5 attachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Attaches the given color list to the panel.
Notes: An application should use this method to add an NSColorList saved with a document in its file package or in a directory other than NSColorList's standard search directories.

36.5.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop only.

Function: The constructor to create a new color panel.

36.5.7 detachColorList(list as NSColorListMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Detaches the color list from the panel.

36.5.8 GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color in the RGB color model.
Notes:

Values from 0.0 to 1.0.
Returns true if the values are valid.
See also:

- 36.5.23 getColor as NSColorMBS 8730

36.5.9 GetColorFromDrag as color

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns color values from the drag.
Notes:

If you receive a drag flavor which can't be handled, it may be a NSColor.
In this case only this method will be successfull.
See also:

- 36.5.10 GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean 8727

36.5.10 GetColorFromDrag(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns color values from the drag.
Notes:

If you receive a drag flavor which can't be handled, it may be a NSColor.
In this case only this method will be successfull.
See also:

- 36.5.9 GetColorFromDrag as color 8726

36.5.11 orderFrontColorPanel

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Brings up the color panel, an instance of NSColorPanel.
Notes: If the NSColorPanel object does not exist yet, this method creates one. This method is typically invoked when the user chooses Colors from a menu.

36.5.12 SetColor(red as single, green as single, blue as single, alpha as single)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Sets the color.
Notes: Values from 0.0 to 1.0.
See also:

- 36.5.13 setColor(value as NSColorMBS) 8727

36.5.13 setColor(value as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Sets the color.
See also:

• 36.5.12 SetColor(red as single, green as single, blue as single, alpha as single) 8727

36.5.14 setContinuous(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether you want to receive Changed events while the user chooses the color.
Notes: Set value to true to have the receiver calls the Changed event continuously as the color of the NSColorPanel is set by the user; otherwise false.

36.5.15 setMode(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Sets the mode of the panel the mode is one of the modes allowed by the color mask.
Notes:

Constants:

```
const NSGrayModeColorPanel              = 0
const NSRGBModeColorPanel               = 1
const NSCMYKModeColorPanel              = 2
const NSHSBModeColorPanel               = 3
const NSCustomPaletteModeColorPanel     = 4
const NSColorListModeColorPanel         = 5
const NSWheelModeColorPanel             = 6
const NSCrayonModeColorPanel            = 7
```

36.5.16 SetPickerMode(value as Integer)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Specifies the color panel's initial picker.
Notes:

Constants:

36.5.17 setShowsAlpha(value as boolean)

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Tells the panel whether or not to show alpha values and an opacity slider.
Notes: Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set

NSColorPanelGrayModeMask	= & h00000001
NSColorPanelRGBModeMask	= & h00000002
NSColorPanelCMYKModeMask	= & h00000004
NSColorPanelHSBModeMask	= & h00000008
NSColorPanelCustomPaletteModeMask	= & h00000010
NSColorPanelColorListModeMask	= & h00000020
NSColorPanelWheelModeMask	= & h00000040
NSColorPanelCrayonModeMask	= & h00000080
NSColorPanelAllModesMask	= & h0000ffff

with this method.

36.5.18 SharedColorPanelExists as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the NSColorPanel has been created already.
Notes: True if the NSColorPanel has been created already; otherwise false.

36.5.19 Properties

36.5.20 accessoryView as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: The accessory view displayed in the panel.
Notes:

The accessory view can be any custom view you want to display with NSColorPanel, such as a view offering color blends in a drawing program. The accessory view is displayed below the color picker and above the color swatches in the NSColorPanel. The NSColorPanel automatically resizes to accommodate the accessory view.
(Read and Write property)

36.5.21 alpha as Double

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns the receiver's current alpha value based on its opacity slider.
Notes:

Value is in the range between 0.0 and 1.0.
This is 1.0 (opaque) if the panel has no opacity slider.

(Read only property)

36.5.22 ColorValue as Color

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color as a Xojo color in the RGB model.
Notes: (Read and Write property)

36.5.23 getColor as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color.
Notes:

The color returned can be RGB or something else.
(Read and Write property)
See also:

- 36.5.8 GetColor(byref red as single, byref green as single, byref blue as single, byref alpha as single) as boolean 8726

36.5.24 getColorAsRGB as NSColorMBS

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The current color.
Notes:

Returned NSColorMBS object is in RGB color mode.
(Read only property)

36.5.25 isContinuous as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether the class continuously calls the Changed event.
Notes:

Returns true if the receiver continuouslycalls the Changed event as the user manipulates the color picker; otherwise false.
(Read and Write property)

36.5.26 mode as Integer

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns the color picker mode.
Notes:

Constants:

const NSGrayModeColorPanel	= 0
const NSRGBModeColorPanel	= 1
const NSCMYKModeColorPanel	= 2
const NSHSBModeColorPanel	= 3
const NSCustomPaletteModeColorPanel	= 4
const NSColorListModeColorPanel	= 5
const NSWheelModeColorPanel	= 6
const NSCrayonModeColorPanel	= 7

(Read and Write property)

36.5.27 showsAlpha as boolean

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value indicating whether or not the panel shows alpha values and an opacity slider.
Notes:

Note that calling the NSColor method setIgnoresAlpha with a value of true overrides any value set with setShowsAlpha.
(Read and Write property)

36.5.28 Events

36.5.29 Changed

MBS MacCocoa Plugin, Plugin Version: 7.2, Platform: macOS, Targets: .

Function: The color changed.
Notes: May not fire in the RB IDE.

36.5.30 DidMove

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: The color panel did move.

36.5.31 GotFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: The color panel got focus.

36.5.32 Hidden

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: The color panel is hidden.

36.5.33 LostFocus

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: The color panel lost focus.

36.5.34 Shown

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: The color panel shows.

36.5.35 WillClose

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: .

Function: The color panel will close.

36.5.36 Constants

36.5.37 NSCMYKModeColorPanel = 2

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Cyan-yellow-magenta-black

36.5.38 NSColorListModeColorPanel = 5

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Custom color list

36.5.39 NSColorPanelAllModesMask = & h0000ffff

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: All of the above.

36.5.40 NSColorPanelCMYKModeMask = & h00000004

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Cyan-yellow-magenta-black.

36.5.41 NSColorPanelColorListModeMask = & h00000020

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Custom color list.

36.5.42 NSColorPanelCrayonModeMask = & h00000080

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Crayons.

36.5.43 NSColorPanelCustomPaletteModeMask = & h00000010

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Custom palette.

36.5.44 NSColorPanelGrayModeMask = & h00000001

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Grayscale-alpha.

36.5.45 NSColorPanelHSBModeMask = & h00000008

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Hue-saturation-brightness.

36.5.46 NSColorPanelRGBModeMask = & h00000002

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Red-green-blue.

36.5.47 NSColorPanelWheelModeMask = & h00000040

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the masks to specify the which modes the panel allows.
Notes: Color wheel.

36.5.48 NSCrayonModeColorPanel = 7

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Crayons.

36.5.49 NSCustomPaletteModeColorPanel = 4

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Custom palette

36.5.50 NSGrayModeColorPanel = 0

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Grayscale-alpha

36.5.51 NSHSBModeColorPanel = 3

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Hue-saturation-brightness

36.5.52 NSNoModeColorPanel = -1

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes:

Indicates no color panel mode.
Available in OS X version 10.5 and later.

36.5.53 NSRGBModeColorPanel = 1

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Red-green-blue

36.5.54 NSWheelModeColorPanel = 6

MBS MacCocoa Plugin, Plugin Version: 14.2.

Function: On of the modes to specify the active color mode used when NSColorPanel is masked for more than one color mode.
Notes: Color wheel

36.5.55 Screenshots

36.5.56 NSColorPanel.jpg

Function: The NSColorPanel running in a Xojo application.

36.6 class NSColorSamplerMBS

36.6.1 class NSColorSamplerMBS

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class for color sampler.

36.6.6 Methods

36.6.7 Available as Boolean

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether NSColorSampler is available.
Notes: Returns true on MacOS 10.15 or newer.

36.6.8 Constructor

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: May raise PlatformNotSupportedException if not available.

36.6.9 Show

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Shows the color sampler.
Notes:

Begins or attaches to an existing color sampling session which presents UI to the user for selecting a color from their screen. The handler will be called on the main thread when the user completes the session (either by selection, or cancelation). In the event of user-cancellation, the color passed with be nil.

Calls Completed event later.

36.6.10 Properties

36.6.11 Handle as Integer

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

36.6.12 Events

36.6.13 Completed(selectedColor as NSColorMBS)

MBS MacBase Plugin, Plugin Version: 19.4, Platform: macOS, Targets: .

Function: The event called when color sampler finished.
Notes: selectedColor is selected color or nil in case of cancel.

36.7 class NSColorSpaceMBS

36.7.1 class NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSColorSpace class enables the creation of objects representing custom color spaces.
Notes: You can make custom color spaces from ColorSync profiles or from ICC profiles. NSColorSpace also has factory methods that return objects representing the system color spaces.

36.7.4 Methods

36.7.5 adobeRGB1998ColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing an Adobe RGB (1998) color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.adobeRGB1998ColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The Adobe RGB (1998) color space was designed to encompass most of the colors achievable on CMYK color printers, but by using RGB primary colors on a device such as the computer display. For more information on this color space, go to this website:

http://www.adobe.com/digitalimag/adobergb.html

36.7.6 availableColorSpacesWithModel(Model as Integer) as NSColorSpaceMBS()

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the list of color spaces available on the system that are displayed in the color panel, in the order they are displayed in the color panel.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSRGBColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

This method doesn't return color spaces created on the fly or spaces without user-displayable names. Pass NSUnknownColorSpaceModel as model to get all available color spaces.

Available in Mac OS X v10.6 and later.

36.7.7 CGColorSpaceHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Core Graphics color-space object that represents a color space equivalent to the receiver's.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.CGColorSpaceHandle)
```

Notes:

A reference to an Core Graphics color-space object (CGColorSpaceRef) or 0if the type of color space represented by the receiver cannot be represented by a CGColorSpace object.

Available in Mac OS X version 10.5.

36.7.8 colorSpaceForColorSpaceName(name as string) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The colorspace for this color space name.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceWhiteColorSpace)
MsgBox n.localizedName
```

Notes:

This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.

Works well on Mac OS X 10.6.

36.7.9 ColorSpaceWithCGColorSpace(CGColorSpaceHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.

36.7.10 ColorSpaceWithColorSyncProfile(ColorSyncProfileHandle as Integer) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given a ColorSync profile.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

36.7.11 ColorSpaceWithICCProfileData(File as FolderItem) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given an ICC profile.
Notes:

file: The path to the ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 36.7.12 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS 8745

36.7.12 ColorSpaceWithICCProfileData(ICCProfileData as Memoryblock) as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given an ICC profile.
Notes:

ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Returns the initialized NSColorSpace object or nil if initialization was not successful.
Available in Mac OS X v10.4 and later.
See also:

- 36.7.11 ColorSpaceWithICCProfileData(File as FolderItem) as NSColorSpaceMBS 8744

36.7.13 colorSyncProfileHandle as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the ColorSync profile from which the receiver was created.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox hex(n.colorSyncProfileHandle)
```

Notes:

The ColorSync profile on which the receiver is based. You need to cast this value to an object of opaque type CMProfileRef. Returns NULL if the receiver was created from a ICC-profile data instead. See ColorSync Manager Reference for further information on CMProfileRef.

Available in Mac OS X v10.4 and later.

36.7.14 Constructor(ICCProfileData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given an ICC profile.
Notes:

ICCProfileData:
The ICC profile to use when initializing the NSColorSpace object. For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

36.7.15 deviceCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a calibrated or device-dependent CMYK color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceCMYKColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color space has cyan, magenta, yellow, black, and alpha components. Typical devices that use the color-subtractive CMYK color space are color printers. This object corresponds to the Cocoa color space name NSDeviceCMYKColorSpace.

Available in Mac OS X v10.4 and later.

36.7.16 deviceGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a calibrated or device-dependent gray color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceGrayColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. The color space also includes an alpha component. Typical devices that use this color space are grayscale printers and displays. This object corresponds to the Cocoa color space name NSDeviceWhiteColorSpace.

Available in Mac OS X v10.4 and later.

36.7.17 deviceRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a calibrated or device-dependent RGB color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.deviceRGBColorSpace
MsgBox n.localizedName
```

Notes: The NSColorSpace object. This color space has red, green, blue, and alpha components. Typical devices that use the color-additive RGB color space are displays and scanners. This object corresponds to the Cocoa color space name NSDeviceRGBColorSpace.

36.7.18 genericCMYKColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a device-independent CMYK color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericCMYKColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color space has cyan, magenta, yellow, black and alpha component.

Available in Mac OS X v10.4 and later.

36.7.19 genericGamma22GrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a gray color space with a gamma value of 2.2.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericGamma22GrayColorSpace
MsgBox n.localizedName
```

Notes: Available in Mac OS X v10.6 and later.

36.7.20 genericGrayColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a device-independent gray color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericGrayColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. The color space also includes an alpha component. This object corresponds to the Cocoa color space name NSCalibratedWhiteColorSpace.

Available in Mac OS X v10.4 and later.

36.7.21 genericRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing a device-independent RGB color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components. This object corresponds to the Cocoa color space name NSCalibratedRGBColorSpace.

Available in Mac OS X v10.4 and later.

36.7.22 ICCProfileData as Memoryblock

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the ICC profile data from which the receiver was created.
Notes:

The ICC profile from which the receiver was created. This method attempts to compute the profile data from a CMProfileRef object and returns nil if it is unable to.

For information on ICC profiles, see the latest ICC specification at the International Color Consortium website.

Available in Mac OS X v10.4 and later.

36.7.23 initWithCGColorSpace(CGColorSpaceHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object initialized from a Core Graphics color-space object.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful, which might happen if the color space represented by the CGColorSpace object is not supported by NSColorSpace.

Because NSColorSpace might retain or copy the CGColorSpace object depending on circumstances, you should not assume pointer equality of the provided object with that returned by CGColorSpace. And even if the pointer equality is preserved during runtime, it may not be after the NSColorSpace object is archived and unarchived.

Available in Mac OS X version 10.5 and later.

36.7.24 initWithColorSyncProfile(ColorSyncProfileHandle as Integer)

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSColorSpace object given a ColorSync profile.
Notes:

The initialized NSColorSpace object or nil if initialization was not successful.

Available in Mac OS X v10.4 and later.

36.7.25 sRGBColorSpace as NSColorSpaceMBS

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSColorSpace object representing an sRGB color space.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedName
```

Notes:

The NSColorSpace object. This color-additive color space has red, green, blue, and alpha components.

The sRGB color space is a standard color space for use on monitors, printers, and the Internet. For further information on sRGB, see this website:

http://www.color.org/srgb.html

Available in Mac OS X version 10.5.

36.7.26 Properties

36.7.27 colorSpaceModel as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the model on which the color space of the receiver is based.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
```

MsgBox str(n.colorSpaceModel)

Notes:

Available in Mac OS X v10.4 and later.
(Read only property)

36.7.28 colorSpaceName as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the colorspace.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.genericRGBColorSpace
MsgBox n.colorSpaceName
```

Notes:

This plugin function uses an undocumented method from Apple's AppKit framework. Seems like they use it only internally.

Works well on Mac OS X 10.6.
Returns an empty string for some color spaces.
(Read only property)

36.7.29 description as string

MBS MacBase Plugin, Plugin Version: 9.8, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the description of the color space.
Notes: (Read only property)

36.7.30 File as FolderItem

MBS MacBase Plugin, Plugin Version: 18.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: The reference to file if available.
Notes:

Will be nil for profiles created from string/MemoryBlock.

(Read only property)

36.7.31 Handle as Integer

MBS MacBase Plugin, Plugin Version: 17.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

36.7.32 localizedName as string

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the localized name of the receiver.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox n.localizedName
```

Notes:

The name of the color space as a localized string or nil if no localized name exists.

Available in Mac OS X v10.4 and later.
(Read only property)

36.7.33 numberOfColorComponents as Integer

MBS MacBase Plugin, Plugin Version: 8.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of components supported by the receiver.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.sRGBColorSpace
MsgBox str(n.numberOfColorComponents) // shows 3
```

Notes:

The number of components (excluding alpha) the receiver supports or zero if the receiver is not based on float components.

Available in Mac OS X v10.4 and later.
(Read only property)

36.7.34 Constants

36.7.35 NSCalibratedBlackColorSpace = "NSCalibratedBlackColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Calibrated color space with black and alpha components (pure black is 1.0)
Example:

dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedBlackColorSpace)
MsgBox n.localizedName

Notes: Deprecated in Mac OS X v10.6.

36.7.36 NSCalibratedRGBColorSpace = "NSCalibratedRGBColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Calibrated color space with red, green, blue, and alpha components.
Example:

dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedRGBColorSpace)
MsgBox n.localizedName

Notes: You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.

36.7.37 NSCalibratedWhiteColorSpace = "NSCalibratedWhiteColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Calibrated color space with white and alpha components (pure white is 1.0)
Example:

dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NSCalibratedWhiteColorSpace)

```
MsgBox n.localizedName
```

36.7.38 NSCMYKColorSpaceModel=2

MBS MacBase Plugin, Plugin Version: 8.6.

Function: The CYMK (cyan, yellow, magenta, black) color-space model.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSCMYKColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

Can refer to both device-dependent and generic color space variants.
Available in Mac OS X v10.4 and later.

36.7.39 NSCustomColorSpace = "NSCustomColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Custom NSColorSpace object and floating-point components describing a color in that space.
Notes: A custom color-space object represents a color space that is not necessarily predefined by the Application Kit. See "Working With Color Spaces" for information on creating custom color-space objects.

36.7.40 NSDeviceBlackColorSpace = "NSDeviceBlackColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Device-dependent color space with black and alpha components (pure black is 1.0)
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceBlackColorSpace)
MsgBox n.localizedName
```

36.7.41 NSDeviceCMYKColorSpace = "NSDeviceCMYKColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Device-dependent color space with cyan, magenta, yellow, black, and alpha components.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceCMYKColorSpace)
MsgBox n.localizedName
```

36.7.42 NSDeviceNColorSpaceModel=4

MBS MacBase Plugin, Plugin Version: 8.6.

Function: DeviceN is a color-space model from Adobe Systems, Inc. used in PostScript and PDF color specification.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSDeviceNColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X v10.4 and later.

36.7.43 NSDeviceRGBColorSpace = "NSDeviceRGBColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Device-dependent color space with red, green, blue, and alpha components.
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceRGBColorSpace)
MsgBox n.localizedName
```

Notes: You can also create a color with HSB (hue, saturation, brightness) and alpha components and can extract these components.

36.7.44 NSDeviceWhiteColorSpace = "NSDeviceWhiteColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Device-dependent color space with white and alpha components (pure white is 1.0)
Example:

```
dim n as NSColorSpaceMBS = NSColorSpaceMBS.colorSpaceForColorSpaceName(NSColorSpaceMBS.NS-
DeviceWhiteColorSpace)
MsgBox n.localizedName
```

36.7.45 NSGrayColorSpaceModel=0

MBS MacBase Plugin, Plugin Version: 8.6.

Function: The grayscale color-space model. Can refer to both device-dependent and generic color space variants.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSGrayColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next
```

```
MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X v10.4 and later.

36.7.46 NSIndexedColorSpaceModel=5

MBS MacBase Plugin, Plugin Version: 8.6.

Function: An indexed color space, which identifies specified discrete colors in a color list by index number.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSIndexedColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

An indexed color value (a color specification in indexed color space) consists of an index value that refers to a color in a color list.

Available in Mac OS X version 10.5 and later.

36.7.47 NSLABColorSpaceModel=3

MBS MacBase Plugin, Plugin Version: 8.6.

Function: The L*a*b* device-independent color-space model, which represents colors relative to a reference white point.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSLABColorSpaceModel
```

```
a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X v10.4 and later.

36.7.48 NSNamedColorSpace = "NSNamedColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Catalog name and color name components.
Notes: The components of this color space are indexes into lists or catalogs of prepared colors. The catalogs of named colors come with lookup tables that are able to generate the correct color on a given device.

36.7.49 NSPatternColorSpace = "NSPatternColorSpace"

MBS MacBase Plugin, Plugin Version: 9.8.

Function: Pattern image (tiled)
Notes: Identifies a pattern color space, which is simply an image that is repeated over and over again in a tiled pattern.

36.7.50 NSPatternColorSpaceModel=6

MBS MacBase Plugin, Plugin Version: 8.6.

Function: Identifies a pattern color space, which is simply an image that is repeated over and over again in a tiled pattern.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSPatternColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)
```

```
dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes: Available in Mac OS X version 10.5 and later.

36.7.51 NSRGBColorSpaceModel=1

MBS MacBase Plugin, Plugin Version: 8.6.

Function: The RGB (red green blue) color-space model.
Example:

```
dim a(-1) as NSColorSpaceMBS
dim m as Integer = NSColorSpaceMBS.NSRGBColorSpaceModel

a = NSColorSpaceMBS.availableColorSpacesWithModel(m)

dim names(-1) As string

for each c as NSColorSpaceMBS in a
names.Append c.localizedName
next

MsgBox Join(names,EndOfLine)
```

Notes:

Can refer to both device-dependent and generic color space variants.
Available in Mac OS X v10.4 and later.

36.7.52 NSUnknownColorSpaceModel=-1

MBS MacBase Plugin, Plugin Version: 8.6.

Function: This model is not known to NSColorSpace.
Notes: Available in Mac OS X v10.4 and later.

36.8 class NSEPSImageRepMBS

36.8.1 class NSEPSImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** An NSEPSImageRep object can render an image from encapsulated PostScript (EPS) code.
Notes:

Won't work in macOS Sonoma since Apple removed the feature from the OS.
Subclass of the NSImageRepMBS class.

36.8.2 Blog Entries

36.8.3 Blog Entries

- MBS Xojo Plugins, version 23.3pr2
- EPS support deprecated in macOS Sonoma
- MBS Xojo Plugins, version 18.1pr2
- MBS Real Studio Plugins, version 12.0pr5

36.8.4 Methods

36.8.5 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the rectangle that bounds the receiver.
Notes: This rectangle is obtained from the "% % BoundingBox:" comment in the EPS header when the NSEPSImageRep object is initialized.

36.8.6 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an NSEPSImageRep object initialized with the specified EPS data.
Notes:

The size of the receiver is set using the bounding box information specified in the EPS header comments.
On success the handle property is not zero.

36.8.7 EPSRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the EPS representation of the receiver.

36.8.8 imageRepWithData(data as Memoryblock) as NSEPSImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSEPSImageRep object initialized with the specified EPS data.
Notes:

Returns a new, initialized NSEPSImageRep object or nil if the object could not be initialized.
The size of the receiver is set using the bounding box information specified in the EPS header comments.

36.8.9 prepareGState

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Implemented by subclasses to configure the graphics state prior to drawing.
Notes: The draw method of NSEPSImageRep sends this message to itself just before rendering the EPS code. The default implementation of this method does nothing. You can override it in your subclass to prepare the graphics state as needed.

36.8.10 Properties

36.8.11 pdfImage as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The PDF representation of the image.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("logo_new.eps")

// read in as image
dim image as new nsimageMBS(f)

// get represenations
dim reps() as NSImageRepMBS = image.representations

// get EPS representation
dim rep as NSEPSImageRepMBS = NSEPSImageRepMBS(Reps(0))

// get PDF representation
dim pdf as NSPDFImageRepMBS = rep.pdfImage

Break
```

Notes:

When you load an EPS file, a PDF file is automatically created.
(Read only property)

36.9 class NSGraphicsMBS

36.9.1 class NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: The Cocoa class for drawing.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes:

The plugin often provides in events such objects for drawing. In that case please only use the object in the event and don't store it for later use. It is only valid with in a draw event.

Internally this is a NSGraphicsContext object.

If you create objects on your own, make sure you only use the methods while the object is valid.

36.9.6 Methods

36.9.7 addClip(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Intersects the area enclosed by the receiver's path with the clipping path of the current graphics context and makes the resulting shape the current clipping path.
Notes: This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver's path.

36.9.8 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Calculates and returns bounding rectangle for the receiver drawn using the options specified, within the given rectangle in the current graphics context.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// query size
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)
dim r as NSRectMBS = g.boundingRectWithSize(m, new NSSizeMBS(canvas1.Width, canvas1.Height),
g.NSStringDrawingUsesLineFragmentOrigin)

MsgBox r.String
```

Notes:

size: The size of the rectangle to draw in.
options: The string drawing options.

Returns the bounding rectangle in the current graphics context.
The origin of the rectangle returned from this method is the first glyph origin.
See also:

- 36.9.9 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DicAttributes as dictionary = nil) as NSRectMBS 8766

36.9.9 boundingRectWithSize(text as string, size as NSSizeMBS, options as Integer = 0, DicAttributes as dictionary = nil) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Calculates and returns the bounding rect for the text drawn using the given options and display characteristics, within the specified rectangle in the current graphics context.
Example:

```
Dim NSGraphics as New NSGraphicsMBS()
dim size as NSSizeMBS = new NSSizeMBS(100,100)
dim text as string = "Hello World. How are you? I'm fine. This is just a test string."
dim options as Integer = NSGraphics.NSStringDrawingUsesLineFragmentOrigin
Dim rect as NSRectMBS = NSGraphics.boundingRectWithSize(text, size, options)

MsgBox str(Rect.Width)+" "+str(Rect.Height)
```

Notes:

text: the text to use for calculation.
size: The size of the rectangle to draw in.
options: String drawing options.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of Strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding rect for the receiver drawn using the given options and display characteristics. The rect origin returned from this method is the first glyph origin.

Available in Mac OS X v10.4 and later.

See NSStringDrawing* constants. Use NSStringDrawingUsesLineFragmentOrigin to switch to multiline mode.
See also:

- 36.9.8 boundingRectWithSize(text as NSAttributedStringMBS, size as NSSizeMBS, options as Integer = 0) as NSRectMBS 8765

36.9.10 clipRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Intersects the specified rectangle with the clipping path of the current graphics context and makes the resulting shape the current clipping path
Notes: r: The rectangle to intersect with the current clipping path.

36.9.11 concat(transform as NSAffineTransformMBS)

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Concats this transform to the current transform of the graphics environment.

36.9.12 ConcatTransform(NSAffineTransform as Variant)

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: Appends the receiver's matrix to the current transformation matrix stored in the current graphics context, replacing the current transformation matrix with the result.
Notes:

Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

Concatenation is performed by matrix multiplication.

If this method is invoked from within an NSView drawRect method, then the current transformation matrix is an accumulation of the screen, window, and any superview's transformation matrices. Invoking this method defines a new user coordinate system whose coordinates are mapped into the former coordinate system according to the receiver's transformation matrix. To undo the concatenation, you must invert the receiver's matrix and invoke this method again.

NSAffineTransform must be a NSAffineTransformMBS object.

36.9.13 Constructor

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Initializes the current graphics context of the current thread.
See also:

- 36.9.14 Constructor(targetImage as NSBitmapImageRepMBS) 8768
- 36.9.15 Constructor(targetImage as NSImageMBS) 8768
- 36.9.16 Constructor(targetView as NSViewMBS) 8769
- 36.9.17 Constructor(targetWindow as DesktopWindow) 8770
- 36.9.18 Constructor(targetWindow as NSWindowMBS) 8770

- 36.9.19 Constructor(targetWindow as window) 8770

36.9.14 Constructor(targetImage as NSBitmapImageRepMBS)

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new graphics context for drawing into a bitmap image representation.
Example:

```
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as new NSGraphicsMBS(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r

Backdrop = n.CopyPictureWithMask
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.
See also:

- 36.9.13 Constructor 8767
- 36.9.15 Constructor(targetImage as NSImageMBS) 8768
- 36.9.16 Constructor(targetView as NSViewMBS) 8769
- 36.9.17 Constructor(targetWindow as DesktopWindow) 8770
- 36.9.18 Constructor(targetWindow as NSWindowMBS) 8770
- 36.9.19 Constructor(targetWindow as window) 8770

36.9.15 Constructor(targetImage as NSImageMBS)

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: Creates a new graphics context for drawing into an image.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
```

```
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.

- 36.9.18 Constructor(targetWindow as NSWindowMBS) 8770
- 36.9.19 Constructor(targetWindow as window) 8770

36.9.16 Constructor(targetView as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a Cocoa view.
Notes: Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the window.
See also:

- 36.9.13 Constructor 8767
- 36.9.14 Constructor(targetImage as NSBitmapImageRepMBS) 8768

36.9.20 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Draws all or part of the image at the specified point in the current coordinate system.
Notes:

x/y: The location in the current coordinate system at which to draw the image.
sx/sy/sw/sh: The source rectangle specifying the portion of the image you want to draw. The coordinates of this rectangle are specified in the image's own coordinate system. If you pass in zeros, the entire image is drawn.
operation: The compositing operation to use when drawing the image. See the NSCompositingOperation constants.
fraction: The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted as 1.0.

The image content is drawn at its current resolution and is not scaled unless the CTM of the current coordinate system itself contains a scaling factor. The image is otherwise positioned and oriented using the current coordinate system.

For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 36.9.21 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 8771
- 36.9.22 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 8772

36.9.21 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Draws the receiver with its font and other display attributes at the given point in the currently focused view.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawAtPoint m, new NSPointMBS(20,20)
```

Notes:

point: The point in the current view to draw the text.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

Don't invoke this method when no NSView is focused.
See also:

- 36.9.20 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 8771
- 36.9.22 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil) 8772

36.9.22 drawAtPoint(text as string, point as NSPointMBS, DicAttributes as dictionary = nil)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Draws the text with the font and other display characteristics of the given attributes, at the specified point in the currently focused view.
Notes:

Point: The origin for the bounding box for drawing the string. If the focused view is flipped, the origin is the upper-left corner of the drawing bounding box; otherwise, the origin is the lower-left corner.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire

string, rather than ranges within the string.

The width (height for vertical layout) of the rendering area is unlimited, unlike drawInRect, which uses a bounding rectangle. As a result, this method renders the text in a single line.

You should only invoke this method when an NSView object has focus.
See also:

- 36.9.20 drawAtPoint(image as NSImageMBS, x as Double, y as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 8771
- 36.9.21 drawAtPoint(text as NSAttributedStringMBS, point as NSPointMBS) 8771

36.9.23 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: draws the image into the given rectangle with the given source rectangle and the given mode.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as new NSGraphicsMBS(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes:

For Operation you use the Composite constants in this class.
In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 36.9.24 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 8774
- 36.9.25 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 8775

36.9.24 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Draws the attributed string within the given rectangle in the currently view, clipping the text layout to this rectangle.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawInRect m, new NSRectMBS(20,20, 100, 100)
```

Notes:

rect: The rectangle in which to draw.

Text is drawn within rect according to its line sweep direction; for example, Arabic text will begin at the right edge and potentially be clipped on the left.

The rect parameter determines how many glyphs are typeset within the width of a line, but it's possible for a portion of a glyph to appear outside the area of rect if the image bounding box of the particular glyph exceeds its typographic bounding box.

If the focus view is flipped, the text origin is set at the upper-left corner of the drawing bounding box; otherwise the origin is set at the lower-left corner. For text rendering, whether the view coordinates are flipped or not doesn't affect the flow of line layout, which goes from top to bottom. However, it affects the interpretation of the text origin. So, for example, if the rect argument is { 0.0, 0.0, 100.0, 100.0 } , the text

origin is { 0.0, 0.0 } when the view coordinates are flipped and { 0.0, 100.0 } when not.

Don't invoke this method when no NSView is focused.
See also:

- 36.9.23 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 8773
- 36.9.25 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil) 8775

36.9.25 drawInRect(text as string, rect as NSRectMBS, DicAttributes as dictionary = nil)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Draws the text with the font and other display characteristics of the given attributes, within the specified rectangle in the currently focused NSView.
Notes:

text: The text to draw.
Rect: The rectangle in which to draw the string.
attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

The rendering area is bounded by rect, unlike drawAtPoint, which has an unlimited width. As a result, this method renders the text in multiple lines.

You should only invoke this method when an NSView has focus.
See also:

- 36.9.23 drawInRect(image as NSImageMBS, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double) 8773
- 36.9.24 drawInRect(text as NSAttributedStringMBS, rect as NSRectMBS) 8774

36.9.26 drawPicture(image as Picture, x as Double, y as Double, w as Double, h as Double, sx as Double, sy as Double, sw as Double, sh as Double, Operation as Integer, fraction as Double)

MBS MacCocoa Plugin, Plugin Version: 17.1, Platform: macOS, Targets: Desktop only.

Function: Draws a picture.
Notes: Same as drawInRect with NSImageMBS, but using picture.

36.9.27 drawRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Draws a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

36.9.28 DrawWindowBackground(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Draws the window's default background pattern into the specified rectangle of the currently focused view.
Notes: Pass the rectangle (in the current coordinate system) in which to draw the window's background pattern.

36.9.29 drawWithRect(text as NSAttributedStringMBS, rect as NSRectMBS, options as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: All.

Function: Draws the receiver with the specified options, within the given rectangle in the current graphics context.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m

// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawWithRect m, new NSRectMBS(20,20, 100, 100), g.NSStringDrawingUsesLineFragmentOrigin
```

Notes:

rect: The rectangle specifies the rendering origin in the current graphics context.
options: The string drawing options. See NSStringDrawingOptions for the available options..

The rect argument's origin field specifies the rendering origin. The point is interpreted as the baseline origin by default. With NSStringDrawingUsesLineFragmentOrigin, it is interpreted as the upper left corner of the line fragment rect. The size field specifies the text container size. The width part of the size field specifies the maximum line fragment width if larger than 0.0. The height defines the maximum size that can be occupied with text if larger than 0.0 and NSStringDrawingUsesLineFragmentOrigin is specified. If NSStringDrawingUsesLineFragmentOrigin is not specified, height is ignored and considered to be single-line rendering (NSLineBreakByWordWrapping and NSLineBreakByCharWrapping are treated as NSLineBreakByClipping).

You should only invoke this method when there is a current graphics context.
Available in OS X v10.4 and later.

36.9.30 eraseRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Erases a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

36.9.31 fill(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Paints the region enclosed by the receiver's path.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
g.fill(b)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes:

This method fills the path using the current fill color and the receiver's current winding rule. If the path

contains any open subpaths, this method implicitly closes them before painting the fill region.

The painted region includes the pixels right up to, but not including, the path line itself. For paths with large line widths, this can result in overlap between the fill region and the stroked path (which is itself centered on the path line).

36.9.32 fillRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Fills the specified rectangular path with the current fill color.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setFillColor NSColorMBS.redColor

dim r as new NSRectMBS(10,10,200,200)
g.fillRect(r)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rectangle
```

Notes:

r: A rectangle in the current coordinate system.

This method fills the specified region immediately. This method uses the compositing operation returned by the compositingOperation method of NSGraphicsContext.
See also:

- 36.9.33 fillRect(x as Double, y as Double, w as Double, h as Double) 8778
- 36.9.34 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer) 8779

36.9.33 fillRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Fills a rectangle with the current color.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.
See also:

- 36.9.32 fillRect(r as NSRectMBS) 8778
- 36.9.34 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer) 8779

36.9.34 fillRect(x as Double, y as Double, w as Double, h as Double, operation as Integer)

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Fills a rectangle using the current fill color and the specified compositing operation.
Notes: See NSComposite* constants.
See also:

- 36.9.32 fillRect(r as NSRectMBS) 8778
- 36.9.33 fillRect(x as Double, y as Double, w as Double, h as Double) 8778

36.9.35 flushGraphics

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Forces any buffered operations or data to be sent to the receiver's destination.
Notes: Graphics contexts use buffers to queue pending operations but for efficiency reasons may not always empty those buffers immediately. This method forces the buffers to be emptied.

36.9.36 graphicsContext as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a NSGraphicsMBS object with the current graphics context of the current thread.
Example:

```
Sub Paint(g As Graphics)
// Canvas Paint event in a Mac Cocoa application

dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContext
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)

End Sub
```

Notes: Returns nil on any error.

36.9.37 graphicsContextWithCGContext(targetCGContext as Variant, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a new graphics context pointing to the given CGContextMBS object.
Example:

```
Sub Paint(g As Graphics)
// get current context
dim cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContext(cg)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.

36.9.38 graphicsContextWithCGContextHandle(targetCGContextRef as Integer, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Creates a new graphics context pointing to the given CGContext reference.
Example:

```
Sub Paint(g As Graphics)
// get current context
dim cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContextHandle(cg.Handle)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.
See also:

- 36.9.39 graphicsContextWithCGContextHandle(targetCGContextRef as Ptr, initialFlippedState as

boolean = false) as NSGraphicsMBS 8781

36.9.39 graphicsContextWithCGContextHandle(targetCGContextRef as Ptr, initialFlippedState as boolean = false) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 20.0, Platform: macOS, Targets: All.

Function: Creates a new graphics context pointing to the given CGContext reference.
Example:

```
Sub Paint(g As Graphics)
// get current context
dim cg as CGContextMBS = GetCurrentCGContextMBS

// get graphics context
dim ng as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithCGContextHandle(cg.Handle)

// and draw inside
ng.drawAtPoint "Hello World", new NSPointMBS(30, 30)
End Sub
```

Notes: Returns nil on any error.
See also:

- 36.9.38 graphicsContextWithCGContextHandle(targetCGContextRef as Integer, initialFlippedState as boolean = false) as NSGraphicsMBS 8780

36.9.40 graphicsContextWithNSBitmapImageRep(targetImage as NSBitmapImageRepMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new graphics context for drawing into a bitmap image representation.
Example:

```
dim n as new NSImageMBS(300,300)
dim r as new NSBitmapImageRepMBS(300, 300, 8, 4, true, NSColorSpaceMBS.NSCalibratedRGBColorSpace, 4*300, 32)

dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSBitmapImageRep(r)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
n.addRepresentation r
```

Backdrop = n.CopyPictureWithMask

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.

36.9.41 graphicsContextWithNSImage(targetImage as NSImageMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Creates a new graphics context for drawing into an image.
Example:

```
// make new image
dim myImage as new NSImageMBS(500,500)
dim myGraphics as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSImage(myImage)

// make logo image
dim myPicture as Picture = LogoMBS(500)
dim anotherImage as new NSImageMBS(myPicture)

// draw logo image to new image
myGraphics.drawInRect(anotherImage, 0, 0, myImage.width, myImage.height, 0, 0, anotherImage.width,
anotherImage.height, myGraphics.NSCompositeSourceOver, 1.0)
myGraphics = nil // flush drawing

// save to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.jpg")
dim b as BinaryStream = BinaryStream.Create(f, True)
if b<>nil then
b.Write myImage.JPEGRepresentation
b.Close
end if
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the image.
Returns nil on any error.

36.9.42 graphicsContextWithNSView(targetView as NSViewMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a Cocoa view.
Example:

```
// draws in a Cocoa view
dim gg as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSView(canvas1.NSViewMBS)
gg.SetColorRGB 1.0,0,0,0.5
gg.fillRect 0, 0, 100, 100
gg = nil // flush
```

Notes:

Please make sure the graphics object is destroyed (Set to nil) so the drawings flush to the window.
Returns nil on any error.

36.9.43 graphicsContextWithNSWindow(targetNSWindow as NSWindowMBS) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a window.
Example:

```
// draw in a Cocoa window
dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithNSWindow(window1.NSWindowMBS)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
```

Notes: Returns nil on any error.

36.9.44 graphicsContextWithWindow(targetWindow as DesktopWindow) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a window.
Notes: Returns nil on any error.

See also:

- 36.9.45 graphicsContextWithWindow(targetWindow as window) as NSGraphicsMBS 8784

36.9.45 graphicsContextWithWindow(targetWindow as window) as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Creates a new graphics context for drawing into a window.
Example:

```
// draws in a Cocoa window
dim g as NSGraphicsMBS = NSGraphicsMBS.graphicsContextWithWindow(window1)
g.SetColorRGB 1.0,0,0,0.5
g.fillRect 0, 0, 100, 100
g = nil // flush
```

Notes: Returns nil on any error.
See also:

- 52.1.52 graphicsContextWithWindow(targetWindow as DesktopWindow) as NSGraphicsMBS 10062

36.9.46 graphicsPort as Variant

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns the low-level, platform-specific graphics context represented by the receiver.
Notes: In Mac OS X, this is the Core Graphics context, a CGContextMBS object.

36.9.47 highlightRect(x as Double, y as Double, w as Double, h as Double)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Highlights the rectangle.
Notes: In the Cocoa world the y axis is reversed. y=0 is on the bottom.

36.9.48 invalidate

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Invalides the graphics object.

36.9.49 isDrawingToScreen as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates whether the drawing destination is the screen.
Notes:

True if the drawing destination is the screen, otherwise false.

A return value of false may mean that the drawing destination is a printer, but the destination may also be a PDF or EPS file. If this method returns false, you can call attributes to see if additional information is available about the drawing destination.

36.9.50 isFlipped as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Returns a Boolean value that indicates the receiver's flipped state.
Notes:

True if the receiver is flipped, otherwise false.

The state is determined by sending isFlipped to the receiver's view that has focus. If no view has focus, returns false unless the receiver is instantiated using graphicsContextWithGraphicsPort:flipped: specifying true as the flipped parameter.

Available in Mac OS X v10.4 and later.

36.9.51 restoreGraphicsState

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Removes the receiver's graphics state from the top of the graphics state stack and makes the next graphics state the current graphics state.
Notes:

This method must have been preceded with a saveGraphicsState message to add the graphics state to the stack. Invocations of saveGraphicsState and restoreGraphicsState methods may be nested.

Restoring the graphics state restores such attributes as the current drawing style, transformation matrix,

color, and font of the original graphics state.

36.9.52 saveGraphicsState

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Saves the graphics state of the current graphics context.
Notes: This method pushes the context onto the per-thread stack.

36.9.53 ScaleCoordinates(x as Double, y as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Scales coordinate system so the next drawing commands will use different scaling.
Notes: Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

36.9.54 set(transform as NSAffineTransformMBS)

MBS MacCocoa Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Sets the current transform of the graphics environment.

36.9.55 setClip(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Replaces the clipping path of the current graphics context with the area inside the receiver's path.
Notes:

You should avoid using this method as a way of adjusting the clipping path, as it may expand the clipping path beyond the bounds set by the enclosing view. If you do use this method, be sure to save the graphics state prior to modifying the clipping path and restore the graphics state when you are done.

This method uses the current winding rule to determine the clipping shape of the receiver. This method does not affect the receiver's path.

36.9.56 setColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Sets the color of subsequent drawing to the color that the receiver represents.

36.9.57 SetColorBW(white as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to a BW color.
Notes:

Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

36.9.58 SetColorCMYK(cyan as Double, magenta as Double, yellow as Double, black as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to a CMYK color.
Notes:

Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

36.9.59 SetColorHSV(hue as Double, saturation as Double, brightness as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to an HSV color.
Notes: Values range is from 0.0 to 1.0.

36.9.60 SetColorRGB(red as Double, green as Double, blue as Double, alpha as Double = 1.0)

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Sets the color to a RGB color.
Notes:

Values range is from 0.0 to 1.0.
Alpha 0.0 is invisible and alpha 1.0 is visible.

36.9.61 setCurrentContext

MBS MacCocoa Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Sets this context to be the current.

36.9.62 setFillColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Sets the fill color of subsequent drawing to the receiver's color.

36.9.63 setStrokeColor(c as NSColorMBS)

MBS MacCocoa Plugin, Plugin Version: 9.8, Platform: macOS, Targets: All.

Function: Sets the stroke color of subsequent drawing to the receiver's color.

36.9.64 SetTransform(NSAffineTransform as Variant)

MBS MacCocoa Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: Sets the current transformation matrix to the receiver's transformation matrix.
Notes:

Please use saveGraphicsState so you can restore the state before applying matrix for other drawings.

The current transformation is stored in the current graphics context and is applied to subsequent drawing operations. You should use this method sparingly because it removes the existing transformation matrix, which is an accumulation of transformation matrices for the screen, window, and any superviews. Instead use the concat method to add this transformation matrix to the current transformation matrix.

NSAffineTransform must be a NSAffineTransformMBS object.

36.9.65 sizeWithAttributes(text as string, DicAttributes as dictionary = nil) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the bounding box size the text occupies when drawn with the given attributes.
Example:

```
Dim NSGraphics as New NSGraphicsMBS()
Dim NSStringWidth as Double = NSGraphics.sizeWithAttributes("Hello World").Width

MsgBox("StringWidth from NSGraphicsMBS: " + Str(NSStringWidth))

Dim REALGraphics as Graphics = window1.Graphics
Dim REALStringWidth as Double = REALGraphics.StringWidth("Hello World")

MsgBox("StringWidth from REAL Graphics: " + Str(REALStringWidth))
```

Notes:

attributes: A dictionary of text attributes to be applied to the string. These are the same attributes that can be applied to an NSAttributedString object, but in the case of strings, the attributes apply to the entire string, rather than ranges within the string.

Returns the bounding box size the receiver occupies when drawn with attributes.

36.9.66 stroke(path as NSBezierPathMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Draws a line along the receiver's path using the current stroke color and drawing attributes.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
dim b as NSBezierPathMBS = NSBezierPathMBS.bezierPathWithRect(r)
b.lineWidth = 5
g.stroke(b)

g = nil
```

```
window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes: The drawn line is centered on the path with its sides parallel to the path segment. This method uses the current drawing attributes associated with the receiver. If a particular attribute is not set for the receiver, this method uses the corresponding default attribute.

36.9.67 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Strokes a line between two points using the current stroke color and the default drawing attributes.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim p1 as new NSPointMBS(10,10)
dim p2 as new NSPointMBS(50,50)
g.strokeLine(p1,p2)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color line
```

Notes:

point1: The starting point of the line.
point2: The ending point of the line.

This method strokes the specified path immediately.
See also:

- 36.9.68 strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double) 8790

36.9.68 strokeLine(x1 as Double, y1 as Double, x2 as Double, y2 as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Strokes a line.
See also:

• 36.9.67 strokeLine(point1 as NSPointMBS, point2 as NSPointMBS) 8790

36.9.69 strokeRect(r as NSRectMBS)

MBS MacCocoa Plugin, Plugin Version: 12.5, Platform: macOS, Targets: All.

Function: Strokes the path of the specified rectangle using the current stroke color and the default drawing attributes.
Example:

```
dim n as new NSImageMBS(300, 300)
dim g as new NSGraphicsMBS(n)

g.setStrokeColor NSColorMBS.redColor

dim r as NSRectMBS = NSMakeRectMBS(50, 50, 100, 100)
g.strokeRect(r)

g = nil

window1.Backdrop = n.CopyPicture // black image with red color rect
```

Notes:

r: A rectangle in the current coordinate system.

The path is drawn beginning at the rectangle's origin and proceeding in a counterclockwise direction. This method strokes the specified path immediately.

36.9.70 TranslateCoordinates(x as Double, y as Double)

MBS MacCocoa Plugin, Plugin Version: 12.1, Platform: macOS, Targets: All.

Function: Moves coordinate system so the next drawing commands will use different starting point.
Notes: Use saveGraphicsState and restoreGraphicsState so you can restore the old state.

36.9.71 Properties

36.9.72 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The internal handle to the Graphics Context.
Notes:

Reference to NSGraphicsContext object.
(Read and Write property)

36.9.73 Owner as Variant

MBS MacCocoa Plugin, Plugin Version: 12.3, Platform: macOS, Targets: All.

Function: The owner object.
Notes:

When you have a graphics object based on a window, view or image, this property points to the original object to keep it alive while drawing.
(Read and Write property)

36.9.74 Valid as Boolean

MBS MacCocoa Plugin, Plugin Version: 7.7, Platform: macOS, Targets: All.

Function: Wheter this graphics object is still valid.
Notes:

Set to true when the plugin creates an object and false when the object is no longer needed.
(Read and Write property)

36.9.75 imageInterpolation as Integer

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: The interpolation behavior.
Notes:

Note that this value is not part of the graphics state, so it cannot be reset using restoreGraphicsState.
(Read and Write computed property)

36.9.76 shouldAntialias as boolean

MBS MacCocoa Plugin, Plugin Version: 10.3, Platform: macOS, Targets: All.

Function: Whether the receiver should use antialiasing.
Notes:

This value is part of the graphics state and is restored by restoreGraphicsState.
(Read and Write computed property)

36.9.77 Constants

36.9.78 NSCompositeClear=0

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Transparent. (R = 0)

36.9.79 NSCompositeCopy=1

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Source image. (R = S)

36.9.80 NSCompositeDestinationAtop=9

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Destination image wherever both images are opaque, source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. (R = S*(1 - Da) + D*Sa)

36.9.81 NSCompositeDestinationIn=7

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Destination image wherever both images are opaque, and transparent elsewhere. (R = D*Sa)

36.9.82 NSCompositeDestinationOut=8

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. (R = D*(1 - Sa))

36.9.83 NSCompositeDestinationOver=6

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Destination image wherever destination image is opaque, and source image elsewhere. (R = S*(1 - Da) + D)

36.9.84 NSCompositeHighlight=12

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Source image wherever source image is opaque, and destination image elsewhere. (Deprecated. Mapped to NSCompositeSourceOver.)

36.9.85 NSCompositePlusDarker=11

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Sum of source and destination images, with color values approaching 0 as a limit. (R = MAX(0, (1 - D) + (1 - S)))

36.9.86 NSCompositePlusLighter=13

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Sum of source and destination images, with color values approaching 1 as a limit. (R = MIN(1, S + D))

36.9.87 NSCompositeSourceAtop=5

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Source image wherever both images are opaque, destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere. (R = S*Da + D*(1 - Sa))

36.9.88 NSCompositeSourceIn=3

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Source image wherever both images are opaque, and transparent elsewhere. (R = S*Da)

36.9.89 NSCompositeSourceOut=4

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Source image wherever source image is opaque but destination image is transparent, and transparent elsewhere. (R = S*(1 - Da))

36.9.90 NSCompositeSourceOver=2

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Source image wherever source image is opaque, and destination image elsewhere. (R = S + D*(1 - Sa))

36.9.91 NSCompositeXOR=10

MBS MacCocoa Plugin, Plugin Version: 7.7.

Function: Exclusive OR of source and destination images. (R = S*(1 - Da) + D*(1 - Sa))
Notes: Works only with black and white images and is not recommended for color contexts.

36.9.92 NSImageInterpolationDefault=0

MBS MacCocoa Plugin, Plugin Version: 10.3.

Function: One of the interpolation contants.
Notes: Use the context's default interpolation.

36.9.93 NSImageInterpolationHigh=3

MBS MacCocoa Plugin, Plugin Version: 10.3.

Function: One of the interpolation contants.
Notes: Slower, higher-quality interpolation.

36.9.94 NSImageInterpolationLow=2

MBS MacCocoa Plugin, Plugin Version: 10.3.

Function: One of the interpolation contants.
Notes: Fast, low-quality interpolation.

36.9.95 NSImageInterpolationMedium=4

MBS MacCocoa Plugin, Plugin Version: 10.3.

Function: One of the interpolation contants.
Notes:

Medium quality, slower than NSImageInterpolationLow.
Available in Mac OS X v10.6 and later.

36.9.96 NSImageInterpolationNone=1

MBS MacCocoa Plugin, Plugin Version: 10.3.

Function: One of the interpolation contants.
Notes: No interpolation.

36.9.97 NSStringDrawingDisableScreenFontSubstitution = 4

MBS MacCocoa Plugin, Plugin Version: 11.3.

Function: One of the drawing option constants.
Notes: Disable screen font substitution (equivalent to NSLayoutManager.setUsesScreenFonts(false)).

36.9.98 NSStringDrawingOneShot = 16

MBS MacCocoa Plugin, Plugin Version: 11.3.

Function: One of the drawing option constants.
Notes: Suppresses caching layout information.

36.9.99 NSStringDrawingTruncatesLastVisibleLine = 32

MBS MacCocoa Plugin, Plugin Version: 11.3.

Function: One of the drawing option constants.
Notes:

Truncates and adds the ellipsis character to the last visible line if the text doesn't fit into the bounds specified.
This option is ignored if NSStringDrawingUsesLineFragmentOrigin is not also set. In addition, the line break mode must be either NSLineBreakByWordWrapping or NSLineBreakByCharWrapping for this option to take effect. The line break mode can be specified in a paragraph style passed in the attributes dictionary argument of the drawing methods.
Available in Mac OS X v10.5 and later.

36.9.100 NSStringDrawingUsesDeviceMetrics = 8

MBS MacCocoa Plugin, Plugin Version: 11.3.

Function: One of the drawing option constants.
Notes: Uses image glyph bounds instead of typographic bounds.

36.9.101 NSStringDrawingUsesFontLeading = 2

MBS MacCocoa Plugin, Plugin Version: 11.3.

Function: One of the drawing option constants.
Notes: Uses the font leading for calculating line heights.

36.9.102 NSStringDrawingUsesLineFragmentOrigin = 1

MBS MacCocoa Plugin, Plugin Version: 11.3.

Function: One of the drawing option constants.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

```
// draw in Canvas
dim g as new NSGraphicsMBS(Canvas1.NSViewMBS)

g.drawWithRect m, new NSRectMBS(20,20, 100, 100), g.NSStringDrawingUsesLineFragmentOrigin
```

Notes: The specified origin is the line fragment origin, not the baseline origin.

36.10 class NSImageMBS

36.10.1 class NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: An NSImage object is a high-level class for manipulating image data.
Notes:

You use this class to load existing images or create new ones and composite them into a view or other image. This class works in conjunction with one or more image representation objects (subclasses of NSImageRep), which manage the actual image data.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

36.10.8 Methods

36.10.9 addRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds the specified image representation object to to the receiver.
Notes:

After invoking this method, you may need to explicitly set features of the new image representation, such as the size, number of colors, and so on. This is true particularly when the NSImage object has multiple image representations to choose from. See NSImageRep and its subclasses for the methods you use to complete initialization.

Any representation added by this method is retained by the receiver. Image representations cannot be shared among multiple NSImage objects.

36.10.10 BMPRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a BMP file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.bmp")
b=f.CreateBinaryFile("")
b.Write img.BMPRepresentation
b.Close

f.Launch
```

Notes: BMP does not support masks.

36.10.11 BMPRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a BMP file.
Notes:

BMP does not support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.12 cancelIncrementalLoad

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels the current download operation immediately, if the image is being incrementally loaded.
Notes: This call has no effect if the image is not loading.

36.10.13 canInitWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Tests whether the receiver can create an instance of itself using pasteboard data.
Notes: This method uses the NSImageRep class method imageUnfilteredPasteboardTypes to find a class that can handle the data in the specified pasteboard. If you create your own NSImageRep subclasses, override the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.

36.10.14 Constructor

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The default constructor creating a dummy NSImage object.
See also:

- 36.10.15 Constructor(data as Memoryblock) 8803
- 36.10.16 Constructor(file as folderitem) 8804
- 36.10.17 Constructor(image as Picture, mask as picture = nil) 8804
- 36.10.18 Constructor(width as Double, height as Double) 8805

36.10.15 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The data constructor calling initWithData internally.
Notes:

Calls initWithData.
On success the image is valid and the handle is not zero.
See also:

- 36.10.14 Constructor 8803
- 36.10.16 Constructor(file as folderitem) 8804

- 36.10.17 Constructor(image as Picture, mask as picture = nil) 8804
- 36.10.18 Constructor(width as Double, height as Double) 8805

36.10.16 Constructor(file as folderitem)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The file constructor calling initWithContentsOfURL(file) internally.
Notes:

Calls initWithContentsOfURL.
On success the image is valid and the handle is not zero.
See also:

- 36.10.14 Constructor 8803
- 36.10.15 Constructor(data as Memoryblock) 8803
- 36.10.17 Constructor(image as Picture, mask as picture = nil) 8804
- 36.10.18 Constructor(width as Double, height as Double) 8805

36.10.17 Constructor(image as Picture, mask as picture = nil)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates a new NSImageMBS object based on the image data in a Xojo picture.
Example:

```
dim img as new NSImageMBS(pict)
```

Notes:

Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.
Calls initWithPicture.
See also:

- 36.10.14 Constructor 8803
- 36.10.15 Constructor(data as Memoryblock) 8803

- 36.10.16 Constructor(file as folderitem) 8804
- 36.10.18 Constructor(width as Double, height as Double) 8805

36.10.18 Constructor(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The size constructor calling initWithSize internally.
Notes:

Calls initWithSize.
On success the image is valid and the handle is not zero.
See also:

- 36.10.14 Constructor 8803
- 36.10.15 Constructor(data as Memoryblock) 8803
- 36.10.16 Constructor(file as folderitem) 8804
- 36.10.17 Constructor(image as Picture, mask as picture = nil) 8804

36.10.19 CopyMask as picture

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyMask
```

Notes:

Copies only the alpha channel as mask.
Returns nil on any error.

Not implemented for iOS.

36.10.20 CopyPicture(CGColorSpace as Variant = nil, BackgroundColor as NSColorMBS = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

Notes:

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

Implemented for iOS in v22.4 to return underlaying UIImage as Xojo picture. Colorspace and background are ignored as picture is passed directly.

36.10.21 CopyPictureRect(x as Integer, y as Integer, w as Integer, h as Integer, CGColorSpace as Variant = nil, BackgroundColor as NSColorMBS = nil) as picture

MBS MacBase Plugin, Plugin Version: 13.2, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage from the given rectangle.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
```

```
n=new NSImageMBS(f)
Backdrop=n.CopyPicture // background is black
```

Notes:

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

If BackgroundColor is not nil, the image is filled in background with this color and NSImage rendered on top of it.

Not implemented for iOS.

36.10.22 CopyPictureWithAlpha as picture

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Notes:

This is a function for Cocoa target which returns picture with alpha channel.
Returns nil on any error.

Not implemented for iOS.

36.10.23 CopyPictureWithAlphaRect(x as Integer, y as Integer, w as Integer, h as Integer) as picture

MBS MacBase Plugin, Plugin Version: 15.1, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in given rectangle.
Notes:

This is a function for Cocoa target which returns picture with alpha channel.
Returns nil on any error.

Not implemented for iOS.

36.10.24 CopyPictureWithMask(CGColorSpace as Variant = nil) as picture

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Copies the content of the NSImage in current size.
Example:

```
dim f as FolderItem
dim n as NSImageMBS

f=SpecialFolder.Desktop.Child("test.png")
n=new NSImageMBS(f)
Backdrop=n.CopyPictureWithMask
```

Notes:

Copies the picture and its mask.
This function is faster than CopyPicture and CopyMask combined as the picture is only copied one time to an internal buffer.

A convenience function instead of using CGPictureContextMBS with DrawIntoCGContextAtRect.

Returns nil on any error.

With Colorspace parameter you can pass a RGB CGColorspace to define which colorspace is used. Default is DeviceRGB, but you could also pass generic RGB or other.

Not implemented for iOS.

36.10.25 DrawIntoCGContextAtPoint(cgcontext as Integer, x as Double, y as Double, sx as Double, sy as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Draws the image.
Notes: Same as DrawIntoCGContextAtRect, but with a point instead of a rectangle.

36.10.26 DrawIntoCGContextAtRect(cgcontext as Integer, x as Double, y as Double, w as Double, h as Double, SourceX as Double, SourceY as Double, SourceW as Double, SourceH as Double, operation as Integer, fraction as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Draws the image.
Example:

```
Function OpenAsNSimage(extends file as folderitem) As picture
dim width as Integer
dim height as Integer
dim c as NSImageMBS
dim g as CGPictureContextMBS

// load image from file
c=new NSImageMBS

// is that image valid?
if c.initWithContentsOfURL(file) then
Width=c.Width
height=c.Height

// create a drawing buffer to draw inside
g=new CGPictureContextMBS(width,height)

if g.Handle<>0 then // valid?

// now draw the image inside.
// you could scale or even apply transparency...
if c.DrawIntoCGContextAtRect(g.Handle, 0, 0, width, height, 0,0,width,height,2,1.0) then
// make a RB Picture from it
Return g.CopyPicture
end if
end if
end if
End Function
```

Notes:

Draws the image into a CGContext. You need to specify first the destination rectangle followed by the source rectangle.

fraction:
The opacity of the image, specified as a value from 0.0 to 1.0. Specifying a value of 0.0 draws the image as

fully transparent while a value of 1.0 draws the image as fully opaque. Values greater than 1.0 are interpreted as 1.0.

operation codes:

NSCompositeClear	= 0	Transparent.
NSCompositeCopy	= 1	Source image.
NSCompositeSourceOver	= 2	Source image wherever source image is opaque, and destination image elsewhere.
NSCompositeSourceIn	= 3	Source image wherever both images are opaque, and transparent elsewhere.
NSCompositeSourceOut	= 4	Source image wherever source image is opaque but destination image is transparent, and transparent elsewhere.
NSCompositeSourceAtop	= 5	Source image wherever both images are opaque, destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere.
NSCompositeDestinationOver	= 6	Destination image wherever destination image is opaque, and source image elsewhere.
NSCompositeDestinationIn	= 7	Destination image wherever both images are opaque, and transparent elsewhere.
NSCompositeDestinationOut	= 8	Destination image wherever destination image is opaque but source image is transparent, and transparent elsewhere.
NSCompositeDestinationAtop	= 9	Destination image wherever both images are opaque, source image wherever source image is opaque but destination image is transparent, and transparent elsewhere.
NSCompositeXOR	= 10	Exclusive OR of source and destination images.
NSCompositePlusDarker	= 11	Sum of source and destination images, with color values approaching 0 as a limit.
NSCompositeHighlight	= 12	Source image wherever source image is opaque, and destination image elsewhere.
NSCompositePlusLighter	= 13	Sum of source and destination images, with color values approaching 1 as a limit.

Returns true on success and false on failure.

36.10.27 GIFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a GIF file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
```

```
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.gif")
b=f.CreateBinaryFile("")
b.Write img.GIFRepresentation
b.Close

f.Launch
```

Notes: GIF does support masks in a limited way.

36.10.28 GIFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a GIF file.
Notes:

GIF does support masks in a limited way.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.29 imageByFadingToFraction(fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns an image with a mask faded to the given percentage
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
```

```
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByFadingToFraction(0.1)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: Returns nil on failure.

36.10.30 imageByScalingToSize(width as Double, height as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Scales image to the new size.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes:

Returns nil on failure.
Internally creates a copy of the image.
See also:

- 36.10.31 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS 8813
- 36.10.32 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS 8814

36.10.31 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Scales image to the new size with given fading.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200,0.5)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes:

Returns nil on failure.
Internally creates a copy of the image.
See also:

- 36.10.30 imageByScalingToSize(width as Double, height as Double) as NSImageMBS 8812

- 36.10.32 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS 8814

36.10.32 imageByScalingToSize(width as Double, height as Double, fraction as Double, flip as boolean, proportionally as boolean) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Scales image to the new size with given fading fraction.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

img=img.imageByScalingToSize(200,200)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes:

Returns nil on failure.
The image can be flipped vertically with the flip property.
Internally creates a copy of the image.
See also:

- 36.10.30 imageByScalingToSize(width as Double, height as Double) as NSImageMBS 8812
- 36.10.31 imageByScalingToSize(width as Double, height as Double, fraction as Double) as NSImageMBS 8813

36.10.33 imageFileTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the image types supported by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageFileTypes
MsgBox Join(types, EndOfLine)
```

Notes:

An array of strings, each of which identifies a single supported file type. The array can include encoded HFS file types as well as filename extensions.

This list includes all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can pass the array returned by this method directly to NSOpenPanelMBS.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredFileTypes method to notify NSImage of the file types your class supports directly.

36.10.34 imageNamed(name as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: Returns the NSImage instance associated with the specified name.
Notes:

This method searches for named images in several places, returning the first image it finds matching the given name. The order of the search is as follows:

1. Search for an object whose name was set explicitly using the setName: method and currently resides in the image cache.
2. Search the application's main bundle for a file whose name matches the pecified string. (For information on how the bundle is searched, see "Searching for Bundle Resources" in Bundle Programming Guide.)
3. Search the Application Kit framework for a shared image with the specified name.

When looking for files in the application bundle, it is better (but not required) to include the filename extension in the name parameter. When naming an image with the setName method, it is also convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application's bundle.

One particularly useful image you can retrieve is your application's icon. This image is set by Cocoa automatically and referenced by the string "NSApplicationIcon". Icons for other applications can be obtained through the use of methods declared in the NSWorkspace class. You can also retrieve some standard system

images using Cocoa defined constants; for more information, see the Constants section of this class.

If an application is linked in Mac OS X v10.5 or later, images requested using this method and whose name ends in the word "Template" are automatically marked as template images.

The NSImage class keeps a reference to any named images in a table until the image name is cleared. Consequently you do not need to retain the returned image object unless its name could be cleared. You can clear an image object from the table by passing nil to the setName: method of the corresponding NSImage object.

Here is a good list of identifiers you can use:
http://hetima.github.io/fucking_nsimage_syntax/

36.10.35 imagePasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imagePasteboardTypes
MsgBox Join(types, EndOfLine)
```

Notes:

Returns an array of strings, each of which identifies a single supported pasteboard type. By default, this list contains the NSPDFPboardType, NSPICTPboardType, NSPostScriptPboardType, and NSTIFFPboardType types.

This list includes all pasteboard types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service.

When creating a subclass of NSImageRep, do not override this method. Instead, override the imageUnfilteredPasteboardTypes method to notify NSImage of the pasteboard types your class supports.

36.10.36 imageTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of UTI strings identifying the image types supported by the registered NSIm-

ageRep objects, either directly or through a user-installed filter service.
Example:

```
dim types() as string = NSImageMBS.imageTypes
MsgBox Join(types, EndOfLine)
```

Notes:

Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of supported types, see UTCoreTypes.h.

The returned list includes UTIs all file types supported by registered subclasses of NSImageRep plus those that can be converted to a supported type by a user-installed filter service. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageTypes method of NSImageRep.

Available in Mac OS X v10.5 and later.

36.10.37 imageUnfilteredFileTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the file types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageUnfilteredFileTypes
MsgBox Join(types, EndOfLine)
```

Notes:

An array of strings, each of which identifies a single supported file type. File types are identified by file extension and HFS file types.
The returned list does not contain pasteboard types that are available only through a user-installed filter service.

36.10.38 imageUnfilteredPasteboardTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings identifying the pasteboard types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageUnfilteredPasteboardTypes
MsgBox Join(types, EndOfLine)
```

Notes:

An array of strings, each of which identifies a single supported pasteboard type.
The returned list does not contain pasteboard types that are supported only through a user-installed filter service.

36.10.39 imageUnfilteredTypes as string()

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of UTI strings identifying the image types supported directly by the registered NSImageRep objects.
Example:

```
dim types() as string = NSImageMBS.imageUnfilteredTypes
MsgBox Join(types, EndOfLine)
```

Notes:

Returns an array of strings, each of which contains a UTI identifying a supported image type. Some sample image-related UTI strings include "public.image", "public.jpeg", and "public.tiff". For a list of supported types, see UTCoreTypes.h.

The returned list includes UTI strings only for those file types that are supported directly by registered subclasses of NSImageRep. It does not include types that are supported through user-installed filter services. You can use the returned UTI strings with any method that supports UTIs.

You should not override this method directly. Instead, you should override the imageUnfilteredTypes method of NSImageRep.

36.10.40 imageWithCGImage(CGImage as Variant, width as Double = 0, height as Double = 0) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the CGImage.
Example:

```
dim logo as Picture = LogoMBS(500)
dim cgimage as CGImageMBS = CGCreateImageMBS(logo)
dim nsimage as NSImageMBS = NSImageMBS.imageWithCGImage(cgimage)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:

If width is zero, we take the width from the CGImage.
If height is zero, we take the height from the CGImage.

cgImage: The source CGImageMBS object.
width & height: The size of the new image.

Returns an initialized NSImage instance, or nil if the new instance cannot be initialized.

You should not assume anything about the image, other than that drawing it is equivalent to drawing the CGImage.
Available in OS X v10.6 and later.

36.10.41 imageWithContentsOfFile(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfFile(file)
Backdrop = image.CopyPictureWithMask
```

Notes:

File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

36.10.42 imageWithContentsOfFileMT(file as folderitem) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfFileMT(file)
Backdrop = image.CopyPictureWithMask
```

Notes:

File: The file to open.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.43 imageWithContentsOfPath(path as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim path as string = file.NativePath
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfPath(path)
Backdrop = image.CopyPictureWithMask
```

Notes:

path: A full or relative path name specifying the file with the desired image data. Relative paths must be

relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

36.10.44 imageWithContentsOfPathMT(path as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified file.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("mbs.jpg")
dim path as string = file.NativePath
dim image as NSImageMBS = NSImageMBS.imageWithContentsOfPathMT(path)
Backdrop = image.CopyPictureWithMask
```

Notes:

path: A full or relative path name specifying the file with the desired image data. Relative paths must be relative to the current working directory.

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified file.

The filename parameter should include the file extension that identifies the type of the image data. This method looks for an NSImageRep subclass that handles that data type from among those registered with NSImage.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.45 imageWithContentsOfURL(URL as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified URL.
Example:

```
dim url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
dim img as NSImageMBS = NSImageMBS.imageWithContentsOfURL(url)
Backdrop = img.CopyPictureWithMask
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.

36.10.46 imageWithContentsOfURLMT(URL as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified URL.
Example:

```
dim url as string = "http://www.monkeybreadsoftware.de/images/MBSLogo.jpg"
dim img as NSImageMBS = NSImageMBS.imageWithContentsOfURLMT(url)
Backdrop = img.CopyPictureWithMask
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified URL.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

36.10.47 imageWithData(data as memoryblock) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified memoryblock.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
```

```
dim nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
See also:

- 36.10.48 imageWithData(data as string) as NSImageMBS 8823

36.10.48 imageWithData(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified string.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithData(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes: Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
See also:

- 36.10.47 imageWithData(data as memoryblock) as NSImageMBS 8822

36.10.49 imageWithDataMT(data as memoryblock) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified memoryblock.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 36.10.50 imageWithDataMT(data as string) as NSImageMBS 8824

36.10.50 imageWithDataMT(data as string) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified string.
Example:

```
dim logo as Picture = LogoMBS(500)
dim jpeg as string = PictureToJPEGStringMBS(logo, 75)
dim nsimage as NSImageMBS = NSImageMBS.imageWithDataMT(jpeg)
dim pic as Picture = nsimage.CopyPictureWithMask
Backdrop = pic
```

Notes:

Returns an initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.
See also:

- 36.10.49 imageWithDataMT(data as memoryblock) as NSImageMBS 8823

36.10.51 imageWithHandle(Handle as Integer) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 14.4, Platform: macOS, Targets: All.

Function: Creates a new picture for a NSImage handle.

36.10.52 imageWithSymbolConfiguration(configuration as NSImageSymbolConfigurationMBS) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a new symbol image with the specified configuration.
Example:

```
Dim config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithPointSize(40, 0)
Dim n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Dim o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

36.10.53 imageWithSystemSymbolName(name as string, accessibilityDescription as string = "") as NSImageMBS

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Returns an image for a given symbol name.
Example:

```
Dim n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
If n <>Nil Then

n.setSize(300,300)
Backdrop = n.CopyPictureWithAlpha

End If
```

Notes:

For macOS 11.0 or newer.

See list of symbols in SF Symbol font, see SF Symbols app or the list here:
https://developer.apple.com/design/human-interface-guidelines/sf-symbols/overview/

36.10.54 imageWithTintColor(tintColor as NSColorMBS) as NSImageMBS

MBS MacBase Plugin, Plugin Version: 20.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the image colored with the given tint.

Notes: Input image should be grayscale.

36.10.55 initWithContentsOfURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified folderitem.
Notes: Returns true on success and false on failure.
See also:

- 36.10.56 initWithContentsOfURL(url as string) as boolean 8826

36.10.56 initWithContentsOfURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes and returns an NSImage instance with the contents of the specified URL.
Notes: Returns true on success and false on failure.
See also:

- 36.10.55 initWithContentsOfURL(file as folderitem) as boolean 8826

36.10.57 initWithData(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes and with the contents of the specified data in the string.
Notes: Returns true on success and false on failure.

36.10.58 initWithDataIgnoringOrientation(data as Memoryblock) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes and returns an NSImage instance with the contents of the specified memoryblock, ignoring the EXIF orientation tags.
Notes:

An initialized NSImage instance, or nil if the method cannot create an image representation from the contents of the specified data object.
Available in Mac OS X v10.6 and later.

36.10.59 initWithIconRef(IconHandle as Integer) as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the image object with a Carbon-style icon resource.
Notes:

IconHandle: A reference to a Carbon icon resource (IconRef).

Creates one or more bitmap image representations, one for each size icon contained in the IconRef data structure. This initialization method automatically retains the data in the iconRef parameter and loads the bitmaps from that data file lazily.
Available in Mac OS X v10.5 and later.

36.10.60 initWithPasteboard as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Initializes an NSImage instance with data from the pasteboard.
Notes: The specified pasteboard should contain a type supported by one of the registered NSImageRep subclasses. Table 1 lists the default pasteboard types and file extensions for several NSImageRep subclasses.

36.10.61 initWithPicture(img as picture, mask as picture = nil) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes the image object with image data from the Xojo pictures.
Example:

```
dim img as new NSImageMBS
if img.initWithPicture(pict, pict.mask) then
MsgBox "OK"
end if
```

Notes:

Optional you can pass a picture with the mask. It is valid to use the mask property of the image for the second parameter.

With 11.3 plugins we are deprecating to pass a mask. The plugin prefers to simply take the mask or alpha channel of the picture itself.

On success the image is valid and the handle is not zero.

36.10.62 initWithSize(width as Double, height as Double) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes an empty image object with the given size.
Notes: Returns true on success and false on failure.

36.10.63 JPEGRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
b=f.CreateBinaryFile("")
b.Write img.JPEGRepresentation
b.Close

f.Launch
```

Notes: JPEG does not support masks. Uses 80% for the quality.

36.10.64 JPEGRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.JPEGRepresentationMT

// decode to see if it worked
dim test as Picture = JPEGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes:

JPEG does not support masks. Uses 80% for the quality.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.65 JPEGRepresentationWithCompressionFactor(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream

p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p)

f=SpecialFolder.Desktop.Child("test.jpeg")
```

```
b=f.CreateBinaryFile("")
b.Write img.JPEGRepresentationWithCompressionFactor(0.01)
b.Close

f.Launch
```

Notes:

Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.

36.10.66 JPEGRepresentationWithCompressionFactorMT(factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a JPEG file.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.JPEGRepresentationWithCompressionFactorMT(1.0)

// decode to see if it worked
dim test as Picture = JPEGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes:

Factor for compression goes from 0.0 to 1.0.
JPEG does not support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows

GUI with progress window.

36.10.67 NSImageHintUserInterfaceLayoutDirection as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the dictionary keys used in the hints dictionary.
Notes: value is a number with NSUserInterfaceLayoutDirection enum value

36.10.68 NSImageNameActionTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An action menu template image.
Available in Mac OS X v10.5 and later.

36.10.69 NSImageNameAddTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Example:

```
Dim n As NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameAddTemplate)

canvas1.backdrop = n.CopyPictureWithAlpha
```

Notes:

An add item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.70 NSImageNameAdvanced as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Example:

```
Dim n As NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameAdvanced)

canvas1.backdrop = n.CopyPictureWithAlpha
```

Notes:

To access this image, pass the specified constant to the imageNamed method.
Advanced preferences toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

36.10.71 NSImageNameApplicationIcon as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
The application's icon.
On versions of Mac OS X prior to v10.6, you can use the string "NSApplicationIcon".
Available in Mac OS X v10.6 and later.

36.10.72 NSImageNameBluetoothTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Bluetooth template image.
Available in Mac OS X v10.5 and later.

36.10.73 NSImageNameBonjour as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Bonjour icon.
Available in Mac OS X v10.5 and later.

36.10.74 NSImageNameBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Bookmarks image suitable for a template.
Available in Mac OS X v10.6 and later.

36.10.75 NSImageNameCaution as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Caution Image.
Available in Mac OS X v10.6 and later.

36.10.76 NSImageNameColorPanel as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A color panel toolbar icon.
Available in Mac OS X v10.5 and later.

36.10.77 NSImageNameColumnViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A column view mode template image.
Available in Mac OS X v10.5 and later.

36.10.78 NSImageNameComputer as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Example:

```
dim n as NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameComputer)

// set to size you need
n.size = NSMakeSizeMBS(512,512)

// and make picture
Backdrop = n.CopyPictureWithMask
```

Notes:

To access this image, pass the specified constant to the imageNamed method.
A computer icon.
Available in Mac OS X v10.5 and later.

36.10.79 NSImageNameDotMac as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Dot Mac icon.
Available in Mac OS X v10.5 and later.

36.10.80 NSImageNameEnterFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

An enter full-screen mode template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.81 NSImageNameEveryone as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing sharing permission icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Permissions for all users.
Available in Mac OS X v10.5 and later.

36.10.82 NSImageNameExitFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

An exit full-screen mode template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.83 NSImageNameFlowViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A cover flow view mode template image.
Available in Mac OS X v10.5 and later.

36.10.84 NSImageNameFolder as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A folder image.
Available in Mac OS X v10.6 and later.

36.10.85 NSImageNameFolderBurnable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A burnable folder icon.
Available in Mac OS X v10.5 and later.

36.10.86 NSImageNameFolderSmart as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes:

A smart folder icon.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.87 NSImageNameFollowLinkFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A link template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.88 NSImageNameFontPanel as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A font panel toolbar icon.
Available in Mac OS X v10.5 and later.

36.10.89 NSImageNameGoBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The template name for the go back image.
Notes:

Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.
Available in macOS 10.12 and newer.

36.10.90 NSImageNameGoForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: The template name for the go forward image.
Notes:

Use these images for "go forward" or "go back" functions, as seen in Safari's toolbar. These images will automatically mirror when the user interface layout direction is right to left.
Available in macOS 10.12 and newer.

36.10.91 NSImageNameGoLeftTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A "go back" template image.
Available in Mac OS X v10.5 and later.

36.10.92 NSImageNameGoRightTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A "go forward" template image.
Available in Mac OS X v10.5 and later.

36.10.93 NSImageNameHomeTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Home image suitable for a template.
Available in Mac OS X v10.6 and later.

36.10.94 NSImageNameIChatTheaterTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An iChat Theater template image.
Available in Mac OS X v10.5 and later.

36.10.95 NSImageNameIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An icon view mode template image.
Available in Mac OS X v10.5 and later.

36.10.96 NSImageNameInfo as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An information toolbar icon.
Available in Mac OS X v10.5 and later.

36.10.97 NSImageNameInvalidDataFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An invalid data template image. Place this icon to the right of any fields containing invalid data. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

36.10.98 NSImageNameLeftFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A generic left-facing triangle template image.
Available in Mac OS X v10.5 and later.

36.10.99 NSImageNameListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A list view mode template image.
Available in Mac OS X v10.5 and later.

36.10.100 NSImageNameLockLockedTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A locked lock template image. Use to indicate locked content.
Available in Mac OS X v10.5 and later.

36.10.101 NSImageNameLockUnlockedTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An unlocked lock template image. Use to indicate modifiable content that can be locked.
Available in Mac OS X v10.5 and later.

36.10.102 NSImageNameMenuMixedStateTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A horizontal dash. Drawing these outside of menus is discouraged.
Available in Mac OS X v10.6 and later.

36.10.103 NSImageNameMenuOnStateTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A check mark. Drawing these outside of menus is discouraged.
Available in Mac OS X v10.6 and later.

36.10.104 NSImageNameMobileMe as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
MobileMe logo. Note that this is preferred to using the NSImageNameDotMac image, although that image is not expected to be deprecated.
Available in Mac OS X v10.6 and later.

36.10.105 NSImageNameMultipleDocuments as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: Drag image you can use in your applications.
Notes:

A drag image for multiple items.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.106 NSImageNameNetwork as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing Finder items.
Notes:

A network icon.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.107 NSImageNamePathTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A path button template image.
Available in Mac OS X v10.5 and later.

36.10.108 NSImageNamePreferencesGeneral as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
General preferences toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

36.10.109 NSImageNameQuickLookTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A Quick Look template image.
Available in Mac OS X v10.5 and later.

36.10.110 NSImageNameRefreshFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A refresh template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.111 NSImageNameRefreshTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A refresh template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.112 NSImageNameRemoveTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Example:

```
Dim n As NSImageMBS = NSImageMBS.imageNamed(NSImageMBS.NSImageNameRemoveTemplate)

canvas1.backdrop = n.CopyPictureWithAlpha
```

Notes:

A remove item template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.113 NSImageNameRevealFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A reveal contents template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.114 NSImageNameRightFacingTriangleTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A generic right-facing triangle template image.
Available in Mac OS X v10.5 and later.

36.10.115 NSImageNameShareTemplate as string

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: All.

Function: One of the images used in segmented controls to switch the current view type.
Notes:

A share view template image.
Available in OS X v10.8 and later.

36.10.116 NSImageNameSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A slideshow template image.
Available in Mac OS X v10.5 and later.

36.10.117 NSImageNameSmartBadgeTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A badge for a "smart" item.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.118 NSImageNameStatusAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small green indicator, similar to iChat's available image.
Available in Mac OS X v10.6 and later.

36.10.119 NSImageNameStatusNone as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small clear indicator.
Available in Mac OS X v10.6 and later.

36.10.120 NSImageNameStatusPartiallyAvailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small yellow indicator, similar to iChat's idle image.
Available in Mac OS X v10.6 and later.

36.10.121 NSImageNameStatusUnavailable as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Small red indicator, similar to iChat's unavailable image.
Available in Mac OS X v10.6 and later.

36.10.122 NSImageNameStopProgressFreestandingTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
A stop progress template image. You can use this image to implement a borderless button.
Available in Mac OS X v10.5 and later.

36.10.123 NSImageNameStopProgressTemplate as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing standard artwork and icons that you can use in your applications.
Notes:

A stop progress button template image.
Available in Mac OS X v10.5 and later.
To access this image, pass the specified constant to the imageNamed method.

36.10.124 NSImageNameTouchBarAddDetailTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddDetailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.125 NSImageNameTouchBarAddTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAddTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.126 NSImageNameTouchBarAlarmTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAlarmTemplate
img = NSImageMBS.imageNamed(n)
```

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

36.10.127 NSImageNameTouchBarAudioInputMuteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.128 NSImageNameTouchBarAudioInputTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioInputTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.129 NSImageNameTouchBarAudioOutputMuteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputMuteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.130 NSImageNameTouchBarAudioOutputVolumeHighTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeHighTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.131 NSImageNameTouchBarAudioOutputVolumeLowTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS
```

```
name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeLowTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.132 NSImageNameTouchBarAudioOutputVolumeMediumTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeMediumTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.133 NSImageNameTouchBarAudioOutputVolumeOffTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarAudioOutputVolumeOffTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.134 NSImageNameTouchBarBookmarksTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarBookmarksTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.135 NSImageNameTouchBarColorPickerFill as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFill
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.136 NSImageNameTouchBarColorPickerFont as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerFont
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.137 NSImageNameTouchBarColorPickerStroke as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarColorPickerStroke
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.138 NSImageNameTouchBarCommunicationAudioTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationAudioTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.139 NSImageNameTouchBarCommunicationVideoTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarCommunicationVideoTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.140 NSImageNameTouchBarComposeTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarComposeTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.141 NSImageNameTouchBarDeleteTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarDeleteTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.142 NSImageNameTouchBarDownloadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarDownloadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.143 NSImageNameTouchBarEnterFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarEnterFullScreenTemplate
img = NSImageMBS.imageNamed(n)
```

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

36.10.144 NSImageNameTouchBarExitFullScreenTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarExitFullScreenTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.145 NSImageNameTouchBarFastForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFastForwardTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.146 NSImageNameTouchBarFolderCopyToTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderCopyToTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.147 NSImageNameTouchBarFolderMoveToTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarFolderMoveToTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.148 NSImageNameTouchBarFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS
```

```
name = NSImageMBS.NSImageNameTouchBarFolderTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.149 NSImageNameTouchBarGetInfoTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGetInfoTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.150 NSImageNameTouchBarGoBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoBackTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.151 NSImageNameTouchBarGoDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoDownTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.152 NSImageNameTouchBarGoForwardTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoForwardTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.153 NSImageNameTouchBarGoUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarGoUpTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.154 NSImageNameTouchBarHistoryTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarHistoryTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.155 NSImageNameTouchBarIconViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarIconViewTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.156 NSImageNameTouchBarListViewTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarListViewTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.157 NSImageNameTouchBarMailTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarMailTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.158 NSImageNameTouchBarNewFolderTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewFolderTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.159 NSImageNameTouchBarNewMessageTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarNewMessageTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.160 NSImageNameTouchBarOpenInBrowserTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarOpenInBrowserTemplate
img = NSImageMBS.imageNamed(n)
```

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

36.10.161 NSImageNameTouchBarPauseTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPauseTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.162 NSImageNameTouchBarPlayheadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayheadTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.163 NSImageNameTouchBarPlayPauseTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayPauseTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.164 NSImageNameTouchBarPlayTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarPlayTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.165 NSImageNameTouchBarQuickLookTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS
```

```
name = NSImageMBS.NSImageNameTouchBarQuickLookTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.166 NSImageNameTouchBarRecordStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRecordStartTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.167 NSImageNameTouchBarRecordStopTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRecordStopTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.168 NSImageNameTouchBarRefreshTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRefreshTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.169 NSImageNameTouchBarRewindTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRewindTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.170 NSImageNameTouchBarRotateLeftTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRotateLeftTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.171 NSImageNameTouchBarRotateRightTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarRotateRightTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.172 NSImageNameTouchBarSearchTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSearchTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.173 NSImageNameTouchBarShareTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarShareTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.174 NSImageNameTouchBarSidebarTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSidebarTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.175 NSImageNameTouchBarSkipAhead15SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead15SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.176 NSImageNameTouchBarSkipAhead30SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAhead30SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.177 NSImageNameTouchBarSkipAheadTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipAheadTemplate
img = NSImageMBS.imageNamed(n)
```

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

36.10.178 NSImageNameTouchBarSkipBack15SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack15SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.179 NSImageNameTouchBarSkipBack30SecondsTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBack30SecondsTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.180 NSImageNameTouchBarSkipBackTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipBackTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.181 NSImageNameTouchBarSkipToEndTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSkipToEndTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.182 NSImageNameTouchBarSkipToStartTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS
```

```
name = NSImageMBS.NSImageNameTouchBarSkipToStartTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.183 NSImageNameTouchBarSlideshowTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarSlideshowTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.184 NSImageNameTouchBarTagIconTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTagIconTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.185 NSImageNameTouchBarTextBoldTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoldTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.186 NSImageNameTouchBarTextBoxTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextBoxTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.187 NSImageNameTouchBarTextCenterAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextCenterAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.188 NSImageNameTouchBarTextItalicTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextItalicTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.189 NSImageNameTouchBarTextJustifiedAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextJustifiedAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.190 NSImageNameTouchBarTextLeftAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextLeftAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.191 NSImageNameTouchBarTextListTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextListTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.192 NSImageNameTouchBarTextRightAlignTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextRightAlignTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.193 NSImageNameTouchBarTextStrikethroughTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextStrikethroughTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.194 NSImageNameTouchBarTextUnderlineTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarTextUnderlineTemplate
img = NSImageMBS.imageNamed(n)
```

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

36.10.195 NSImageNameTouchBarUserAddTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserAddTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.196 NSImageNameTouchBarUserGroupTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserGroupTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.197 NSImageNameTouchBarUserTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarUserTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.198 NSImageNameTouchBarVolumeDownTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS

name = NSImageMBS.NSImageNameTouchBarVolumeDownTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha
```

Notes: Available in macOS 10.12 and newer.

36.10.199 NSImageNameTouchBarVolumeUpTemplate as string

MBS MacBase Plugin, Plugin Version: 16.5, Platform: macOS, Targets: All.

Function: One of the touchbar image templates.
Example:

```
dim name as string
dim img as NSImageMBS
```

name = NSImageMBS.NSImageNameTouchBarVolumeUpTemplate
img = NSImageMBS.imageNamed(n)

Backdrop = img.CopyPictureWithAlpha

Notes: Available in macOS 10.12 and newer.

36.10.200 NSImageNameTrashEmpty as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An image of the empty trash can.
Available in Mac OS X v10.6 and later.

36.10.201 NSImageNameTrashFull as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
An image of the full trash can.
Available in Mac OS X v10.6 and later.

36.10.202 NSImageNameUser as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing sharing permission icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Permissions for a single user.
Available in Mac OS X v10.5 and later.

36.10.203 NSImageNameUserAccounts as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
User account toolbar icon. Use in a preferences window only.
Available in Mac OS X v10.5 and later.

36.10.204 NSImageNameUserGroup as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images representing sharing permission icons that you can use in your applications.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Permissions for a group of users.
Available in Mac OS X v10.5 and later.

36.10.205 NSImageNameUserGuest as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: One of the images that you can use in application toolbars.
Notes:

To access this image, pass the specified constant to the imageNamed method.
Shaded user figure.
Available in Mac OS X v10.6 and later.

36.10.206 PNGRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The image as the binary data in a PNG file.
Example:

```
dim img as NSImageMBS
dim p as Picture
dim f as FolderItem
dim b as BinaryStream
```

```
p=New Picture(100,100,32)
p.Graphics.ForeColor=& cFF0000
p.Graphics.FillOval 0,0,100,100
Backdrop=p
img=new NSImageMBS(p,p.Mask)

f=SpecialFolder.Desktop.Child("test.png")
b=f.CreateBinaryFile("")
b.Write img.PNGRepresentation
b.Close

f.Launch
```

Notes: PNG does support masks.

36.10.207 PNGRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The image as the binary data in a PNG file.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim jpeg as MemoryBlock = nsimage.PNGRepresentationMT

// decode to see if it worked
dim test as Picture = PNGStringToPictureMBS(jpeg)

// and display
Backdrop = test
```

Notes:

PNG does support masks.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will

block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.208 recache

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Invalidates and frees the offscreen caches of all image representations.
Notes:

If you modify an image representation, you must send a recache message to the corresponding image object to force the changes to be recached. The next time any image representation is drawn, it is asked to recreate its cached image. If you do not send this message, the image representation may use the old cache data. This method simply clears the cached image data; it does not delete the NSCachedImageRep objects associated with any image representations.
If you do not plan to use an image again right away, you can free its caches to reduce the amount of memory consumed by your program.

36.10.209 removeRepresentation(img as NSImageRepMBS)

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Removes the specified image representation from the receiver and releases it.

36.10.210 RepresentationHeight(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Height of the representation with the given index in pixel.
Notes:

Index from 0 to RepresetationCount-1.
Returns 0 on invalid index.

36.10.211 representations as NSImageRepMBS()

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array containing all of the receiver's image representations.
Notes:

An array containing zero or more NSImageRep objects.
Returns nil on any error.

36.10.212 RepresentationWidth(index as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Width of the representation with the given index in pixel.
Notes:

Index from 0 to RepresetationCount-1.
Returns 0 on invalid index.

36.10.213 setName(value as String) as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Registers the image under the specified name.
Notes:

Returns true if the receiver was successfully registered with the given name; otherwise, false.

Discussion
If the receiver is already registered under a different name, this method unregisters the other name. If a different image is registered under the name specified in aString, this method does nothing and returns false.

When naming an image using this method, it is convention not to include filename extensions in the names you specify. That way, you can easily distinguish between images you have named explicitly and those you want to load from the application's bundle. For information about the rules used to search for images, see the imageNamed method.

36.10.214 setSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the width and height of the image.
Notes:

Pass the new size of the image, measured in points.

Discussion:
The size of an NSImage object must be set before it can be used. If the size of the image hasn't already

been set when an image representation is added, the size is taken from the image representation's data. For EPS images, the size is taken from the image's bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation will draw itself in an offscreen window to recreate the cache.

36.10.215 TIFFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Example:

```
Dim p As Picture = LogoMBS(500)

// save as tiff

Dim n As New NSImageMBS(p)
Dim tiff As String = n.TIFFRepresentation
Dim file1 As FolderItem = SpecialFolder.Desktop.Child("test1.tif")
Dim b As BinaryStream = BinaryStream.Create(file1)
b.Write tiff
b.Close
```

Notes:

A string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

36.10.216 TIFFRepresentationMT as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Example:

```
// take some Picture
dim logo as Picture = LogoMBS(500)

// make a NSImageMBS from it
dim nsimage as new NSImageMBS(logo)

// use thread friendly compress function
dim data as MemoryBlock = nsimage.TIFFRepresentationMT

// decode to see if it worked
dim test as Picture = TIFFStringToPictureMBS(data)

// and display
Backdrop = test
```

Notes:

A string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. For each image representation, this method uses the TIFF compression option associated with that representation or NSTIFFCompressionNone, if no option is set.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.217 TIFFRepresentationUsingCompression(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Notes:

comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn't applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

36.10.218 TIFFRepresentationUsingCompressionMT(comp as Integer, factor as Double) as Memoryblock

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: Returns a string containing TIFF data for all of the image representations in the receiver.
Notes:

comp: The type of compression to use. For a list of values, see the constants in NSBitmapImageRep.

aFloat: Provides a hint for compression types that implement variable compression ratios. Currently, only JPEG compression uses a compression factor.

Returns a string containing the TIFF data, or nil if the TIFF data could not be created.

Discussion:
You can use the returned data object to write the TIFF data to a file. If the specified compression isn't applicable, no compression is used. If a problem is encountered during generation of the TIFF data, this method may raise an exception.

If one of the receiver's image representations does not support the creation of TIFF data natively (PDF and EPS images, for example), this method creates the TIFF data from that representation's cached content.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

If you run several threads calling MT methods, you can get all CPU cores busy while main thread shows GUI with progress window.

36.10.219 Properties

36.10.220 accessibilityDescription as string

MBS MacBase Plugin, Plugin Version: 12.2, Platform: macOS, Targets: All.

Function: The image's accessibility description.
Notes:

A short localized string that does not include the name of the interface element.

This description will be used automatically by interface elements that display images. Like all accessibility descriptions, the string should be a short localized string that does not include the name of the interface element. For instance, "delete" rather than "delete button".
(Read and Write property)

36.10.221 backgroundColor as NSColorMBS

MBS MacBase Plugin, Plugin Version: 8.4, Platform: macOS, Targets: All.

Function: The background color of image.
Notes:

The background color of the image. The default color is transparent, as returned by the clearColor method of NSColor.
The background color is visible only if the drawn image representation does not completely cover all of the pixels available for the image's current size.

The value of this variant must be an object of class NSColorMBS.
(Read and Write property)

36.10.222 cacheDepthMatchesImageDepth as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether an image's offscreen window caches use the same bit depth as the image data itself.
Notes:

Returns true if the offscreen window caches use the same bit depth as the image data; otherwise, false. The

default value is false.
(Read and Write property)

36.10.223 cacheMode as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The receiver's caching mode.
Notes:

The caching mode determines when the receiver's image representations use offscreen caches. Offscreen caches speed up rendering time but do so by using extra memory. In the default caching mode (NSImageCacheDefault), each image representation chooses the caching technique that produces the fastest drawing times. For example, in the default mode, the NSPDFImageRep and NSEPSImageRep classes use the NSImageCacheAlways mode but the NSBitmapImageRep class uses the NSImageCacheBySize mode.
(Read and Write property)

36.10.224 EXIFData as Dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns a dictionary with exif data.
Notes: (Read only property)

36.10.225 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The handle to the internally used NSImage object.
Notes: (Read and Write property)

36.10.226 height as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The height of the image or zero.
Notes:

If no size has been set and the size cannot be determined from any of the receiver's image representations.
(Read only property)

36.10.227 isCachedSeparately as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether each image representation caches its contents in a separate offscreen window.
Notes:

Returns true if the image representations cache their content in separate offscreen windows; otherwise, false. The default value is false.

Discussion:
If this method returns false, it means that the image may be cached in a shared window but is not required to be. Images are cached in a shared window if they have the same general attributes, such as color space, resolution, and bit depth.
(Read and Write property)

36.10.228 isDataRetained as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver retains its source image data.
Notes:

Returns true if the image retains its source data; otherwise, false. The default value is false with some exceptions, which are covered in the discussion.
(Read and Write property)

36.10.229 isFlipped as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the image uses a flipped coordinate system.
Notes:

Returns true if the image's coordinate system is flipped; otherwise, false. The default is false.
(Read and Write property)

36.10.230 isTemplate as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: A Boolean value indicating whether the image is a template image.
Example:

```
Dim ActionGearTemplate as string // content of PDF file
Dim Image as New NSImageMBS( ActionGearTemplate )
Image.setSize( 14,14 )
Image.IsTemplate = true
```

Notes:

Value is true if the image is a template image; otherwise, false.
Template images consist of black and clear colors (and an alpha channel). Template images are not intended to be used as standalone images and are usually mixed with other content to create the desired final appearance.
Available in Mac OS X v10.5 and later.
Assigning value to istemplate, will internally call setTemplate.
(Read and Write property)

36.10.231 isValid as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the image can be drawn.
Notes:

Return value: true if the receiver can be drawn; otherwise, false.

If the object is initialized with an existing image file, but the corresponding image data is not yet loaded into memory, this method loads the data and expands it as needed. If the object contains no image representations and no associated image file, this method creates a valid cached image representation and initializes it to the default bit depth. This method returns false in cases where the file or URL from which it was initialized is nonexistent or when the data in an existing file is invalid.
(Read only property)

36.10.232 matchesOnMultipleResolution as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether image representations whose resolution is an integral multiple of the device resolution are considered a match.
Notes:

Returns true if image representations whose resolution is an integral multiple of the device resolution are considered a match; otherwise, false.

Discussion:

When this method returns false, only image representations whose resolution is exactly the same as the device resolution are considered matches. If this method returns true and multiple image representations fit this criteria, the one whose resolution is closest to the device resolution is chosen.

The default value is true.
(Read and Write property)

36.10.233 MaximumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the height of the heighest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

36.10.234 MaximumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the width of the widest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

36.10.235 MinimumPixelHeight as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the width of the smallest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

36.10.236 MinimumPixelWidth as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: From all the image representation the width of the smallest one.
Notes:

Value is returned in pixels. Returns 0 on any error.
(Read only property)

36.10.237 name as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the name associated with the receiver, if any.
Notes: (Read only property)

36.10.238 prefersColorMatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a Boolean value indicating whether the image prefers to choose image representations using color matching or resolution matching.
Notes:

Discussion:
Both color matching and resolution matching may influence the choice of an image representation. This method simply indicates which technique is used first during the selection process. The default value is true.
(Read and Write property)

36.10.239 RepresentationsCount as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Number of represtations this image has.
Notes:

Same as Representations.Count
(Read only property)

36.10.240 scalesWhenResized as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether image representations are scaled to fit the receiver's size.
Notes:

Returns true if image representations are scaled to fit the receiver; otherwise, false. The default value is false.

Images are not resized during drawing if this method returns true. They are only resized when you change the size by sending the receiver a setSize message.
(Read and Write property)

36.10.241 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: The size of the receiver.
Notes:

The size of the receiver or (0.0, 0.0) if no size has been set and the size cannot be determined from any of the receiver's image representations.

The size of an NSImage object must be set before it can be used. If the size of the image hasn't already been set when an image representation is added, the size is taken from the image representation's data. For EPS images, the size is taken from the image's bounding box. For TIFF images, the size is taken from the ImageLength and ImageWidth attributes.

Changing the size of an NSImage after it has been used effectively resizes the image. Changing the size invalidates all its caches and frees them. When the image is next composited, the selected representation will draw itself in an offscreen window to recreate the cache.
(Read and Write property)

36.10.242 symbolConfiguration as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: The configuration details for a symbol image.
Notes:

Use this property to access the traits and rendering attributes the system uses with the symbol image. These details determine which variant of the image to load and draw and how to render it, falling back on the current environment for values that you don,Äôt specify. For symbol images, the default value of this property is a symbol image configuration object with unspecified values.
You can,Äôt modify this property directly, but you can use imageWithSymbolConfiguration() when you want to create a new image object with a specific set of traits.

For macOS 12.0 or newer.
(Read only property)

36.10.243 usesEPSOnResolutionMismatch as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether EPS image representations are preferred when no other representations match the resolution of the device.
Notes: (Read and Write property)

36.10.244 width as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The width of the image or zero.
Notes:

If no size has been set and the size cannot be determined from any of the receiver's image representations.
(Read only property)

36.10.245 Constants

36.10.246 NSImageCacheAlways=1

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image cache mode constants.
Notes: Always generate a cache when drawing.

36.10.247 NSImageCacheBySize=2

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image cache mode constants.
Notes: Cache if cache size is smaller than the original data.

36.10.248 NSImageCacheDefault=0

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image cache mode constants.
Notes:

Caching is unspecified.
Use the image rep's default.

36.10.249 NSImageCacheNever=3

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image cache mode constants.
Notes: Never cache; always draw direct.

36.10.250 NSImageLoadStatusCancelled=1

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image load status constants.
Notes:

Image loading was canceled.
The image contains the portions of the data that have already been successfully decompressed, if any.

36.10.251 NSImageLoadStatusCompleted=0

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image load status constants.
Notes: Enough data has been provided to completely decompress the image.

36.10.252 NSImageLoadStatusInvalidData=2

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image load status constants.
Notes:

An error occurred during image decompression.
The image data is probably corrupt. The image contains the portions of the data that have already been successfully decompressed, if any.

36.10.253 NSImageLoadStatusReadError=4

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image load status constants.
Notes:

Not enough data was available for full decompression of the image.
The image contains the portions of the data that have already been successfully decompressed, if any.

36.10.254 NSImageLoadStatusUnexpectedEOF=3

MBS MacBase Plugin, Plugin Version: 11.2.

Function: One of the image load status constants.
Notes:

Not enough data was available for full decompression of the image.
The image contains the portions of the data that have already been successfully decompressed, if any.

36.11 class NSImageRepMBS

36.11.1 class NSImageRepMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSImageRep class is a semiabstract superclass ("semi" because it has some instance variables and implementation of its own).
Notes:

Each of its subclasses knows how to draw an image from a particular kind of source data. While an NSImageRep subclass can be used directly, it is typically through an NSImage object. An NSImage object manages a group of image representations, choosing the best one for the current output device.

Subclasses are not implemented in the plugin currently.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

36.11.2 Methods

36.11.3 canInitWithData(data as memoryblock) as Boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver can initialize itself from the specified data.
Notes:

Returns true if the receiver understands the format of the specified data and can use it to initialize itself; otherwise, false.

This method should be overridden by subclasses. Note that this method does not need to do a comprehensive check of the image data; it should return false only if it knows it cannot initialize itself from the data.

36.11.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

36.11.5 setSize(width as Double, height as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the size of the image representation to the specified value.
Notes:

This method determines the size of the image when it's rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation. You must set the image size before you can render it.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.

36.11.6 Properties

36.11.7 bitsPerSample as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of bits per sample in the receiver.
Notes: (Read and Write property)

36.11.8 colorSpaceName as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of the receiver's color space.
Notes:

The colorspace name, or NSCalibratedRGBColorSpace if no name has been assigned.

By default, an NSImageRep object's color space name is NSCalibratedRGBColorSpace. Color space names are defined as part of the NSColor class, in NSGraphics.h. The following are valid color space names:

NSCalibratedWhiteColorSpace
NSCalibratedBlackColorSpace
NSCalibratedRGBColorSpace
NSDeviceWhiteColorSpace
NSDeviceBlackColorSpace
NSDeviceRGBColorSpace
NSDeviceCMYKColorSpace
NSNamedColorSpace
NSCustomColorSpace

(Read and Write property)

36.11.9 Handle as Integer

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

36.11.10 hasAlpha as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver has an alpha channel.
Notes:

Returns true if the receiver has a known alpha channel; otherwise, false.

Subclasses should call this method when loading image data to notify the parent class whether that data contains an alpha component. Passing in a value of true does not add an alpha channel to the image data itself; it merely records the fact that the data has an alpha channel.
(Read and Write property)

36.11.11 height as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Height of image in points.
Notes:

0 on any error.
(Read only property)

36.11.12 isOpaque as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver is opaque.
Notes:

Use this method to test whether an image representation completely covers the area within the rectangle returned by the size method.

The returned value does not indicate whether the image has an alpha channel or if there is partial or complete transparency when drawing the image rep. Use the hasAlpha method to determine if the image has an alpha channel.
(Read and Write property)

36.11.13 pixelsHigh as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the height of the image, measured in pixels.
Notes:

Return Value:
The height of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.
(Read and Write property)

36.11.14 pixelsWide as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the width of the image, measured in pixels.
Notes:

Return Value:
The width of the image, measured in the units of the device coordinate space. This value is usually derived from the image data itself.
(Read and Write property)

36.11.15 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop, Console & Web.

Function: The size of the image representation.
Notes:

This size is the size of the image representation when it's rendered. It is not necessarily the same as the width and height of the image in pixels as specified by the image data, nor must it be equal to the size set for the NSImage object that wraps this image representation.

The size of an image representation combined with the physical dimensions of the image data determine the resolution of the image.

(Read and Write property)

36.11.16 width as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Width of image in points.
Notes:

0 on any error.
(Read only property)

36.11.17 Constants

36.11.18 NSImageRepMatchesDevice = 0

MBS MacBase Plugin, Plugin Version: 9.6.

Function: One of the constants used by NSImageRep to denote an attribute whose value changes to match the display device.
Notes:

Indicates that the value of certain attributes, such as the number of colors or bits per sample, will change to match the display device.

This value can be passed in (or received back) as the value of bitsPerSample, pixelsWide, and pixelsHigh.

36.12 class NSImageSymbolConfigurationMBS

36.12.1 class NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: An object that contains the specific font, style, and weight attributes to apply to a symbol image.
Example:

```
Dim config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithPointSize(40, 0)
Dim n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Dim o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

Notes:

Symbol image configuration objects include details such as the point size, scale, text style, and weight to apply to your symbol image. The system uses these details to determine which variant of the image to use and how to scale or style the image.

NSImageSymbolConfiguration objects are immutable after you create them. If you use the configurationByApplyingConfiguration method on the object, the new image attributes replace any previous attributes you supplied. After creating a symbol configuration object, assign it to the symbolConfiguration property of the NSImageViewMBS object you use to display the image. If you draw the image directly, use the imageWithSymbolConfiguration method to create a new image that contains the new attributes.

For design guidance, see Human Interface Guidelines.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

36.12.6 Methods

36.12.7 available as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on macOS 11.0 or later.

36.12.8 configurationByApplyingConfiguration(configuration as NSImageSymbolConfigurationMBS) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a configuration object by applying the values from the configuration you specify.
Notes: for macOS 12.0 or newer.

36.12.9 configurationPreferringMulticolor as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a configuration that specifies that the symbol should prefer its multicolor variant if one exists.
Notes:

You can combine this configuration with one of the palette-based configurations. In that case, the symbol uses the multicolor variant if one exists; otherwise the symbol uses the palette version.
If the symbol supports neither, the symbol uses the monochrome (templated) symbol.

36.12.10 configurationWithHierarchicalColor(hierarchicalColor as NSColorMBS) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a hierarchical color configuration using the color you specify.
Notes:

This method creates a color scheme based on a single color. The system reduces the intensity of the base color to create the secondary and tertiary colors.
When combining this with another configuration, the last configuration overrides existing values.
If the symbol doesn,Äôt have a palette variant, this color configuration doesn,Äôt have an effect, so the symbol uses the monochrome (templated) symbol.

36.12.11 configurationWithPaletteColors(paletteColors() as NSColorMBS) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a color configuration by specifying a palette of colors.
Example:

```
// shows red colored trash can
Dim colors() As NSColorMBS
colors.Append NSColorMBS.redColor
Dim config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWith-
PaletteColors(colors)
Dim n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Dim o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

Notes:

The system applies the colors sequentially per layer ,Äî the first color for the first layer, and the second color for the second layer. This is independent of the hierarchy level of the layer.
When you combine this with another configuration to create a palette, the last configuration overrides any existing color configuration.
If the symbol doesn,Äôt have a palette variant, this color configuration doesn,Äôt have an effect, so the symbol uses the monochrome (templated) symbol.

36.12.12 configurationWithPointSize(pointSize as Double, weight as Double) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified point size and font weight.
See also:

- 36.12.13 configurationWithPointSize(pointSize as Double, weight as Double, SymbolScale as Integer) as NSImageSymbolConfigurationMBS 8904

36.12.13 configurationWithPointSize(pointSize as Double, weight as Double, SymbolScale as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified point size, font weight, and symbol scale.
See also:

- 36.12.12 configurationWithPointSize(pointSize as Double, weight as Double) as NSImageSymbolConfigurationMBS 8904

36.12.14 configurationWithScale(SymbolScale as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration using the scale you specify.
Example:

```
Dim config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWithScale(NSImageSymbolConfigurationMBS.kSymbolScaleLarge)
Dim n As NSImageMBS = NSImageMBS.imageWithSystemSymbolName("trash")
Dim o As NSImageMBS = n.imageWithSymbolConfiguration(config)

Backdrop = o.CopyPictureWithAlpha
```

36.12.15 configurationWithTextStyle(TextStyle as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified text style.
See also:

- 36.12.16 configurationWithTextStyle(TextStyle as Integer, SymbolScale as Integer) as NSImageSymbolConfigurationMBS 8905

36.12.16 configurationWithTextStyle(TextStyle as Integer, SymbolScale as Integer) as NSImageSymbolConfigurationMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a symbol configuration with the specified text style and symbol scale.
See also:

- 36.12.15 configurationWithTextStyle(TextStyle as Integer) as NSImageSymbolConfigurationMBS 8904

36.12.17 Constructor

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: The private constructor.

36.12.18 NSFontTextStyleBody as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for body text.

36.12.19 NSFontTextStyleCallout as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for callouts.

36.12.20 NSFontTextStyleCaption1 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for standard captions.

36.12.21 NSFontTextStyleCaption2 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for alternate captions.

36.12.22 NSFontTextStyleFootnote as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use in footnotes.

36.12.23 NSFontTextStyleHeadline as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for headings.

36.12.24 NSFontTextStyleLargeTitle as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for titles.

36.12.25 NSFontTextStyleSubheadline as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for subheadings.

36.12.26 NSFontTextStyleTitle1 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for first-level hierarchical headings.

36.12.27 NSFontTextStyleTitle2 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for second-level hierarchical headings.

36.12.28 NSFontTextStyleTitle3 as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: One of the text style constants.
Notes: The font you use for third-level hierarchical headings.

36.12.29 Properties

36.12.30 Description as String

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: Shows description for debugging.
Example:

```
Dim config As NSImageSymbolConfigurationMBS = NSImageSymbolConfigurationMBS.configurationWith-
Scale(NSImageSymbolConfigurationMBS.kSymbolScaleLarge)

MessageBox config.Description
```

Notes: (Read only property)

36.12.31 Handle as Integer

MBS MacBase Plugin, Plugin Version: 22.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference number.
Notes: (Read only property)

36.12.32 Constants

36.12.33 kSymbolScaleLarge = 3

MBS MacBase Plugin, Plugin Version: 22.1.

Function: Specifies which scale variant of a symbol image to use.
Notes:

The symbol uses the large scale variant.
This scale is approximately 30% larger than the kSymbolScaleMedium scale.

36.12.34 kSymbolScaleMedium = 2

MBS MacBase Plugin, Plugin Version: 22.1.

Function: Specifies which scale variant of a symbol image to use.
Notes: The symbol uses the default medium scale variant.

36.12.35 kSymbolScaleSmall = 1

MBS MacBase Plugin, Plugin Version: 22.1.

Function: Specifies which scale variant of a symbol image to use.
Notes:

The symbol uses the small scale variant.
This scale is approximately 20% smaller than the kSymbolScaleMedium scale.

36.13 class NSPDFImageRepMBS

36.13.1 class NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPDFImageRep object can render an image from a PDF format data stream.
Notes: Subclass of the NSImageRepMBS class.

36.13.2 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

36.13.3 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

36.13.4 Methods

36.13.5 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSPDFImageRep object initialized with the specified PDF data.
Notes:

Initialized NSPDFImageRep object. Initialization may fail if the PDF data does not conform to the PDF file format.
On success handle property is not zero.

36.13.6 imageRepWithData(data as Memoryblock) as NSPDFImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPDFImageRep object initialized with the specified PDF data.
Notes: Returns an initialized NSPDFImageRep object or nil if the object could not be initialized. Initialization may fail if the PDF data does not conform to the PDF file format.

36.13.7 PDFRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the PDF representation of the receiver's image.

36.13.8 Properties

36.13.9 bounds as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's bounding rectangle.
Notes:

This value is equivalent to the crop box specified by the PDF data.
(Read only property)

36.13.10 currentPage as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: The page currently displayed by the image representation.
Notes:

A zero-based index indicating the page being displayed.
(Read and Write property)

36.13.11 pageCount as Integer

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the number of pages in the receiver.
Notes: (Read only property)

36.14 class NSPICTImageRepMBS

36.14.1 class NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPICTImageRep object renders an image from a PICT format data stream as described in the Carbon QuickDraw Manager documentation.
Notes:

This class can render PICT format version 1, version 2, and extended version 2 pictures.
Subclass of the NSImageRepMBS class.

36.14.2 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

36.14.3 Blog Entries

- MBS Real Studio Plugins, version 12.0pr5

36.14.4 Methods

36.14.5 Constructor(data as Memoryblock)

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an NSPICTImageRep object initialized with the specified data.
Notes:

data: A data object containing the PICT data.

Initialization may fail if the data does not conform to the PICT file format.
On success the handle property is not zero.

If the PICT data is obtained directly from a PICT file or document, this method ignores most of the 512-byte header that occurs before the start of the actual picture data. It may retrieve some relevant meta information from the header.

36.14.6 imageRepWithData(data as Memoryblock) as NSPICTImageRepMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPICTImageRep object initialized with the specified data.
Notes:

Initialization may fail if the data does not conform to the PICT file format.
On failure the handle property is nil.

36.14.7 PICTRepresentation as Memoryblock

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's PICT data.
Notes: A data object containing the PICT data. The returned data does not include the 512-byte header, if it was present in the original data. If you want to write the returned data to a file, you must precede it with a 512-byte header (containing all zeros) if you want to conform to the PICT document format.

36.14.8 Properties

36.14.9 boundingBox as NSRectMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the rectangle that bounds the receiver.
Notes:

The rectangle bounding the receiver. This rectangle is obtained from the the picFrame field in the picture header. See the Carbon QuickDraw Manager documentation for information on the picture header.
(Read only property)

Chapter 37

Cocoa Menus

37.1 class NSMenuItemMBS

37.1.1 class NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to represent a menuitem from the Cocoa world.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

37.1.6 Methods

37.1.7 clearAction

MBS MacBase Plugin, Plugin Version: 20.3, Platform: macOS, Targets: Desktop only.

Function: Clears action event.
Notes: Call this method once to have a menuitem which has no action.

37.1.8 Constructor(DesktopMenuitem as DesktopMenuitem)

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSMenuItemMBS object for a given MenuItem.
Notes: May raise UnsupportedOperationException or NilObjectException if used incorrectly.

- 37.1.12 Constructor(title as string="", keyEquivalent as string="") 8917

37.1.9 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Constructor for creating an instanced based on an existing handle.
Example:

```
dim m as MenuItem = EditCopy
dim h as Integer = m.Handle(MenuItem.HandleType.CocoaNSMenuItem)
dim i as new NSMenuItemMBS(h)

i.Title = "Hello"
```

Notes:

Useful if you get a NSMenuItem reference from a declare.
The object is retained.
See also:

- 37.1.8 Constructor(DesktopMenuitem as DesktopMenuitem) 8915
- 37.1.10 Constructor(MenuItem as MenuItem) 8915
- 37.1.11 Constructor(Other as NSMenuItemMBS) 8916
- 37.1.12 Constructor(title as string="", keyEquivalent as string="") 8917

37.1.10 Constructor(MenuItem as MenuItem)

MBS MacBase Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSMenuItemMBS object for a given MenuItem.
Example:

```
dim FileDot, FileDiamond as MenuItem

FileDot.enable
FileDot.checked = true

// via constructor
dim n1 as new NSMenuItemMBS(fileDot)
n1.onStateImage = NSImageMBS.imageNamed("NSMenuItemBullet")

FileDiamond.enable
FileDiamond.checked = true

// via function
dim n2 as NSMenuItemMBS = NSMenuItemMBS.MenuItem(FileDiamond)
n2.onStateImage = NSImageMBS.imageNamed("NSMenuItemDiamond")
```

Notes: May raise UnsupportedOperationException or NilObjectException if used incorrectly.
See also:

- 37.1.8 Constructor(DesktopMenuitem as DesktopMenuitem) 8915
- 37.1.9 Constructor(Handle as Integer) 8915
- 37.1.11 Constructor(Other as NSMenuItemMBS) 8916
- 37.1.12 Constructor(title as string="", keyEquivalent as string="") 8917

37.1.11 Constructor(Other as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 22.3, Platform: macOS, Targets: Desktop only.

Function: Creates a new NSMenuItemMBS object referencing same NSMenuItem with a new Xojo object.
See also:

- 37.1.8 Constructor(DesktopMenuitem as DesktopMenuitem) 8915
- 37.1.9 Constructor(Handle as Integer) 8915
- 37.1.10 Constructor(MenuItem as MenuItem) 8915
- 37.1.12 Constructor(title as string="", keyEquivalent as string="") 8917

37.1.12 Constructor(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new menu items.
Notes:

Handle is not 0 after this call if it was successfull.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.
See also:

- 37.1.8 Constructor(DesktopMenuitem as DesktopMenuitem) 8915
- 37.1.9 Constructor(Handle as Integer) 8915
- 37.1.10 Constructor(MenuItem as MenuItem) 8915
- 37.1.11 Constructor(Other as NSMenuItemMBS) 8916

37.1.13 CreateMenuItem(title as string="", keyEquivalent as string="")

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new menu items.
Notes:

Handle is not 0 after this call if it was successfull.
name and charcode are optional and can be "".
Charcode is the initial keyEquivalent for this menu item.
You can set the KeyEquivalentModifierMask to get different modifier keys.

Deprecated, please use the Constructor instead.

37.1.14 CreateSeparator

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Creates a Separator menu item.

37.1.15 MenuItem(DesktopMenuItem as DesktopMenuItem) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Queries NSMenuItemMBS for a given menu item.
Notes: Returns nil on any error.
See also:

- 37.1.16 MenuItem(MenuItem as MenuItem) as NSMenuItemMBS 8918

37.1.16 MenuItem(MenuItem as MenuItem) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 18.3, Platform: macOS, Targets: Desktop only.

Function: Queries NSMenuItemMBS for a given menu item.
Example:

```
dim FileDot, FileDiamond as MenuItem

FileDot.enable
FileDot.checked = true

// via constructor
dim n1 as new NSMenuItemMBS(fileDot)
n1.onStateImage = NSImageMBS.imageNamed("NSMenuItemBullet")

FileDiamond.enable
FileDiamond.checked = true

// via function
dim n2 as NSMenuItemMBS = NSMenuItemMBS.MenuItem(FileDiamond)
n2.onStateImage = NSImageMBS.imageNamed("NSMenuItemDiamond")
```

Notes: Returns nil on any error.
See also:

- 37.1.15 MenuItem(DesktopMenuItem as DesktopMenuItem) as NSMenuItemMBS 8917

37.1.17 sectionHeaderWithTitle(Title as String) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Creates a menu item representing a section header with the provided title.
Example:

```
dim m as NSMenuItemMBS = NSMenuItemMBS.MenuItem(EditMenu)

// add the header
dim h as NSMenuItemMBS = NSMenuItemMBS.sectionHeaderWithTitle("Section Header")
h.Enabled = true
```

```
m.submenu.addItem h
self.SectionHeader = h

// and the new entry with our MyNSMenuItemMBS class to handle validate and action.
dim n as new MyNSMenuItemMBS("Hello")
n.Enabled = true
m.submenu.addItem n
self.HelloMenu = n // keep references
```

Notes:

Section header items are used to provide context to a grouping of menu items.
Items created using this method are non-interactive and do not perform an action.

Requires macOS Sonoma or newer.

37.1.18 separatorItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Creates a new separator menu item.

37.1.19 setAction(target as NSResponderMBS, selectorName as string)

MBS MacBase Plugin, Plugin Version: 23.3, Platform: macOS, Targets: Desktop only.

Function: Sets the target for the menu action.
Example:

```
dim n as NSMenuItemMBS // your menu item

n.setAction(window1.NSWindowMBS, "performClose:")
```

Notes:

Please make sure the selector is correct as otherwise you get an exception later.
And make sure the target object stays alive.

37.1.20 setTitleWithMnemonic(title as String)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets the title of a menu item with a character denoting an access key.
Notes:

Use an ampersand character to mark the character (the one following the ampersand) to be designated.
Deprecated by Apple.

37.1.21 Properties

37.1.22 ActionSelector as String

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Returns the name of the objective-c method called for this menu event.
Notes:

You can use this to find menu items by their selector. Which is often more save than by index or title.
(Read only property)

37.1.23 Alternate as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether this menu item is an alternate to the previous menu item.
Notes:

Available in Mac OS X v10.3 and later.
(Read and Write property)

37.1.24 attributedTitle as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Specifies a custom string for a menu item.
Notes:

You can use this method to add styled text and embedded images to menu item strings. If you do not set a text color for the attributed string, it is black when not selected, white when selected, and gray when disabled. Colored text remains unchanged when selected.

When you call this method to set the menu title to an attributed string, the setTitle: method is also called to set the menu title with a plain string. If you clear the attributed title, the plain title remains unchanged.
(Read and Write property)

37.1.25 Enabled as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Whether this menuitem is enabled.
Notes: (Read and Write property)

37.1.26 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The reference to the NSMenuItem object used internally.
Notes: (Read and Write property)

37.1.27 hasSubmenu as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns true if the menuitem has a submenu, false if it doesn't.
Notes: (Read only property)

37.1.28 image as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image displayed by the menuitem, or nil if it displays no image.
Notes: (Read and Write property)

37.1.29 indentationLevel as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The menu item indentation level for the menu item.
Notes:

The value will be from 0 to 15. The default indentation level is 0.
Available in Mac OS X v10.3 and later.
(Read and Write property)

37.1.30 isHidden as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the menuitem is hidden.
Notes:

Mac OS X 10.5 only.
Returns true if the receiver is hidden, otherwise false.
This value can be set to hide or show a menuitem.
(Read and Write property)

37.1.31 isHiddenOrHasHiddenAncestor as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the menuitem or any of its superitems is hidden.
Notes:

Mac OS X 10.5 only.
Returns true if the receiver or any of its superitems is hidden, otherwise false.
(Read only property)

37.1.32 isHighlighted as boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver should be drawn highlighted.
Notes:

Returns true if the receiver should be drawn highlighted, otherwise false.
Mac OS X 10.5 only.
(Read only property)

37.1.33 isSectionHeader as Boolean

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Indicates whether the item is a section header.
Notes:

Section header items are created using the sectionHeader() class method.

Requires macOS Sonoma or newer.

(Read only property)

37.1.34 isSeparatorItem as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns whether the receiver is a separator item (that is, a menu item used to visually segregate related menu items).
Notes: (Read only property)

37.1.35 keyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The receiver's unmodified keyboard equivalent, or the empty string if one hasn't been defined.
Example:

```
dim m as new NSMenuItemMBS
m.CreateMenuItem "Hello"
m.keyEquivalent = "a" // A
m.keyEquivalent = "A" // shift-A
```

Notes:

Use keyEquivalentModifierMask to determine the modifier mask for the key equivalent. In the current implementation "A" can be interpreted as Shift-A by the system even without the shift in the mask.
(Read and Write property)

37.1.36 keyEquivalentModifierMask as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: the menu item's keyboard equivalent modifier mask.
Example:

```
const NSShiftKeyMask=131072
const NSControlKeyMask=262144
const NSAlternateKeyMask=524288
const NSCommandKeyMask=1048576

dim d as new NSMenuItemMBS
d.CreateMenuItem "Last menu entry",""
d.Enabled=true
```

d.KeyEquivalent="A"
d.KeyEquivalentModifierMask=NSShiftKeyMask+NSCommandKeyMask+NSAlternateKeyMask // command-option-shift

Notes:

Constants for the mask:

NSAlphaShiftKeyMask = 65536
Set if Caps Lock key is pressed.
Available in Mac OS X v10.0 and later.

NSShiftKeyMask = 131072
Set if Shift key is pressed.
Available in Mac OS X v10.0 and later.

NSControlKeyMask = 262144
Set if Control key is pressed.
Available in Mac OS X v10.0 and later.

NSAlternateKeyMask = 524288
Set if Option or Alternate key is pressed.
Available in Mac OS X v10.0 and later.

NSCommandKeyMask = 1048576
Set if Command key is pressed.
Available in Mac OS X v10.0 and later.

NSNumericPadKeyMask = 2097152
Set if any key in the numeric keypad is pressed. The numeric keypad is generally on the right side of the keyboard. This is also set if any of the arrow keys are pressed (NSUpArrowFunctionKey, NSDownArrowFunctionKey, NSLeftArrowFunctionKey, and NSRightArrowFunctionKey).
Available in Mac OS X v10.0 and later.

NSHelpKeyMask = 4194304
Set if the Help key is pressed.
Available in Mac OS X v10.0 and later.

NSFunctionKeyMask = 8388608
Set if any function key is pressed. The function keys include the F keys at the top of most keyboards (F1, F2, and so on) and the navigation keys in the center of most keyboards (Help, Forward Delete, Home, End, Page Up, Page Down, and the arrow keys).

Available in Mac OS X v10.0 and later.

NSDeviceIndependentModifierFlagsMask = 16777216
Used to retrieve only the device-independent modifier flags, allowing applications to mask off the device-dependent modifier flags, including event coalescing information.
Available in Mac OS X v10.4.
(Read and Write property)

37.1.37 menu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The menu where this menu item is inside.
Notes:

nil if no menu belongs to this menuitem.
(Read only property)

37.1.38 mixedStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image used to depict a "mixed state."
Notes:

A mixed state is useful for indicating "off" and "on" attribute values in a group of selected objects, such as a selection of text containing bold and plain (nonbolded) words.
(Read and Write property)

37.1.39 offStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image used to depict the receiver's "off" state, or nil if the image has not been set.
Notes:

By default, there is no off state image.
(Read and Write property)

37.1.40 onStateImage as NSImageMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The image of the receiver that indicates an "on" state.
Notes:

The Image object to use for the "on" state of the menu item. If itemImage is nil, any current on-state image is removed.
(Read and Write property)

37.1.41 parentItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the menu item whose submenu contains the receiver.
Notes:

Returns the parent menu item, or nil if the receiver does not have a parent item.
Available in Mac OS X v10.6 and later.
(Read only property)

37.1.42 state as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The state of the menuitem.
Notes:

An integer constant representing a state; it should be one of NSOffState, NSOnState, or NSMixedState.
Same as Checked property on Xojo's menu items.

Constants:

NSMixedState = -1	The corresponding feature is in effect somewhere.
NSOffState = 0	The corresponding feature is in effect nowhere.
NSOnState = 1	The corresponding feature is in effect everywhere.

(Read and Write property)

37.1.43 submenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The submenu attached to this menuitem.
Notes:

nil if there is no submenu.
(Read and Write property)

37.1.44 tag as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The menu item tag value.
Notes:

You can use this value as you like.

If you need to store more custom data than just an integer, you should subclass the NSMenuItemMBS class and add properties as needed.
(Read and Write property)

37.1.45 Title as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The title of the menu item.
Notes: (Read and Write property)

37.1.46 toolTip as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The help tag for a menu item.
Notes: (Read and Write property)

37.1.47 userKeyEquivalent as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The user-assigned key equivalent for the menu item.
Notes: (Read only property)

37.1.48 view as NSViewMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The view to be used for this menuitem.
Notes:

Using a view you can draw whatever you like in the menu item.
You can set it to nil to remove the view.
Requires Mac OS X 10.5.
(Read and Write property)

37.1.49 usesUserKeyEquivalents as boolean

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop only.

Function: Whether menu items conform to user preferences for key equivalents.
Notes:

If true, menu items conform to user preferences for key equivalents; if false, the key equivalents originally assigned to the menu items are used.
(Read and Write computed property)

37.1.50 Events

37.1.51 Action

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: .

Function: The action event called when the user clicks on the statusitem.
Notes:

This event is coming from the Cocoa event system. What you can do is a bit limited when using GUI functions from Xojo. To avoid some redraw errors, you may want to start a timer and let your Xojo code run a millisecond after the menu code has finished.
Depending on what you do, you can see the menu not redrawing properly (staying highlighted) and crashes if the Xojo code modifies some global Cocoa states.

37.1.52 validateMenuItem(menuItem as NSMenuItemMBS) as boolean

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: .

Function: Implemented to override the default action of enabling or disabling a specific menu item.
Notes:

Return true to enable menuItem, false to disable it.
This is needed to modify the menuitem for a menu attached to a NSSearchFieldMBS.
Menuitem parameter is often the same as self, but for a searchfield menu, self is the template and menuitem parameter the actual menu item.

37.1.53 Constants

37.1.54 NSMixedState=-1

MBS MacBase Plugin, Plugin Version: 9.2.

Function: One of the constants for the state property.
Notes: The corresponding feature is in effect somewhere.

37.1.55 NSOffState=0

MBS MacBase Plugin, Plugin Version: 9.2.

Function: One of the constants for the state property.
Notes: The corresponding feature is in effect nowhere.

37.1.56 NSOnState=1

MBS MacBase Plugin, Plugin Version: 9.2.

Function: One of the constants for the state property.
Notes: The corresponding feature is in effect everywhere.

37.2 class NSMenuMBS

37.2.1 class NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: A class to represent a menu in the Cocoa world.
Notes: All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

37.2.2 Blog Entries

37.2.6 Methods

37.2.7 addItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Adds a menu item to the end.
Notes:

If the menuitem is nil, nothing happens.
The menuitem can only be in one menu.

The menu doesn't references to the RB classes behind, so it's up to you to keep those references if you want to get the events and avoid crashes.
The StatusItem example keeps an array with all those menu item objects it needs so RB will not destroy them.

37.2.8 cancelTracking

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Dismisses the menu and ends all menu tracking.
Notes: Available in Mac OS X v10.5 and later.

37.2.9 cancelTrackingWithoutAnimation

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Dismisses the menu and ends all menu tracking without displaying the associated animation.
Notes: Available in Mac OS X v10.6 and later.

37.2.10 Constructor(Handle as Integer)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: Constructor for creating an instanced based on an existing handle.
Notes:

Useful if you get a NSMenu reference from a declare.
The object is retained.
See also:

- 37.2.11 Constructor(title as string="") 8932

37.2.11 Constructor(title as string="")

MBS MacBase Plugin, Plugin Version: 7.4, Platform: macOS, Targets: Desktop only.

Function: Constructor for a new nsmenu.
Example:

```
dim m as NSMenuMBS
m=new NSMenuMBS("Hello World")
msgbox m.title // shows "Hello World"
```

Notes: Title is optional.
See also:

- 37.2.10 Constructor(Handle as Integer) 8932

37.2.12 helpMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the help menu if one is registered.

37.2.13 indexOfItem(item as NSMenuItemMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index identifying the location of a specified menu item in the receiver.
Notes: Returns the integer index of the menu item or, if no such menu item is in the menu, ‚Äì1.

37.2.14 indexOfItemWithSelector(selector as string) as Integer

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Searches menu items for one with the given selector.
Notes:

Returns -1 if not found.
You can use this to find menu items by their selector. Which is often more save than by index or title.

37.2.15 indexOfItemWithSubmenu(item as NSMenuMBS) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the menu item in the receiver with the given submenu.
Notes:

item: A menu object that is a menu item of the receiver (that is, a submenu).

The integer index of the menu item or, if no such menu item is in the menu, ,Äì1.

37.2.16 indexOfItemWithTag(tag as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the first menu item in the receiver identified by a tag.
Notes: Returns the integer index of the menu item or, if no such menu item is in the menu, ,Äì1.

37.2.17 indexOfItemWithTitle(title as string) as Integer

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the index of the first menu item in the receiver that has a specified title.
Notes: The integer index of the menu item or, if no such menu item is in the menu, ,Äì1.

37.2.18 insertItem(m as NSMenuItemMBS, index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Inserts a menu item into the menu at a specific location.
Notes:

If the menuitem is nil, nothing happens. A menuitem can only be part of one menu.

index: An integer index identifying the location of the menu item in the menu. Zero based.

37.2.19 Item(index as Integer) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Returns the item with the given index.
Notes:

Index is from 0 to numberOfItems-1.
Remember: The objects returned are not the same Xojo objects used with additem or insertitem.

37.2.20 itemWithSelector(selector as string) as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: Desktop only.

Function: Searches menu items for one with the given selector.
Notes: You can use this to find menu items by their selector. Which is often more save than by index or title.

37.2.21 mainMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the main menu.

37.2.22 menuBarVisible as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the menu bar is visible.
Notes:

Available in Mac OS X v10.2 and later.
Returns true if the menu bar is visible, otherwise false.

37.2.23 NSMenuDidAddItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item is added to the menu. The notification object is the instance of NSMenuMBS that just added the new menu item.
This is very useful to customize the menu in Xojo. The runtime rebuilds menu bar often, so you can catch it and edit menu.

The userInfo dictionary contains the following information:
NSMenuItemIndex: An integer index of the menu item that was added.

37.2.24 NSMenuDidBeginTrackingNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes:

Posted when menu tracking begins. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo dictionary.

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

37.2.25 NSMenuDidChangeItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item in the menu changes appearance. Changes include enabling/disabling, changes in state, and changes to title. The notification object is the instance of NSMenuMBS with the menu item that changed. The userInfo dictionary contains the following information:

Key	Value
NSMenuItemIndex	An integer index of the menu item that changed.

37.2.26 NSMenuDidEndTrackingNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted when menu tracking ends, even if no action is sent. The notification object is the main menu bar (NSApplicationMBS mainMenu) or the root menu of a popup button. This notification does not contain a userInfo

37.2.27 NSMenuDidRemoveItemNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted after a menu item is removed from the menu. The notification object is the instance of NSMenu that just removed the menu item. The userInfo dictionary contains the following information:

NSMenuItemIndex: An integer index of the menu item that was removed. Note that this index may no longer be valid and in any event no longer points to the menu item that was removed.

37.2.28 NSMenuDidSendActionNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just after the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:

Key	Value
MenuItem	The menu item that was chosen.

37.2.29 NSMenuWillSendActionNotification as string

MBS MacBase Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop only.

Function: One of the notifications sent for menus.
Notes:

Use this constant with NSNotificationObserverMBS class to get an event when such a notification is sent.

Posted just before the application dispatches a menu item's action method to the menu item's target. The notification object is the instance of NSMenuMBS containing the chosen menu item. The userInfo dictionary contains the following information:

Key	Value
MenuItem	The menu item that was chosen.

37.2.30 paletteMenuWithColors(colors() as NSColorMBS, itemTitles() as String, templateImage as NSImageMBS = nil) as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Creates an palette menu displaying user-selectable color tags using the provided template image, tinted using the specified array of colors.
Example:

```
dim m as NSMenuItemMBS = NSMenuItemMBS.MenuItem(EditMenu)

// gather data for menu
dim colors() as NSColorMBS
colors.Append NSColorMBS.whiteColor
colors.Append NSColorMBS.redColor
colors.Append NSColorMBS.blueColor

dim titles() as string = array("White", "Red", "Blue")

// now create palette and attach our handler
paletteMenu = NSMenuMBS.paletteMenuWithColors(Colors, titles)
AddHandler paletteMenu.PaletteSelectionChange, WeakAddressOf PaletteSelectionChange

// now make a dummy menu and add palette
```

```
dim n as new MyNSMenuItemMBS("Hello")
n.Enabled = true
n.submenu = paletteMenu
m.submenu.addItem n
self.HelloMenu = n
```

Notes:

Optionally allows observing changes to the selection state in the compact menu. The block is invoked after the selection has been updated. Currently selected items can be retrieved from the 'selectedItems' property.

Returns a palette menu.

Requires macOS Sonoma or newer.

37.2.31 performActionForItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Causes the application to send the action message of a specified menu item to its target.
Notes:

If a target is not specified, the message is sent to the first responder. As a side effect, this method posts NSMenuWillSendActionNotification and NSMenuDidSendActionNotification.

In Mac OS X v10.6 and laster the performActionForItemAtIndex no longer triggers menu validation. This is because validation is typically done during menu tracking or key equivalent matching, so the subsequent performActionForItemAtIndex validation was redundant. To trigger validation explicitly, use invoke the update method.

In Mac OS X v10.6 performActionForItemAtIndex, when called, now triggers highlighting in the menu bar. It also sends out appropriate accessibility notifications indicating the item was selected.

37.2.32 popUpContextMenu(menu as NSMenuMBS, theEvent as NSEventMBS, view as NSViewMBS, font as NSFontMBS = nil)

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Displays a contextual menu over a view for an event using a specified font.
Notes:

menu: The menu object to use for the contextual menu.
event: An NSEvent object representing the event.

view: The view object over which to display the contextual menu.
font: An NSFont object representing the font for the contextual menu. If you pass in nil for the font, the method uses the default font for menu.

Specifying a font using the font parameter is discouraged. Instead set the menu,Äôs font using the setFont: method and pass nil for the font parameter.

37.2.33 popUpMenuPositioningItem(item as NSMenuItemMBS, location as NSPointMBS, view as NSViewMBS = nil) as boolean

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: Desktop only.

Function: Pops up the menu at the specified location.
Example:

```
// create menu
dim m as new NSMenuMBS
m.autoenablesItems = false

// add some items
dim it as new NSMenuItemMBS
it.CreateMenuItem "Hello"
it.Enabled = true
m.addItem it

it = new NSMenuItemMBS
it.CreateMenuItem "World"
it.Enabled = true
m.addItem it

// show relative to this view
dim v as NSViewMBS = window1.PushButton1.NSViewMBS

dim r as Boolean
r = m.popUpMenuPositioningItem(nil, nil, v)
// you need to use NSMenuItemMBS subclasses with action event to get an event for which item was selected...
```

Notes:

item: The menu item to be positioned at the specified location in the view.
location: The location in the view coordinate system to display the menu item.
view: The view to display the menu item over.

Returns true if menu tracking ended because an item was selected, and false if menu tracking was cancelled for any reason.

Pops up the receiver as a popup menu. The top left corner of the specified item (if specified, item must be present in the receiver) is positioned at the specified location in the specified view, interpreted in the view's own coordinate system.

If item is nil, the menu is positioned such that the top left of the menu content frame is at the given location. If view is nil, the location is interpreted in the screen coordinate system. This allows you to pop up a menu disconnected from any window.

Available in OS X v10.6 and later.

37.2.34 removeAllItems

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Removes all the menu items in the receiver.
Example:

```
dim n as NSMenuMBS // your menu

// for Mac OS X 10.6
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
n.removeItemAtIndex i
next
```

Notes:

This method is more efficient than removing menu items individually.
Unlike the other remove methods, this method does not post NSMenuDidChangeItemNotification notifications.
Available in Mac OS X v10.6 and later.

37.2.35 removeItem(m as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the menuitem.

Notes:

Does nothing if menuitem is nil.

The Xojo object used to add the menuitem must not be the same as the one you use here, but the values for the menuitems handle property must match.

37.2.36 removeItemAtIndex(index as Integer)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: Removes the menu item with the given index.
Example:

```
dim n as NSMenuMBS // your menu

// for Mac OS X 10.6
n.removeAllItems

// for any Mac OS X version
for i as Integer = n.numberOfItems-1 DownTo 0
n.removeItemAtIndex i
next
```

Notes: Index is from 0 to NumberOfItems-1.

37.2.37 selectedItems as NSMenuItemMBS()

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: The menu items that are selected.
Notes:

An item is selected when its state is ‘NSControl.StateValue.on‘.

Requires macOS Sonoma or newer.

37.2.38 setMenuBarVisible(value as boolean)

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Sets whether the menu bar is visible and selectable by the user.
Notes:

value: true if menu bar is to be visible, otherwise false.
Available in Mac OS X v10.2 and later.

37.2.39 setSelectedItems(items() as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: Sets the menu items that are selected.
Notes:

An item is selected when its state is ‘NSControl.StateValue.on‘.

Setting ‘selectedItems‘ will select any items that are contained in the provided array, and deselect any previously selected items that are not in the array.

Requires macOS Sonoma or newer.

37.2.40 update

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Enables or disables the receiver’s menu items based on the NSMenuValidation informal protocol and sizes the menu to fit its current menu items if necessary.

37.2.41 windowsMenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 14.0, Platform: macOS, Targets: Desktop only.

Function: Returns the window menu if one is registered.

37.2.42 Properties

37.2.43 allowsContextMenuPlugIns as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Whether the popup menu allows appending of contextual menu plugin items.
Notes:

Value is true if the popup menu allows appending of contextual menu plugin items, otherwise false.
Available in Mac OS X v10.6 and later.
(Read and Write property)

37.2.44 autoenablesItems as Boolean

MBS MacBase Plugin, Plugin Version: 7.7, Platform: macOS, Targets: Desktop only.

Function: Whether menu items are automatically enabled and disabled.
Notes:

Mac OS X 10.5 only.
(Read and Write property)

37.2.45 Font as NSFontMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The font used to display the menu and its submenus.
Notes:

This font will be used to display the menu and any submenus that have not had their font set explicitly.
Available in Mac OS X v10.6 and later.
(Read and Write property)

37.2.46 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The internal reference to the NSMenu object.
Notes: (Read and Write property)

37.2.47 highlightedItem as NSMenuItemMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the highlighted item in the receiver.
Notes:

Returns the highlighted item in the receiver, or nil if no item in the menu is highlighted.
Available in Mac OS X v10.5 and later.
(Read only property)

37.2.48 menuBarHeight as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the menu bar height for the current application's main menu.
Notes:

Returns the receiver's main menu bar height or 0.0 if the receiver is some other menu.
This method supersedes the menuBarHeight class method of the NSMenuView class.
Available in Mac OS X v10.4 and later.
(Read only property)

37.2.49 minimumWidth as Double

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: The minimum width of the menu.
Notes:

The menu will not draw smaller than its minimum width, but may draw larger if it needs more space. The default value is 0.
Available in Mac OS X v10.6 and later.
(Read and Write property)

37.2.50 numberOfItems as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The number of menu items in this menu.
Notes: (Read only property)

37.2.51 presentationStyle as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: The presentation style of the menu.
Notes:

This property is not respected if the menu is the main menu of the app.

Requires macOS Sonoma or newer.
(Read and Write property)

37.2.52 selectionMode as Integer

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: Desktop only.

Function: The selection mode of the menu.
Notes:

Note the selection mode only has effect on menu items that belong to the same selection group. A selection group consists of the items with the same target/action.

Requires macOS Sonoma or newer.
(Read and Write property)

37.2.53 showsStateColumn as boolean

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns a Boolean value that indicates whether the receiver displays the state column.
Notes:

Available in Mac OS X v10.5 and later.
Returns true if the receiver displays the state column, otherwise false.

The state column is the area in the menu items, where state of menuitems are shown like a checkmark.
(Read and Write property)

37.2.54 size as NSSizeMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: Desktop only.

Function: Returns the size of the menu.
Notes:

Returns the size of the menu in screen coordinates.
The menu may draw at a smaller size when shown, depending on its positioning and display configuration.
Available in Mac OS X v10.6 and later.
(Read only property)

37.2.55 supermenu as NSMenuMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The parent menu of this menu.

Notes: (Read only property)

37.2.56 Title as String

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop only.

Function: The title of the menu.
Notes: (Read and Write property)

37.2.57 userInterfaceLayoutDirection as Integer

MBS MacBase Plugin, Plugin Version: 16.3, Platform: macOS, Targets: Desktop only.

Function: Configures the layout direction of menu items in the menu.
Notes:

This property configures the layout direction (a value of type NSUserInterfaceLayoutDirection) of menu items in the menu. If no layout direction is explicitly set for a menu, then the menu defaults to the layout direction specified for the application object. See userInterfaceLayoutDirection in NSApplication Class Reference.

NSUserInterfaceLayoutDirectionLeftToRight = 0
NSUserInterfaceLayoutDirectionRightToLeft = 1

Available in OS X v10.11 and later.
(Read and Write property)

37.2.58 Events

37.2.59 DidClose

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: .

Function: Invoked after a menu closed.
Notes: Don,Äôt modify the structure of the menu or the menu items during this method.

37.2.60 EnableMenuItems

MBS MacBase Plugin, Plugin Version: 8.7, Platform: macOS, Targets: .

Function: This event is called before the menu opens so you can edit the menu.

37.2.61 PaletteSelectionChange

MBS MacBase Plugin, Plugin Version: 23.5, Platform: macOS, Targets: .

Function: The event called when the palette selection changes.

37.2.62 willHighlightItem(item as NSMenuItemMBS)

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: .

Function: Invoked to indicate that a menu is about to highlight a given item.
Notes:

item: The item about to be highlighted.

Only one item per menu can be highlighted at a time. If item is nil, it means that all items in the menu are about to be unhighlighted.

37.2.63 WillOpen

MBS MacBase Plugin, Plugin Version: 14.3, Platform: macOS, Targets: .

Function: Invoked when a menu is about to open.
Notes: Don,Äôt modify the structure of the menu or the menu items during this method.

37.2.64 Constants

37.2.65 PresentationStylePalette = 1

MBS MacBase Plugin, Plugin Version: 23.5.

Function: One of the constants for presentationStyle property to determine how the given menu is presented.
Notes: The menu marked as palette is to be displayed in place of the menu item presenting it, with its items aligned horizontally.

37.2.66 PresentationStyleRegular = 0

MBS MacBase Plugin, Plugin Version: 23.5.

Function: One of the constants for presentationStyle property to determine how the given menu is presented.
Notes: The default presentation style. Typically means the menu will be presented as either a popup or pulldown menu, based on the context.

37.2.67 SelectionModeAutomatic = 0

MBS MacBase Plugin, Plugin Version: 23.5.

Function: One of the selection mode constants.
Notes: The menu will determine the appropriate selection mode based on the context and its contents.

37.2.68 SelectionModeSelectAny = 2

MBS MacBase Plugin, Plugin Version: 23.5.

Function: One of the selection mode constants.
Notes: The user can select multiple items in the menu. A change in selection will not automatically deselect any previously selected item in the same selection group.

37.2.69 SelectionModeSelectOne = 1

MBS MacBase Plugin, Plugin Version: 23.5.

Function: One of the selection mode constants.
Notes: The user will be allowed to select at most one menu item in the same selection group at a time. A change in selection will deselect any previously selected item.

Chapter 38

Cocoa Networking

38.1 class NSCachedURLResponseMBS

38.1.1 class NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: A cached response to a URL request.
Notes:

A NSCachedURLResponseMBS object provides the server,Äôs response metadata in the form of a NSURLResponseMBS object, along with an NSData object containing the actual cached content data. Its storage policy determines whether the response should be cached on disk, in memory, or not at all.
Cached responses also contain a user info dictionary where you can store app-specific information about the cached item.
The NSURLCacheMBS class stores and retrieves instances of NSCachedURLResponseMBS.

38.1.6 Methods

38.1.7 Constructor(response as NSURLResponseMBS, data as MemoryBlock, userInfo as Dictionary = nil, storagePolicy as Integer = 0)

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Creates a cached URL response instance.
Notes:

response: The response to cache.
data: The data to cache.

Returns a cached URL response object, containing the response and data.

The cache storage policy is set to the default, kCacheStorageAllowed, and the user info dictionary is set to nil.

38.1.8 copy as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Creates a copy of the object.

38.1.9 Properties

38.1.10 Data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The cached response,Äôs data.
Notes: (Read only property)

38.1.11 Handle as Integer

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.1.12 Response as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The URL response object associated with the instance.
Notes: (Read only property)

38.1.13 StoragePolicy as Integer

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The cached response,Äôs storage policy.
Notes: (Read only property)

38.1.14 UserInfo as Dictionary

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The cached response,Äôs user info dictionary.
Notes:

This value is nil if there is no user info dictionary.
(Read only property)

38.1.15 Constants

38.1.16 kCacheStorageAllowed = 0

MBS MacBase Plugin, Plugin Version: 19.0.

Function: One of the cache storage policy constants.
Notes: Allow caching.

38.1.17 kCacheStorageAllowedInMemoryOnly = 1

MBS MacBase Plugin, Plugin Version: 19.0.

Function: One of the cache storage policy constants.
Notes: Allow caching only in memory.

38.1.18 kCacheStorageNotAllowed = 1

MBS MacBase Plugin, Plugin Version: 19.0.

Function: One of the cache storage policy constants.
Notes: Caching is not allowed.

38.2 class NSHTTPCookieMBS

38.2.1 class NSHTTPCookieMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSHTTPCookie object represents an HTTP cookie.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect domain names
dim domains(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
if domains.IndexOf(cookie.domain) <0 then
domains.Append cookie.domain
end if
next

// and display them
MsgBox "You have cookies from this domains: "+Join(domains, ", ")
```

Notes:

It's an immutable object initialized from a dictionary containing the cookie attributes.

Two versions of cookies are supported:

Version 0: This version refers to "traditional" or "old-style" cookies, the original cookie format defined by Netscape. The majority of cookies encountered are in this format.
Version 1: This version refers to cookies as defined in RFC 2965, HTTP State Management Mechanism.

38.2.4 Methods

38.2.5 Constructor(properties as dictionary)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an initialized NSHTTPCookie object using the provided properties.
Example:

```
// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as new NSHTTPCookieMBS(prop)

// and display properties
dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes:

properties: The properties for the new cookie object, expressed as key value pairs.

Handle is non zero on success.

38.2.6 cookiesWithResponseHeaderFields(headerFields as dictionary, URL as string) as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of NSHTTPCookie objects corresponding to the provided response header fields for the provided URL.
Notes:

headerFields: The header fields used to create the NSHTTPCookie objects.
URL: The URL associated with the created cookies.

Returns the array of created cookies.

This method ignores irrelevant header fields in headerFields, allowing dictionaries to contain additional data.

If headerFields does not specify a domain for a given cookie, the cookie is created with a default domain value of theURL.

If headerFields does not specify a path for a given cookie, the cookie is created with a default path value of "/".

38.2.7 cookieWithProperties(dic as dictionary) as NSHTTPCookieMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and initializes an NSHTTPCookie object using the provided properties.
Example:

```
// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
```

```
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as NSHTTPCookieMBS = NSHTTPCookieMBS.cookieWithProperties(prop)

// and display properties
dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes:

dic: The properties for the new cookie object, expressed as key value pairs.

Returns the newly created cookie object. Returns nil if the provided properties are invalid.

See NSHTTPCookie* shared method for more information on the available header field constants and the constraints imposed on the values in the dictionary.

38.2.8 NSHTTPCookieComment as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing the comment for the cookie.
Only valid for Version 1 cookies and later. This header field is optional.

38.2.9 NSHTTPCookieCommentURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing the comment URL for the cookie.
Only valid for Version 1 cookies or later. This header field is optional.

38.2.10 NSHTTPCookieDiscard as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String stating whether the cookie should be discarded at the end of the session.
String value must be either "TRUE" or "FALSE". This header field is optional. Default is "FALSE", unless this is cookie is version 1 or greater and a value for NSHTTPCookieMaximumAge is not specified, in which case it is assumed "TRUE".

38.2.11 NSHTTPCookieDomain as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing the domain for the cookie.
A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL. If this header field is missing the domain is inferred from the value for NSHTTPCookieOriginURL.

38.2.12 NSHTTPCookieExpires as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An Date object or String specifying the expiration date for the cookie.
This header field is only used for Version 0 cookies. This header field is optional.

38.2.13 NSHTTPCookieMaximumAge as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing an integer value stating how long in seconds the cookie should be kept, at most.
Only valid for Version 1 cookies and later. Default is "0". This field is optional.

38.2.14 NSHTTPCookieName as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes: An String object containing the name of the cookie. This field is required.

38.2.15 NSHTTPCookieOriginURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing the URL that set this cookie.
A value must be specified for either NSHTTPCookieDomain or NSHTTPCookieOriginURL.

38.2.16 NSHTTPCookiePath as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing the path for the cookie. This field is required if you are using the NSHTTPCookieDomain key instead of the NSHTTPCookieOriginURL key.
If you are using the NSHTTPCookieOriginURL key, the path is inferred if it is not provided. The default value is "/".

38.2.17 NSHTTPCookiePort as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing comma-separated integer values specifying the ports for the cookie.
Only valid for Version 1 cookies or later. The default value is an empty string (""). This header field is optional.

38.2.18 NSHTTPCookieSecure as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String indicating that the cookie should be transmitted only over secure channels.
Providing any value for this key indicates that the cookie should remain secure.

38.2.19 NSHTTPCookieValue as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String containing the value of the cookie.
This header field is required.

38.2.20 NSHTTPCookieVersion as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary constants for cookies.
Notes:

An String that specifies the version of the cookie.
Must be either "0" or "1". The default is "0". This header field is optional.

38.2.21 portList as Integer()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's port list.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display port list
```

```
dim PortList(-1) as Integer = cookie.portList
if UBound(PortList)=-1 then
MsgBox "Port List: all ports."
else
dim list(-1) as string
for each port as Integer in portList
List.Append str(port)
next

MsgBox "Port List: "+Join(list, ", ")
end if
```

Notes: The list of ports for the cookie, returned as an array of integers. If the cookie has no port list this method returns nil and the cookie will be sent to any port. Otherwise, the cookie is only sent to ports specified in the port list.

38.2.22 requestHeaderFieldsWithCookies(cookies() as NSHTTPCookieMBS) as dictionary

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of header fields corresponding to a provided array of cookies.
Example:

```
// create dictionary with properties:
dim prop as new Dictionary
dim d as new date
d.Year = d.Year + 1

prop.Value(NSHTTPCookieMBS.NSHTTPCookieVersion)="0"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieName)="test"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieValue)="some value"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieOriginURL)="http://www.mbsplugins.de/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieDomain)="www.mbsplugins.de"
prop.Value(NSHTTPCookieMBS.NSHTTPCookiePath)="/"
prop.Value(NSHTTPCookieMBS.NSHTTPCookieExpires)=d

// create cookie from properties
dim cookie as new NSHTTPCookieMBS(prop)
dim cookies(-1) as NSHTTPCookieMBS
cookies.Append cookie

// get request headers
dim dic as Dictionary = NSHTTPCookieMBS.requestHeaderFieldsWithCookies(cookies)
```

```
// and show them:
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes:

cookies: The cookies from which the header fields are created.

Returns the dictionary of header fields created from the provided cookies. This dictionary can be used to add cookies to a request.

38.2.23 Properties

38.2.24 comment as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's comment string.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display comment
MsgBox "Comment: "+Cookie.comment
```

Notes:

The receiver's comment string or "" if the cookie has no comment. This string is suitable for presentation to the user, explaining the contents and purpose of this cookie.
(Read only property)

38.2.25 commentURL as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's comment URL.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display comment URL
MsgBox "commentURL: "+Cookie.commentURL
```

Notes:

The receiver's comment URL or "" if the cookie has none. This value specifies a URL which is suitable for presentation to the user as a link for further information about this cookie.
(Read only property)

38.2.26 domain as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the domain of the receiver's cookie.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display domain:
MsgBox "Domain: "+Cookie.Domain
```

Notes:

If the domain does not start with a dot, then the cookie is only sent to the exact host specified by the domain. If the domain does start with a dot, then the cookie is sent to other hosts in that domain as well, subject to certain restrictions. See RFC 2965 for more detail.
(Read only property)

38.2.27 expiresDate as date

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's expiration date.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display date:
MsgBox "Domain: "+Cookie.expiresDate.ShortTime+" "+Cookie.expiresDate.LongTime
```

Notes:

The receiver's expiration date, or nil if there is no specific expiration date such as in the case of "session-only" cookies. The expiration date is the date when the cookie should be deleted.
(Read only property)

38.2.28 expiresDateTime as dateTime

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's expiration date.
Notes: (Read only property)

38.2.29 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

38.2.30 isHTTPOnly as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the receiver should only be sent to HTTP servers per RFC 2965.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display isHTTPOnly value:
MsgBox "isHTTPOnly: "+str(Cookie.isHTTPOnly)
```

Notes:

Returns true if this cookie should only be sent via HTTP headers, false otherwise.

Cookies may be marked as HTTP only by a server (or by a javascript). Cookies marked as such must only be sent via HTTP Headers in HTTP requests for URL's that match both the path and domain of the respective cookies.

Important: Cookies specified as HTTP only should not be delivered to any javascript applications to prevent cross-site scripting vulnerabilities.
(Read only property)

38.2.31 isSecure as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether his cookie should only be sent over secure channels.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display isSecure value:
MsgBox "isSecure: "+str(Cookie.isSecure)
```

Notes:

True if this cookie should only be sent over secure channels, otherwise false.
(Read only property)

38.2.32 isSessionOnly as boolean

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the receiver should be discarded at the end of the session (regardless of expiration date).
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display isSessionOnly value:
MsgBox "isSessionOnly: "+str(Cookie.isSessionOnly)
```

Notes:

True if the receiver should be discarded at the end of the session (regardless of expiration date), otherwise false.
(Read only property)

38.2.33 name as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's name.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display name:
MsgBox "name: "+Cookie.name
```

Notes: (Read only property)

38.2.34 path as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's path.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display path:
MsgBox "path: "+Cookie.path
```

Notes:

The cookie will be sent with requests for this path in the cookie's domain, and all paths that have this prefix.
A path of "/" means the cookie will be sent for all URLs in the domain.
(Read only property)

38.2.35 properties as dictionary

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's cookie properties.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display properties

dim dic as Dictionary = cookie.properties
dim list(-1) as string

for each key as Variant in dic.keys
List.Append key.StringValue+": "+dic.Value(key).StringValue
next

MsgBox Join(list,EndOfLine)
```

Notes:

Returns dictionary representation of the receiver's cookie properties.
This dictionary can be used with Constructor or cookieWithProperties to create an equivalent NSHTTP-Cookie object.
(Read only property)

38.2.36 value as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's value.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display value
MsgBox "Value: "+Cookie.value
```

Notes: (Read only property)

38.2.37 version as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's version.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// pick first one
dim cookie as NSHTTPCookieMBS = cookies(0)

// display version value:
MsgBox "Version: "+str(Cookie.Version)
```

Notes:

Returns the receiver's version. Version 0 maps to "old-style" Netscape cookies. Version 1 maps to RFC 2965 cookies.
(Read only property)

38.3 class NSHTTPCookieStorageMBS

38.3.1 class NSHTTPCookieStorageMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: NSHTTPCookieStorage implements a singleton object (shared instance) that manages the shared cookie storage.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes:

These cookies are shared among all applications and are kept in sync cross-process.

Note: Changes made to the cookie accept policy affect all currently running applications using the cookie storage.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.3.2 Blog Entries

- MBS REALbasic Plugins, version 11.1pr3

38.3.4 Methods

38.3.5 Constructor

MBS MacControls Plugin, Plugin Version: 12.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The private constructor.

38.3.6 cookies as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the cookie storage's cookies.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookies

// we collect values
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes: Returns an array containing all of the cookie storage's cookies.

38.3.7 cookiesForURL(URL as string) as NSHTTPCookieMBS()

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns all the cookie storage's cookies that are sent to a specified URL.
Example:

```
// query list of all cookies in shared storage
dim cookies(-1) as NSHTTPCookieMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookiesForURL("http://www.apple.com/")

// we collect values for apple.com:
dim list(-1) as string
for each cookie as NSHTTPCookieMBS in cookies
List.Append cookie.name+": "+cookie.value
```

```
next

// and display them
MsgBox join(list, EndOfLine)
```

Notes: An application can use NSHTTPCookie method requestHeaderFieldsWithCookies to turn this array into a set of header fields to add to an NSMutableURLRequest object.

38.3.8 cookiesToArray(cookies() as NSHTTPCookieMBS) as Integer

MBS MacControls Plugin, Plugin Version: 16.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Puts the cookie storage's cookies in the given array.
Example:

```
// get storage
dim s as NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage

// predim an array with a lot of space
dim cookies(5000) as NSHTTPCookieMBS

// now ask plugin to put cookies inside
dim c as Integer = s.cookiesToArray(cookies)

// show count
MsgBox str(c)+" cookies"

// pick first and show name
dim cookie as NSHTTPCookieMBS = cookies(0)
MsgBox cookie.name
```

Notes:

Returns total number of cookies.
This is for Xojo 2007 where the cookies function doesn't work.
For Xojo and Xojo you can use cookies function.

38.3.9 deleteCookie(cookie as NSHTTPCookieMBS)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Deletes the specified cookie from the cookie storage.

38.3.10 NSHTTPCookieManagerAcceptPolicyChangedNotification as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names you can register with the NSNotificationObserverMBS class.
Notes:

This notification is posted when the acceptance policy of the NSHTTPCookieStorage instance has changed. In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo dictionary.

38.3.11 NSHTTPCookieManagerCookiesChangedNotification as string

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the notification names you can register with the NSNotificationObserverMBS class.
Notes:

This notification is posted when the cookies stored in the NSHTTPCookieStorage instance have changed. In Mac OS X, cookies are shared among applications, meaning this notification can be sent in response to another application's actions. Cookies are not shared among applications in iOS.

The notification object is the NSHTTPCookieStorage instance. This notification does not contain a userInfo dictionary.

38.3.12 removeCookiesSinceDate(d as date)

MBS MacControls Plugin, Plugin Version: 17.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Delete all cookies from the cookie storage since the provided date.
Notes: Available on macOS 10.10 or newer.
See also:

- 38.3.13 removeCookiesSinceDate(d as dateTime) 8972

38.3.13 removeCookiesSinceDate(d as dateTime)

MBS MacControls Plugin, Plugin Version: 20.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: Delete all cookies from the cookie storage since the provided date.
Notes: Available on macOS 10.10 or newer.
See also:

- 38.3.12 removeCookiesSinceDate(d as date) 8972

38.3.14 setCookie(cookie as NSHTTPCookieMBS)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Stores a specified cookie in the cookie storage if the cookie accept policy permits.
Notes: The cookie replaces an existing cookie with the same name, domain, and path, if one exists in the cookie storage. This method accepts the cookie only if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyAlways or NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain. The cookie is ignored if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyNever.

38.3.15 setCookies(cookies() as NSHTTPCookieMBS, URL as string, mainDocumentURL as string)

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Adds an array of cookies to the receiver if the receiver's cookie acceptance policy permits.
Notes:

cookies: The cookies to add.
URL: The URL associated with the added cookies.
mainDocumentURL: The URL of the main HTML document for the top-level frame, if known. Can be "". This URL is used to determine if the cookie should be accepted if the cookie accept policy is NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain.

The cookies will replace existing cookies with the same name, domain, and path, if one exists in the cookie storage. The cookie will be ignored if the receiver's cookie accept policy is NSHTTPCookieAcceptPolicyNever.

To store cookies from a set of response headers, an application can use cookiesWithResponseHeaderFields passing a header field dictionary and then use this method to store the resulting cookies in accordance with the receiver's cookie acceptance policy.

38.3.16 sharedHTTPCookieStorage as NSHTTPCookieStorageMBS

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the shared cookie storage instance.
Example:

```
dim s as NSHTTPCookieStorageMBS = NSHTTPCookieStorageMBS.sharedHTTPCookieStorage
dim cookies() as NSHTTPCookieMBS = s.cookies
MsgBox str(UBound(cookies)+1)+" cookies"
```

38.3.17 Properties

38.3.18 Handle as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSHTTPCookieStorage object.
Notes: (Read and Write property)

38.3.19 cookieAcceptPolicy as Integer

MBS MacControls Plugin, Plugin Version: 11.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The cookie storage's cookie accept policy.
Example:

```
Select case NSHTTPCookieStorageMBS.sharedHTTPCookieStorage.cookieAcceptPolicy
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain
MsgBox "Cookies: only from main document domain"
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyNever
MsgBox "Cookies: never"
case NSHTTPCookieStorageMBS.NSHTTPCookieAcceptPolicyAlways
MsgBox "Cookies: always"
else
MsgBox "Cookies: unknown setting"
end Select
```

Notes:

The default cookie accept policy is NSHTTPCookieAcceptPolicyAlways.

Changing the cookie policy affects all currently running applications using the cookie storage.
(Read and Write computed property)

38.3.20 Constants

38.3.21 NSHTTPCookieAcceptPolicyAlways = 0

MBS MacControls Plugin, Plugin Version: 11.1.

Function: One of the cookie accept policy constants.
Notes: Accept all cookies. This is the default cookie accept policy.

38.3.22 NSHTTPCookieAcceptPolicyNever = 1

MBS MacControls Plugin, Plugin Version: 11.1.

Function: One of the cookie accept policy constants.
Notes: Reject all cookies.

38.3.23 NSHTTPCookieAcceptPolicyOnlyFromMainDocumentDomain = 2

MBS MacControls Plugin, Plugin Version: 11.1.

Function: One of the cookie accept policy constants.
Notes: Accept cookies only from the main document domain.

38.4 class NSNetServiceBrowserMBS

38.4.1 class NSNetServiceBrowserMBS

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A network service browser that finds published services on a network using multicast DNS.
Notes:

Services can range from standard services, such as HTTP and FTP, to custom services defined by other applications. You can use a network service browser in your code to obtain the list of accessible domains and then to obtain an NSNetServiceMBS object for each discovered service. Each network service browser performs one search at a time, so if you want to perform multiple simultaneous searches, use multiple network service browsers.

A network service browser performs all searches asynchronously using the current run loop to execute the search in the background. Results from a search are returned through the associated delegate object, which your client application must provide. Searching proceeds in the background until the object receives a stop message.

To use an NSNetServiceBrowserMBS object to search for services, use the constructor. Once your object is ready, you begin by gathering the list of accessible domains using either the searchForRegistrationDomains or searchForBrowsableDomains methods. From the list of returned domains, you can pick one and use the searchForServicesOfType method to search for services in that domain.

The NSNetServiceBrowserMBS class provides two ways to search for domains. In most cases, your client should use the searchForRegistrationDomains method to search only for local domains to which the host machine has registration authority. This is the preferred method for accessing domains as it guarantees that the host machine can connect to services in the returned domains. Access to domains outside this list may be more limited.

38.4.4 Methods

38.4.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes an NSNetServiceBrowser object.

38.4.6 Destructor

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The destructor.

38.4.7 searchForBrowsableDomains

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initiates a search for domains visible to the host. This method returns immediately.
Notes: didFindDomain:moreComing event is raised for each domain discovered.

38.4.8 searchForRegistrationDomains

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initiates a search for domains in which the host may register services.
Notes:

This method returns immediately, sending a WillSearch event if the network was ready to initiate the search. Subsequent didFindDomain event is raised for each domain discovered.

Most network service browser clients do not have to use this method,Äîit is sufficient to publish a service with the empty string, which registers it in any available registration domains automatically.

38.4.9 searchForServicesOfType(serviceType as string, domainName as string = "")

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts a search for services of a particular type within a specific domain.
Notes:

serviceType: Type of the service to search for.
domainName: Domain name in which to perform the search.

This method returns immediately, sending a WillSearch event if the network was ready to initiate the search.The delegate receives subsequent didFindService event for each service discovered.

The serviceType argument must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, rather than hosts, make sure to prefix both the service name and transport layer name with an underscore character (,Äú_,Äù). For example, to search for an HTTP service on TCP, you would use the type string ,Äú_http._tcp.,Äú. Note that the period character at the end is required.

The domainName argument can be an explicit domain name, the generic local domain "local." (note trailing period, which indicates an absolute name), or the empty string (""), which indicates the default registration domains. Usually, you pass in an empty string. Note that it is acceptable to use an empty string for the domainName argument when publishing or browsing a service, but do not rely on this for resolution.

38.4.10 stop

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Halts a currently running search or resolution.
Notes: This method sends a DidStop event and causes the browser to discard any pending search results.

38.4.11 Properties

38.4.12 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

38.4.13 includesPeerToPeer as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Whether to browse over peer-to-peer Bluetooth and Wi-Fi, if available. NO, by default.
Notes:

This property must be set before initiating a search to have an effect.
(Read and Write property)

38.4.14 Events

38.4.15 DidFindDomain(domainName as String, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Tells you the sender found a domain.
Notes:

domainName: Name of the domain found by netServiceBrowser.
moreComing: True when netServiceBrowser is waiting for additional domains. false when there are no additional domains.

You use this event to compile a list of available domains. It should wait until moreComing is false to do a bulk update of user interface elements.

38.4.16 DidFindService(service as NSNetServiceMBS, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Tells you that it found a service.
Notes:

Service: Network service found by netServiceBrowser.
moreComing: True when netServiceBrowser is waiting for additional services. False when there are no additional services.

You use this event to compile a list of available services. It should wait until moreComing is false to do a bulk update of user interface elements.

Special Considerations
If you choose to resolve netService, you need to create a new object with copy constructor in your subclass to catch events. And please store the new reference in an array or property.

38.4.17 DidNotSearch(error as Dictionary)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Tells you that a search was not successful.
Notes: error: Dictionary with the reasons the search was unsuccessful. Use the dictionary keys NSNetServicesErrorCode and NSNetServicesErrorDomain to retrieve the error information from the dictionary.

38.4.18 DidRemoveDomain(domainName as String, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Tells you that a domain has disappeared or has become unavailable.
Notes:

domainName: Name of the domain that became unavailable.
moreComing: True when netServiceBrowser is waiting for additional domains. False when there are no additional domains.

You this event to compile a list of unavailable domains. It should wait until moreComing is false to do a bulk update of user interface elements.

38.4.19 DidRemoveService(service as NSNetServiceMBS, moreComing as Boolean)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Tells you a service has disappeared or has become unavailable.
Notes:

Service: Network service that has become unavailable.
moreComing: True when netServiceBrowser is waiting for additional services. False when there are no additional services.

You this event to compile a list of unavailable services. It should wait until moreComing is false to do a bulk update of user interface elements.

38.4.20 DidStopSearch

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Tells you that a search was stopped.
Notes: Triggered by stop method.

38.4.21 WillSearch

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Tells you that a search is commencing.
Notes: This event is raised only if the underlying network layer is ready to begin a search.

38.5 class NSNetServiceMBS

38.5.1 class NSNetServiceMBS

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A network service that broadcasts its availability using multicast DNS.
Notes:

The NSNetServiceMBS class represents a network service, either one your application publishes or is a client of. This class and the NSNetServiceBrowserMBS class use multicast DNS to convey information about network services to and from your application. The API of NSNetServiceMBS provides a convenient way to publish the services offered by your application and to resolve the socket address for a service.

The types of services you access using NSNetServiceMBS are the same types that you access directly using BSD sockets. HTTP and FTP are two services commonly provided by systems. (For a list of common services and the ports used by those services, see the file /etc/services.) Applications can also define their own custom services to provide specific data to clients.

You can use the NSNetServiceMBS class as either a publisher of a service or a client of a service. If your application publishes a service, your code must acquire a port and prepare a socket to communicate with clients. Once your socket is ready, you use the NSNetServiceMBS class to notify clients that your service is ready. If your application is the client of a network service, you can either create an NSNetServiceMBS object directly (if you know the exact host and port information) or use an NSNetServiceBrowserMBS object to browse for services.

To publish a service, initialize your NSNetServiceMBS object with the service name, domain, type, and port information. All of this information must be valid for the socket created by your application. Once initialized, call the publish method to broadcast your service information to the network.

When connecting to a service, use the NSNetServiceBrowserMBS class to locate the service on the network and obtain the corresponding NSNetServiceMBS object. Once you have the object, call the resolve method to verify that the service is available and ready for your application. If it is, the addresses property provides the socket information you can use to connect to the service.

The methods of NSNetServiceMBS operate asynchronously so your application is not impacted by the speed of the network. All information about a service is returned to your application through events. You must subclass and fill event handlers to respond to messages and to handle errors appropriately.

38.5.8 Methods

38.5.9 addresses as String()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An array of addresses.
Notes: We take the raw addresses and decode IPv4 and IPv6 addresses for you.

38.5.10 addressesIPv4 as String()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An array of IPv4 addresses.
Notes: We take the raw addresses and decode only IPv4 addresses for you.

38.5.11 addressesIPv6 as String()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An array of IPv6 addresses.
Notes: We take the raw addresses and decode only IPv6 addresses for you.

38.5.12 addressesRaw as MemoryBlock()

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A read-only array containing Memoryblock objects, each of which contains a socket address for the service.
Notes:

An array containing Memoryblock objects, each of which contains a socket address for the service. Each Memoryblock object in the returned array contains an appropriate sockaddr structure that you can use to connect to the socket. The exact type of this structure depends on the service to which you are connecting. If no addresses were resolved for the service, the returned array contains zero elements.
It is possible for a single service to resolve to more than one address or not resolve to any addresses. A service might resolve to multiple addresses if the computer publishing the service is currently multihoming.

38.5.13 Constructor(Domain as String, Type as String, Name as String)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the receiver, initialized as a network service of a given type and sets the initial host information.
Notes:

domain: The domain for the service. To resolve in the default domains, pass in an empty string (""). To limit resolution to the local domain, use "local.".
If you are creating this object to resolve a service whose information your app stored previously, you should set this to the domain in which the service was originally discovered.
You can also use a NSNetServiceBrowserMBS object to obtain a list of possible domains in which you can discover and resolve services.
type: The network service type.
type must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, as opposed to hosts, prefix both the service name and transport layer name with an underscore character (,Äú_,Äù). For example, to search for an HTTP service on TCP, you would use the type string "_http._tcp.". Note that the period character at the end of the string, which indicates that the domain name is an absolute name, is required.
name: The name of the service to resolve.

Returns the receiver, initialized as a network service named name of type type in the domain domain.

This method is the appropriate initializer to use to resolve a service,Äîto publish a service, use Constructor with port.
If you know the values for domain, type, and name of the service you wish to connect to, you can create an NSNetServiceMBS object using this initializer and call resolve on the result.

You cannot use this initializer to publish a service. This initializer passes an invalid port number to the designated initializer, which prevents the service from being registered. Calling publish on an NSNetService object initialized with this method generates a call to your didNotPublish event with an NSNetServicesBadArgumentError error.
See also:

- 38.5.14 Constructor(Domain as String, Type as String, Name as String, Port as Integer) 8985
- 38.5.15 Constructor(other as NSNetServiceMBS) 8986

38.5.14 Constructor(Domain as String, Type as String, Name as String, Port as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes the receiver for publishing a network service of type type at the socket location specified by domain, name, and port.
Notes:

domain: The domain for the service. To use the default registration domains, pass in an empty string (""). To limit registration to the local domain, use "local.".

You can also use a NSNetServiceBrowser object to obtain a list of possible domains in which you can publish your service.
type: The network service type.
type must contain both the service type and transport layer information. To ensure that the mDNS responder searches for services, as opposed to hosts, prefix both the service name and transport layer name with an underscore character (,Äú_,Äù). For example, to search for an HTTP service on TCP, you would use the type string "_http._tcp.". Note that the period character at the end of the string, which indicates that the domain name is an absolute name, is required.
name: The name by which the service is identified to the network. The name must be unique. If you pass the empty string (""), the system automatically advertises your service using the computer name as the service name.
port: The port on which the service is published.
If you specify the NSNetServiceListenForConnections flag, you may pass zero (0), in which case the service automatically allocates an arbitrary (ephemeral) port for your service. When the DidPublish event is called, you can determine the actual port chosen by calling the service object,Äôs NSNetServiceMBS method or accessing the corresponding property.
If your app is listening for connections on its own, the value of port must be a port number acquired by your application for the service.

You use this method to create a service that you wish to publish on the network. Although you can also use this method to create a service you wish to resolve on the network, it is generally more appropriate to use the Constructor method instead.

When publishing a service, you must provide valid arguments in order to advertise your service correctly. If the host computer has access to multiple registration domains, you must create separate NSNetServiceMBS objects for each domain. If you attempt to publish in a domain for which you do not have registration authority, your request may be denied.

It is acceptable to use an empty string for the domain argument when publishing or browsing a service, but do not rely on this for resolution.

This method is the designated initializer.
See also:

- 38.5.13 Constructor(Domain as String, Type as String, Name as String) 8984
- 38.5.15 Constructor(other as NSNetServiceMBS) 8986

38.5.15 Constructor(other as NSNetServiceMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a new object to catch events.
Notes: You can subclass and fill in events. Then create a copy with this constructor to connect events.
See also:

- 38.5.13 Constructor(Domain as String, Type as String, Name as String) 8984
- 38.5.14 Constructor(Domain as String, Type as String, Name as String, Port as Integer) 8985

38.5.16 dataFromTXTRecordDictionary(data as Dictionary) as Memoryblock

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an Memoryblock object representing a TXT record formed from a given dictionary.
Notes:

Data: A dictionary containing a TXT record.

Returns a Memoryblock representing TXT data formed from txtDictionary. Fails an assertion if data cannot be represented as a MemoryBlock.

38.5.17 Destructor

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The destructor.

38.5.18 dictionaryFromTXTRecordData(data as Memoryblock) as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a dictionary representing a TXT record given as a Memoryblock.
Notes:

Data: A data object encoding a TXT record.

Returns a dictionary representing txtData. The dictionary,Äôs keys are strings. The values associated with all the dictionary,Äôs keys are Memoryblcoks that encapsulate strings or data.
Fails an assertion if txtData cannot be represented as an Dictionary object.

38.5.19 getStreams(byref inputStream as NSInputStreamMBS, byref outputStream as NSOutputStreamMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a pair of input and output streams for the receiver and returns a Boolean value that indicates whether they were retrieved successfully.

Notes:

inputStream: Upon return, the input stream for the receiver.
outputStream: Upon return, the output stream for the receiver.

Returns yes if the streams are created successfully, otherwise false.

After this method is called, no events are called by the receiver.

38.5.20 isEqual(other as NSNetServiceMBS) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Checks whether two services are same.
Notes: Returns true if equal or false if not.

38.5.21 NSNetServicesErrorCode as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: This key identifies the error that occurred during the most recent operation.

38.5.22 NSNetServicesErrorDomain as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: This key identifies the originator of the error, which is either the NSNetService object or the mach network layer.
Notes: For most errors, you should not need the value provided by this key.

38.5.23 publish

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Attempts to advertise the receiver,Äôs on the network.
Notes:

This method returns immediately, with success or failure indicated by the events.
This is equivalent to calling publish with the default options (0).
See also:

• 38.5.24 publish(options as Integer) 8989

38.5.24 publish(options as Integer)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Attempts to advertise the receiver on the network, with the given options.
Notes:

options: Options for the receiver. The supported options are described in constants.

This method returns immediately, with success or failure indicated by the events.
See also:

• 38.5.23 publish 8988

38.5.25 resolve

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts a resolve process for the service.
Notes: Attempts to determine at least one address for the service. This method returns immediately, with success or failure indicated by the callbacks to the delegate.
See also:

• 38.5.26 resolve(timeout as Double) 8989

38.5.26 resolve(timeout as Double)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts a resolve process of a finite duration for the service.
Notes:

timeout: The maximum number of seconds to attempt a resolve. A value of 0.0 indicates no timeout and a resolve process of indefinite duration.

During the resolve period, the service sends DidResolveAddress event for each address it discovers that matches the service parameters. Once the timeout is hit, the service sends DidStop event. If no addresses resolve during the timeout period, the service sends didNotResolve event.
See also:

• 38.5.25 resolve 8989

38.5.27 setTXTRecordData(Data as MemoryBlock) as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Sets the TXT record for the receiver, and returns a Boolean value that indicates whether the operation was successful.
Notes:

Data: The TXT record for the receiver.

True if recordData is successfully set as the TXT record, otherwise false.

38.5.28 startMonitoring

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Starts the monitoring of TXT-record updates for the receiver.
Notes: Please implement didUpdateTXTRecordData event, which is called when the TXT record for the receiver is updated.

38.5.29 stop

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Halts a currently running attempt to publish or resolve a service.
Notes:

We raise DidStop event after the service stops.
It is safe to remove all strong references to the service immediately after calling stop.

38.5.30 stopMonitoring

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Stops the monitoring of TXT-record updates for the receiver.

38.5.31 Properties

38.5.32 Address as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: First address decoded.
Notes:

Can be IPv4 or IPv6.
(Read only property)

38.5.33 AddressIPv4 as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: First IPv4 address decoded.
Notes: (Read only property)

38.5.34 AddressIPv6 as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: First IPv6 address decoded.
Notes: (Read only property)

38.5.35 description as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The description string for debugging.
Notes: (Read only property)

38.5.36 domain as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A string containing the domain for this service.
Notes:

This can be an explicit domain name or it can contain the generic local domain name, ”local.” (note the trailing period, which indicates an absolute name).

This property,Äôs value is set when the object is first initialized, whether by your code or by a browser object. See Constructor for more information.
(Read only property)

38.5.37 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

38.5.38 hostName as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A string containing the DNS hostname for this service.
Notes:

This value is "" until the service has been resolved (when addresses is non-nil).
(Read only property)

38.5.39 includesPeerToPeer as Boolean

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Specifies whether to also publish, resolve, or monitor this service over peer-to-peer Bluetooth and Wi-Fi, if available.
Notes:

False by default.

This property must be set before calling publish, resolve, or startMonitoring in order to take effect.
(Read and Write property)

38.5.40 name as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A string containing the name of this service.
Notes:

This value is set when the object is first initialized, whether by your code or by a browser object.
See Constructor for more information.
(Read only property)

38.5.41 port as Integer

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The port on which the service is listening for connections.
Notes:

If the object was initialized by calling Constructor (whether by your code or by a browser object), then the value was set when the object was first initialized.
If the object was initialized by calling Constructor without port, the value of this property is not valid (-1) until after the service has successfully been resolved (when addresses is non-nil).
(Read only property)

38.5.42 TXTRecordData as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the TXT record for the receiver.
Notes: (Read only property)

38.5.43 type as String

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The type of the published service.
Notes:

This value is set when the object is first initialized, whether by your code or by a browser object. See Constructor for more information.
(Read only property)

38.5.44 Events

38.5.45 DidAcceptConnection(InputStream as NSInputStreamMBS, outputStream as NSOutputStreamMBS)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Called when a client connects to a service managed by Bonjour.
Notes:

inputStream: A stream object for receiving data from the client.
outputStream: A stream object for sending data to the client.

When you publish a service, if you set the NSNetServiceListenForConnections flag in the service options, the service object accepts connections on behalf of your app. Later, when a client connects to that service, the service object calls this method to provide the app with a pair of streams for communicating with that client.

38.5.46 DidNotPublish(Error as Dictionary)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Notifies the delegate that a service could not be published.
Notes:

error: A dictionary containing information about the problem. The dictionary contains the keys NSNetServicesErrorCode and NSNetServicesErrorDomain.

This method may be called long after a WillPublish event has been delivered.

38.5.47 DidNotResolve(Error as Dictionary)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Informs that an error occurred during resolution of a given service.
Notes:

error: A dictionary containing information about the problem. The dictionary contains the keys NSNetServicesErrorCode and NSNetServicesErrorDomain.

Clients may try to resolve again upon receiving this error. For example, a DNS rotary may yield different IP addresses on different resolution requests. A common error condition is that no addresses were resolved during the timeout period specified in resolve.

38.5.48 DidPublish

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Notifies you that a service was successfully published.

38.5.49 DidResolveAddress

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Informs you that the address for a given service was resolved.
Notes: The delegate can use the addresses method to retrieve the service,Äôs address. If the delegate needs only one address, it can stop the resolution process using stop. Otherwise, the resolution will continue until the timeout specified in resolve is reached.

38.5.50 DidStop

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Informs you that a publish or resolveWithTimeout: request was stopped.

38.5.51 DidUpdateTXTRecordData(data as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Notifies the delegate that the TXT record for a given service has been updated.
Notes: data: The new TXT record.

38.5.52 WillPublish

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Notifies you that the network is ready to publish the service.
Notes: Publication of the service proceeds asynchronously and may still generate a call to the didNotPublish event if an error occurs.

38.5.53 WillResolve

MBS MacFrameworks Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: Notifies you that the network is ready to resolve the service.
Notes: Resolution of the service proceeds asynchronously and may still generate a call to the didNotResolve event if an error occurs.

38.5.54 Constants

38.5.55 NSNetServiceListenForConnections = 2

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the NetService options.
Notes:

Specifies that a TCP listener should be started for both IPv4 and IPv6 on the port specified by this service. If the listening port can't be opened, the service calls its didNotPublish event to report the error.
The listener supports only TCP connections. If the service,Äôs type does not end with _tcp, publication fails with NSNetServicesBadArgumentError.
Whenever a client connects to the listening socket, the service calls its didAcceptConnection event with a pair of NSStream objects.

38.5.56 NSNetServiceNoAutoRename = 1

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the NetService options.
Notes: Specifies that the network service should not rename itself in the event of a name collision.

38.5.57 NSNetServicesActivityInProgress = -72003

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: The net service cannot process the request at this time. No additional information about the network state is known.

38.5.58 NSNetServicesBadArgumentError = -72004

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: An invalid argument was used when creating the NSNetService object.

38.5.59 NSNetServicesCancelledError = -72005

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: The client canceled the action.

38.5.60 NSNetServicesCollisionError = -72001

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: The service could not be published because the name is already in use. The name could be in use locally or on another system.

38.5.61 NSNetServicesInvalidError = -72006

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: The net service was improperly configured.

38.5.62 NSNetServicesMissingRequiredConfigurationError = -72008

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: Missing required configuration error.

38.5.63 NSNetServicesNotFoundError = -72002

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: The service could not be found on the network.

38.5.64 NSNetServicesTimeoutError = -72007

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: The net service has timed out.

38.5.65 NSNetServicesUnknownError = -72000

MBS MacFrameworks Plugin, Plugin Version: 21.1.

Function: One of the error codes.
Notes: An unknown error occurred.

38.6 class NSURLAuthenticationChallengeMBS

38.6.1 class NSURLAuthenticationChallengeMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: A class for an authentication challenge.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.6.2 Methods

38.6.3 cancelAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Tells the system to cancel this challenge.

38.6.4 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

38.6.5 continueWithoutCredentialForAuthenticationChallenge

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Tells the system to continue this challenge without a password.

38.6.6 error as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Returns the NSError object representing the last authentication failure.
Notes:

This method returns nil if the protocol doesn't use errors to indicate an authentication failure.

Available in Mac OS X v10.2 with Safari 1.0 installed.

Available in Mac OS X v10.2.7 and later.

38.6.7 failureResponse as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the response representing authentication failure.
Notes: If there was a previous authentication failure, and this protocol uses responses to indicate authentication failure, then this method will return the response. Otherwise it will return nil.

38.6.8 previousFailureCount as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get count of previous failed authentication attempts.

38.6.9 proposedCredential as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the proposed credential for this challenge.
Notes: proposedCredential may be nil, if there is no default credential to use for this challenge (either stored or in the URL). If the credential is not nil and returns true for hasPassword, this means the NSURLConnection thinks the credential is ready to use as-is. If it returns false for hasPassword, then the credential is not ready to use as-is, but provides a default username the client could use when prompting.

38.6.10 protectionSpace as NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get a description of the protection space that requires authentication.
Notes: Returns the protection space that needs authentication.

38.6.11 useCredential(credential as NSURLCredentialMBS)

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Tells the system to use a certain credential for this challenge.

38.6.12 Properties

38.6.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this challenge.
Notes: (Read and Write property)

38.7 class NSURLCacheMBS

38.7.1 class NSURLCacheMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The class for the caching.
Notes:

NSURLCache implements the caching of responses to URL load requests by mapping NSURLRequest objects to NSCachedURLResponse objects. It is a composite of an in-memory and an on-disk cache.
Methods are provided to manipulate the sizes of each of these caches as well as to control the path on disk to use for persistent storage of cache data.

38.7.8 Methods

38.7.9 cachedResponseForRequest(request as NSURLRequestMBS) as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Returns the cached URL response in the cache for the specified URL request.
Notes:

request: The URL request whose cached response is desired.

Returns the cached URL response for request, or nil if no response has been cached.

38.7.10 Constructor(memoryCapacity as UInt64, diskCapacity as UInt64, diskPath as folderitem)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Initializes an NSURLCache object with the specified values.
Notes:

memoryCapacity: The memory capacity of the cache, in bytes.
diskCapacity: The disk capacity of the cache, in bytes.
path: The location at which to store the on-disk cache.

The returned NSURLCache is backed by disk, so developers can be more liberal with space when choosing the capacity for this kind of cache. A disk cache measured in the tens of megabytes should be acceptable in most cases.

38.7.11 removeAllCachedResponses

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Clears the receiver's cache, removing all stored cached URL responses.

38.7.12 removeCachedResponseForRequest(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Removes the cached URL response for a specified URL request.
Notes: request: The URL request whose cached URL response should be removed. If there is no corresponding cached URL response, no action is taken.

38.7.13 removeCachedResponsesSinceDate(d as date)

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Clears the given cache of any cached responses since the provided date.
Notes:

d: The earliest date of responses that should remain in the cache. Any responses with dates later than this parameter should be removed.

Available in macOS 10.10 or newer.
See also:

- 38.7.14 removeCachedResponsesSinceDate(d as dateTime) 9004

38.7.14 removeCachedResponsesSinceDate(d as dateTime)

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Clears the given cache of any cached responses since the provided date.
Notes:

d: The earliest date of responses that should remain in the cache. Any responses with dates later than this parameter should be removed.

Available in macOS 10.10 or newer.
See also:

- 38.7.13 removeCachedResponsesSinceDate(d as date) 9004

38.7.15 setSharedURLCache(cache as NSURLCacheMBS)

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Sets the shared NSURLCache instance to a specified cache object.
Notes: Applications that have special caching requirements or constraints should use this method to specify

an NSURLCache instance with customized cache settings.

38.7.16 sharedURLCache as NSURLCacheMBS

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the shared NSURLCache instance.
Notes:

The disk path is set to: <user_home_directory>/Library/Caches/<current_process_name>. The user's home directory is determined by calling NSHomeDirectory and the current process name is determined using NSProcessInfoMBS.processName.

Applications that do not have special caching requirements or constraints should find the default shared cache instance acceptable. Applications with more specific needs can create a custom NSURLCache object and set it as the shared cache instance using setSharedURLCache.

38.7.17 storeCachedResponse(cachedResponse as NSCachedURLResponseMBS, request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: Stores a cached URL response for a specified request.
Notes:

cachedResponse: The cached URL response to store.
request: The request for which the cached URL response is being stored.

If you override this method, you should also override storeCachedResponse.

38.7.18 Properties

38.7.19 currentDiskUsage as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the current size of the receiver's on-disk cache, in bytes.
Notes: (Read only property)

38.7.20 currentMemoryUsage as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the current size of the receiver's in-memory cache, in bytes.
Notes: (Read only property)

38.7.21 diskCapacity as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The on-disk cache capacity.
Notes: (Read and Write property)

38.7.22 Handle as Integer

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal handle to the NSURLCache object.
Notes: (Read and Write property)

38.7.23 memoryCapacity as UInt64

MBS MacBase Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The in-memory cache capacity.
Notes: (Read and Write property)

38.7.24 Constants

38.7.25 NSURLCacheStorageAllowed = 0

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is allowed without restriction.

38.7.26 NSURLCacheStorageAllowedInMemoryOnly = 1

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is allowed; however storage should be done in memory only, no disk storage should be done.

38.7.27 NSURLCacheStorageNotAllowed = 2

MBS MacBase Plugin, Plugin Version: 9.7.

Function: One of the constants for the cache strategy.
Notes: Specifies that storage in an NSURLCache is not allowed in any fashion, either in memory or on disk.

38.8 class NSURLConnectionFilterMBS

38.8.1 class NSURLConnectionFilterMBS

MBS MacCocoa Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to filter URL connections.
Notes: This class is designed to allow you to intercept your application creating NSURLConnection objects and change the NSURLRequest used. This can be useful to change timeouts on Xojo.Net.HTTPSocket class.

38.8.6 Properties

38.8.7 Enabled as Boolean

MBS MacCocoa Plugin, Plugin Version: 18.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the event is enabled.
Notes:

Default is true.
(Read and Write property)

38.8.8 Events

38.8.9 FilterConnection(request as NSURLRequestMBS) as NSURLRequestMBS

MBS MacCocoa Plugin, Plugin Version: 18.2, Platform: macOS, Targets: .

Function: The event called when a new connection is made.
Example:

```
Function FilterConnection(request as NSURLRequestMBS) Handles FilterConnection as NSURLRequestMBS
system.debuglog CurrentMethodName
system.debuglog "URL: "+request.URL

dim newRequest as NSMutableURLRequestMBS = request.mutableCopy

// change to 10 minutes
newRequest.setTimeoutInterval 600

return newRequest
End Function
```

Notes:

You get the current request and you can return a new request.
If you return nil, we pass through the existing one.
Only requests on main thread trigger the event.

38.9 class NSURLConnectionMBS

38.9.1 class NSURLConnectionMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Deprecated: This item is deprecated and should no longer be used. You can use NSURLSessionMBS instead. **Function:** An NSURLConnection object provides support to perform the loading of a URL request. **Notes:**

The interface for NSURLConnection is sparse, providing only the controls to start and cancel asynchronous loads of a URL request.

NSURLConnection's events allow an object to receive informational callbacks about the asynchronous load of a URL request. Other events provide facilities that allow the subclass to customize the process of performing an asynchronous URL load. These events are called on the thread that started the asynchronous load operation for the associated NSURLConnection object.

NSURLConnection also has a convenience class method, sendSynchronousRequest, to load a URL request synchronously.

The following contract governs the events defined in this class:

- Zero or more willSendRequest events are called before any further event is called if it is determined that the download must redirect to a new location. The delegate can allow the redirect, modify the destination, or deny the redirect.
- Zero or more willSendRequestForAuthenticationChallenge events are called before a request for an authentication challenge is sent. The delegate can call the appropriate NSURLAuthenticationChallengeMBS method and perform any other required task related to credentials.
- Zero or more didReceiveAuthenticationChallenge vents are called if it is necessary to authenticate in order to download the request and the connection does not already have authenticated credentials.
- Zero or more didCancelAuthenticationChallenge vents are called if the connection cancels the authentication challenge due to the protocol implementation encountering an error.
- Zero or more didReceiveResponse events are called before receiving a didReceiveData message. The only case where didReceiveResponse is not sent to a delegate is when the protocol implementation encounters an error before a response can be created.
- Zero or more didReceiveData events are called before any of the following messages are sent to the delegate: willCacheResponse, DidFinishLoading, didFailWithError.
- Zero or one willCacheResponse events are called to the delegate after didReceiveData is sent but before a DidFinishLoading message is sent.

Unless an NSURLConnection object receives a cancel message, the subclasses receives one and only one of DidFinishLoading, or didFailWithError message, but never both. In addition, once either of these messages is sent, the delegate receives no further messages for the connection.

38.9.4 Methods

38.9.5 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Cancels an asynchronous load of a request.
Notes: After this method is called, the connection's delegate no longer receives any messages for the connection. If you want to reattempt the connection, you should create a new connection object.

38.9.6 canHandleRequest(request as NSURLRequestMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns whether a request can be handled based on a preflight evaluation.
Notes:

request: The request to evaluate.

Returns true if a preflight operation determines that a connection with request can be created and the associated I/O can be started, false otherwise.

The result of this method is valid as long as no NSURLProtocol classes are registered or unregistered, and request remains unchanged. Applications should be prepared to handle failures even if they have performed request preflighting by calling this method.

38.9.7 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates URL connection and begins to load the data for the URL request.
Notes:

request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.

On success handle property is not zero.

This is equivalent to calling Constructor and passing true for optional startImmediately.
See also:

- 38.9.8 Constructor(request as NSURLRequestMBS, startImmediately as boolean) 9012

38.9.8 Constructor(request as NSURLRequestMBS, startImmediately as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Creates URL connection and begins to load the data for the URL request, if specified.
Notes:

request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.
startImmediately: True if the connection should being loading data immediately, otherwise false.

On success the handle property is not zero.

Available in Mac OS X v10.5 and later.
See also:

- 38.9.7 Constructor(request as NSURLRequestMBS) 9012

38.9.9 data as MemoryBlock

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The data downloaded so far.
Notes: The plugin adds the new data it gets in the didReceiveData event to a big memoryblock and gives you access to it using this event.

38.9.10 sendSynchronousRequest(request as NSURLRequestMBS, byref response as NSURLResponseMBS, byref error as NSErrorMBS) as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Performs a synchronous load of the specified URL request.
Example:

```
dim request as new NSURLRequestMBS("http://www.monkeybreadsoftware.de/images/MBSLogo.jpg")
dim error as NSErrorMBS
dim response as NSURLResponseMBS
dim d as MemoryBlock = NSURLConnectionMBS.sendSynchronousRequest(request, response, error)

if d<>Nil then
dim pic as Picture = JPEGStringToPictureMBS(d, true)
window1.Backdrop = pic
end if

if error<>Nil then
MsgBox "Error: "+error.description
end if
```

Notes:

request: The URL request to load. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.
response: Out parameter for the URL response returned by the server.
error: Out parameter used if an error occurs while processing the request.

Returns the downloaded data for the URL request. Returns nil if a connection could not be created or if the download fails.

A synchronous load is built on top of the asynchronous loading code made available by the class. The calling thread is blocked while the asynchronous loading system performs the URL load on a thread spawned

specifically for this load request. No special threading or run loop configuration is necessary in the calling thread in order to perform a synchronous load.

Important: Because this call can potentially take several minutes to fail (particularly when using a cellular network in iOS), you should never call this function from the main thread of a GUI application.

If authentication is required in order to download the request, the required credentials must be specified as part of the URL. If authentication fails, or credentials are missing, the connection will attempt to continue without credentials.

38.9.11 start

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Causes the connection to begin loading data, if it has not already.
Notes:

Calling this method is necessary only if you create a connection with the Constructor method and provide false for the startImmediately parameter.

Available in Mac OS X v10.5 and later.

38.9.12 Properties

38.9.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.9.14 Events

38.9.15 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURLProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent to determine whether the delegate is able to respond to a protection space's form of authentication.
Notes:

protectionSpace: The protection space that generates an authentication challenge.

Return true if you are able to respond to a protection space's form of authentication, otherwise false.

This method is called before didReceiveAuthenticationChallenge, allowing the class to inspect a protection space before attempting to authenticate against it. By returning true, the event indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. If the event returns false, the system attempts to use the user's keychain to authenticate. If your delegate does not implement this method and the protection space uses client certificate authentication or server trust authentication, the system behaves as if you returned false. The system behaves as if you returned true for all other authentication methods.

Available in Mac OS X v10.6 and later.

38.9.16 didCancelAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a connection cancels an authentication challenge.
Notes: challenge: The challenge that was canceled.

38.9.17 didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a connection fails to load its request successfully.
Notes:

error: An error object containing details of why the connection failed to load the request successfully.

Once the delegate receives this message, it will receive no further messages for connection.

38.9.18 didFinishLoading

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a connection has finished loading successfully.

38.9.19 didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a connection must authenticate a challenge in order to download its request.
Notes:

challenge: The challenge that connection must authenticate in order to download its request.

This method gives the class the opportunity to determine the course of action taken for the challenge provide credentials, continue without providing credentials, or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential:forAuthenticationChallenge: message to [challenge sender] , passing the credential and challenge as parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending [challenge sender] a continueWithoutCredentialForAuthenticationChallenge: or a cancelAuthenticationChallenge: message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of the following messages: useCredential:forAuthenticationChallenge:, continueWithoutCredentialForAuthenticationChallenge: or cancelAuthenticationChallenge:.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the [challenge sender] is sent a useCredential:forAuthenticationChallenge: with the credential. If the challenge has no credential or the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge: is sent to [challenge sender] instead.

38.9.20 didReceiveData(newData as Memoryblock)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent as a connection loads data incrementally.
Notes:

newdata: The newly available data.

The data property is updated before this event is called and gives you a way to see all data received so far.

38.9.21 didReceiveResponse(response as NSURLResponseMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when the connection has received sufficient data to construct the URL response for its request.
Notes:

response: The URL response for the connection's request. This object is immutable and will not be modified by the URL loading system once it is presented to the delegate.

In rare cases, for example in the case of an HTTP load where the content type of the load data is multipart/x-mixed-replace, the delegate will receive more than one didReceiveResponse message. In the event this occurs, delegates should discard all data previously delivered by didReceiveData, and should be prepared to handle the, potentially different, MIME type reported by the newly reported URL response.

The only case where this message is not sent to the delegate is when the protocol implementation encounters an error before a response could be created.

38.9.22 didSendBodyData(bytesWritten as Int64, totalBytesWritten as Int64, totalBytesExpectedToWrite as Int64)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent as the body (message data) of a request is transmitted (such as in an http POST request).
Notes:

bytesWritten: The number of bytes written in the latest write.
totalBytesWritten: The total number of bytes written for this connection.
totalBytesExpectedToWrite: The number of bytes the connection expects to write.

This method provides an estimate of the progress of a URL upload.
The value of totalBytesExpectedToWrite may change during the upload if the request needs to be retransmitted due to a lost connection or an authentication challenge from the server.
Available in Mac OS X v10.6 and later.

38.9.23 shouldUseCredentialStorage as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent to determine whether the URL loader should consult the credential storage for authenticating the connection.
Notes:

This method is called before any attempt to authenticate is made. By returning false, the delegate tells the connection not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returning true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge event.

Available in Mac OS X v10.6 and later.

38.9.24 willCacheResponse(cachedResponse as NSCachedURLResponseMBS) as NSCachedURLResponseMBS

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: .

Function: The connection will cache this response.
Notes: If you implement this event, please return request to cache or nil to not cache.

38.9.25 willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when the connection determines that it must change URLs in order to continue loading a request.
Notes:

request: The proposed redirected request. You should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.
redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

The actual URL request to use in light of the redirection response. The event may return request unmodified to allow the redirect, return a new request, or return nil to reject the redirect and continue processing the connection.

If you wish to cancel the redirect connection, it should call the connection object's cancel method. Alternatively, the delegate method can return nil to cancel the redirect connection, and the original connection will continue to process. This has special relevance in the case where redirectResponse is not nil. In this

case, any data that is loaded for the connection will be sent to the delegate, and the delegate will receive a connectionDidFinishLoading or didFailLoadingWithError message, as appropriate.

Note: Prior to Mac OS X version 10.5, returning nil in this method sometimes would cancel the connection but other times would cause the connection to use the given request unmodified. In addition, prior to version 10.5, NSURLConnection would often modify the incoming NSURLRequest object before transmission without notifying the delegate. In version 10.5 and later, it always notifies the delegate via willSendRequest, and thus the delegate might receive this message before the connection has even properly begun, prior to transmitting the request to the remote server.
The delegate can receive this message as a result of modifying a request before it is sent, for example to transform the request's URL to its canonical form. To detect this case, examine redirectResponse; if it is nil, the message was not sent due to a redirect.

The delegate should be prepared to receive this message multiple times.

38.9.26 willSendRequestForAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Tells the delegate that the connection will send a request for an authentication challenge.
Notes:

challenge: The authentication challenge for which a request is being sent.

This method allows the delegate to make an informed decision about connection authentication at once. If the delegate implements this method, it has no need to implement canAuthenticateAgainstProtectionSpace, didReceiveAuthenticationChallenge, shouldUseCredentialStorage. In fact, these other methods are not invoked.

In this method,you must invoke one of the challenge-responder methods (NSURLAuthenticationChallengeSenderMBS):

useCredential
continueWithoutCredentialForAuthenticationChallenge
cancelAuthenticationChallenge
performDefaultHandlingForAuthenticationChallenge
rejectProtectionSpaceAndContinueWithChallenge

You might also want to analyze challenge for the authentication scheme and the proposed credential before calling a NSURLAuthenticationChallengeSenderMBS method. You should never assume that a proposed credential is present. You can either create your own credential and respond with that, or you can send the proposed credential back. (Because this object is immutable, if you want to change it you must copy it and

then modify the copy.)

38.10 class NSURLCredentialMBS

38.10.1 class NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: A class for a stored password.
Notes:

dim u as NSURLCredentialMBS
dim p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.10.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.4pr6

38.10.3 Blog Entries

- MBS Xojo Plugins, version 20.2pr3
- MBS Xojo / Real Studio Plugins, version 13.4pr6

38.10.4 Methods

38.10.5 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

38.10.6 copy as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Creates a copy of the credential object.

38.10.7 credential(User as string, password as string, persistence as Integer = 0) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 13.4, Platform: macOS, Targets: All.

Function: Create a new NSURLCredential with a user and password.
Example:

```
dim u as NSURLCredentialMBS
dim p as Integer = NSURLCredentialMBS.NSURLCredentialPersistenceForSession

u = NSURLCredentialMBS.credential("Christian", "teddy123", p)

MsgBox u.user+EndOfLine+u.password+EndOfLine+str(u.persistence)
```

Notes:

user: the username
password: the password
persistence: Integer that says to store per session, permanently or not at all.
Can be NSURLCredentialPersistenceForSession, NSURLCredentialPersistenceNone or NSURLCredentialPersistencePermanent.

38.10.8 credentialWithPEM(Data as MemoryBlock, Password as String = "") as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates an identity credentials with certificate and private key in PEM file.
Notes:

Password is optional.
This is a convenience function using SecItemImport to read data and then builds the result with credentialWithIdentity function.
Returns nil for any error.

38.10.9 credentialWithPKCS12(Data as MemoryBlock, Password as String = "") as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates an identity credentials with certificate and private key in PKCS# 12 file.
Notes:

Password is optional.
This is a convenience function using SecPKCS12Import to read data and then builds the result with credentialWithIdentity function.
Returns nil for any error.

38.10.10 credentialWithTrustingServer(ProtectionSpace as NSURLProtectionSpaceMBS) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a credential trusting the server in the protection space.
Notes:

This is a convenience function using the ServerTrust in the protection space to wrap it in a new to read data and then builds the result with credential object with credentialForTrust function.
Returns nil for any error.

38.10.11 Properties

38.10.12 CertificateCount as Integer

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Queries number of certificates in this credential object.
Notes: (Read only property)

38.10.13 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this class.
Notes: (Read and Write property)

38.10.14 HasIdentity as Boolean

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this credential object contains an identity reference.
Notes: (Read only property)

38.10.15 hasPassword as Boolean

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Find out if this credential has a password, without trying to get it.
Notes:

Returns true if this credential has a password, otherwise false.

If this credential's password is actually kept in an external store, the password method may return "" even if this method returns true, since getting the password may fail, or the user may refuse access.
(Read only property)

38.10.16 password as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the password.
Notes:

This method might actually attempt to retrieve the password from an external store, possible resulting in prompting, so do not call it unless needed.
(Read only property)

38.10.17 persistence as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Determine whether this credential is or should be stored persistently.
Notes:

Use the constants:
NSURLCredentialPersistenceNone
NSURLCredentialPersistenceForSession
NSURLCredentialPersistencePermanent
(Read only property)

38.10.18 user as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the username.
Notes: (Read only property)

38.10.19 Constants

38.10.20 NSURLCredentialPersistenceForSession = 1

MBS MacBase Plugin, Plugin Version: 7.5.

Function: This credential will only be stored for this session.

38.10.21 NSURLCredentialPersistenceNone = 0

MBS MacBase Plugin, Plugin Version: 7.5.

Function: This credential won't be saved.

38.10.22 NSURLCredentialPersistencePermanent = 2

MBS MacBase Plugin, Plugin Version: 7.5.

Function: This credential will be stored permanently and shared with other applications.

38.11 class NSURLCredentialStorageMBS

38.11.1 class NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: NSURLCredentialStorage implements a singleton object (shared instance) which manages the shared credentials cache.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.11.2 Methods

38.11.3 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

38.11.4 defaultCredentialForProtectionSpace(space as NSURLProtectionSpaceMBS) as NSURLCredentialMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the default credential for the specified protection space.

38.11.5 sharedCredentialStorage as NSURLCredentialStorageMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the shared singleton authentication storage.

38.11.6 Properties

38.11.7 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this class.
Notes: (Read and Write property)

38.12 class NSURLDownloadMBS

38.12.1 class NSURLDownloadMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The NSURL Download class which handles downloads for Webkit.
Notes:

NSURLDownload downloads a request asynchronously and saves the data to a file. The interface for NSURL-Download is sparse, providing methods to initialize a download, set the destination path and cancel loading the request.

NSURLDownload's delegate methods,Äîdefined by the NSURLDownloadDelegate,Äîallow an object to receive informational callbacks about the asynchronous load of the URL request. Other delegate methods provide facilities that allow the delegate to customize the process of performing an asynchronous URL load.

Note that these delegate methods are called on the thread that started the asynchronous load operation for the associated NSURLDownload object.

The MBS Plugins currently only implement a part of this class for use with WebDownloadDelegateMBS. So please contact us if you need more.

38.12.4 Methods

38.12.5 cancel

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Cancels the receiver's download and deletes the downloaded file.

38.12.6 canResumeDownloadDecodedWithEncodingMIMEType(MimeType as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether a URL download object can resume a download that was decoded with the specified MIME type.
Notes:

MIMEType: The MIME type the caller wants to know about.
Returns true if the URL download object can resume a download that was decoded with the specified MIME type, false otherwise.
NSURLDownload cannot resume a download that was partially decoded in the gzip format.

38.12.7 Constructor(request as NSURLRequestMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an initialized URL download for a URL request and begins to download the data for the request.
Notes:

request: The URL request to download. The request object is deep-copied as part of the initialization process. Changes made to request after this method returns do not affect the request that is used for the loading process.

On success the handle property is not zero.
See also:

- 38.12.8 Constructor(resumeData as Memoryblock, path as folderitem) 9029
- 38.12.9 Constructor(resumeData as Memoryblock, path as string) 9030

38.12.8 Constructor(resumeData as Memoryblock, path as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.
Notes:

resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.

On success the handle property is not zero.
See also:

- 38.12.7 Constructor(request as NSURLRequestMBS) 9029
- 38.12.9 Constructor(resumeData as Memoryblock, path as string) 9030

38.12.9 Constructor(resumeData as Memoryblock, path as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an initialized NSURLDownload object that will resume downloading the specified data to the specified file and begins the download.
Notes:

resumeData: Specifies the data to resume downloading.
path: The location for the downloaded data.

On success the handle property is not zero.
See also:

- 38.12.7 Constructor(request as NSURLRequestMBS) 9029
- 38.12.8 Constructor(resumeData as Memoryblock, path as folderitem) 9029

38.12.10 request as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the request that initiated the receiver's download.

38.12.11 resumeData as Memoryblock

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the resume data for a download that is not yet complete.
Notes:

The resume data for a download that is not yet complete. This data represents the necessary state information that an NSURLDownload object needs to resume a download. The resume data can later be used when initializing a download with Constructor. Returns nil if the download is not able to be resumed.

Resume data will only be returned if the protocol of the download as well as the server support resuming. In order to later resume a download you must call setDeletesFileUponFailure passing false so the partially downloaded data is not deleted when the initial connection is lost or canceled.

38.12.12 setDestination(path as folderitem, allowOverwrite as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the destination path of the downloaded file.
Notes:

path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.
See also:

- 38.12.13 setDestination(path as string, allowOverwrite as boolean) 9031

38.12.13 setDestination(path as string, allowOverwrite as boolean)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the destination path of the downloaded file.
Notes:

path: The path for the downloaded file.
allowOverwrite: true if an existing file at path can be replaced, false otherwise.

If allowOverwrite is false and a file already exists at path, a unique filename will be created for the downloaded file by appending a number to the filename. The delegate can implement didCreateDestination to determine the filename used when the file is written to disk.

An NSURLDownload instance ignores multiple calls to this method.
See also:

• 38.12.12 setDestination(path as folderitem, allowOverwrite as boolean) 9031

38.12.14 Properties

38.12.15 Handle as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

38.12.16 deletesFileUponFailure as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver deletes partially downloaded files when a download stops prematurely.
Notes:

True if partially downloaded files should be deleted when a download stops prematurely, false otherwise. The default is true.
(Read and Write computed property)

38.12.17 Events

38.12.18 canAuthenticateAgainstProtectionSpace(protectionSpace as NSURLProtectionSpaceMBS) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent to determine whether the delegate is able to respond to a protection space's form of authentication. (required)
Notes:

protectionSpace: The protection space that generates an authentication challenge.

This method is called before didReceiveAuthenticationChallenge, allowing the delegate to inspect a protection space before attempting to authenticate against it. By returning true, the delegate indicates that it can handle the form of authentication, which it does in the subsequent call to didReceiveAuthenticationChallenge. Not implementing this method is the same as returning false, in which case default authentication handling is used.

Available in Mac OS X v10.6 and later.

38.12.19 decideDestinationWithSuggestedFilename(filename as string)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: The delegate receives this message when download has determined a suggested filename for the downloaded file. (required)
Notes:

filename: The suggested filename for the download.

The suggested filename is either derived from the last path component of the URL and the MIME type or, if the download was encoded, from the encoding. If the delegate wishes to modify the path, it should send setDestination to download.

The delegate will not receive this message if setDestination has already been called for the download.

Available in Mac OS X v10.2 and later.

38.12.20 DidBegin

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent immediately after a download object begins a download. (required)
Notes: Available in Mac OS X v10.2 and later.

38.12.21 didCancelAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent if an authentication challenge is canceled due to the protocol implementation encountering an error. (required)
Notes:

challenge: The authentication challenge that caused the download object to cancel the download.

If the delegate receives this message the download will fail and the delegate will receive a didFailWithError message.

Available in Mac OS X v10.2 and later.

38.12.22 didCreateDestination(path as string, file as folderitem)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when the destination file is created. (required)
Notes:

path: The path to the destination file.
file: The path to the destination file as folderitem.

Available in Mac OS X v10.2 and later.

38.12.23 didFailWithError(error as NSErrorMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent if the download fails or if an I/O error occurs when the file is written to disk. (required)
Notes:

error: The error that caused the failure of the download.

Any partially downloaded file will be deleted.

Once the delegate receives this message, it will receive no further messages for download.
Available in Mac OS X v10.2 and later.

38.12.24 DidFinish

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a download object has completed downloading successfully and has written its results to disk. (required)
Notes:

The delegate will receive no further messages for download.
Available in Mac OS X v10.2 and later.

38.12.25 didReceiveAuthenticationChallenge(challenge as NSURLAuthenticationChallengeMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when the URL download must authenticate a challenge in order to download the request. (required)
Notes:

challenge: The URL authentication challenge that must be authenticated in order to download the request.

This method gives the delegate the opportunity to determine the course of action taken for the challenge: provide credentials, continue without providing credentials or cancel the authentication challenge and the download.

The delegate can determine the number of previous authentication challenges by sending the message previousFailureCount to challenge.

If the previous failure count is 0 and the value returned by proposedCredential is nil, the delegate can create a new NSURLCredential object, providing information specific to the type of credential, and send a useCredential message to challenge, passing the credential and challenge as parameters. If proposedCredential is not nil, the value is a credential from the URL or the shared credential storage that can be provided to the user as feedback.

The delegate may decide to abandon further attempts at authentication at any time by sending challenge a continueWithoutCredentialForAuthenticationChallenge or a cancelAuthenticationChallenge message. The specific action is implementation dependent.

If the delegate implements this method, the download will suspend until [challenge sender] is sent one of the following messages: useCredential, continueWithoutCredentialForAuthenticationChallenge or cancelAuthenticationChallenge.

If the delegate does not implement this method the default implementation is used. If a valid credential for the request is provided as part of the URL, or is available from the NSURLCredentialStorage the challenge is sent a useCredential:forAuthenticationChallenge with the credential. If the challenge has no credential or the credentials fail to authorize access, then continueWithoutCredentialForAuthenticationChallenge is sent to challenge sender instead.

Available in Mac OS X v10.2 and later.

38.12.26 didReceiveDataOfLength(length as UInt64)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent as a download object receives data incrementally. (required)
Notes:

length: The amount of data received in this increment of the download, measured in bytes.

Available in Mac OS X v10.2 and later.

38.12.27 didReceiveResponse(response as NSURLResponseMBS)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a download object has received sufficient load data to construct the NSURLResponse object for the download. (required)
Notes:

response: The URL response object received as part of the download. response is immutable and will not be modified after this method is called.

In some rare cases, multiple responses may be received for a single download. In this case, the client should assume that each new response resets the download progress to 0 and should check the new response for the expected content length.
Available in Mac OS X v10.2 and later.

38.12.28 shouldDecodeSourceDataOfMIMEType(encodingType as string) as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a download object determines that the downloaded file is encoded to inquire whether the file should be automatically decoded. (required)
Notes:

encodingType: The type of encoding used by the downloaded file. The supported encoding formats are MacBinary ("application/macbinary"), Binhex ("application/mac-binhex40") and gzip ("application/gzip").

Return true to decode the file, false otherwise.

The delegate may receive this message more than once if the file has been encoded multiple times. This method is not called if the downloaded file is not encoded.
Available in Mac OS X v10.2 and later.

38.12.29 shouldUseCredentialStorage as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent to determine whether the URL loader should consult the credential storage to authenticate

the download. (required)
Notes:

This method is called before any attempt to authenticate is made. By returning false, the delegate tells the download not to consult the credential storage and makes itself responsible for providing credentials for any authentication challenges. Not implementing this method is the same as returing true. The delegate is free to consult the credential storage itself when it receives a didReceiveAuthenticationChallenge message.

Available in Mac OS X v10.6 and later.

38.12.30 willResumeWithResponse(response as NSURLResponseMBS, startingByte as Int64)

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when a download object has received a response from the server after attempting to resume a download. (required)
Notes:

response: The URL response received from the server in response to an attempt to resume a download.

The location of the start of the resumed data, in bytes.
Available in Mac OS X v10.4 and later.

38.12.31 willSendRequest(request as NSURLRequestMBS, redirectResponse as NSURLResponseMBS) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: .

Function: Sent when the download object determines that it must change URLs in order to continue loading a request. (required)
Notes:

request: The proposed redirected request. The delegate should inspect the redirected request to verify that it meets its needs, and create a copy with new attributes to return to the connection if necessary.
redirectResponse: The URL response that caused the redirect. May be nil in cases where this method is not being sent as a result of involving the delegate in redirect processing.

Return the actual URL request to use in light of the redirection response. The delegate may copy and modify request as necessary to change its attributes, return request unmodified, or return nil.

If the delegate wishes to cancel the redirect, it should call the download object's cancel method. Alternatively, the delegate method can return nil to cancel the redirect, and the download will continue to process.

This has special relevance in the case where redirectResponse is not nil. In this case, any data that is loaded for the download will be sent to the delegate, and the delegate will receive a downloadDidFinish: or download:didFailWithError: message, as appropriate.

The delegate can receive this message as a result of transforming a request's URL to its canonical form, or for protocol-specific reasons, such as an HTTP redirect. The delegate implementation should be prepared to receive this message multiple times.

Available in Mac OS X v10.2 and later.

38.13 class NSURLMBS

38.13.1 class NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The class for URL.
Notes:

An NSURL object represents a URL that can potentially contain the location of a resource on a remote server, the path of a local file on disk, or even an arbitrary piece of encoded data.

Please also review Apples documentation on this class:
https://developer.apple.com/library/mac/documentation/Cocoa/Reference/Foundation/Classes/NSURL_Class/index.html

MBS Plugin only includes a part of the original class. EMail us if you miss something.

38.13.4 Methods

38.13.5 checkResourceIsReachableAndReturnError as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns whether the URL's resource exists and is reachable.
Notes: This method synchronously checks if the resource's backing store is reachable. Checking reachability is appropriate when making decisions that do not require other immediate operations on the resource, e.g. periodic maintenance of UI state that depends on the existence of a specific document. When performing operations such as opening a file or copying resource properties, it is more efficient to simply try the operation and handle failures. If this method returns false, the optional error is populated. This method is currently applicable only to URLs for file system resources. For other URL types, NO is returned. Symbol is present in iOS 4, but performs no operation.

38.13.6 Constructor(item as folderitem)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates an URL based on folderItem.
See also:

- 38.13.7 Constructor(scheme as string, host as string, path as string) 9040
- 38.13.8 Constructor(url as string) 9041
- 38.13.9 Constructor(url as string, baseURL as NSURLMBS) 9041

38.13.7 Constructor(scheme as string, host as string, path as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Initializes a newly created NSURL with a specified scheme, host, and path.
Notes:

scheme: The scheme for the NSURL object. For example, in the URL http://www.example.com/index.html, the scheme is http.
host: The host for the NSURL object (for example, www.example.com). May be the empty string.
path: The path for the NSURL object (for example, /index.html). If the path begins with a tilde, you must

first expand it by calling stringByExpandingTildeInPath.
See also:

- 38.13.6 Constructor(item as folderitem) 9040
- 38.13.8 Constructor(url as string) 9041
- 38.13.9 Constructor(url as string, baseURL as NSURLMBS) 9041

38.13.8 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a provided URL string.
See also:

- 38.13.6 Constructor(item as folderitem) 9040
- 38.13.7 Constructor(scheme as string, host as string, path as string) 9040
- 38.13.9 Constructor(url as string, baseURL as NSURLMBS) 9041

38.13.9 Constructor(url as string, baseURL as NSURLMBS)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a base URL and a relative string.
Notes:

This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folder,Äôs URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.
See also:

- 38.13.6 Constructor(item as folderitem) 9040
- 38.13.7 Constructor(scheme as string, host as string, path as string) 9040
- 38.13.8 Constructor(url as string) 9041

38.13.10 copy as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates a copy of the URL object.

38.13.11 fileURLWithFileSystemRepresentation(path as string, isDirectory as boolean, relativeToURL as NSURLMBS) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Initializes a newly created URL referencing the local file or directory at the file system representation of the path.
Notes: File system representation is a string with canonical UTF-8 encoding.

38.13.12 fileURLWithPath(path as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Builds a file URL with given file path.
Notes: Better to use fileURLWithPath with directory parameter if you know if the path is a directory vs non-directory, as it saves an i/o.
See also:

- 38.13.13 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS 9042

38.13.13 fileURLWithPath(path as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Builds a file URL based on a given file path.
See also:

- 38.13.12 fileURLWithPath(path as string) as NSURLMBS 9042

38.13.14 fileURLWithPathComponents(components() as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Builds an URL based on given components.

38.13.15 getResourceValue(byref value as Variant, key as string, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns the value of the resource property for the specified key.
Notes:

value: The location where the value for the resource property identified by key should be stored.
key: The name of one of the URL,Äôs resource properties.
error: The error that occurred if the resource value could not be retrieved.

Returns true if value is successfully populated; otherwise, false.

This method first checks if the URL object already caches the resource value. If so, it returns the cached resource value to the caller. If not, then this method synchronously obtains the resource value from the backing store, adds the resource value to the URL object's cache, and returns the resource value to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for the key you want to access.

If this method returns true and the value is populated with nil, it means that the resource property is not available for the specified resource, and that no errors occurred when determining that the resource property was unavailable.

If this method returns false, an error occurred. The object pointer referenced by error is populated with additional information.

This method applies only to URLs that represent file system resources.

Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).
e.g. NSNumber can be converted to Integer or Boolean depending on content.

38.13.16 isEqual(other as NSURLMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Tests if two NSURLs are equal.
Notes: Returns a Boolean value that indicates whether the receiver and a given object have identical URL strings and base URLs.

38.13.17 Items(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries list of items in the directory the URL points to on disk.
Notes: Error is optional.
See also:

- 38.13.18 Items(VisibleItemsOnly as boolean = false) as NSURLMBS() 9044

38.13.18 Items(VisibleItemsOnly as boolean = false) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries list of items in the directory the URL points to on disk.
See also:

- 38.13.17 Items(byref error as NSErrorMBS, VisibleItemsOnly as boolean = false) as NSURLMBS() 9044

38.13.19 mountedVolumeURLs(SkipHidden as boolean = true) as NSURLMBS()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries array of all NSURLs for mounted volumes.
Notes:

if SkipHidden is true, hidden volumes are skipped.
Returns nil in case of error.

38.13.20 NSThumbnail1024x1024SizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible keys for the NSURLThumbnailDictionaryKey dictionary.
Notes:

A 1024 x 1024 pixel thumbnail as an NSImage on OS X.
Available in OS X v10.10 and later.

38.13.21 NSURLAddedToDirectoryDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The time at which the resource,Äôs was created or renamed into or within its parent directory, returned as an date. Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.

38.13.22 NSURLAttributeModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The time at which the resource,Äôs attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported (read-write).

Available in OS X v10.6 and later.

38.13.23 NSURLContentAccessDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The time at which the resource was most recently accessed, returned as a date object if the volume supports access dates, or nil if access dates are unsupported (read-only).

Available in OS X v10.6 and later.

38.13.24 NSURLContentModificationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported (read-write).

Available in OS X v10.6 and later.

38.13.25 NSURLCreationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported (read-write).

Available in OS X v10.6 and later.

38.13.26 NSURLCustomIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The icon stored with the resource, returned as an NSImage object, or nil if the resource has no custom icon. Available in OS X v10.6 and later.

38.13.27 NSURLDocumentIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The document identifier returned as a number (read-only).

The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It is not transferred when the file is copied, but it survives "safe save" operations. For example, it remains on the path to which it was assigned, even after calling the replaceItemAtURL:withItemAtURL:backupItemName:options:resultingItemURL:error: method. Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.

38.13.28 NSURLEffectiveIconKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs normal icon, returned as an NSImage object (read-only).

Available in OS X v10.6 and later.

38.13.29 NSURLFileAllocatedSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes:

Key for the total size allocated on disk for the file, returned as an NSNumber object (read-only).

Available in OS X v10.6 and later.

38.13.30 NSURLFileResourceIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs unique identifier, returned as an id (read-only).

This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.

If used with getResourceValue will give a MemoryBlock.

38.13.31 NSURLFileResourceTypeBlockSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a block special file.
Available in OS X v10.7 and later.

38.13.32 NSURLFileResourceTypeCharacterSpecial as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a character special file.
Available in OS X v10.7 and later.

38.13.33 NSURLFileResourceTypeDirectory as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a directory.
Available in OS X v10.7 and later.

38.13.34 NSURLFileResourceTypeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs object type, returned as an NSString object. See File Resource Types for possible values.
Available in OS X v10.7 and later.

38.13.35 NSURLFileResourceTypeNamedPipe as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a named pipe.
Available in OS X v10.7 and later.

38.13.36 NSURLFileResourceTypeRegular as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a regular file.
Available in OS X v10.7 and later.

38.13.37 NSURLFileResourceTypeSocket as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a socket.
Available in OS X v10.7 and later.

38.13.38 NSURLFileResourceTypeSymbolicLink as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource is a symbolic link.
Available in OS X v10.7 and later.

38.13.39 NSURLFileResourceTypeUnknown as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the possible values for the NSURLFileResourceTypeKey key.
Notes:

The resource,Äôs type is unknown.
Available in OS X v10.7 and later.

38.13.40 NSURLFileScheme as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: These schemes are the ones that NSURL can parse.
Notes: Identifies a URL that points to a file on a mounted volume.

38.13.41 NSURLFileSecurityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs security information, returned as an NSFileSecurity object (read-write).
Available in OS X v10.7 and later.

38.13.42 NSURLFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes:

Key for the file,Äôs size in bytes, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

38.13.43 NSURLGenerationIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

An opaque generation identifier, returned as an id (read-only)

The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file's data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.

38.13.44 NSURLHasHiddenExtensionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Key for determining whether the resource,Äôs extension is normally removed from its localized name, returned as a Boolean (read-write).

38.13.45 NSURLIsAliasFileKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes:

Key for determining whether the file is an alias, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

38.13.46 NSURLIsDirectoryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a directory, returned as a Boolean- (read-only).
Available in OS X v10.6 and later.

38.13.47 NSURLIsExcludedFromBackupKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource is excluded from all backups of app data, returned as a Boolean NSNumber object (read-write).

You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.

38.13.48 NSURLIsExecutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean (read-only).

Available in OS X v10.7 and later.

38.13.49 NSURLIsHiddenKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource is normally not displayed to users, returned as a Boolean NSNumber object (read-write).

If the resource is hidden because its name begins with a period, setting this value has no effect.
Available in OS X v10.6 and later.

38.13.50 NSURLIsMountTriggerKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the URL is a file system trigger directory, returned as a Boolean NSNumber object (read-only). Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.

Available in OS X v10.7 and later.

38.13.51 NSURLIsPackageKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a file package, returned as a Boolean NSNumber object (read-write in OS X v10.8 and later, read-only in previous versions). A true value means that the resource is a file package.

If you attempt to set or clear this key,Äôs value on a file instead of a directory, the system ignores your attempt. If the directory is defined as a package by way of its filename extension or other reason apart from this key, setting this key,Äôs value to false has no effect.

Available in OS X v10.6 and later.

38.13.52 NSURLIsReadableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the current process (as determined by the EUID) can read the resource, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

38.13.53 NSURLIsRegularFileKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a regular file, as opposed to a directory or a symbolic link. Returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

38.13.54 NSURLIsSymbolicLinkKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource is a symbolic link, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

38.13.55 NSURLIsSystemImmutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource's system immutable bit is set, returned as a Boolean NSNumber object (read-write).

Available in OS X v10.6 and later.

38.13.56 NSURLIsUbiquitousItemKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the keys for files.
Example:

```
Dim f as FolderItem // your folderitem
Dim n As New NSURLMBS(f)

dim value as Variant
dim error as NSErrorMBS
Dim result As Boolean = n.getResourceValue(value, n.NSURLIsUbiquitousItemKey, error)
break // check in debugger
```

Notes:

A boolean that contains true if this item is in iCloud storage, false if it is a local item (read-only).

Available in OS X v10.7 and later.

38.13.57 NSURLIsUserImmutableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource's user immutable bit is set, returned as a Boolean NSNumber object (read-write).
Available in OS X v10.6 and later.

38.13.58 NSURLIsVolumeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the resource is the root directory of a volume, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.6 and later.

38.13.59 NSURLIsWritableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Key for determining whether the current process (as determined by the EUID) can write to the resource, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

38.13.60 NSURLKeysOfUnsetValuesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Key for the resource properties that have not been set after setResourceValues returns an error, returned as an array of of strings.

38.13.61 NSURLLabelColorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs label color, returned as an NSColor object, or nil if the resource has no label color (read-only).
Available in OS X v10.6 and later.

38.13.62 NSURLLabelNumberKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs label number, returned as an NSNumber object (read-write).

Available in OS X v10.6 and later.

38.13.63 NSURLLinkCountKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The number of hard links to the resource, returned as an NSNumber object (read-only).
Available in OS X v10.6 and later.

38.13.64 NSURLLocalizedLabelKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs localized label text, returned as an NSString object, or nil if the resource has no localized label text (read-only).

Available in OS X v10.6 and later.

38.13.65 NSURLLocalizedNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs localized or extension-hidden name, returned as an NSString object (read-only).

Available in OS X v10.6 and later.

38.13.66 NSURLLocalizedTypeDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs localized type description, returned as an NSString object (read-only).
Available in OS X v10.6 and later.

38.13.67 NSURLNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs name in the file system, returned as an NSString object (read-write).
Available in OS X v10.6 and later.

38.13.68 NSURLParentDirectoryURLKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The parent directory of the resource, returned as an NSURL object, or nil if the resource is the root directory of its volume (read-only).
Available in OS X v10.6 and later.

38.13.69 NSURLPathKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The file system path for the URL, returned as an NSString object (read-only).

Available in OS X v10.8 and later.

38.13.70 NSURLPreferredIOBlockSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The optimal block size to use when reading or writing this file's data, returned as an NSNumber object, or nil if the preferred size is not available (read-only).
Available in OS X v10.7 and later.

38.13.71 NSURLQuarantinePropertiesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A key for quarantine properties.
Example:

```
Dim f As FolderItem = SpecialFolder.UserHome.Child("Downloads").Child("Installation.pdf")
Dim n As New NSURLMBS(f)
'Dim d As Dictionary = n.QuarantineProperties

Dim d As Dictionary
Dim v As Variant
dim e as NSErrorMBS

If n.getResourceValue(v, n.NSURLQuarantinePropertiesKey, e) Then

d = v
Break // inspect in debugger

Else
Break // failed
End If
```

Notes:

The quarantine properties as defined in LSQuarantine.h. To remove quarantine information from a file, pass NSNull as the value when setting this property. (Read-write, value type dictionary)
Available on Mac OS X 10.10 and later.

38.13.72 NSURLTagNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The names of tags attached to the resource, returned as an array of String values (read-write).

Available in OS X v10.9 and later.

38.13.73 NSURLThumbnailDictionaryKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

A dictionary of NSImage objects keyed by size (read-write).
See Thumbnail Property Keys for a list of possible keys.
Available in OS X v10.10.

38.13.74 NSURLThumbnailKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

All thumbnails as a single NSImage (read-write).
Available in OS X v10.10.

38.13.75 NSURLTotalFileAllocatedSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes:

Key for the total allocated size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

38.13.76 NSURLTotalFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that apply to properties of files.
Notes:

Key for the total displayable size of the file in bytes, returned as an NSNumber object (read-only). This includes the size of any file metadata.

Available in OS X v10.7 and later.

38.13.77 NSURLTypeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The resource,Äôs uniform type identifier (UTI), returned as a string (read-only).
Available in OS X v10.6 and later.

38.13.78 NSURLUbiquitousItemContainerDisplayNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

A string containing the name of the item,Äôs container, as it is displayed to the user.

Available in OS X v10.10 and later.

38.13.79 NSURLUbiquitousItemDownloadingErrorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

An error object that indicates why downloading the item from iCloud failed.

Available in OS X v10.9 and later.

38.13.80 NSURLUbiquitousItemDownloadingStatusCurrent as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Values that describe the iCloud storage state of a file.
Notes:

A local copy of this item exists and is the most up-to-date version known to the device.

Available in OS X v10.9 and later.

38.13.81 NSURLUbiquitousItemDownloadingStatusDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Values that describe the iCloud storage state of a file.
Notes:

A local copy of this item exists, but it is stale. The most recent version will be downloaded as soon as possible.

Available in OS X v10.9 and later.

38.13.82 NSURLUbiquitousItemDownloadingStatusKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

The current download state for the item, indicating whether a local copy exists and whether that copy is the most current version of the item. The possible values for this key are described in Ubiquitous Item Downloading Status Constants.

Available in OS X v10.9 and later.

38.13.83 NSURLUbiquitousItemDownloadingStatusNotDownloaded as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Values that describe the iCloud storage state of a file.
Notes:

This item has not been downloaded yet. Use startDownloadingUbiquitousItemAtURL to download it.

Available in OS X v10.9 and later.

38.13.84 NSURLUbiquitousItemDownloadRequestedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

A Boolean indicating whether a call to startDownloadingUbiquitousItemAtURL has already been made to

download the item. The value of this key is read-only.

Available in OS X v10.10 and later.

38.13.85 NSURLUbiquitousItemHasUnresolvedConflictsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item has conflicts outstanding, false otherwise (read-only).
Available in OS X v10.7 and later.

38.13.86 NSURLUbiquitousItemIsDownloadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item,Äôs data has been downloaded to a ubiquity container, false otherwise (read-only).

Available in OS X v10.7 and later.
Deprecated in OS X v10.9.

38.13.87 NSURLUbiquitousItemIsDownloadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item is being downloaded from iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.

38.13.88 NSURLUbiquitousItemIsExcludedFromSyncKey as string

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: All.

Function: One of the resource keys.
Notes:

Value is a boolean.
The item is excluded from sync, which means it is locally on disk but won't be available on the server. An excluded item is no longer ubiquitous.

38.13.89 NSURLUbiquitousItemIsSharedKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the ubiquitous item is shared. (Read-only, value type boolean)

38.13.90 NSURLUbiquitousItemIsUploadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item,Äôs data has been uploaded to iCloud storage, false otherwise (read-only).

When waiting for an upload to complete, do not poll this key from within a block passed to coordinateReadingItemAtURL, because the coordinated read required to obtain this value cannot be performed until that block completes and returns. Instead, use NSMetadataQuery or an NSFilePresenter delegate to asynchronously notify your app when the status changes.

Available in OS X v10.7 and later.

38.13.91 NSURLUbiquitousItemIsUploadingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

A boolean NSNumber that contains true if this item is being uploaded to iCloud, false otherwise (read-only).

Available in OS X v10.7 and later.

38.13.92 NSURLUbiquitousItemPercentDownloadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

An NSNumber in the range 0,Äì100 that indicates the percentage of the data that has been downloaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentDownloadedKey attribute instead.

Available in OS X v10.7 and later.
Deprecated in OS X v10.8.

38.13.93 NSURLUbiquitousItemPercentUploadedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

An NSNumber in the range 0,Äì100 that indicates the percentage of the data that has been uploaded (read-only).

Use the NSMetadataQuery class to search for NSMetadataItem objects that have the NSMetadataUbiquitousItemPercentUploadedKey attribute instead.

Available in OS X v10.7 and later.
Deprecated in OS X v10.8.

38.13.94 NSURLUbiquitousItemUploadingErrorKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Keys that describe the iCloud storage state of a file.
Notes:

An error object that indicates why uploading the item to iCloud failed.
Available in OS X v10.9 and later.

38.13.95 NSURLUbiquitousSharedItemCurrentUserPermissionsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: returns the permissions for the current user, or nil if not shared. (Read-only, value type string). Possible values below.

38.13.96 NSURLUbiquitousSharedItemCurrentUserRoleKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: Returns the current user's role for this shared item, or nil if not shared. (Read-only, value type string). See NSURLUbiquitousSharedItemRoleOwner and NSURLUbiquitousSharedItemRoleParticipant.

38.13.97 NSURLUbiquitousSharedItemMostRecentEditorNameComponentsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: returns a NSPersonNameComponents for the most recent editor of the document, or nil if it is the current user. (Read-only, value type NSPersonNameComponents)

38.13.98 NSURLUbiquitousSharedItemOwnerNameComponentsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: returns a NSPersonNameComponents, or nil if the current user. (Read-only, value type NSPersonNameComponents)

38.13.99 NSURLUbiquitousSharedItemPermissionsReadOnly as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is only allowed to read this item

38.13.100 NSURLUbiquitousSharedItemPermissionsReadWrite as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is allowed to both read and write this item

38.13.101 NSURLUbiquitousSharedItemRoleOwner as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is the owner of this shared item.

38.13.102 NSURLUbiquitousSharedItemRoleParticipant as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: the current user is a participant of this shared item.

38.13.103 NSURLVolumeAvailableCapacityForImportantUsageKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Total available capacity in bytes for "Opportunistic" resources, including space expected to be cleared by purging non-essential and cached resources. "Opportunistic" means something that the user is likely to want but does not expect to be present on the local system, but is ultimately non-essential and replaceable. This would include items that will be created or downloaded without an explicit request from the user on the current device.

Examples: A background download of a newly available episode of a TV series that a user has been recently watching, a piece of content explicitly requested on another device, or a new document saved to a network server by the current user from another device.

Value is zero if unknown. Please switch to NSURLVolumeAvailableCapacityKey key in that case.

Read-only, value type number

38.13.104 NSURLVolumeAvailableCapacityForOpportunisticUsageKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

Total available capacity in bytes for "Important" resources, including space expected to be cleared by purging non-essential and cached resources. "Important" means something that the user or application clearly expects to be present on the local system, but is ultimately replaceable. This would include items that the user has explicitly requested via the UI, and resources that an application requires in order to provide functionality.

Examples: A video that the user has explicitly requested to watch but has not yet finished watching or an audio file that the user has requested to download.

This value should not be used in determining if there is room for an irreplaceable resource. In the case of irreplaceable resources, always attempt to save the resource regardless of available capacity and handle failure as gracefully as possible.

Value is zero if unknown. Please switch to NSURLVolumeAvailableCapacityKey key in that case.

Read-only, value type number

38.13.105 NSURLVolumeAvailableCapacityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the volume,Äôs available capacity in bytes, returned as an Int64 (read-only).
Available in OS X v10.6 and later.

38.13.106 NSURLVolumeCreationDateKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the volume,Äôs creation date, returned as a date, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

38.13.107 NSURLVolumeIdentifierKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The unique identifier of the resource,Äôs volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.

If used with getResourceValue will give a MemoryBlock.

38.13.108 NSURLVolumeIsAutomountedKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume is automounted, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

38.13.109 NSURLVolumeIsBrowsableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume is visible in GUI-based file-browsing environments, such as the Desktop or the Finder application, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

38.13.110 NSURLVolumeIsEjectableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume is ejectable from the drive mechanism under software control, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

38.13.111 NSURLVolumeIsEncryptedKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume is encrypted. (Read-only, value type boolean)

38.13.112 NSURLVolumeIsInternalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume is connected to an internal bus, returned as a Boolean, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

38.13.113 NSURLVolumeIsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume is currently journaling, returned as a Boolean.
Available in OS X v10.6 and later.

38.13.114 NSURLVolumeIsLocalKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
dim f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)

dim n as NSURLMBS = NSURLMBS.URLWithItem(f)
dim value as Variant
dim error as NSErrorMBS

dim Local as Boolean

// network volumes are not local
if n.getResourceValue(value, n.NSURLVolumeIsLocalKey, error) then
MsgBox "Local: "+value.StringValue
Local = value.BooleanValue
else
MsgBox error.LocalizedDescription
end if

// network volumes have an URL
if n.getResourceValue(value, n.NSURLVolumeURLForRemountingKey, error) then
MsgBox "URLForRemounting: "+value.StringValue
else
```

```
MsgBox error.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume is stored on a local device, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

38.13.115 NSURLVolumeIsReadOnlyKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume is read-only, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

38.13.116 NSURLVolumeIsRemovableKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
dim f as FolderItem = GetFolderItem("/Volumes/Test", FolderItem.PathTypeNative)

dim n as NSURLMBS = NSURLMBS.URLWithItem(f)
dim value as Variant
dim error as NSErrorMBS

if n.getResourceValue(value, n.NSURLVolumeIsRemovableKey, error) then
MsgBox "Removable: "+value.StringValue
else
MsgBox error.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume is removable from the drive mechanism, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

38.13.117 NSURLVolumeIsRootFileSystemKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume is the root filesystem. (Read-only, value type boolean)

38.13.118 NSURLVolumeLocalizedFormatDescriptionKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the volume,Äôs descriptive format name, returned as a string (read-only).
Available in OS X v10.6 and later.

38.13.119 NSURLVolumeLocalizedNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

The name of the volume as it should be displayed in the user interface, returned as a string (read-only).
Available in OS X v10.7 and later.

38.13.120 NSURLVolumeMaximumFileSizeKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the largest file size supported by the volume in bytes, returned as a Boolean, or nil if it cannot be determined (read-only).

Available in OS X v10.7 and later.

38.13.121 NSURLVolumeNameKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

The name of the volume, returned as an NSString object (read-write). Settable only if NSURLVolumeSupportsRenamingKey is true.

Available in OS X v10.7 and later.

38.13.122 NSURLVolumeResourceCountKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the total number of resources on the volume, returned as an integer (read-only).
Available in OS X v10.6 and later.

38.13.123 NSURLVolumeSupportsAccessPermissionsKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports setting POSIX access permissions with the NSURLFileSecurityKey property (Read-only, value type boolean)

38.13.124 NSURLVolumeSupportsAdvisoryFileLockingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume implements whole-file advisory locks in the style of flock, along with the O_EXLOCK and O_SHLOCK flags of the open function, returned as a Boolean NSNumber object (read-only).

Available in OS X v10.7 and later.

38.13.125 NSURLVolumeSupportsCasePreservedNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
dim f as FolderItem = Volume(0)
dim n as new NSURLMBS(f)

dim v as Variant
dim e as NSErrorMBS
if n.getResourceValue(v, n.NSURLVolumeSupportsCasePreservedNamesKey, e) then
MsgBox "VolumeSupportsCasePreservedNames: "+str(v.BooleanValue)
else
MsgBox "Failed to query: "+e.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume supports case-preserved names, returned as a Boolean (read-only). Available in OS X v10.6 and later.

38.13.126 NSURLVolumeSupportsCaseSensitiveNamesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Example:

```
dim f as FolderItem = Volume(0)
dim n as new NSURLMBS(f)

dim v as Variant
dim e as NSErrorMBS
if n.getResourceValue(v, n.NSURLVolumeSupportsCaseSensitiveNamesKey, e) then
MsgBox "VolumeSupportsCaseSensitiveNames: "+str(v.BooleanValue)
else
MsgBox "Failed to query: "+e.LocalizedDescription
end if
```

Notes:

Key for determining whether the volume supports case-sensitive names, returned as a Boolean (read-only). Available in OS X v10.6 and later.

38.13.127 NSURLVolumeSupportsCompressionKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports transparent decompression of compressed files using decmpfs. (Read-only, value type boolean)

38.13.128 NSURLVolumeSupportsExclusiveRenamingKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports renamex_np(2)'s RENAME_EXCL option (Read-only, value type boolean)

38.13.129 NSURLVolumeSupportsExtendedSecurityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports extended security (access control lists), returned as a Boolean (read-only) (read-only).

Available in OS X v10.7 and later.

38.13.130 NSURLVolumeSupportsFileCloningKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports clonefile(2) (Read-only, value type boolean)

38.13.131 NSURLVolumeSupportsFileProtectionKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: True if the volume supports the File Protection attribute (see NSURLFileProtectionKey). (Read-only, value type number)

38.13.132 NSURLVolumeSupportsHardLinksKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports hard links, returned as a Boolean.
Available in OS X v10.6 and later.

38.13.133 NSURLVolumeSupportsImmutableFilesKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports making files immutable with the NSURLIsUserImmutableKey or NSURLIsSystemImmutableKey properties (Read-only, value type boolean)

38.13.134 NSURLVolumeSupportsJournalingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports journaling, returned as a Boolean.
Available in OS X v10.6 and later.

38.13.135 NSURLVolumeSupportsPersistentIDsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports persistent IDs, returned as a Boolean (read-only).
Available in OS X v10.6 and later.

38.13.136 NSURLVolumeSupportsRenamingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume can be renamed, returned as a Boolean (read-only).
Available in OS X v10.7 and later.

38.13.137 NSURLVolumeSupportsRootDirectoryDatesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports reliable storage of times for the root directory, returned as a Boolean (read-only).

Available in OS X v10.7 and later.

38.13.138 NSURLVolumeSupportsSparseFilesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports sparse files, returned as a Boolean.
Available in OS X v10.6 and later.

38.13.139 NSURLVolumeSupportsSwapRenamingKey as string

MBS MacBase Plugin, Plugin Version: 21.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes: true if the volume supports renamex_np(2)'s RENAME_SWAP option (Read-only, value type boolean)

38.13.140 NSURLVolumeSupportsSymbolicLinksKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports symbolic links, returned as a Boolean.
Available in OS X v10.6 and later.

38.13.141 NSURLVolumeSupportsVolumeSizesKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports returning volume size information, returned as a Boolean (read-only). If true, volume size information is available as values of the NSURLVolumeTotalCapacityKey and NSURLVolumeAvailableCapacityKey keys.

Available in OS X v10.7 and later.

38.13.142 NSURLVolumeSupportsZeroRunsKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for determining whether the volume supports zero runs, returned as a Boolean. (read-only).
Available in OS X v10.6 and later.

38.13.143 NSURLVolumeTotalCapacityKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the volume,Äôs capacity in bytes, returned as an Int64 (read-only).

Available in OS X v10.6 and later.

38.13.144 NSURLVolumeURLForRemountingKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the URL needed to remount the network volume, returned as an NSURL object, or nil if a URL is not available (read-only).

Available in OS X v10.7 and later.

38.13.145 NSURLVolumeURLKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the file system URL resource keys.
Notes:

The root directory of the resource,Äôs volume, returned as an NSURL object (read-only).
Available in OS X v10.6 and later.

38.13.146 NSURLVolumeUUIDStringKey as string

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: One of the property keys for volumes.
Notes:

Key for the volume,Äôs persistent UUID, returned as an NSString object, or nil if a persistent UUID is not available (read-only).

Available in OS X v10.7 and later.

38.13.147 pathComponents as string()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: An array containing the path components. (read-only)
Notes: This property contains an array containing the individual path components of the URL. For example, in the URL file:///directory/directory2/file, the path components array would be "/", "directory", "directory2", "file".

38.13.148 removeAllCachedResourceValues

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Removes all cached resource values and temporary resource values from the URL object.
Notes:

This method is applicable only to URLs that represent file system resources.
Available in OS X v10.9 and later.

38.13.149 removeCachedResourceValueForKey(key as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Removes the cached resource value identified by a given key from the URL object.
Notes:

key: The resource value key whose cached values you want to remove.

Removing a cached resource value may remove other cached resource values because some resource values are cached as a set of values, and because some resource values depend on other resource values. (Temporary resource values have no dependencies.)

This method is currently applicable only to URLs for file system resources.

Available in OS X v10.9 and later.

38.13.150 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns the resource values for the properties identified by specified array of keys.
Notes:

Returns a dictionary of resource values indexed by key.

This method first checks if the URL object already caches the specified resource values. If so, it returns the cached resource values to the caller. If not, then this method synchronously obtains the resource values from the backing store, adds the resource values to the URL object's cache, and returns the resource values to the caller.

The type of the returned resource value varies by resource property; for details, see the documentation for

the key you want to access.

If the result dictionary does not contain a resource value for one or more of the requested resource keys, it means those resource properties are not available for the URL, and no errors occurred when determining those resource properties were not available.

If an error occurs, this method returns nil and populates the object pointer referenced by error with additional information.

This method applies only to URLs that represent file system resources.
Available in OS X v10.6 and later.
See also:

- 38.13.151 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false) 9082

38.13.151 resourceValuesForKeys(keys() as string, targetDelegate as ResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Query keys asynchronously.
Notes:

The plugin will query values on a different preemptive thread and call your delegate on main thread with results as soon as possible. This way you can keep app responsive while system e.g. loads icons.
For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it's really quick.

The delegate has this parameters:
ResourceValuesForKeysDelegateMBS(URL as NSURLMBS, keys() as String, Values as Dictionary, Error as NSErrorMBS, tag as Variant)
See also:

- 38.13.150 resourceValuesForKeys(keys() as string, byref error as NSErrorMBS) as Dictionary 9081

38.13.152 setResourceValue(value as Variant, key as string, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Sets the URL,Äôs resource property for a given key to a given value.
Notes:

value: The value for the resource property defined by key.
key: The name of one of the URL,Äôs resource properties.
error: The error that occurred if the resource value could not be set.

Returns true if the resource property named key is successfully set to value; otherwise, false.

This method synchronously writes the new resource value out to disk. Attempts to set a read-only resource property or to set a resource property that is not supported by the resource are ignored and are not considered errors.

If an error occurs, this method returns NO and populates the object pointer referenced by error with additional information.

This method applies only to URLs for file system resources.
Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

38.13.153 setResourceValues(keyedValues as Dictionary, byref error as NSErrorMBS) as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Sets the URL,Äôs resource properties for a given set of keys to a given set of values.
Notes:

keyedValues: A dictionary of resource values to be set.
error: The error that occurred if one or more resource values could not be set.

Returns true if all resource values in keyedValues are successfully set; otherwise, false.

This method synchronously writes the new resource value out to disk. If an error occurs after some resource properties have been successfully changed, the userInfo dictionary in the returned error object contains a kCFURLKeysOfUnsetValuesKey key whose value is an array of the resource values that were not successfully set.

Attempts to set a read-only resource property or to set a resource property that is not supported by the resource are ignored and are not considered errors.

The order in which the resource values are set is not defined. If you need to guarantee the order in which resource values are set, you should make multiple requests to this method or setResourceValue:forKey:error:.

This method applies only to URLs for file system resources.
Available in OS X v10.6 and later.

Automatic type translation applies (See FAQ about NSDictionary).

38.13.154 setTemporaryResourceValue(value as Variant, key as string)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Sets a temporary resource value on the URL object.
Notes:

value: The value to store.
key: The key where the value should be stored. This key must be unique and must not conflict with any system-defined keys. Reverse-domain-name notation is recommended.

Your app can use a temporary resource value to temporarily store a value for an app-defined resource value key in memory without modifying the actual resource that the URL represents. Once set, you can copy the temporary resource value from the URL object just as you would copy system-defined keys,Äîby calling getResourceValue or resourceValuesForKeys.

Your app can remove a temporary resource value from the URL object by calling removeCachedResourceValueForKey or removeAllCachedResourceValues (to remove all temporary values).

This method is applicable only to URLs for file system resources.
Available in OS X v10.9 and later.

38.13.155 startAccessingSecurityScopedResource as boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Starts accessing a security scoped bookmark URL.
Notes: Given a NSURL created by resolving a bookmark data created with security scope, make the resource referenced by the url accessible to the process. When access to this resource is no longer needed the client must call stopAccessingSecurityScopedResource. Each call to startAccessingSecurityScopedResource must be balanced with a call to stopAccessingSecurityScopedResource (Note: this is not reference counted).

38.13.156 stopAccessingSecurityScopedResource

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Revokes the access granted to the url by a prior successful call to startAccessingSecurityScopedResource.

38.13.157 TagNames as string()

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The names of tags attached to the resource, returned as an array of String values.
Notes: Available in OS X v10.9 and later.

38.13.158 URLByAppendingPathComponent(pathComponent as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path component to the original URL.
Notes:

pathComponent: The path component to add to the URL, in its original form (not URL encoded).

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in OS X v10.6 and later.
See also:

- 38.13.159 URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS 9085

38.13.159 URLByAppendingPathComponent(pathComponent as string, isDirectory as boolean) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path component to the original URL, along with a trailing slash if the component is designated a directory.
Notes:

pathComponent: The path component to add to the URL.
isDirectory: If true, a trailing slash is appended after pathComponent.

Returns a new URL with pathComponent appended.

If the original URL does not end with a forward slash and pathComponent does not begin with a forward slash, a forward slash is inserted between the two parts of the returned URL, unless the original URL is the empty string.

Available in OS X v10.7 and later.
On Mac OS X 10.6 the plugin falls back
See also:

- 38.13.158 URLByAppendingPathComponent(pathComponent as string) as NSURLMBS 9085

38.13.160 URLByAppendingPathExtension(PathExtension as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new URL made by appending a path extension to the original URL.
Notes:

pathExtension: The path extension to add to the URL.

Returns a new URL with pathExtension appended.

If the original URL ends with one or more forward slashes, these are removed from the returned URL. A period is inserted between the two parts of the new URL.
Available in OS X v10.6 and later.

38.13.161 URLByDeletingLastPathComponent as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL created by taking the receiver and removing the last path component.
Notes:

If the receiver,Äôs URL represents the root path, this property contains a copy of the original URL. Otherwise, if the original URL has only one path component, this property contains the empty string.

Available in OS X v10.6 and later.

38.13.162 URLByDeletingPathExtension as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL created by taking the receiver and removing the path extension, if any.
Notes:

If the receiver represents the root path, this property contains a copy of the original URL. If the URL has multiple path extensions, only the last one is removed.

Available in OS X v10.6 and later.

38.13.163 URLByResolvingSymlinksInPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL that points to the same resource as the receiver and includes no symbolic links.
Notes:

If the receiver has no symbolic links, this property contains a copy of the original URL.

If some symbolic links cannot be resolved, this property contains those broken symbolic links.

If the name of the receiving path begins with /private, this property strips off the /private designator, provided the result is the name of an existing file.

This property only works on URLs with the file: path scheme. For all other URLs, it contains a copy of the receiver.
Available in OS X v10.6 and later.

38.13.164 URLByStandardizingPath as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A URL that points to the same resource as the original URL using an absolute path.
Notes:

This property only works on URLs with the file: path scheme. For all other URLs, it returns a copy of the original URL.

Like stringByStandardizingPath, this property can make the following changes in the provided URL:

- Expand an initial tilde expression using stringByExpandingTildeInPath.
- Reduce empty components and references to the current directory (that is, the sequences "//" and "/./") to single path separators.
- In absolute paths only, resolve references to the parent directory (that is, the component "..") to the real parent directory if possible using stringByResolvingSymlinksInPath, which consults the file system to resolve each potential symbolic link.
- In relative paths, because symbolic links can,Äôt be resolved, references to the parent directory are left in place.
- Remove an initial component of "/private" from the path if the result still indicates an existing file or directory (checked by consulting the file system).

Note that the path contained by this property may still have symbolic link components in it. Note also that this property only works with file paths (not, for example, string representations of URLs).

Available in OS X v10.6 and later.

38.13.165 URLsResourceValuesForKeys(URLs() as NSURLMBS, keys() as string, targetDelegate as URLsResourceValuesForKeysDelegateMBS, tag as Variant = nil, PrecacheIcons as boolean = false)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Queries several URLs for values.
Notes:

Similar to resourceValuesForKeys, this method will start a preemptive thread and queries values for all URLs on all keys in background. Once done it calls the delegate on main thread.

For icons, you can set PrecacheIcons to true. In that case plugin will draw icon on the preemptive thread, so icon data is really loaded from disk. When you than draw on main thread, it's really quick.

the delegate is declared like this:
URLsResourceValuesForKeysDelegateMBS(URLs() as NSURLMBS, keys() as String, Values() as Dictionary, Errors() as NSErrorMBS, tag as Variant)

38.13.166 URLWithHandle(Handle as Integer) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Creates a new URL object based on a handle value.
Notes: Will retain the reference.

38.13.167 URLWithItem(Item as FolderItem) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates an URL based on folderItem.
Example:

```
dim f as FolderItem = GetFolderItem("/Volumes/Ablage1", FolderItem.PathTypeNative)
dim n as NSURLMBS = NSURLMBS.URLWithItem(f)
MsgBox n.absoluteString
```

38.13.168 URLWithString(URL as string) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a provided URL string.
See also:

- 38.13.169 URLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS 9089

38.13.169 URLWithString(URL as string, baseURL as NSURLMBS) as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Creates and returns an NSURL object initialized with a base URL and a relative string.
Notes:

This method allows you to create a URL relative to a base path or URL. For example, if you have the URL for a folder on disk and the name of a file within that folder, you can construct a URL for the file by providing the folder,Äôs URL as the base path (with a trailing slash) and the filename as the string part.

This method expects URLString to contain only characters that are allowed in a properly formed URL. All other characters must be properly percent escaped. Any percent-escaped characters are interpreted using UTF-8 encoding.
See also:

- 38.13.168 URLWithString(URL as string) as NSURLMBS 9089

38.13.170 Properties

38.13.171 absoluteString as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The URL string for the receiver as an absolute URL.
Notes:

This property,Äôs value is calculated by resolving the receiver,Äôs string against its base according to the algorithm given in RFC 1808.
(Read only property)

38.13.172 absoluteURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: An absolute URL that refers to the same resource as the receiver.
Notes:

If the URL is already absolute, this property contains a copy of the receiver. Resolution is performed per RFC 1808.
(Read only property)

38.13.173 AddedToDirectoryDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time at which the resource,Äôs was created or renamed into or within its parent directory, returned as an date.
Notes:

Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.
(Read only property)

38.13.174 AddedToDirectoryDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time at which the resource,Äôs was created or renamed into or within its parent directory, returned as an date.
Notes:

Inconsistent behavior may be observed when this attribute is requested on hard-linked items. This property is not supported by all volumes. (read-only)

Available in OS X v10.10.
(Read only property)

38.13.175 AttributeModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Modification date.
Notes:

The time at which the resource,Äôs attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

38.13.176 AttributeModificationDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Modification date.
Notes:

The time at which the resource,Äôs attributes were most recently modified, returned as an NSDate object if the volume supports attribute modification dates, or nil if attribute modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

38.13.177 baseURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The base URL.
Notes:

This property contains the base URL. If the receiver is an absolute URL, this property contains nil.
(Read only property)

38.13.178 ContentAccessDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time at which the resource was most recently accessed.
Notes:

Returned as date object if the volume supports access dates, or nil if access dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

38.13.179 ContentAccessDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time at which the resource was most recently accessed.
Notes:

Returned as date object if the volume supports access dates, or nil if access dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

38.13.180 ContentModificationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The modification date.
Notes:

The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

38.13.181 ContentModificationDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The modification date.
Notes:

The time at which the resource was most recently modified, returned as a date object if the volume supports modification dates, or nil if modification dates are unsupported.

Available in OS X v10.6 and later.
(Read only property)

38.13.182 CreationDate as Date

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The creation date.
Notes:

The resource,Äôs creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

38.13.183 CreationDateTime as DateTime

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The creation date.
Notes:

The resource,Äôs creation date, returned as an NSDate object if the volume supports creation dates, or nil if creation dates are unsupported.
Available in OS X v10.6 and later.
(Read only property)

38.13.184 DocumentIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The document identifier returned as a number.
Notes:

The document identifier is a value assigned by the kernel to a file or directory. This value is used to identify the document regardless of where it is moved on a volume. The identifier persists across system restarts. It is not transferred when the file is copied, but it survives "safe save" operations.
Document identifiers are only unique within a single volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

38.13.185 EffectiveIcon as Variant

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs normal icon, returned as an NSImage object.
Notes:

Available in OS X v10.6 and later.

Value is a NSImageMBS object.
(Read only property)

38.13.186 filePathURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A file path URL that points to the same resource as the URL object.
Notes:

If the receiver is a file reference URL, this property contains a copy of the URL converted to a file path URL. If the receiver,Äôs URL is a file path URL, this property contains the original URL. If the original URL is not a file URL, or if the resource is not reachable or no longer exists, this property contains nil.

Available in OS X v10.6 and later.
(Read only property)

38.13.187 fileReferenceURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns a new file reference URL that points to the same resource as the receiver.
Notes:

File reference URLs use a URL path syntax that identifies a file system object by reference, not by path. This form of file URL remains valid when the file system path of the URL,Äôs underlying resource changes.

If the original URL is a file path URL, this property contains a copy of the URL converted into a file reference URL. If the original URL is a file reference URL, this property contains the original. If the original URL is not a file URL, this property contains nil.

File reference URLs cannot be created to file system objects which do not exist or are not reachable. This property contains nil instead.

In some areas of the file system hierarchy, file reference URLs cannot be generated to the leaf node of the URL path.

A file reference URL's path should never be persistently stored, because it is not valid across system restarts or remounts of volumes. If you need to store a persistent reference to a file system object, use a bookmark instead. You can create a bookmark by calling bookmarkDataWithOptions.

Available in OS X v10.6 and later.
(Read only property)

38.13.188 FileResourceIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs unique identifier, returned as an id.
Notes:

This identifier can be used to determine equality between file system resources with the isEqual: method. Two resources are equal if they have the same file-system path or if their paths link to the same inode on the same file system.

The value of this identifier is not persistent across system restarts.

Available in OS X v10.7 and later.
Returns hex encoded data.
(Read only property)

38.13.189 FileResourceType as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs object type, returned as an NSString object.
Notes:

See File Resource Types for possible values.
Available in OS X v10.7 and later.
(Read only property)

38.13.190 fileSystemRepresentation as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A string containing the URL,Äôs file system path.
Notes: (Read only property)

38.13.191 fragment as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The fragment identifier, conforming to RFC 1808. (read-only)
Notes:

This property contains the URL,Äôs fragment. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.html# jumpLocation, the fragment identifier is jumpLocation.
(Read only property)

38.13.192 GenerationIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: An opaque generation identifier, returned as an id.
Notes:

The generation identifier can be compared using isEqual to determine if the data in a document has been modified. For URLs which refer to the same file inode, the generation identifier changes when the data in the file's data fork is changed. Changes to extended attributes or other file system metadata do not change the identifier. For URLs which refer to the same directory inode, the generation identifier changes when direct children of that directory are added, removed or renamed. Changes to the data of the direct children of that directory does not change the generation identifier. The identifier persists across system restarts. It is tied to a specific document on a specific volume and is not transferred when the document is copied to another volume. This property is not supported by all volumes.

Available in OS X v10.10 and iOS 8.0.
(Read only property)

38.13.193 Handle as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes:

Can be used as NSURL* or CFURLRef for declares.
(Read and Write property)

38.13.194 HasHiddenExtension as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource,Äôs extension is normally removed from its localized name.
Notes:

Returned as a Boolean (read-write).
(Read only property)

38.13.195 host as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The host, conforming to RFC 1808. (read-only)
Notes:

This property contains the host. For example, in the URL http://www.example.com/index.html, the host is www.example.com.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808,Äîspecifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

38.13.196 IsAlias as Boolean

MBS MacBase Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Whether the file is an alias.
Example:

```
Dim file As folderitem = specialfolder.desktop.child("Hello.txt")

Dim url As New NSURLMBS(file)
MsgBox "IsAlias: " + If(url.IsAlias, "yes", "no")
```

Notes:

Returns true for alias files.
(Read only property)

38.13.197 IsDirectory as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is a directory.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.198 IsExcludedFromBackup as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is excluded from all backups of app data.
Notes:

You can use this property to exclude cache and other app support files which are not needed in a backup. Some operations commonly made to user documents cause this property to be reset to false; consequently, do not use this property on user documents.

Available in OS X v10.8 and later.
(Read only property)

38.13.199 IsExecutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Key for determining whether the current process (as determined by the EUID) can execute the resource (if it is a file) or search the resource (if it is a directory), returned as a Boolean.
Notes:

Available in OS X v10.7 and later.
(Read only property)

38.13.200 isFileReferenceURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Returns whether the URL is a file reference URL. S
Notes: (Read only property)

38.13.201 isFileURL as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the scheme is file.
Notes:

if myURL.isFileURL is true, then myURL.path is suitable for input into NSFileManager or NSPathUtilities.
(Read only property)

38.13.202 IsHidden as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is normally not displayed to users.
Notes:

If the resource is hidden because its name begins with a period, setting this value has no effect.
Available in OS X v10.6 and later.
(Read only property)

38.13.203 IsMountTrigger as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the URL is a file system trigger directory, returned as a Boolean.
Notes:

Traversing or opening a file system trigger directory causes an attempt to mount a file system on the directory.

Available in OS X v10.7 and later.
(Read only property)

38.13.204 IsPackage as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is a file package
Notes:

A true value means that the resource is a file package.
Available in OS X v10.6 and later.
(Read only property)

38.13.205 IsReadable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the current process (as determined by the EUID) can read the resource.
Notes:

Available in OS X v10.7 and later.
(Read only property)

38.13.206 IsRegularFile as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Determining whether the resource is a regular file, as opposed to a directory or a symbolic link.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.207 IsSymbolicLink as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is a symbolic link.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.208 IsSystemImmutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource's system immutable bit is set.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.209 IsUbiquitousItem as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if this item is synced to the cloud, false if it is only a local file.
Notes: (Read only property)

38.13.210 IsUserImmutable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource's user immutable bit is set.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.211 IsVolume as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the resource is the root directory of a volume.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.212 IsWritable as Boolean

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: Whether the current process (as determined by the EUID) can write to the resource.
Notes:

Available in OS X v10.7 and later.
(Read only property)

38.13.213 Item as FolderItem

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: For the file URLs the corresponding folderitem.
Notes: (Read only property)

38.13.214 LabelColor as Variant

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs label color, returned as an NSColor object, or nil if the resource has no label color.
Notes:

Available in OS X v10.6 and later.

Value is a NSColorMBS object.
(Read only property)

38.13.215 LabelNumber as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs label number.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.216 lastPathComponent as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The last path component. (read-only)
Notes:

This property contains the last path component. For example, in the URL file:///path/to/file, the last path component is file.
Available in OS X v10.6 and later.
(Read only property)

38.13.217 LinkCount as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The number of hard links to the resource.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.218 LocalizedLabel as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs localized label text, returned as a string, or empty if the resource has no localized label text.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.219 LocalizedName as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs localized or extension-hidden name, returned as a string.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.220 LocalizedTypeDescription as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs localized type description, returned as a string.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.221 Name as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs name in the file system, returned as a string.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.222 parameterString as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The parameter string conforming to RFC 1808. (read-only)
Notes:

This property contains the parameter string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL file:///path/to/file;foo, the parameter string is foo.

This property should not be confused with the query property, which also often contains a string of parameters.
(Read only property)

38.13.223 ParentDirectoryURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The parent directory of the resource, returned as an NSURLMBS object, or nil if the resource is the root directory of its volume.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.224 password as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The password conforming to RFC 1808. (read-only)
Notes:

This property contains the password. If the receiver does not conform to RFC 1808, it contains nil. For example, in the URL http://username:password@www.example.com/index.html, the password is password.
(Read only property)

38.13.225 path as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The path, conforming to RFC 1808. (read-only)
Notes:

This property contains the path, unescaped with the stringByReplacingPercentEscapesUsingEncoding: method.

If the receiver does not conform to RFC 1808, this property contains nil.

If the receiver contains a file or file reference URL (as determined with isFileURL), this property,Äôs value is suitable for input into methods of NSFileManager or NSPathUtilities. If the path has a trailing slash, it is stripped.

If the receiver contains a file reference URL, this property,Äôs value provides the current path for the referenced resource, which may be nil if the resource no longer exists.

If the parameterString property contains a non-nil value, the path may be incomplete. If the receiver contains an unencoded semicolon, the path property ends at the character before the semicolon. The remainder of the URL is provided in the parameterString property.

To obtain the complete path, if parameterString contains a non-nil value, append a semicolon, followed by the parameter string.

Per RFC 3986, the leading slash after the authority (host name and port) portion is treated as part of the path. For example, in the URL http://www.example.com/index.html, the path is /index.html.

Available in OS X v10.8 and later.
(Read only property)

38.13.226 pathExtension as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The path extension. (read-only)
Notes:

This property contains the path extension. For example, in the URL file:///path/to/file.txt, the path extension is txt.
Available in OS X v10.6 and later.
(Read only property)

38.13.227 port as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The port, conforming to RFC 1808. (read-only)
Notes:

This property contains the port number. For example, in the URL http://www.example.com:8080/in-

dex.php, the port number is 8080.

If the receiver does not conform to RFC 1808, this property contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808,Äîspecifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

38.13.228 PreferredIOBlockSize as Integer

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The preferred block size.
Notes:

The optimal block size to use when reading or writing this file's data, returned as an integer, or zero if the preferred size is not available (read-only).
Available in OS X v10.7 and later.
(Read only property)

38.13.229 QuarantineProperties as Dictionary

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The quarantine properties as defined in LSQuarantine.h.
Example:

```
Dim f As FolderItem = SpecialFolder.UserHome.Child("Downloads").Child("Installation.pdf")
Dim n As New NSURLMBS(f)
Dim d As Dictionary = n.QuarantineProperties

Break // inspect in debugger
```

Notes:

Available on Mac OS X 10.10 and later.
(Read only property)

38.13.230 query as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The query string, conforming to RFC 1808. (read-only)
Notes:

This property contains the query string. If the receiver does not conform to RFC 1808, this property contains nil. For example, in the URL http://www.example.com/index.php?key1=value1& key2=value2, the query string is key1=value1& key2=value2.
(Read only property)

38.13.231 relativePath as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The relative path, conforming to RFC 1808. (read-only)
Notes:

This property contains the relative path of the receiver,Äôs URL without resolving against its base URL. If the path has a trailing slash it is stripped. If the receiver is an absolute URL, this property contains the same value as path. If the receiver does not conform to RFC 1808, it contains nil.
(Read only property)

38.13.232 relativeString as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A string representation of the relative portion of the URL. (read-only)
Notes:

This property contains a string representation of the relative portion of the URL. If the receiver is an absolute URL this method returns the same value as absoluteString.
(Read only property)

38.13.233 resourceSpecifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource specifier. (read-only)
Notes:

This property contains the resource specifier. For example, in the URL http://www.example.com/index.html?key1=value1# jumplink, the resource specifier is //www.example.com/index.html?key1=value1# jumplink (everything after the colon).
(Read only property)

38.13.234 scheme as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The scheme. (read-only)
Notes:

This property contains the scheme. For example, in the URL http://www.example.com/index.html, the scheme is http.

The full URL is the concatenation of the scheme, a colon (:), and the value of resourceSpecifier.

The term "protocol" is also sometimes used when talking about network-based URL schemes. However, not all URL schemes are networking protocols,Äîdata:// URLs, for example.
(Read only property)

38.13.235 standardizedURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: A copy of the URL with any instances of ".." or "." removed from its path. (read-only)
Notes:

This property contains a new NSURL object, initialized using the receiver,Äôs path with any instances of ".." or "." removed.

If the URL conforms to RFC 1808 (the most common form of URL), this property contains the specified URL component; otherwise it contains nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808,Äîspecifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

38.13.236 TypeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The resource,Äôs uniform type identifier (UTI), returned as a string.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.237 UbiquitousItemContainerDisplayName as String

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the name of this item's container as displayed to users.
Notes: (Read only property)

38.13.238 UbiquitousItemDownloadingError as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the error when downloading the item from iCloud failed,.
Notes: (Read only property)

38.13.239 UbiquitousItemDownloadingStatus as String

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the download status of this item.
Notes: (Read only property)

38.13.240 UbiquitousItemDownloadRequested as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns whether a download of this item has already been requested with an API like startDownloadingUbiquitousItem.
Notes: (Read only property)

38.13.241 UbiquitousItemHasUnresolvedConflicts as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if this item has conflicts outstanding.
Notes: (Read only property)

38.13.242 UbiquitousItemIsDownloaded as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Has never behaved as documented in earlier releases, hence deprecated.
Notes:

Equivalent to UbiquitousItemDownloadingStatus = NSURLUbiquitousItemDownloadingStatusCurrent.
(Read only property)

38.13.243 UbiquitousItemIsDownloading as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if data is being downloaded for this item.
Notes: (Read only property)

38.13.244 UbiquitousItemIsExcludedFromSync as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if the item is excluded from sync, which means it is locally on disk but won't be available on the server.
Notes:

An excluded item is no longer ubiquitous.
(Read only property)

38.13.245 UbiquitousItemIsShared as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if the ubiquitous item is shared.
Notes: (Read only property)

38.13.246 UbiquitousItemIsUploaded as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if there is data present in the cloud for this item.
Notes: (Read only property)

38.13.247 UbiquitousItemIsUploading as Boolean

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: True if data is being uploaded for this item.
Notes: (Read only property)

38.13.248 UbiquitousItemUploadingError as NSErrorMBS

MBS MacBase Plugin, Plugin Version: 22.1, Platform: macOS, Targets: All.

Function: Returns the error when uploading the item to iCloud failed.
Notes: (Read only property)

38.13.249 user as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The user name, conforming to RFC 1808. (read-only)
Notes:

This property contains the user name. For example, in the URL ftp://username@www.example.com/, the user name is username.

If the receiver,Äôs URL does not conform to RFC 1808, this property returns nil. The litmus test for conformance to RFC 1808 is as recommended in RFC 1808,Äîspecifically, whether the first two characters of resourceSpecifier are slashes (//).
(Read only property)

38.13.250 VolumeIdentifier as String

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The unique identifier of the resource,Äôs volume, returned as an id.
Notes:

The unique identifier of the resource,Äôs volume, returned as an id (read-only).
This identifier can be used with the isEqual method to determine whether two file system resources are on the same volume.
The value of this identifier is not persistent across system restarts.
Available in OS X v10.7 and later.
Returns hex encoded data.
(Read only property)

38.13.251 VolumeURL as NSURLMBS

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: All.

Function: The root directory of the resource,Äôs volume, returned as an NSURL object.
Notes:

Available in OS X v10.6 and later.
(Read only property)

38.13.252 Delegates

38.13.253 ResourceValuesForKeysDelegateMBS(URL as NSURLMBS, keys() as String, Values as Dictionary, Error as NSErrorMBS, tag as variant)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The delegate to use for resourceValuesForKeys method.

38.13.254 URLsResourceValuesForKeysDelegateMBS(URLs() as NSURLMBS, keys() as String, Values() as Dictionary, Errors() as NSErrorMBS, tag as variant)

MBS MacBase Plugin, Plugin Version: 15.2, Platform: macOS, Targets: Desktop only.

Function: The delegate to use with URLsResourceValuesForKeys method.

38.14 class NSURLProtectionSpaceMBS

38.14.1 class NSURLProtectionSpaceMBS

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: A class for the Cocoa URL protection space class.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.14.2 Blog Entries

- MBS Xojo Plugins, version 20.2pr3

38.14.3 Blog Entries

- MBS Xojo Plugins, version 20.2pr3

38.14.4 Methods

38.14.5 authenticationMethod as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the authentication method to be used for this protection space

38.14.6 Constructor

MBS MacBase Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

38.14.7 host as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the proxy host if this is a proxy authentication, or the host from the URL.
Notes: Returns the host for this protection space.

38.14.8 isProxy as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Determine if this authenticating protection space is a proxy server
Notes: Returns true if a proxy, false otherwise.

38.14.9 NSURLAuthenticationMethodClientCertificate as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use client certificate authentication for this protection space.
Notes: This authentication method can apply to any protocol.

38.14.10 NSURLAuthenticationMethodDefault as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use the default authentication method for a protocol.

38.14.11 NSURLAuthenticationMethodHTMLForm as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use HTML form authentication for this protection space.
Notes: The URL loading system never issues authentication challenges based on this authentication method. However, if your app authenticates by submitting a web form (or in some other protocol-neutral way), you can specify this protection space when you persist or look up credentials using the NSURLCredentialStorageMBS class.

38.14.12 NSURLAuthenticationMethodHTTPBasic as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use HTTP basic authentication for this protection space.

38.14.13 NSURLAuthenticationMethodHTTPDigest as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use HTTP digest authentication for this protection space.

38.14.14 NSURLAuthenticationMethodNegotiate as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Negotiate whether to use Kerberos or NTLM authentication for this protection space.

38.14.15 NSURLAuthenticationMethodNTLM as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Use NTLM authentication for this protection space.

38.14.16 NSURLAuthenticationMethodServerTrust as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Perform server trust authentication (certificate validation) for this protection space.
Notes: This authentication method can apply to any protocol, and is most commonly used for overriding SSL and TLS chain validation.

38.14.17 NSURLProtectionSpaceFTP as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The protocol type for FTP.

38.14.18 NSURLProtectionSpaceFTPProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for FTP proxies.

38.14.19 NSURLProtectionSpaceHTTP as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The protocol type for HTTP.

38.14.20 NSURLProtectionSpaceHTTPProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for HTTP proxies.

38.14.21 NSURLProtectionSpaceHTTPS as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The protocol type for HTTPS.

38.14.22 NSURLProtectionSpaceHTTPSProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for HTTPS proxies.

38.14.23 NSURLProtectionSpaceSOCKSProxy as String

MBS MacBase Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The proxy type for SOCKS proxies.

38.14.24 port as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the proxy port if this is a proxy authentication, or the port from the URL.
Notes: Returns the port for this protection space, or 0 if not set.

38.14.25 protocol as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the protocol of this protection space, if not a proxy.
Notes: Returns the type string, or "" if a proxy.

38.14.26 proxyType as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the type of this protection space, if a proxy.
Notes: Returns the type string, or "" if not a proxy.

38.14.27 realm as string

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Get the authentication realm for which the protection space that needs authentication
Notes: This is generally only available for http authentication, and may be "" otherwise.

38.14.28 receivesCredentialSecurely as boolean

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: Determine if the password for this protection space can be sent securely
Notes: True if a secure authentication method or protocol will be used, false otherwise.

38.14.29 Properties

38.14.30 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.5, Platform: macOS, Targets: All.

Function: The internal used handle for this class.
Notes: (Read and Write property)

38.15 class NSURLRequestCertificateFilterMBS

38.15.1 class NSURLRequestCertificateFilterMBS

MBS MacCocoa Plugin, Plugin Version: 7.5, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to filter certificate requests.
Notes: This is the only way to fix the problem with the webview that certificates which are not valid can still be used.

38.15.2 Events

38.15.3 allowsAnyHTTPSCertificateForHost(host as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 7.5, Platform: macOS, Targets: .

Function: An event being called for each host which may have a https certificate.
Notes:

This event is called very often, so make it very fast.
Also this event is often called with the same host value as it is called for each request.

Retrun true to allow this host to run without a valid https certificate.

38.16 class NSURLRequestMBS

38.16.1 class NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: An NSURLRequest object represents a URL load request in a manner independent of protocol and URL scheme.
Example:

msgbox HTMLViewer1.mainFrameMBS.DataSource.Request.url

Notes:

NSURLRequest encapsulates two basic data elements about a URL load request:

The URL to load.
The policy to use when consulting the URL content cache made available by the implementation.

38.16.6 Methods

38.16.7 allHTTPHeaderFields as Dictionary

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns a dictionary of the HTTP header fields associated with the receiver.

38.16.8 Constructor(url as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
dim r as NSURLRequestMBS
r=new NSURLRequestMBS("http://www.apple.com")
```

Notes:

Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).
On success, handle property is not zero.
See also:

- 38.16.9 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double) 9120

38.16.9 Constructor(url as string, cachePolicy as Integer, timeoutInterval as Double)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
dim r as NSURLRequestMBS
r=new NSURLRequestMBS("http://www.apple.com",NSURLRequestMBS.NSURLRequestReturnCacheDataElseLoad,5.0)
```

Notes: On success, handle property is not zero.
See also:

- 38.16.8 Constructor(url as string) 9120

38.16.10 copy as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the request.
Example:

```
// create PUT request
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"

// make a copy
dim r as NSURLRequestMBS = m.copy

// change first request to POST
m.setHTTPMethod "POST"

// and check values
MsgBox m.HTTPMethod+" "+r.HTTPMethod
```

38.16.11 mutableCopy as NSMutableURLRequestMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates an editable copy of the request.
Example:

```
// create PUT request
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"

// make a copy
dim r as NSMutableURLRequestMBS = m.mutableCopy

// change request to POST
r.setHTTPMethod "POST"
```

```
// and check values
MsgBox m.HTTPMethod+" "+r.HTTPMethod
```

38.16.12 requestWithHandle(Handle as Integer) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 16.4, Platform: macOS, Targets: All.

Function: Creates a new request object based on a handle value.
Notes: Will retain the reference.

38.16.13 requestWithURL(url as string) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
dim r as NSURLRequestMBS

r=r.requestWithURL("http://www.apple.com",0,5.0)
```

Notes: Default values are used for cache policy (NSURLRequestUseProtocolCachePolicy) and timeout interval (60 seconds).
See also:

- 38.16.14 requestWithURL(url as string, cachePolicy as Integer, timeoutInterval as Double) as NSURLRequestMBS 9122

38.16.14 requestWithURL(url as string, cachePolicy as Integer, timeoutInterval as Double) as NSURLRequestMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Creates an NSURLRequest with the given URL.
Example:

```
dim r as NSURLRequestMBS

r=r.requestWithURL("http://www.apple.com", NSURLRequestMBS.NSURLRequestUseProtocolCachePolicy, 5.0)
```

See also:

- 38.16.13 requestWithURL(url as string) as NSURLRequestMBS 9122

38.16.15 valueForHTTPHeaderField(field as string) as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the value of the specified HTTP header field.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setValue("just a test", "test")
MsgBox m.valueForHTTPHeaderField("test")
```

Notes:

field: The name of the header field whose value is to be returned. In keeping with the HTTP RFC, HTTP header field names are case-insensitive.

Returns the value associated with the header field field, or "" if there is no corresponding header field.

38.16.16 Properties

38.16.17 attribution as Integer

MBS MacBase Plugin, Plugin Version: 21.5, Platform: macOS, Targets: All.

Function: Returns the NSURLRequestAttribution associated with this request.
Notes:

This will return NSURLRequestAttributionDeveloper for requests that have not explicitly set an attribution.
(Read only property)

38.16.18 cachePolicy as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the cache policy of the request.
Example:

```
dim r as NSURLRequestMBS

r=new NSURLRequestMBS("http://www.apple.com",0,5.0)

MsgBox str(r.cachePolicy)
```

Notes:

Value is one of the constants in this class.
(Read only property)

38.16.19 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The reference to the internal used NSURLRequest object.
Notes: (Read and Write property)

38.16.20 HTTPBody as memoryblock

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns the body of the request.
Notes:

This is the data sent in a POST request.
(Read only property)

38.16.21 HTTPMethod as string

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns the HTTP method assiciated with the receiver.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test")
m.setHTTPMethod "PUT"
MsgBox m.HTTPMethod
```

Notes: (Read only property)

38.16.22 HTTPShouldHandleCookies as boolean

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns a flag indicating whether this request should use standard cookie handling (sending of cookies with the request and storing any cookies returned in the response.
Notes: (Read only property)

38.16.23 HTTPShouldUsePipelining as boolean

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Reports whether the receiver is not expected to wait for the previous response before transmitting.
Notes:

Returns true if the receiver should transmit before the previous response is received. False if the receiver should wait for the previous response before transmitting.

Available in Mac OS X 10.7 or newer.
(Read only property)

38.16.24 isHTTPRequest as boolean

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Whether this is an HTTP request.
Notes:

If true, the allHTTPHeaderFields, HTTPShouldHandleCookies, HTTPMethod and HTTPBody methods do work.
(Read only property)

38.16.25 mainDocumentURL as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The main document URL associated with this load.
Example:

```
dim m as new NSMutableURLRequestMBS("http://test.test/test.jpg")
m.setMainDocumentURL "http://test.test/"
MsgBox m.mainDocumentURL
```

Notes:

This URL is used for the cookie "same domain as main document" policy. There may also be other future uses.

NOTE: In the current implementation, this value is unused by the webkit framework. A fully functional version of this method will be available in the future.
(Read only property)

38.16.26 networkServiceType as Integer

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: Returns the service type associated with this request.
Notes:

This will return NSURLNetworkServiceTypeDefault for requests that have not explicitly set a networkServiceType (using the setNetworkServiceType method). See NSURLNetworkServiceType* constants.

Available in Mac OS X 10.7 or newer.
(Read only property)

38.16.27 timeoutInterval as Double

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the timeout interval of the request.
Example:

```
dim r as NSURLRequestMBS

r=new NSURLRequestMBS("http://www.apple.com",0,5.0)

MsgBox str(r.timeoutInterval)
```

Notes:

The timeout interval specifies the limit on the idle interval alloted to a request in the process of loading. The "idle interval" is defined as the period of time that has passed since the last instance of load activity occurred for a request that is in the process of loading. Hence, when an instance of load activity occurs (e.g. bytes are received from the network for a request), the idle interval for a request is reset to 0. If the idle interval ever becomes greater than or equal to the timeout interval, the request is considered to have timed out. This timeout interval is measured in seconds.
(Read only property)

38.16.28 URL as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the URL of the request.
Example:

```
dim r as NSURLRequestMBS

r=new NSURLRequestMBS("http://www.apple.com")

MsgBox r.URL
```

Notes: (Read only property)

38.16.29 Constants

38.16.30 NSURLNetworkServiceTypeBackground = 3

MBS MacBase Plugin, Plugin Version: 11.3.

Function: One of the constants that can be used to specify the service type to associate with this request.
Notes:

Specifies that the request is for background traffic (such as a file download).
The service type is used to provide the networking layers a hint of the purpose of the request.

38.16.31 NSURLNetworkServiceTypeDefault = 0

MBS MacBase Plugin, Plugin Version: 11.3.

Function: One of the constants that can be used to specify the service type to associate with this request.
Notes:

Is the default value for an NSURLRequest when created. This value should be left unchanged for the vast majority of requests.
The service type is used to provide the networking layers a hint of the purpose of the request.

38.16.32 NSURLNetworkServiceTypeVideo = 2

MBS MacBase Plugin, Plugin Version: 11.3.

Function: One of the constants that can be used to specify the service type to associate with this request.
Notes:

Specifies that the request is for video traffic.
The service type is used to provide the networking layers a hint of the purpose of the request.

38.16.33 NSURLNetworkServiceTypeVoice = 4

MBS MacBase Plugin, Plugin Version: 11.3.

Function: One of the constants that can be used to specify the service type to associate with this request.
Notes:

Specifies that the request is for voice data.
The service type is used to provide the networking layers a hint of the purpose of the request.

38.16.34 NSURLNetworkServiceTypeVoIP = 1

MBS MacBase Plugin, Plugin Version: 11.3.

Function: One of the constants that can be used to specify the service type to associate with this request.
Notes:

Specifies that the request is for voice over IP control traffic.
The service type is used to provide the networking layers a hint of the purpose of the request.

38.16.35 NSURLRequestAttributionDeveloper = 0

MBS MacBase Plugin, Plugin Version: 21.5.

Function: One of the constants used to indicate whether the user or developer specified the URL.
Notes: Indicates that the URL was specified by the developer. This is the default value for an NSURLRequest when created.

38.16.36 NSURLRequestAttributionUser = 1

MBS MacBase Plugin, Plugin Version: 21.5.

Function: One of the constants used to indicate whether the user or developer specified the URL.
Notes: Indicates that the URL was specified by the user.

38.16.37 NSURLRequestReloadIgnoringCacheData = 1

MBS MacBase Plugin, Plugin Version: 7.2.

Function: A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request.
Notes:

Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

NSURLRequestReloadIgnoringCacheData Specifies that the data for the URL load should be loaded from the origin source. No existing cache data, regardless of its freshness or validity, should be used to satisfy a URL load request.

38.16.38 NSURLRequestReloadIgnoringLocalAndRemoteCacheData = 4

MBS MacBase Plugin, Plugin Version: 9.6.

Function: A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request.
Notes:

Specifies that not only should the local cache data be ignored, but that proxies and other intermediates should be instructed to disregard their caches so far as the protocol allows.

Available in Mac OS X v10.5 and later.

38.16.39 NSURLRequestReloadRevalidatingCacheData = 5

MBS MacBase Plugin, Plugin Version: 9.6.

Function: A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request.
Notes:

Specifies that the existing cache data may be used provided the origin source confirms its validity, otherwise the URL is loaded from the origin source.

Available in Mac OS X v10.5 and later.

38.16.40 NSURLRequestReturnCacheDataDontLoad = 3

MBS MacBase Plugin, Plugin Version: 7.2.

Function: A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request.
Notes:

Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

NSURLRequestReturnCacheDataDontLoad Specifies that the existing cache data should be used to satisfy a URL load request, regardless of its age or expiration date. However, if there is no existing data in the cache corresponding to a URL load request, no attempt is made to load the URL from the origin source, and the load is considered to have failed. This constant specifies a behavior that is similar to an "offline" mode.

38.16.41 NSURLRequestReturnCacheDataElseLoad = 2

MBS MacBase Plugin, Plugin Version: 7.2.

Function: A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request.
Notes:

Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

NSURLRequestReturnCacheDataElseLoad Specifies that the existing cache data should be used to satisfy a URL load request, regardless of its age or expiration date. However, if there is no existing data in the cache corresponding to a URL load request, the URL is loaded from the origin source.

38.16.42 NSURLRequestUseProtocolCachePolicy = 0

MBS MacBase Plugin, Plugin Version: 7.2.

Function: A constant that can be used to specify the type of interactions that take place with the caching system when the URL loading system processes a request.
Notes:

Specifically, these constants cover interactions that have to do with whether already-existing cache data is returned to satisfy a URL load request.

NSURLRequestUseProtocolCachePolicy Specifies that the caching logic defined in the protocol implementation, if any, is used for a particular URL load request. This is the default policy for URL load requests.

38.17 class NSURLResponseMBS

38.17.1 class NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: An NSURLResponse object represents a URL load response in a manner independent of protocol and URL scheme.
Notes:

NSURLResponse encapsulates the metadata associated with a URL load. Note that NSURLResponse objects do not contain the actual bytes representing the content of a URL.

All methods in this class will catch exceptions from Cocoa and raise a NSExceptionMBS instead. Using the message, name and reason properties you can see what was the reason for this exception. Please report if you find a method which does not handle exceptions correct.

38.17.2 Methods

38.17.3 allHeaderFields as Dictionary

MBS MacBase Plugin, Plugin Version: 11.0, Platform: macOS, Targets: All.

Function: Returns all the HTTP header fields of the receiver.
Notes: A dictionary containing all the HTTP header fields of the receiver. By examining this dictionary clients can see the "raw" header information returned by the HTTP server.

38.17.4 Constructor(URL as string, MimeType as string, expectedContentLength as Integer, textEncodingName as string)

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initialize an NSURLResponse with the provided values.
Notes:

URL: the URL
MIMETYPE: the MIME content type of the response
expectedContentLength: the expected content length of the associated data
textEncodingName: the name of the text encoding for the associated data, if applicable, else "".

Use -1 for an unknown length.
See also FileExtensionToMimeTypeMBS function.

38.17.5 copy as NSURLResponseMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the object.
Notes: Makes a copy of the RB object and the NSURLResponse object behind.

38.17.6 expectedContentLength as int64

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the expected content length of the response.
Notes:

Some protocol implementations report a content length as part of delivering load metadata, but not all protocols guarantee the amount of data that will be delivered in actuality.
Hence, this method returns an expected amount. Clients should use this value as an advisory, and should be prepared to deal with either more or less data.

Returns the expected content length of the receiver, or -1 if there is no expectation that can be arrived at regarding expected content length.

38.17.7 isHTTPResponse as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Whether this response is a http response.
Notes: the StatusCode property can only be used on HTTP Responses.

38.17.8 localizedStringForStatusCode(statusCode as Integer) as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Convenience method which returns a localized string corresponding to the status code for this response.
Notes:

statusCode: the status code to use to produce a localized string.
Returns a localized string corresponding to the given status code or an empty string.

38.17.9 MIMEType as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the MIME type of the response.
Example:

msgbox HTMLViewer1.mainFrameMBS.DataSource.response.MIMEType

Notes:

The MIME type is based on the information provided from an origin source. However, that value may be changed or corrected by a protocol implementation if it can be determined that the origin server or source reported the information incorrectly or imprecisely. An attempt to guess the MIME type may be made if the origin source did not report any such information.
See also FileExtensionToMimeTypeMBS function.

38.17.10 statusCode as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the HTTP status code of the response.
Notes:

Returns -1 if no statuscode is available (e.g. in case this is no ta http response)
See also: localizedStringForStatusCode

38.17.11 suggestedFilename as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns a suggested filename if the resource were saved to disk.
Notes:

The method first checks if the server has specified a filename using the content disposition header. If no valid filename is specified using that mechanism, this method checks the last path component of the URL. If no valid filename can be obtained using the last path component, this method uses the URL's host as the filename.
If the URL's host can't be converted to a valid filename, the filename "unknown" is used. In mose cases, this method appends the proper file extension based on the MIME type. This method always returns a valid filename.

38.17.12 textEncodingName as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the name of the text encoding of the response.
Notes:

This name will be the actual string reported by the origin source during the course of performing a protocol-specific URL load. Clients can inspect this string and convert it to a TextEncoding using the methods and functions made available in the appropriate framework.

Returns the name of the text encoding of the response, or an empty string if no text encoding was specified.

38.17.13 URL as string

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Returns the URL of the response.
Example:

msgbox HTMLViewer1.mainFrameMBS.DataSource.response.URL

38.17.14 Properties

38.17.15 Handle as Integer

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: The internal used reference to the NSURLResponse object.
Notes: (Read and Write property)

38.17.16 Constants

38.17.17 NSURLResponseUnknownLength=-1

MBS MacBase Plugin, Plugin Version: 9.6.

Function: The constant for use with expectedContentLength for an unknown length.

38.18 class NSURLSessionConfigurationMBS

38.18.1 class NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A configuration object that defines behavior and policies for a URL session.
Notes:

An NSURLSessionConfigurationMBS object defines the behavior and policies to use when uploading and downloading data using an NSURLSessionMBS object. When uploading or downloading data, creating a configuration object is always the first step you must take. You use this object to configure the timeout values, caching policies, connection requirements, and other types of information that you intend to use with your NSURLSessionMBS object.

It is important to configure your NSURLSessionConfigurationMBS object appropriately before using it to initialize a session object. Session objects make a copy of the configuration settings you provide and use those settings to configure the session. Once configured, the session object ignores any changes you make to the NSURLSessionConfigurationMBS object. If you need to modify your transfer policies, you must update the session configuration object and use it to create a new NSURLSessionMBS object.

Note
In some cases, the policies defined in this configuration may be overridden by policies specified by an NSURLRequestMBS object provided for a task. Any policy specified on the request object is respected unless the session,Äôs policy is more restrictive. For example, if the session configuration specifies that cellular networking should not be allowed, the NSURLRequestMBS object cannot request cellular networking.

For more information about using configuration objects to create sessions, see NSURLSessionMBS class.

Types of Session Configurations

The behavior and capabilities of a URL session are largely determined by the kind of configuration used to create the session.

The singleton shared session (which has no configuration object) is for basic requests. It,Äôs not as customizable as sessions that you create, but it serves as a good starting point if you have very limited requirements. You access this session by calling the shared class method. See that method,Äôs discussion for more information about its limitations.

Default sessions behave much like the shared session (unless you customize them further), but let you obtain data incrementally using a delegate. You can create a default session configuration by calling the default method on the URLSessionConfiguration class.

Ephemeral sessions are similar to default sessions, but they don,Äôt write caches, cookies, or credentials to disk. You can create an ephemeral session configuration by calling the ephemeral method on the URLSessionConfiguration class.

Background sessions let you perform uploads and downloads of content in the background while your app isn,Äôt running. You can create a background session configuration by calling the backgroundSessionConfiguration(_:) method on the URLSessionConfiguration class.

38.18.2 Blog Entries

- Adding NSURLSession classes for Xojo

38.18.3 Blog Entries

- Adding NSURLSession classes for Xojo

38.18.4 Methods

38.18.5 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes:

Returns true on MacOS 10.9 or newer.
A lot of properties require higher MacOS versions.

38.18.6 backgroundSessionConfiguration(identifier as String) as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a session configuration object that allows HTTP and HTTPS uploads or downloads to be performed in the background.
Notes:

identifier: The unique identifier for the configuration object. This parameter must not be nil or an empty string.

Returns a configuration object that causes the system to perform upload and download tasks in a separate process.

Use this method to initialize a configuration object suitable for transferring data files while the app runs in the background. A session configured with this object hands control of the transfers over to the system, which handles the transfers in a separate process. In iOS, this configuration makes it possible for transfers to continue even when the app itself is suspended or terminated.

If an iOS app is terminated by the system and relaunched, the app can use the same identifier to create a new configuration object and session and to retrieve the status of transfers that were in progress at the time of termination. This behavior applies only for normal termination of the app by the system. If the user terminates the app from the multitasking screen, the system cancels all of the session,Äôs background transfers. In addition, the system does not automatically relaunch apps that were force quit by the user. The user must explicitly relaunch the app before transfers can begin again.

You can configure an background session to schedule transfers at the discretion of the system for optimal performance using the discretionary property. When transferring large amounts of data, you are encouraged to set the value of this property to true. For an example of using the background configuration, see Downloading Files in the Background.

Requires MacOS 10.10 or newer.

38.18.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The constructor.
Notes: Creates a new object for shared session.

38.18.8 copy as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a copy of the configuration.

38.18.9 defaultSessionConfiguration as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A default session configuration object.
Notes:

The default session configuration uses a persistent disk-based cache (except when the result is downloaded to

a file) and stores credentials in the user,Äôs keychain. It also stores cookies (by default) in the same shared cookie store as the NSURLConnectionMBS and NSURLDownloadMBS classes.

If you,Äôre porting code based on the NSURLConnectionMBS class, use this method to obtain an initial configuration object and then customize that object as needed.

Modifying the returned session configuration object does not affect any configuration objects returned by future calls to this method, and does not change the default behavior for existing sessions. It is therefore always safe to use the returned object as a starting point for additional customization.

38.18.10 ephemeralSessionConfiguration as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A session configuration that uses no persistent storage for caches, cookies, or credentials.
Notes:

An ephemeral session configuration object is similar to a default session configuration (see defaultSession-Configuration), except that the corresponding session object doesn,Äôt store caches, credential stores, or any session-related data to disk. Instead, session-related data is stored in RAM. The only time an ephemeral session writes data to disk is when you tell it to write the contents of a URL to a file.

It is possible to customize a default session configuration object to obtain the same behavior (or any portion thereof) provided by an ephemeral session configuration object, but the use of this method is more convenient.

Privacy and Performance Considerations
The main advantage to using ephemeral sessions is privacy. By not writing potentially sensitive data to disk, you make it less likely that the data will be intercepted and used later. For this reason, ephemeral sessions are ideal for private browsing modes in web browsers and other similar situations.
Because an ephemeral session doesn,Äôt write cached data to disk, the size of the cache is limited by available RAM. This limitation means that previously fetched resources are less likely to be in the cache (and are guaranteed to not be there if the user quits and relaunches your app). This behavior may reduce perceived performance, depending on your app.
When your app invalidates the session, all ephemeral session data is purged automatically. Additionally, in iOS, the in-memory cache isn,Äôt purged automatically when your app is suspended but may be purged when your app is terminated or when the system experiences memory pressure.

38.18.11 Properties

38.18.12 allowsCellularAccess as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether connections should be made over a cellular network.
Notes:

This property controls whether tasks in sessions based on this session configuration are allowed to make connections over a cellular network.
The default value is true.

For more information, read Restrict Cellular Networking Correctly on Apple website.
(Read and Write property)

38.18.13 allowsConstrainedNetworkAccess as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether connections may use the network when the user has specified Low Data Mode.
Notes:

In iOS 13 and later, users can set their device to use Low Data Mode as one of the Cellular Data Options in the Settings app. Users can turn on Low Data Mode to reduce your app,Äôs network data usage. This property controls a URL session,Äôs behavior when the user turns on Low Data Mode. If there are no nonconstrained network interfaces available and the session,Äôs allowsConstrainedNetworkAccess property is false, any task created from the session fails. In this case, the error provided when the task fails has a networkUnavailableReason property whose value is NSURLErrorNetworkUnavailableReasonConstrained.
Limit your app,Äôs of use of constrained network access to user-initiated tasks, and put off discretionary tasks until a nonconstrained interface becomes available. To do this, set allowsConstrainedNetworkAccess (and allowsExpensiveNetworkAccess) to false and waitsForConnectivity to true. This way, your NSURLSessionTaskMBS waits for a suitable interface to become available before sending or receiving data.

Available in MacOS 10.15 or newer.
(Read and Write property)

38.18.14 allowsExpensiveNetworkAccess as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether connections may use a network interface that the system considers expensive.
Notes:

The system determines what constitutes ,Äúexpensive,Äù based on the nature of the network interface and other factors. iOS 13 considers most cellular networks and personal hotspots expensive. If there are no nonexpensive network interfaces available and the session,Äôs allowsExpensiveNetworkAccess property is false, any task created from the session fails. In this case, the error provided when the task fails has a

networkUnavailableReason property whose value is NSURLErrorNetworkUnavailableReasonExpensive.

Limit your app,Äôs of use of expensive network access to user-initiated tasks, and put off discretionary tasks until an nonexpensive interface becomes available. To do this, set allowsExpensiveNetworkAccess (and allowsConstrainedNetworkAccess) to false and waitsForConnectivity to true. This way, your NSURLSessionTaskMBS waits for a suitable interface to become available before sending or receiving data.

Available in MacOS 10.15 or newer.
(Read and Write property)

38.18.15 connectionProxyDictionary as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A dictionary containing information about the proxy to use within this session.
Notes:

This property controls which proxy tasks within sessions based on this configuration use when connecting to remote hosts.
The default value is nil, which means that tasks use the default system settings.
See Global Proxy Configuration for more information about these dictionaries.
(Read and Write property)

38.18.16 discretionary as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether background tasks can be scheduled at the discretion of the system for optimal performance.
Notes:

For configuration objects created using the backgroundSessionConfigurationWithIdentifier method, use this property to give the system control over when transfers should occur. This property is ignored for configuration objects created using other methods.
When transferring large amounts of data, you are encouraged to set the value of this property to true. Doing so lets the system schedule those transfers at times that are more optimal for the device. For example, the system might delay transferring large files until the device is plugged in and connected to the network via Wi-Fi. The default value of this property is false.
The session object applies the value of this property only to transfers that your app starts while it is in the foreground. For transfers started while your app is in the background, the system always starts transfers at its discretion,Äîin other words, the system assumes this property is true and ignores any value you specified.

Available in MacOS 10.10 or newer.
(Read and Write property)

38.18.17 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.18.18 HTTPAdditionalHeaders as Dictionary

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A dictionary of additional headers to send with requests.
Notes:

This property specifies additional headers that are added to all tasks within sessions based on this configuration. For example, you might set the User-Agent header so that it is automatically included in every request your app makes through sessions based on this configuration.

An NSURLSessionMBS object is designed to handle various aspects of the HTTP protocol for you. As a result, you should not modify the following headers:

- Authorization
- Connection
- Host
- Proxy-Authenticate
- Proxy-Authorization
- WWW-Authenticate

Additionally, if the length of your upload body data can be determined automatically,Äîfor example, if you provide the body content with an MemoryBlock object,Äîthe value of Content-Length is set for you.
If the same header appears in both this array and the request object (where applicable), the request object,Äôs value takes precedence.
The default value is an empty array.
(Read and Write property)

38.18.19 HTTPCookieAcceptPolicy as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A policy constant that determines when cookies should be accepted.
Notes:

This property determines the cookie accept policy for all tasks within sessions based on this configuration.
The default value is CookieAcceptPolicyOnlyFromMainDocumentDomain. You can change it to any of the constants defined in the CookieAcceptPolicy enumerated type.
If you want more direct control over what cookies are accepted, set this value to CookieAcceptPolicyNever and then use the allHeaderFields and cookiesWithResponseHeaderFields methods to extract cookies from the URL response object yourself.
(Read and Write property)

38.18.20 HTTPCookieStorage as NSHTTPCookieStorageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The cookie store for storing cookies within this session.
Notes:

This property determines the cookie storage object used by all tasks within sessions based on this configuration.
To disable cookie storage, set this property to nil.
For default and background sessions, the default value is the sharedHTTPCookieStorage cookie storage object.
For ephemeralSessionConfiguration sessions, the default value is a private cookie storage object that stores data in memory only, and is destroyed when you invalidate the session.
(Read and Write property)

38.18.21 HTTPMaximumConnectionsPerHost as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The maximum number of simultaneous connections to make to a given host.
Notes:

This property determines the maximum number of simultaneous connections made to each host by tasks within sessions based on this configuration.
This limit is per session, so if you use multiple sessions, your app as a whole may exceed this limit. Additionally, depending on your connection to the Internet, a session may use a lower limit than the one you specify.
The default value is 6 in macOS, or 4 in iOS.
(Read and Write property)

38.18.22 HTTPShouldSetCookies as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether requests should contain cookies from the cookie store.
Notes:

This property controls whether tasks within sessions based on this configuration should automatically provide cookies from the shared cookie store when making requests.
If you want to provide cookies yourself, set this value to false and provide a Cookie header either through the session,Äôs HTTPAdditionalHeaders property or on a per-request level using a custom NSURLRequestMBS object.
The default value is true.
(Read and Write property)

38.18.23 HTTPShouldUsePipelining as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that determines whether the session should use HTTP pipelining.
Notes:

This property determines whether tasks within sessions based on this configuration should use HTTP pipelining. You can also enable pipelining on a per-task basis by creating the task with an NSURLRequestMBS object.
The default value is false.
(Read and Write property)

38.18.24 identifier as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The background session identifier of the configuration object.
Notes:

The value of this property is set only when you use the backgroundSessionConfigurationWithIdentifier method to create the configuration object. The string uniquely identifies a background session object. In iOS, you use this string in cases where the app was terminated while transfers were occurring in the background. When the app relaunches, it uses the string to recreate the configuration and session objects associated with the transfers.
(Read only property)

38.18.25 NetworkServiceType as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The type of network service for all tasks within sessions based on this configuration.
Notes:

The network service type provides a hint to the operating system about what the underlying traffic is used for. This hint enhances the system's ability to prioritize traffic, determine how quickly it needs to wake up the cellular or Wi-Fi radio, and so on. By providing accurate information, you improve the ability of the system to optimally balance battery life, performance, and other considerations.

For example, specify the NetworkServiceTypeBackground type if your app is performing a download that wasn,Äôt requested by the user, like prefetching content so that it,Äôs available when the user chooses to view it.
This setting can also affect the Wi-Fi Quality of Service (QoS) Priority.
The default value is NetworkServiceTypeDefault.
(Read and Write property)

38.18.26 RequestCachePolicy as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A predefined constant that determines when to return a response from the cache.
Notes:

This property determines the request caching policy used by tasks within sessions based on this configuration.
Set this property to one of the constants defined in CachePolicy constants to specify whether the cache policy should depend on expiration dates and age, whether the cache should be disabled entirely, and whether the server should be contacted to determine if the content has changed since it was last requested.
The default value is CachePolicyUseProtocolCachePolicy.
(Read and Write property)

38.18.27 sharedContainerIdentifier as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The identifier for the shared container into which files in background URL sessions should be downloaded.
Notes:

To create a URL session for use by an app extension, set this property to a valid identifier for a container shared between the app extension and its containing app.

Available in MacOS 10.10 or newer.
(Read and Write property)

38.18.28 shouldUseExtendedBackgroundIdleMode as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether TCP connections should be kept open when the app moves to the background.
Notes:

In addition to requesting that the connection be kept open, setting this value to true asks the system to delay reclaiming the connection when the app moves to the background.

Available in MacOS 10.11 or newer.
(Read and Write property)

38.18.29 timeoutIntervalForRequest as Double

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The timeout interval to use when waiting for additional data.
Notes:

This property determines the request timeout interval for all tasks within sessions based on this configuration. The request timeout interval controls how long (in seconds) a task should wait for additional data to arrive before giving up. The timer associated with this value is reset whenever new data arrives. When the request timer reaches the specified interval without receiving any new data, it triggers a timeout.
The default value is 60.

Important
Any upload or download tasks created by a background session are automatically retried if the original request fails due to a timeout. To configure how long an upload or download task should be allowed to be retried or transferred, use the timeoutIntervalForResource property.
(Read and Write property)

38.18.30 timeoutIntervalForResource as Double

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The maximum amount of time that a resource request should be allowed to take.
Notes:

This property determines the resource timeout interval for all tasks within sessions based on this configuration. The resource timeout interval controls how long (in seconds) to wait for an entire resource to transfer before giving up. The resource timer starts when the request is initiated and counts until either the request completes or this timeout interval is reached, whichever comes first.
The default value is 7 days.
(Read and Write property)

38.18.31 URLCache as NSURLCacheMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The URL cache for providing cached responses to requests within the session.
Notes:

This property determines the URL cache object used by tasks within sessions based on this configuration.
To disable caching, set this property to nil.
For default sessions, the default value is the shared URL cache object.
For background sessions, the default value is nil.
For ephemeral sessions, the default value is a private cache object that stores data in memory only, and is destroyed when you invalidate the session.
(Read and Write property)

38.18.32 URLCredentialStorage as NSURLCredentialStorageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A credential store that provides credentials for authentication.
Notes:

This property determines the credential storage object used by tasks within sessions based on this configuration.
If you don,Äôt want to use a credential store, set this property to nil.
For default and background sessions, the default value is the sharedCredentialStorage credential store object.
For ephemeralSessionConfiguration sessions, the default value is a private credential store object that stores data in memory only, and is destroyed when you invalidate the session.
(Read and Write property)

38.18.33 waitsForConnectivity as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the session should wait for connectivity to become available, or fail immediately.
Notes:

Connectivity might be temporarily unavailable for several reasons. For example, a device might only have a cellular connection when allowsCellularAccess is set to false, or the device might require a VPN connection but none is available. If the value of this property is true and sufficient connectivity is unavailable, the session calls the taskIsWaitingForConnectivity: method of NSURLSessionTaskDelegate and waits for connectivity. When connectivity becomes available, the task begins its work and ultimately calls the delegate or completion handler as usual.
If the value of the property is false and connectivity is unavailable, the connection fails immediately with an error, such as NSURLErrorNotConnectedToInternet.
This property is relevant only during the establishment of a connection. If a connection is established and then drops, the completion handler or delegate receives an error, such as NSURLErrorNetworkConnectionLost. For help dealing with dropped connections, see Handling ‚ÄúThe network connection was lost‚Äù Errors.
This property is ignored by background sessions, which always wait for connectivity.

Available in MacOS 10.13 or newer.
(Read and Write property)

38.18.34 Constants

38.18.35 CachePolicyReloadIgnoringCacheData = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cache policy constants.
Notes: The URL load should be loaded only from the originating source.

38.18.36 CachePolicyReloadIgnoringLocalAndRemoteCacheData = 4

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cache policy constants.
Notes: Ignore local cache data, and instruct proxies and other intermediates to disregard their caches so far as the protocol allows.

38.18.37 CachePolicyReloadIgnoringLocalCacheData = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cache policy constants.
Notes: The URL load should be loaded only from the originating source.

38.18.38 CachePolicyReloadRevalidatingCacheData = 5

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cache policy constants.
Notes: Use cache data if the origin source can validate it; otherwise, load from the origin.

38.18.39 CachePolicyReturnCacheDataDontLoad = 3

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cache policy constants.
Notes: Use existing cache data, regardless or age or expiration date, and fail if no cached data is available.

38.18.40 CachePolicyReturnCacheDataElseLoad = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cache policy constants.
Notes: Use existing cache data, regardless or age or expiration date, loading from originating source only if there is no cached data.

38.18.41 CachePolicyUseProtocolCachePolicy = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cache policy constants.
Notes: Use the caching logic defined in the protocol implementation, if any, for a particular URL load request.

38.18.42 CookieAcceptPolicyAlways = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cookie accept policy constants.
Notes: Accept all cookies. This is the default cookie accept policy.

38.18.43 CookieAcceptPolicyNever = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cookie accept policy constants.
Notes: Reject all cookies.

38.18.44 CookieAcceptPolicyOnlyFromMainDocumentDomain = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cookie accept policy constants.
Notes: Accept cookies only from the main document domain.

38.18.45 MultipathServiceTypeAggregate = 3

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants that specify the type of service that Multipath TCP uses.
Notes: A service that aggregates the capacities of other Multipath options in an attempt to increase throughput and minimize latency.

38.18.46 MultipathServiceTypeHandover = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants that specify the type of service that Multipath TCP uses.
Notes: A Multipath TCP service that provides seamless handover between Wi-Fi and cellular in order to preserve the connection.

38.18.47 MultipathServiceTypeInteractive = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants that specify the type of service that Multipath TCP uses.
Notes: A service whereby Multipath TCP attempts to use the lowest-latency interface.

38.18.48 MultipathServiceTypeNone = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants that specify the type of service that Multipath TCP uses.
Notes: The default service type indicating that Multipath TCP should not be used.

38.18.49 NetworkServiceTypeAVStreaming = 8

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes: A service type for streaming audio/video data.

38.18.50 NetworkServiceTypeBackground = 3

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes:

A service type for background traffic.
You should specify this type if your app is performing a download that was not requested by the user,Äîfor example, prefetching content so that it will be available when the user chooses to view it.

38.18.51 NetworkServiceTypeCallSignaling = 11

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes:

A service type for call signaling.
Use this service type with network traffic that establishes, maintains, or tears down a VoIP call. Use the NSURLNetworkServiceTypeVoIP type for the actual media of a call.

38.18.52 NetworkServiceTypeDefault = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes: A service type for standard network traffic.

38.18.53 NetworkServiceTypeResponsiveAV = 9

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes: A service type for responsive (time-sensitive) audio/video data.

38.18.54 NetworkServiceTypeResponsiveData = 6

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes:

A service type for data that the user is actively waiting for.
This service type,Äôs priority is higher than NSURLNetworkServiceTypeDefault. Use this service type for interactive situations where the user is anticipating a quick response, like instant messaging or completing a purchase.

38.18.55 NetworkServiceTypeVideo = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes: A service type for video traffic.

38.18.56 NetworkServiceTypeVoice = 4

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes: A service type for voice traffic.

38.18.57 NetworkServiceTypeVoIP = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: Constants that specify how a request uses network resources.
Notes:

A service type for VoIP traffic.
With the VoIP service type, the kernel continues to listen for incoming traffic while your app is in the background, then wakes up your app whenever new data arrives. This should be used only for connections that are used to communicate with a VoIP service.

38.19 class NSURLSessionDataTaskMBS

38.19.1 class NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that returns downloaded data directly to the app in memory.
Notes:

A NSURLSessionDataTaskMBS is a concrete subclass of NSURLSessionTaskMBS. The methods in the NSURLSessionDataTaskMBS class are documented in NSURLSessionTaskMBS.

A data task returns data directly to the app (in memory) as one or more NSData objects. When you use a data task:

- During upload of the body data (if your app provides any), the session periodically calls the taskDidSendBodyData event with status information.
- After receiving an initial response, the session calls the dataTaskDidReceiveResponse event to let you examine the status code and headers, and optionally convert the data task into a download task.
- During the transfer, the session calls dataTaskDidReceiveData event to provide your app with the content as it arrives.
- Upon completion, the session calls the dataTaskWillCacheResponse event to let you determine whether the response should be cached.

For examples of using data tasks for fetching and uploading data, see Fetching Website Data into Memory and Uploading Data to a Website on Apple website.
Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.19.3 Blog Entries

- Adding NSURLSession classes for Xojo

38.19.4 Methods

38.19.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.20 class NSURLSessionDownloadTaskMBS

38.20.1 class NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that stores downloaded data to file.
Notes:

An NSURLSessionDownloadTaskMBS is a concrete subclass of NSURLSessionTask. Most of the methods associated with this class are documented in NSURLSessionTaskMBS.

Download tasks directly write the server,Äôs response data to a temporary file, providing your app with progress updates as data arrives from the server. When you use download tasks in background sessions, these downloads continue even when your app is suspended or is otherwise not running.

You can pause (cancel) download tasks and resume them later (assuming the server supports doing so). You can also resume downloads that failed because of network connectivity problems.

When you use a download task, your NSURLSessionMBS subclass receives several callbacks unique to download scenarios.

- During download, the session periodically calls the downloadTaskDidWriteData event with status information.
- Upon successful completion, the session calls the downloadTaskDidFinishDownloadingToURL event or completion handler. In that method, you must either open the file for reading or move it to a permanent location in your app,Äôs sandbox container directory.
- Upon unsuccessful completion, the session calls the taskDidCompleteWithError method or completion handler. Unlike NSURLSessionDataTaskMBS or NSURLSessionUploadTaskMBS, a download task reports server-side errors reported through HTTP status codes into corresponding NSError objects.

Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.20.4 Methods

38.20.5 cancelByProducingResumeData(Handler as ProducingResumeDataCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Cancels a download and calls a callback with resume data for later use.
Notes:

A download can be resumed only if the following conditions are met:

- The resource has not changed since you first requested it
- The task is an HTTP or HTTPS GET request
- The server provides either the ETag or Last-Modified header (or both) in its response
- The server supports byte-range requests
- The temporary file hasn,Äôt been deleted by the system in response to disk space pressure

Calls the handler later when finished.

38.20.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.20.7 NSURLSessionDownloadTaskResumeData as string

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Key in the userInfo dictionary of an NSErrorMBS received during a failed download.

38.20.8 Delegates

38.20.9 ProducingResumeDataCompletedMBS(downloadTask as NSURLSessionDownloadTaskMBS, resumeData as MemoryBlock, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: A completion handler that is called when the download has been successfully canceled.
Notes: If the download is resumable, the completion handler is provided with a resumeData object. Your app can later pass this object to a session,Äôs downloadTaskWithResumeDat methods in NSURLSession-MBS class to create a new task that resumes the download where it left off.

38.21 class NSURLSessionMBS

38.21.1 class NSURLSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An object that coordinates a group of related, network data-transfer tasks.
Notes:

Read more on Apple's website:
https://developer.apple.com/documentation/foundation/nsurlsession

MBS Plugin implements all delegates within NSURLSessionMBS class, so you can subclass it and fill events.

38.21.4 Methods

38.21.5 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether the class is available.
Notes: Returns true on MacOS 10.9 or newer.

38.21.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates new object referencing shared session.
See also:

- 38.21.7 Constructor(configuration as NSURLSessionConfigurationMBS) 9159

38.21.7 Constructor(configuration as NSURLSessionConfigurationMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a session with the specified session configuration.
Notes:

configuration: A configuration object that specifies certain behaviors, such as caching policies, timeouts, proxies, pipelining, TLS versions to support, cookie policies, credential storage, and so on.
See NSURLSessionConfigurationMBS class for more information.
See also:

- 38.21.6 Constructor 9159

38.21.8 dataTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of a URL based on the specified URL request object.
Notes:

request: A URL request object that provides request-specific information such as the URL, cache policy, request type, and body data or body stream.

Returns he new session data task.

By creating a task based on a request object, you can tune various aspects of the task,Äôs behavior, including the cache policy and timeout interval.
After you create the task, you must start it by calling its resume method.
See also:

- 38.21.9 dataTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9160

38.21.9 dataTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of a URL based on the specified URL request object, and calls a handler upon completion.
Notes:

request: A URL request object that provides the URL, cache policy, request type, body data or body stream, and so on.
completionHandler: The completion handler to call when the load request is complete.
See also:

- 38.21.8 dataTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDataTaskMBS 9159

38.21.10 dataTaskWithURL(URL as String) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of the specified URL.
Notes:

URL: The URL to be retrieved.

After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the response metadata, response data, and so on.
See also:

- 38.21.11 dataTaskWithURL(URL as String, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9160

38.21.11 dataTaskWithURL(URL as String, handler as NSURLSessionDataTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that retrieves the contents of the specified URL, then calls a handler upon completion.
Notes:

url: The URL to be retrieved.
handler: The completion handler to call when the load request is complete.
See also:

- 38.21.10 dataTaskWithURL(URL as String) as NSURLSessionDataTaskMBS 9160

38.21.12 downloadTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of a URL based on the specified URL request object and saves the results to a file.
Notes:

request: A URL request object that provides the URL, cache policy, request type, body data or body stream, and so on.

Returns the new session download task.

By creating a task based on a request object, you can tune various aspects of the task,Äôs behavior, including the cache policy and timeout interval.
After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with progress notifications, the location of the resulting temporary file, and so on.
See also:

- 38.21.13 downloadTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9161

38.21.13 downloadTaskWithRequest(request as NSURLRequestMBS, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of a URL based on the specified URL request object, saves the results to a file, and calls a handler upon completion.
Notes:

request: A URL request object that provides the URL, cache policy, request type, body data or body stream, and so on.

Handler: The completion handler to call when the load request is complete.
See also:

- 38.21.12 downloadTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionDownloadTaskMBS 9161

38.21.14 downloadTaskWithResumeData(resumeData as MemoryBlock) as NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task to resume a previously canceled or failed download.
Notes:

resumeData: A data object that provides the data necessary to resume a download.

After you create the task, you must start it by calling its resume method.
This method is equivalent to the downloadTaskWithResumeData:completionHandler: with a nil completion handler. For detailed usage information, including ways to obtain a resume data object, see that method.
See also:

- 38.21.15 downloadTaskWithResumeData(resumeData as MemoryBlock, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9162

38.21.15 downloadTaskWithResumeData(resumeData as MemoryBlock, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task to resume a previously canceled or failed download and calls a handler upon completion.
Notes:

resumeData: A data object that provides the data necessary to resume the download.
Handler: The completion handler to call when the load request is complete.
See also:

- 38.21.14 downloadTaskWithResumeData(resumeData as MemoryBlock) as NSURLSessionDownloadTaskMBS 9162

38.21.16 downloadTaskWithURL(URL as String) as NSURLSessionDownloadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of the specified URL and saves the results to a file.
Notes:

url: The URL to download.

After you create the task, you must start it by calling its resume method.
See also:

- 38.21.17 downloadTaskWithURL(URL as String, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9163

38.21.17 downloadTaskWithURL(URL as String, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a download task that retrieves the contents of the specified URL, saves the results to a file, and calls a handler upon completion.
Notes:

url: An URL that provides the URL to download.
Handler: The completion handler to call when the load request is complete.
See also:

- 38.21.16 downloadTaskWithURL(URL as String) as NSURLSessionDownloadTaskMBS 9162

38.21.18 finishTasksAndInvalidate

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Invalidates the session, allowing any outstanding tasks to finish.
Notes:

This method returns immediately without waiting for tasks to finish. Once a session is invalidated, new tasks cannot be created in the session, but existing tasks continue until completion. After the last task finishes and the session makes the last delegate call related to those tasks, the session calls the DidBecomeInvalidWithError event, then breaks references to the delegate and callback objects. After invalidation, session objects cannot be reused.
To cancel all outstanding tasks, call invalidateAndCancel instead.

Important
Calling this method on the session returned by the sharedSession method has no effect.

38.21.19 flush(Handler as NSURLSessionFlushCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Flushes cookies and credentials to disk, clears transient caches, and ensures that future requests occur on a new TCP connection.
Notes: Handler: The completion handler to call when the flush operation is complete.

38.21.20 invalidateAndCancel

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Cancels all outstanding tasks and then invalidates the session.
Notes:

Once invalidated, references to the delegate and callback objects are broken. After invalidation, session objects cannot be reused.
To allow outstanding tasks to run until completion, call finishTasksAndInvalidate instead.

Important
Calling this method on the session returned by the sharedSession method has no effect.

38.21.21 reset(Handler as NSURLSessionResetCompletedMBS = nil, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Resets the session.
Notes:

Empties all cookies, caches and credential stores, removes disk files, flushes in-progress downloads to disk, and ensures that future requests occur on a new socket.

Handler: The completion handler to call when the reset operation is complete.

38.21.22 sharedSession as NSURLSessionMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The shared singleton session object.
Notes:

For basic requests, the NSURLSessionMBS class provides a shared singleton session object that gives you a reasonable default behavior for creating tasks. Use the shared session to fetch the contents of a URL to memory with just a few lines of code.
Unlike the other session types, you don,Äôt create the shared session; you merely access it by using this property directly. As a result, you don,Äôt provide a delegate or a configuration object.

Limitations of the Shared Session
Because the shared session has neither a delegate nor a customizable configuration object, the shared session has important limitations:

- You can,Äôt obtain data incrementally as it arrives from the server.
- You can,Äôt significantly customize the default connection behavior.
- Your ability to perform authentication is limited.
- You can,Äôt perform background downloads or uploads when your app isn,Äôt running.

The shared session uses the shared NSURLCacheMBS, NSHTTPCookieStorageMBS, and NSURLCredentialStorageMBS objects, uses a shared custom networking protocol lis, and is based on a default configuration.

In general, when working with a shared session, you should avoid customizing the cache, cookie storage, or credential storage (unless you are already doing so with NSURLConnectionMBS). There,Äôs a good chance that you,Äôll outgrow the capabilities of the default session, at which point you,Äôll have to rewrite all of those customizations to work with your custom URL sessions.
In other words, if you,Äôre doing anything with caches, cookies, authentication, or custom networking protocols, you should probably be using a default session instead of the shared session.

38.21.23 streamTaskWithHostName(hostname as String, Port as Integer) as NSURLSessionStreamTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that establishes a bidirectional TCP/IP connection to a specified hostname and port.
Notes:

hostname: The hostname of the connection endpoint.
port: The port of the connection endpoint.

Returns the new session stream task.

After you create the task, you must start it by calling its resume method.

38.21.24 Tasks as NSURLSessionTaskMBS()

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Queries all tasks for the session.
Notes: Please use the asynchronous variant if possible.
See also:

- 38.21.25 Tasks(Handler as NSURLSessionTasksCompletedMBS, tag as variant = nil) 9166

38.21.25 Tasks(Handler as NSURLSessionTasksCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asynchronously calls a completion callback with all data, upload, and download tasks in a session.
Notes:

Handler: The completion handler to call with the list of tasks. This handler is executed on the delegate queue.

The arrays passed to the completion handler contain any tasks that you have created within the session, not including any tasks that have been invalidated after completing, failing, or being cancelled.
See also:

- 38.21.24 Tasks as NSURLSessionTaskMBS() 9166

38.21.26 uploadTaskWithRequest(request as NSURLRequestMBS, data as MemoryBlock) as NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for the specified URL request object and uploads the provided data.
Notes:

request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
Data: The body data for the request.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like HTTP request headers.

After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the upload,Äôs progress, response metadata, response data, and so on.

- 38.21.27 uploadTaskWithRequest(request as NSURLRequestMBS, data as MemoryBlock, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9167
- 38.21.28 uploadTaskWithRequest(request as NSURLRequestMBS, file as folderItem) as NSURLSessionUploadTaskMBS 9168
- 38.21.29 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9169

38.21.27 uploadTaskWithRequest(request as NSURLRequestMBS, data as MemoryBlock, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for the specified URL request object, uploads the provided data, and calls a handler upon completion.
Notes:

request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
bodyData: The body data for the request.
Handler: The completion handler to call when the load request is complete.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like HTTP request headers.

Unlike uploadTaskWithRequest, this method returns the response body after it has been received in full, and does not require you to write a custom delegate to obtain the response body.

By using a completion handler, the task bypasses calls to delegate methods for response and data delivery, and instead provides any resulting data, response, or error inside the completion handler. Delegate methods for handling authentication challenges, however, are still called.

Typically you pass a nil completion handler only when creating tasks in sessions whose delegates include a dataTaskDidReceiveData method. However, if you do not need the response data, use key-value observing

to watch for changes to the task,Äôs status to determine when it completes.

After you create the task, you must start it by calling its resume method.

If the request completes successfully, the data parameter of the completion handler block contains the resource data, and the error parameter is nil. If the request fails, the data parameter is nil, and the error parameter contains information about the failure. If a response from the server is received, regardless of whether the request completes successfully or fails, the response parameter contains that information.

- 38.21.29 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9169

38.21.28 uploadTaskWithRequest(request as NSURLRequestMBS, file as folderItem) as NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for uploading the specified file.
Notes:

request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
file: The file to upload.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like HTTP request headers.
After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the upload,Äôs progress, response metadata, response data, and so on.

- 38.21.29 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS 9169

38.21.29 uploadTaskWithRequest(request as NSURLRequestMBS, file as FolderItem, handler as NSURLSessionUploadTaskCompletedMBS, tag as Variant = nil) as NSURLSessionDataTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for uploading the specified file, then calls a handler upon completion.
Notes:

request: An NSURLRequestMBS instance that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored.
file: The file to upload.
Handler: The completion handler to call when the load request is complete.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to create a request object so that you can provide metadata for the upload, like HTTP request headers.

Unlike uploadTaskWithRequest, this method returns the response body after it has been received in full, and does not require you to write a custom delegate to obtain the response body.

By using a completion handler, the task bypasses calls to delegate methods for response and data delivery, and instead provides any resulting data, response, or error inside the completion handler. Delegate methods for handling authentication challenges, however, are still called.

Typically you usually pass a nil completion handler only when creating tasks in sessions whose delegates include a dataTaskDidReceiveData method. However, if you do not need the response data, use key-value observing to watch for changes to the task,Äôs status to determine when it completes.

After you create the task, you must start it by calling its resume method.

If the request completes successfully, the data parameter of the completion handler block contains the resource data, and the error parameter is nil. If the request fails, the data parameter is nil, and the error parameter contains information about the failure. If a response from the server is received, regardless of whether the request completes successfully or fails, the response parameter contains that information.

- 38.21.28 uploadTaskWithRequest(request as NSURLRequestMBS, file as folderItem) as NSURLSessionUploadTaskMBS 9168

38.21.30 uploadTaskWithStreamedRequest(request as NSURLRequestMBS) as NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a task that performs an HTTP request for uploading data based on the specified URL request.
Notes:

request: A URL request object that provides the URL, cache policy, request type, and so on. The body stream and body data in this request object are ignored, and the session calls its taskNeedNewBodyStream event to provide the body data.

Returns the new session upload task.

An HTTP upload request is any request that contains a request body, such as a POST or PUT request. Upload tasks require you to provide a request object so that you can provide metadata for the upload, such as HTTP request headers.
After you create the task, you must start it by calling its resume method. The task calls methods on the session,Äôs delegate to provide you with the upload,Äôs progress, response metadata, response data, and so on. The session must have a taskNeedNewBodyStream event that provides the body data to upload.

38.21.31 webSocketTaskWithRequest(request as NSURLRequestMBS) as NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a WebSocket task for the provided URL request.
Notes:

request: A URL request that indicates a WebSockets endpoint with which to connect.

You can modify the request,Äôs properties prior to calling resume on the task. The task uses these properties during the HTTP handshake phase.
To add custom protocols, add a header with the key Sec-WebSocket-Protocol, and a comma-separated list of protocols you want to negotiate with the server. The custom HTTP headers provided by the client remain unchanged for the handshake with the server.

38.21.32 webSocketTaskWithURL(URL as String) as NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a WebSocket task for the provided URL.
Notes:

url: The WebSocket URL with which to connect.

The provided URL must have a ws or wss scheme.
See also:

- 38.21.33 webSocketTaskWithURL(URL as String, Protocols() as String) as NSURLSessionWebSocketTaskMBS 9171

38.21.33 webSocketTaskWithURL(URL as String, Protocols() as String) as NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Creates a WebSocket task given a URL and an array of protocols.
Notes:

url: The WebSocket URL with which to connect.
protocols: An array of protocols to negotiate with the server.

During the WebSocket handshake, the task uses the provided protocols to negotiate a preferred protocol with the server.

The protocol doesn,Äôt affect the WebSocket framing. More details on the protocol are available in RFC 6455, The WebSocket Protocol.
See also:

- 38.21.32 webSocketTaskWithURL(URL as String) as NSURLSessionWebSocketTaskMBS 9171

38.21.34 Properties

38.21.35 configuration as NSURLSessionConfigurationMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A copy of the configuration object for this session.
Notes:

Beginning in iOS 9 and OS X 10.11, NSURLSession objects store a copy of the NSURLSessionConfiguration object passed to their initializers, such that a session,Äôs configuration is immutable after initialization. Any further changes to mutable properties on the configuration object passed to a session,Äôs initializer or the value returned from a session,Äôs configuration property do not affect the behavior of that session. However, you can create a new session with the modified configuration object.
(Read only property)

38.21.36 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.21.37 sessionDescription as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An app-defined descriptive label for the session.
Notes:

This property contains a human-readable string that you can use for debugging purposes. This value may be "" and defaults to "". The value is ignored by the session.
(Read and Write property)

38.21.38 Events

38.21.39 dataTaskDidBecomeDownloadTask(dataTask as NSURLSessionDataTaskMBS, downloadTask as NSURLSessionDownloadTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The data task was changed to a download task.
Notes:

dataTask: The data task that was replaced by a download task.
downloadTask: The new download task that replaced the data task.

When your dataTaskDidReceiveResponse event uses the ResponseBecomeDownload disposition to convert the request to use a download, the session calls this event to provide you with the new download task. After this call, the session receives no further event calls related to the original data task.

38.21.40 dataTaskDidBecomeStreamTask(dataTask as NSURLSessionDataTaskMBS, downloadTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The data task was changed to a stream task.
Notes:

dataTask: The data task that was replaced by a stream task.
streamTask: The new stream task that replaced the data task.

When your dataTaskDidReceiveResponse event uses the ResponseBecomeStream disposition to convert the request to use a stream, the session calls this event to provide you with the new stream task. After this call, the session receives no further event calls related to the original data task.

For requests that were pipelined, the stream task allows only reading, and the object immediately sends the delegate message writeClosedForStreamTask. You can disable pipelining for all requests in a session by setting the HTTPShouldUsePipelining property on its NSURLSessionConfigurationMBS object, or for individual requests by setting the HTTPShouldUsePipelining property on an NSURLRequestMBS object.

38.21.41 dataTaskDidReceiveData(dataTask as NSURLSessionDataTaskMBS, data as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The data task has received some of the expected data.
Notes:

dataTask: The data task that provided data.
data: A data object containing the transferred data.

This event may be called more than once, and each call provides only data received since the previous call. The app is responsible for accumulating this data if needed.

38.21.42 dataTaskDidReceiveResponse(dataTask as NSURLSessionDataTaskMBS, response as NSURLResponseMBS) as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The data task received the initial reply (headers) from the server.
Notes:

dataTask:

The data task that received an initial reply.
response: A URL response object populated with headers.

Return your decision whether to continue a transfer, passing a NSURLSessionResponseDisposition constant to indicate whether the transfer should continue as a data task or should become a download task.

- If you pass ResponseAllow, the task continues as a data task.
- If you pass ResponseCancel, the task is canceled.
- If you pass ResponseBecomeDownload, your delegate,Äôs dataTaskDidBecomeDownloadTask method is called to provide the new download task that supersedes the current task.

Implementing this method is optional unless you need to cancel the transfer or convert it to a download task when the response headers are first received. If you don,Äôt provide this event, the session always allows the task to continue.
You also implement this method if you need to support the fairly obscure multipart/x-mixed-replace content type. With that content type, the server sends a series of parts, each of which is intended to replace the previous part. The session calls this method at the beginning of each part, followed by one or more calls to dataTaskDidReceiveData with the contents of that part.

Each time the dataTaskDidReceiveResponse method is called for a part, collect the data received for the previous part (if any) and process the data as needed for your application. This processing can include storing the data to the filesystem, parsing it into custom types, or displaying it to the user. Next, begin receiving the next part by calling the completion handler with the NSURLSessionResponseAllow constant. Finally, if you have also implemented taskDidCompleteWithError, the session will call it after sending all the data for the last part.

38.21.43 dataTaskWillCacheResponse(dataTask as NSURLSessionDataTaskMBS, proposedResponse as NSCachedURLResponseMBS) as NSCachedURLResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: Asks the event whether the data (or upload) task should store the response in the cache.
Notes:

dataTask: The data (or upload) task.
proposedResponse: The default caching behavior. This behavior is determined based on the current caching policy and the values of certain received headers, such as the Pragma and Cache-Control headers.

Please return the new respnose:

Provide either the original proposed response, a modified version of that response, or nil to prevent caching the response.

The session calls this event after the task finishes receiving all of the expected data. If you don,Äôt implement this method, the default behavior is to use the caching policy specified in the session,Äôs configuration object. The primary purpose of this method is to prevent caching of specific URLs or to modify the userInfo dictionary associated with the URL response.

This method is called only if the NSURLProtocol handling the request decides to cache the response. As a rule, responses are cached only when all of the following are true:

- The request is for an HTTP or HTTPS URL (or your own custom networking protocol that supports caching).
- The request was successful (with a status code in the 200,Äì299 range).
- The provided response came from the server, rather than out of the cache.
- The session configuration,Äôs cache policy allows caching.
- The provided NSURLRequestMBS object's cache policy (if applicable) allows caching.
- The cache-related headers in the server,Äôs response (if present) allow caching.
- The response size is small enough to reasonably fit within the cache. (For example, if you provide a disk cache, the response must be no larger than about 5% of the disk cache size.)

38.21.44 didBecomeInvalid(error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: Tells the URL session that the session has been invalidated.
Notes:

error: The error that caused invalidation, or nil if the invalidation was explicit.

If you invalidate a session by calling its finishTasksAndInvalidate method, the session waits until after the final task in the session finishes or fails before calling this event. If you call the invalidateAndCancel method, the session calls this event immediately.

38.21.45 didReceiveChallenge(challenge as NSURLAuthenticationChallengeMBS, byref disposition as Integer, byref credential as NSURLCredentialMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: Requests credentials from the delegate in response to a session-level authentication request from the remote server.
Notes:

session: The session containing the task that requested authentication.
challenge: An object that contains the request for authentication.

disposition,ÄîOne of several constants that describes how the challenge should be handled.
credential,ÄîThe credential that should be used for authentication if disposition is NSURLSessionAuthChallengeUseCredential, otherwise nil.

This method is called in two situations:

- When a remote server asks for client certificates or Windows NT LAN Manager (NTLM) authentication, to allow your app to provide appropriate credentials

- When a session first establishes a connection to a remote server that uses SSL or TLS, to allow your app to verify the server,Äôs certificate chain

If you do not implement this event, the session calls its delegate,Äôs taskDidReceiveChallenge method instead.
Note
This method handles only the NSURLAuthenticationMethodNTLM, NSURLAuthenticationMethodNegotiate, NSURLAuthenticationMethodClientCertificate, and NSURLAuthenticationMethodServerTrust authentication types. For all other authentication schemes, the session calls only the taskDidReceiveChallenge method.

38.21.46 downloadTaskDidFinishDownloadingToURL(downloadTask as NSURLSessionDownloadTaskMBS, location as String, file as FolderItem)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: A download task has finished downloading.
Notes:

downloadTask: The download task that finished.
location: A file URL for the temporary file. Because the file is temporary, you must either open the file for reading or move it to a permanent location in your app,Äôs sandbox container directory before returning from this event.

38.21.47 downloadTaskDidResumeAtOffset(downloadTask as NSURLSessionDownloadTaskMBS, fileOffset as Int64, expectedTotalBytes as Int64)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The download task has resumed downloading.
Notes:

downloadTask: The download task that resumed. See explanation in the discussion.
fileOffset: If the file's cache policy or last modified date prevents reuse of the existing content, then this value is zero. Otherwise, this value is an integer representing the number of bytes on disk that do not need to be retrieved again.

In some situations, it may be possible for the transfer to resume earlier in the file than where the previous transfer ended.
expectedTotalBytes: The expected length of the file, as provided by the Content-Length header. If this header was not provided, the value is NSURLSessionTransferSizeUnknown (-1).

If a resumable download task is canceled or fails, you can request a resumeData object that provides enough information to restart the download in the future. Later, you can call downloadTaskWithResumeData with that data.

When you call those methods, you get a new download task. As soon as you resume that task, the session calls this method with that new task to indicate that the download is resumed.

38.21.48 downloadTaskDidWriteData(downloadTask as NSURLSessionDownloadTaskMBS, bytesWritten as Int64, totalBytesWritten as Int64, totalBytesExpectedToWrite as Int64)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: Periodically informs the delegate about the download,Äôs progress.
Notes:

downloadTask: The download task.
bytesWritten: The number of bytes transferred since the last time this event was called.
totalBytesWritten: The total number of bytes transferred so far.
totalBytesExpectedToWrite: The expected length of the file, as provided by the Content-Length header. If this header was not provided, the value is NSURLSessionTransferSizeUnknown (-1).

38.21.49 streamTaskBetterRouteDiscoveredForStreamTask(streamTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: A better route to the host has been detected for the stream.
Notes:

streamTask: The stream task that discovered a better route.

This method is called when the URL loading system determines that a better route to the endpoint host is available. For example, this method may be called when a Wi-Fi interface becomes available.
You should consider completing pending work and creating a new stream task in order to take advantage of better routes when they become available.

38.21.50 streamTaskDidBecomeInputStream(streamTask as NSURLSessionStreamTaskMBS, inputStream as NSInputStreamMBS, outputStream as NSOutputStreamMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The stream task has been completed as a result of the stream task calling the captureStreams method.
Notes:

streamTask: The stream task that has been completed.
inputStream: The created input stream. This NSInputStream object is unopened.
outputStream: The created output stream. This NSOutputStream object is unopened

This event will only be called after all enqueued reads and writes for the stream task have been completed.

38.21.51 streamTaskReadClosedForStreamTask(streamTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The read side of the underlying socket has been closed.
Notes:

streamTask: The stream task that closed reads.

This method may be called even if no reads are currently in progress. This method does not indicate that the stream reached end-of-file (EOF), such that no more data can be read.

38.21.52 streamTaskWriteClosedForStreamTask(streamTask as NSURLSessionStreamTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The write side of the underlying socket has been closed.
Notes:

streamTask: The stream task that closed writes.

This method may be called even if no writes are currently in progress.

38.21.53 taskDidCompleteWithError(task as NSURLSessionTaskMBS, error as NSErrorMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The task finished transferring data.
Notes:

task: The task whose request finished transferring data.
error: If an error occurred, an error object indicating how the transfer failed, otherwise nil.

Server errors are not reported through the error parameter. The only errors your delegate receives through the error parameter are client-side errors, such as being unable to resolve the hostname or connect to the host.

38.21.54 taskDidFinishCollectingMetrics(task as NSURLSessionTaskMBS, metrics as NSURLSessionTaskMetricsMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The session finished collecting metrics for the task.
Notes:

task: The task whose metrics have been collected.
metrics: The collected metrics.

38.21.55 taskDidSendBodyData(task as NSURLSessionTaskMBS, bytesSent as Int64, totalBytesSent as Int64, totalBytesExpectedToSend as Integer)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: Periodically informs the delegate of the progress of sending body content to the server.
Notes:

task: The data task.
bytesSent: The number of bytes sent since the last time this event was called.
totalBytesSent: The total number of bytes sent so far.
totalBytesExpectedToSend: The expected length of the body data. The URL loading system can determine the length of the upload data in three ways:

- From the length of the NSData object provided as the upload body.
- From the length of the file on disk provided as the upload body of an upload task (not a download task).
- From the Content-Length in the request object, if you explicitly set it.

Otherwise, the value is NSURLSessionTransferSizeUnknown (-1) if you provided a stream or body data object, or zero (0) if you did not.

The totalBytesSent and totalBytesExpectedToSend parameters are also available as NSURLSessionTaskMBS properties countOfBytesSent and countOfBytesExpectedToSend.

38.21.56 taskIsWaitingForConnectivity(task as NSURLSessionTaskMBS)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The task is waiting until suitable connectivity is available before beginning the network load.
Notes:

task: The task that is waiting for a change in connectivity.

This method is called if the waitsForConnectivity property of NSURLSessionConfigurationMBS is true, and sufficient connectivity is unavailable. The delegate can use this opportunity to update the user interface; for example, by presenting an offline mode or a cellular-only mode.

This method is called, at most, once per task, and only if connectivity is initially unavailable. It is never called for background sessions because waitsForConnectivity is ignored for those sessions.

38.21.57 taskWillPerformHTTPRedirection(task as NSURLSessionTaskMBS, response as NSURLResponseMBS, request as NSURLRequestMBS) as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The remote server requested an HTTP redirect.
Notes:

task: The task whose request resulted in a redirect.
response: An object containing the server,Äôs response to the original request.
request: A URL request object filled out with the new location.

Return either the value of the request parameter, a modified URL request object, or NULL to refuse the redirect and return the body of the redirect response.

This method is called only for tasks in default and ephemeral sessions. Tasks in background sessions automatically follow redirects.

38.21.58 webSocketTaskDidCloseWithCode(webSocketTask as NSURLSessionWebSocketTaskMBS, closeCode as Integer, reason as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The WebSocket task received a close frame from the server endpoint, optionally including a close code and reason from the server.
Notes:

webSocketTask: The WebSocket task that closed.
closeCode: The close code provided by the server. If the close frame didn,Äôt include a close code, this value is 0.
reason: The close reason provided by the server. If the close frame didn,Äôt include a reason, this value is nil.

38.21.59 webSocketTaskDidOpenWithProtocol(webSocketTask as NSURLSessionWebSocketTaskMBS, protocol as String)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: .

Function: The WebSocket task successfully negotiated the handshake with the endpoint, indicating the negotiated protocol.
Notes:

webSocketTask: The WebSocket task that opened.
protocol: The protocol picked during the handshake phase. This parameter is nil if the server did not pick a protocol, or if the client did not advertise protocols when creating the task.

If the handshake fails, the task doesn,Äôt call this event.

38.21.60 Constants

38.21.61 AuthChallengeCancelAuthenticationChallenge = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the authentication challenge disposition modes.
Notes: The entire request will be canceled; the credential parameter is ignored.

38.21.62 AuthChallengePerformDefaultHandling = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the authentication challenge disposition modes.
Notes: Default handling for the challenge - as if this delegate were not implemented; the credential parameter is ignored.

38.21.63 AuthChallengeRejectProtectionSpace = 3

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the authentication challenge disposition modes.
Notes: This challenge is rejected and the next authentication protection space should be tried; the credential parameter is ignored.

38.21.64 AuthChallengeUseCredential = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the authentication challenge disposition modes.
Notes: Use the specified credential, which may be nil

38.21.65 DelayedRequestCancel = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the disposition options for delayed requests.
Notes: Cancel the task; the request parameter is ignored.

38.21.66 DelayedRequestContinueLoading = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the disposition options for delayed requests.
Notes: Use the original request provided when the task was created; the request parameter is ignored.

38.21.67 DelayedRequestUseNewRequest = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the disposition options for delayed requests.
Notes: Use the specified request, which may not be nil.

38.21.68 ResponseAllow = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants indicating how a data or upload session should proceed after receiving the initial headers.
Notes: Allow the load operation to continue.

38.21.69 ResponseBecomeDownload = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants indicating how a data or upload session should proceed after receiving the initial headers.
Notes: Convert the response for this request to use a NSURLSessionDownloadTaskMBS.

38.21.70 ResponseBecomeStream = 3

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants indicating how a data or upload session should proceed after receiving the initial headers.
Notes: Convert the response for this request to use a NSURLSessionStreamTaskMBS.

38.21.71 ResponseCancel = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants indicating how a data or upload session should proceed after receiving the initial headers.
Notes: Cancel the load.

38.21.72 Delegates

38.21.73 NSURLSessionAllTasksCompletedMBS(tasks() as NSURLSessionTaskMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Asynchronously calls a completion callback with all tasks in a session.
Notes: Handler: The completion handler to call with the list of tasks.

38.21.74 NSURLSessionDataTaskCompletedMBS(data as MemoryBlock, response as NSURLResponseMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call when the load request is complete.
Notes:

data: The data returned by the server.
response: An object that provides response metadata, such as HTTP headers and status code. If you are making an HTTP or HTTPS request, the returned object is actually an NSHTTPURLResponseMBS object.
error: An error object that indicates why the request failed, or nil if the request was successful.

38.21.75 NSURLSessionDownloadTaskCompletedMBS(location as String, file as FolderItem, response as NSURLResponseMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call when the load request is complete.
Notes:

location: The location of a temporary file where the server,Äôs response is stored. You must move this file or open it for reading before your completion handler returns. Otherwise, the file is deleted, and the data is lost.

response: An object that provides response metadata, such as HTTP headers and status code. If you are making an HTTP or HTTPS request, the returned object is actually an NSHTTPURLResponse object.
error: An error object that indicates why the request failed, or nil if the request was successful.

For your convenience we provide a folderitem for the location URL.

38.21.76 NSURLSessionFlushCompletedMBS(tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call when the flush operation is complete.

38.21.77 NSURLSessionResetCompletedMBS(tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call when the reset operation is complete.

38.21.78 NSURLSessionTasksCompletedMBS(dataTasks() as NSURLSessionDataTaskMBS, uploadTasks() as NSURLSessionUploadTaskMBS, downloadTasks() as NSURLSessionDownloadTaskMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call with the list of tasks.
Notes: The arrays passed to the completion handler contain any tasks that you have created within the session, not including any tasks that have been invalidated after completing, failing, or being cancelled.

38.21.79 NSURLSessionUploadTaskCompletedMBS(data as MemoryBlock, response as NSURLResponseMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call when the load request is complete.
Notes:

data: The data returned by the server.
response: An object that provides response metadata, such as HTTP headers and status code. If you are making an HTTP or HTTPS request, the returned object is actually an NSHTTPURLResponse object.

error: An error object that indicates why the request failed, or nil if the request was successful.

38.22 class NSURLSessionStreamTaskMBS

38.22.1 class NSURLSessionStreamTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that is stream-based.
Notes:

NSURLSessionStreamTaskMBS is a concrete subclass of NSURLSessionTaskMBS. Many of the methods in the NSURLSessionStreamTaskMBS class are documented in NSURLSessionTaskMBS.
The NSURLSessionStreamTaskMBS class provides an interface a TCP/IP connection created via NSURLSession. Tasks may be created from an NSURLSession using the streamTaskWithHostName and streamTaskWithNetService methods. They may also created as a result of an NSURLSessionDataTaskMBS being upgraded via the HTTP Upgrade: response header and appropriate use of the HTTPShouldUsePipelining option of NSURLSessionConfigurationMBS.

See RFC 2817 and RFC 6455 for information about the Upgrade: header.
An NSURLSessionStreamTask object perform sasynchronous reads and writes, which are enqueued and executed serially, calling a handler upon completion being on the session delegate queue. If the task is canceled, all enqueued reads and writes will call their completion handlers with an appropriate error.

When working with APIs that accept NSStreamMBS objects, you can create NSInputStreamMBS and NSOutputStreamMBS objects from an NSURLSessionStreamTaskMBS object by calling the captureStreams method.
Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Adding NSURLSession classes for Xojo

38.22.3 Blog Entries

- Adding NSURLSession classes for Xojo

38.22.4 Methods

38.22.5 captureStreams

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any already enqueued reads and writes, and then invokes the streamTaskDidBecomeInputStream event.

38.22.6 closeRead

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any enqueued reads and writes, and then closes the read side of the underlying socket.
Notes: You may continue to write data using the writeData method after calling this method. Any calls to readData after calling this method will result in an error.

38.22.7 closeWrite

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any enqueued reads and writes, and then closes the write side of the underlying socket.
Notes:

You may continue to read data using the readDat method after calling this method. Any calls to writeData after calling this method will result in an error.
Because the server may continue to write bytes to the client, it is recommended that you continue reading until the stream reaches end-of-file (EOF).

38.22.8 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.22.9 readData(minBytes as Integer, maxBytes as Integer, timeout as Double, Handler as NSURLSessionStreamTaskReadDataCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asynchronously reads a number of bytes from the stream, and calls a handler upon completion.
Notes:

minBytes: The minimum number of bytes to read.
maxBytes: The maximum number of bytes to read.
timeout: A timeout for reading bytes. If the read is not completed within the specified interval, the read is

canceled and the completionHandler is called with an error. Pass 0 to prevent a read from timing out.

Handler: The completion handler to call when all bytes are read, or an error occurs.

38.22.10 startSecureConnection

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Completes any enqueued reads and writes, and establishes a secure connection.
Notes: Authentication callbacks are sent to the taskDidReceiveChallenge event in NSURLSessionMBS class.

38.22.11 writeData(data as MemoryBlock, timeout as Double, Handler as NSURLSessionStreamTaskWriteDataCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Asynchronously writes the specified data to the stream, and calls a handler upon completion.
Notes:

data: The data to be written.
timeout: A timeout for writing bytes. If the write is not completed within the specified interval, the write is canceled and the completionHandler is called with an error. Pass 0 to prevent a write from timing out.

completionHandler: The completion handler to call when all bytes are written, or an error occurs.

There is no guarantee that the remote side of the stream has received all of the written bytes at the time that completionHandler is called, only that all of the data has been written to the kernel.

38.22.12 Delegates

38.22.13 NSURLSessionStreamTaskReadDataCompletedMBS(streamTask as NSURLSessionStreamTaskMBS, data as MemoryBlock, atEOF as Boolean, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call when all bytes are read, or an error occurs.
Notes:

data: The data read from the stream.
atEOF: Whether or not the stream reached end-of-file (EOF), such that no more data can be read.

error: An error object that indicates why the read failed, or nil if the read was successful.

38.22.14 NSURLSessionStreamTaskWriteDataCompletedMBS(streamTask as NSURLSessionStreamTaskMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The completion handler to call when all bytes are written, or an error occurs.
Notes: error: An error object that indicates why the write failed, or nil if the write was successful.

38.23 class NSURLSessionTaskMBS

38.23.1 class NSURLSessionTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A task, like downloading a specific resource, performed in a URL session.
Notes:

The NSURLSessionTaskMBS class is the base class for tasks in a URL session. Tasks are always part of a session; you create a task by calling one of the task creation methods on a NSURLSession instance. The method you call determines the type of task.

- Use NSURLSessionMBS,Äôs dataTaskWithURL and related methods to create NSURLSessionDataTaskMBS instances. Data tasks request a resource, returning the server,Äôs response as one or more NSData objects in memory. They are supported in default, ephemeral, and shared sessions, but are not supported in background sessions.
- Use NSURLSessionMBS,Äôs uploadTaskWithRequest and related methods to create NSURLSessionUploadTaskMBS instances. Upload tasks are like data tasks, except that they make it easier to provide a request body so you can upload data before retrieving the server,Äôs response. Additionally, upload tasks are supported in background sessions.
- Use NSURLSessionMBS,Äôs downloadTaskWithURL and related methods to create NSURLSessionDownloadTaskMBS instances. Download tasks download a resource directly to a file on disk. Download tasks are supported in any type of session.
- Use NSURLSessionMBS,Äôs streamTaskWithHostName or streamTaskWithNetService to create NSURLSessionStreamTaskMBS instances. Stream tasks establish a TCP/IP connection from a host name and port or a net service object.

After you create a task, you start it by calling its resume method. The session then maintains a strong reference to the task until the request finishes or fails; you don,Äôt need to maintain a reference to the task unless it,Äôs useful for your app,Äôs internal bookkeeping.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

- Adding NSURLSession classes for Xojo

38.23.4 Methods

38.23.5 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.9 or newer.

38.23.6 Cancel

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Cancels the task.
Notes:

This method returns immediately, marking the task as being canceled. Once a task is marked as being canceled, taskDidCompleteWithError event is called, passing an error in the domain NSURLErrorDomain with the code NSURLErrorCancelled. A task may, under some circumstances, send messages to its delegate before the cancelation is acknowledged.
This method may be called on a task that is suspended.

38.23.7 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.23.8 copy as NSURLSessionTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Copies the task.

38.23.9 PriorityDefault as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: One of the priorities.
Notes: The default URL session task priority, used implicitly for any task you have not prioritized. The floating point value of this constant is 0.5.

38.23.10 PriorityHigh as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: One of the priorities.
Notes: A high URL session task priority, with a floating point value above the default value and below the maximum of 1.0.

38.23.11 PriorityLow as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: One of the priorities.
Notes: A low URL session task priority, with a floating point value above the minimum of 0 and below the default value.

38.23.12 resume

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Resumes the task, if it is suspended.
Notes: Newly-initialized tasks begin in a suspended state, so you need to call this method to start the task.

38.23.13 suspend

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Temporarily suspends a task.
Notes: A task, while suspended, produces no network traffic and is not subject to timeouts. A download task can continue transferring data at a later time. All other tasks must start over when resumed.

38.23.14 Properties

38.23.15 countOfBytesClientExpectsToReceive as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A best-guess upper bound on the number of bytes the client expects to receive.
Notes:

The value set for this property should account for the size of both HTTP response headers and the response body. If no value is specified, the system uses -1 instead. This property is used by the system to optimize

the scheduling of URL session tasks. Developers are strongly encouraged to provide an approximate upper bound, or an exact byte count, if possible, rather than accept the default.
(Read only property)

38.23.16 countOfBytesClientExpectsToSend as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A best-guess upper bound on the number of bytes the client expects to send.
Notes:

The value set for this property should account for the size of HTTP headers and body data or body stream. If no value is specified, the system uses -1 instead. This property is used by the system to optimize the scheduling of URL session tasks. Developers are strongly encouraged to provide an approximate upper bound, or an exact byte count, if possible, rather than accept the default.
(Read only property)

38.23.17 countOfBytesExpectedToReceive as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task expects to receive in the response body.
Notes:

This value is determined based on the Content-Length header received from the server. If that header is absent, the value is NSURLSessionTransferSizeUnknown = -1.
(Read only property)

38.23.18 countOfBytesExpectedToSend as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task expects to send in the request body.
Notes:

The URL loading system can determine the length of the upload data in three ways:

- From the length of the data object provided as the upload body.
- From the length of the file on disk provided as the upload body of an upload task (not a download task).
- From the Content-Length in the request object, if you explicitly set it.

Otherwise, the value is NSURLSessionTransferSizeUnknown (-1) if you provided a stream or body data object, or zero (0) if you did not.
(Read only property)

38.23.19 countOfBytesReceived as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task has received from the server in the response body.
Notes:

To be notified when this value changes, implement the dataTaskDidReceiveData event (for data and upload tasks) or the downloadTaskDidWriteData event (for download tasks).
(Read only property)

38.23.20 countOfBytesSent as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes that the task has sent to the server in the request body.
Notes:

This byte count includes only the length of the request body itself, not the request headers.
To be notified when this value changes, implement the taskDidSendBodyData event in your NSURLSession-MBS class.
(Read only property)

38.23.21 currentRequest as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The URL request object currently being handled by the task.
Notes:

This value is typically the same as the initial request (originalRequest) except when the server has responded to the initial request with a redirect to a different URL.
(Read only property)

38.23.22 earliestBeginDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The earliest date at which the network load should begin.
Notes:

For tasks created from background NSURLSessionMBS instances, this property indicates that the network load should not begin any earlier than this date. Setting this property does not guarantee that the load will begin at the specified date, but only that it will not begin sooner. If not specified, no start delay is used. This property has no effect for tasks created from nonbackground sessions.
(Read and Write property)

38.23.23 earliestBeginDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The earliest date at which the network load should begin.
Notes:

For tasks created from background NSURLSessionMBS instances, this property indicates that the network load should not begin any earlier than this date. Setting this property does not guarantee that the load will begin at the specified date, but only that it will not begin sooner. If not specified, no start delay is used. This property has no effect for tasks created from nonbackground sessions.
(Read and Write property)

38.23.24 error as NSErrorMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An error object that indicates why the task failed.
Notes:

This value is nil if the task is still active or if the transfer completed successfully.
(Read only property)

38.23.25 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.23.26 originalRequest as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The original request object passed when the task was created.
Notes:

This value is typically the same as the currently active request (currentRequest) except when the server has responded to the initial request with a redirect to a different URL.
(Read only property)

38.23.27 Priority as Single

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The relative priority at which you,Äôd like a host to handle the task, specified as a floating point value between 0.0 (lowest priority) and 1.0 (highest priority).
Notes:

To provide hints to a host on how to prioritize URL session tasks from your app, specify a priority for each task. Specifying a priority provides only a hint and does not guarantee performance. If you don,Äôt specify a priority, a URL session task has a priority of NSURLSessionTaskPriorityDefault, with a value of 0.5.

There are three named priorities you can employ, described in URL Session Task Priority.

You can specify or change a task,Äôs priority at any time, but not all networking protocols respond to changes after a task has started. There is no API to let you determine the effective priority for a task from a host,Äôs perspective.
(Read and Write property)

38.23.28 response as NSURLResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The server,Äôs response to the currently active request.
Notes:

This object provides information about the request as provided by the server. This information always includes the original URL. It may also include an expected length, MIME type information, encoding information, a suggested filename, or a combination of these.
(Read only property)

38.23.29 state as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The current state of the task,Äîactive, suspended, in the process of being canceled, or completed.

Notes: (Read only property)

38.23.30 taskDescription as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An app-provided string value for the current task.
Notes:

The system doesn,Äôt interpret this value; use it for whatever purpose you see fit. For example, you could store a description of the task for debugging purposes, or a key to track the task in your own data structures.
(Read and Write property)

38.23.31 taskIdentifier as UInt64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An identifier uniquely identifying the task within a given session.
Notes:

This value is unique only within the context of a single session; tasks in other sessions may have the same taskIdentifier value.
(Read only property)

38.23.32 Constants

38.23.33 StateCanceling = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants for determining the current state of a task.
Notes:

The task has received a cancel message.
The delegate may or may not have received a taskDidCompleteWithError message yet. A task in this state is not subject to timeouts.

38.23.34 StateCompleted = 3

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants for determining the current state of a task.
Notes:

The task has completed (without being canceled), and the task's delegate receives no further callbacks.
If the task completed successfully, the task,Äôs error property is nil. Otherwise, it provides an error object that tells what went wrong. A task in this state is not subject to timeouts.

38.23.35 StateRunning = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants for determining the current state of a task.
Notes:

The task is currently being serviced by the session.
A task in this state is subject to the request and resource timeouts specified in the session configuration object.

38.23.36 StateSuspended = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the constants for determining the current state of a task.
Notes:

The task was suspended by the app.
No further processing takes place until the task is resumed. A task in this state is not subject to timeouts.

38.24 class NSURLSessionTaskMetricsMBS

38.24.1 class NSURLSessionTaskMetricsMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An object encapsulating the metrics for a session task.
Notes:

Each NSURLSessionTaskMetricsMBS object contains the taskInterval and redirectCount, as well as metrics for each request-and-response transaction made during the execution of the task.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.24.2 Methods

38.24.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.12 or newer.

38.24.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.24.5 transactionMetrics as NSURLSessionTaskTransactionMetricsMBS()

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An array of metrics for each individual request-response transaction made during the execution of the task.

38.24.6 Properties

38.24.7 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.24.8 redirectCount as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of redirects that occurred during the execution of the task.
Notes: (Read only property)

38.24.9 taskInterval as NSDateIntervalMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The time interval between when a task is instantiated and when the task is completed.
Notes: (Read only property)

38.25 class NSURLSessionTaskTransactionMetricsMBS

38.25.1 class NSURLSessionTaskTransactionMetricsMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: An object that encapsualtes the performance metrics collected by the URL Loading System during the execution of a session task.
Notes:

Each NSURLSessionTaskTransactionMetricsMBS object consists of a request and response property, corresponding to the request and response of the corresponding task. It also contains temporal metrics, starting with fetchStartDate and ending with responseEndDate, as well as other characteristics like networkProtocolName and resourceFetchType.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.25.2 Methods

38.25.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Wether this class is available.
Notes:

Returns true on MacOS 10.12 or later.
Some properties are MacOS 10.15 or later.

38.25.4 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.25.5 Properties

38.25.6 Cellular as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection operates over a cellular interface.
Notes:

You permit or deny use of cellular interfaces with the allowsCellularAccess property on NSURLSessionConfigurationMBS or allowsCellularAccess on NSMutableURLRequestMBS.
(Read only property)

38.25.7 connectEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task finished establishing the connection to the server.
Notes:

This value accounts for completion of security-related and other handshakes. The value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

38.25.8 connectEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task finished establishing the connection to the server.
Notes:

This value accounts for completion of security-related and other handshakes. The value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

38.25.9 connectStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started establishing a TCP connection to the server.
Notes:

This value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

38.25.10 connectStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started establishing a TCP connection to the server.
Notes:

This value will be nil if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

38.25.11 Constrained as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this is a constrained network.
Notes: (Read only property)

38.25.12 countOfRequestBodyBytesBeforeEncoding as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The size of the upload body data, file, or stream, in bytes.
Notes: (Read only property)

38.25.13 countOfRequestBodyBytesSent as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the request body.
Notes:

This value includes protocol-specific framing, transfer encoding, and content encoding.
(Read only property)

38.25.14 countOfRequestHeaderBytesSent as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the request header.
Notes: (Read only property)

38.25.15 countOfResponseBodyBytesAfterDecoding as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The size of data delivered to your delegate or completion handler.
Notes: (Read only property)

38.25.16 countOfResponseBodyBytesReceived as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the response body.
Notes:

This value includes protocol-specific framing, transfer encoding, and content encoding.
(Read only property)

38.25.17 countOfResponseHeaderBytesReceived as Int64

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The number of bytes transferred for the response header.
Notes: (Read only property)

38.25.18 domainLookupEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time after the name lookup was completed.
Notes:

This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.
(Read only property)

38.25.19 domainLookupEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time after the name lookup was completed.
Notes:

This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.
(Read only property)

38.25.20 domainLookupStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started the name lookup for the resource.
Notes:

This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.
(Read only property)

38.25.21 domainLookupStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started the name lookup for the resource.
Notes:

This value will be nil if a persistent connection was used, or if the resource was retrieved from local resources.
(Read only property)

38.25.22 Expensive as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection operates over an expensive interface.
Notes:

An expensive interface is one which is more costly or consumes more power, such as 3G or LTE as compared to ethernet or Wi-Fi. You permit or deny use of expensive interfaces with the allowsExpensiveNetworkAccess property on NSURLSessionConfigurationMBS or allowsExpensiveNetworkAccess on NSMutableURLRequestMBS.
(Read only property)

38.25.23 fetchStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time when the task started fetching the resource, from the server or locally.
Notes: (Read only property)

38.25.24 fetchStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time when the task started fetching the resource, from the server or locally.
Notes: (Read only property)

38.25.25 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.25.26 localAddress as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The IP address string of the local interface for the connection.
Notes:

For multipath protocols, this is the local address of the initial flow. If the app didn,Äôt use the connection, this value is empty.
(Read only property)

38.25.27 localPort as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The port number of the local interface for the connection.
Notes:

For multipath protocols, this is the local port of the initial flow. If the app didn,Äôt use the connection, this value is 0.
(Read only property)

38.25.28 Multipath as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the connection uses a successfully negotiated multipath protocol.
Notes:

You configure the use of multipath protocols with the multipathServiceType property on NSURLSession-ConfigurationMBS.
(Read only property)

38.25.29 negotiatedTLSCipherSuite as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The TLS cipher suite the task negotiated with the endpoint for the connection.
Notes:

This value is a 2-byte sequence in host byte order. See TLSCipherSuite* constants for possible values. If the task didn,Äôt negotiate an encrypted connection, this value is 0.
(Read only property)

38.25.30 negotiatedTLSProtocolVersion as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The TLS protocol version the task negotiated with the endpoint for the connection.
Notes:

This value is a 2-byte sequence in host byte order. See TLSProtocolVersion* constants for possible values. If the task didn,Äôt negotiate an encrypted connection, this value is 0.
(Read only property)

38.25.31 networkProtocolName as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The network protocol used to fetch the resource.
Notes:

When a proxy is configured and a tunnel connection is established, this attribute returns the value for the tunneled protocol, which is identified by the ALPN Protocol ID Identification Sequence, as per RFC 7310. For example:

- If no proxy is used, and HTTP/2 is negotiated, then h2 is returned.
- If HTTP/1.1 is used with the proxy, and the tunneled connection is HTTP/2, then h2 is returned.
- If HTTP/1.1 is used with the proxy, and there,Äôs no tunnel, then http/1.1 is returned.

(Read only property)

38.25.32 ProxyConnection as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicastes whether the task used a proxy connection to fetch the resource.
Notes: (Read only property)

38.25.33 remoteAddress as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The IP address string of the remote interface for the connection.
Notes:

For multipath protocols, this is the remote address of the initial flow. If the app didn,Äôt use the connection, this value is empty.
(Read only property)

38.25.34 remotePort as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The port number of the remote interface for the connection.
Notes:

For multipath protocols, this is the remote port of the initial flow. If the app didn,Äôt use the connection, this value is 0.
(Read only property)

38.25.35 request as NSURLRequestMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The transaction request.
Notes: (Read only property)

38.25.36 requestEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task finished requesting the resource, regardless of whether it was retrieved from the server or local resources.
Notes: (Read only property)

38.25.37 requestEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task finished requesting the resource, regardless of whether it was retrieved from the server or local resources.
Notes: (Read only property)

38.25.38 requestStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started requesting the resource, regardless of whether it is retrieved from the server or local resources.
Notes: (Read only property)

38.25.39 requestStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started requesting the resource, regardless of whether it is retrieved from the server or local resources.
Notes: (Read only property)

38.25.40 resourceFetchType as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A value that indicates whether the resource was loaded, pushed, or retrieved from the local cache.
Notes: (Read only property)

38.25.41 response as NSURLResponseMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The transaction response.
Notes:

This property is nil if an error occurred and no response was generated.
(Read only property)

38.25.42 responseEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task received the last byte of the resource.
Notes: (Read only property)

38.25.43 responseEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task received the last byte of the resource.
Notes: (Read only property)

38.25.44 responseStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the task received the first byte of the response from the server or from local resources.
Notes: (Read only property)

38.25.45 responseStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the task received the first byte of the response from the server or from local resources.
Notes: (Read only property)

38.25.46 ReusedConnection as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A Boolean value that indicates whether the task used a persistent connection to fetch the resource.
Notes: (Read only property)

38.25.47 secureConnectionEndDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately after the security handshake completed.
Notes:

This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

38.25.48 secureConnectionEndDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately after the security handshake completed.
Notes:

This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

38.25.49 secureConnectionStartDate as Date

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The time immediately before the task started the TLS security handshake to secure the current connection.
Notes:

This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.
(Read only property)

38.25.50 secureConnectionStartDateTime as DateTime

MBS MacFrameworks Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The time immediately before the task started the TLS security handshake to secure the current connection.
Notes:

This value is nil if an encrypted connection isn,Äôt used, if a persistent connection is used, or if the resource is retrieved from local resources.

(Read only property)

38.25.51 Constants

38.25.52 FetchTypeLocalCache = 3

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the fetch type constants.
Notes: The resource was retrieved from the local storage.

38.25.53 FetchTypeNetworkLoad = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the fetch type constants.
Notes: The resource was loaded over the network.

38.25.54 FetchTypeServerPush = 2

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the fetch type constants.
Notes: The resource was pushed by the server to the client.

38.25.55 FetchTypeUnknown = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the fetch type constants.
Notes: The manner in which the resource was fetched could not be determined.

38.25.56 TLSCipherSuite_AES_128_GCM_SHA256 = & h1301

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: AES 128 GCM SHA256

38.25.57 TLSCipherSuite_AES_256_GCM_SHA384 = & h1302

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: AES 256 GCM SHA384

38.25.58 TLSCipherSuite_CHACHA20_POLY1305_SHA256 = & h1303

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: CHACHA20 POLY1305 SHA256

38.25.59 TLSCipherSuite_ECDHE_ECDSA_WITH_3DES_EDE_CBC_SHA = & hC008

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with 3DES EDE CBC SHA

38.25.60 TLSCipherSuite_ECDHE_ECDSA_WITH_AES_128_CBC_SHA = & hC009

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with AES 128 CBC SHA

38.25.61 TLSCipherSuite_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 = & hC023

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with AES 128 CBC SHA256

38.25.62 TLSCipherSuite_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 = & hC02B

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with AES 128 GCM SHA256

38.25.63 TLSCipherSuite_ECDHE_ECDSA_WITH_AES_256_CBC_SHA = & hC00A

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with AES 256 CBC SHA

38.25.64 TLSCipherSuite_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 = & hC024

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with AES 256 CBC SHA384

38.25.65 TLSCipherSuite_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 = & hC02C

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with AES 256 GCM SHA384

38.25.66 TLSCipherSuite_ECDHE_ECDSA_WITH_CHACHA20_POLY1305_SHA256 = & hCCA9

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE ECDSA with CHACHA20 POLY1305 SHA256

38.25.67 TLSCipherSuite_ECDHE_RSA_WITH_3DES_EDE_CBC_SHA = & hC012

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA with 3DES EDE CBC SHA

38.25.68 TLSCipherSuite_ECDHE_RSA_WITH_AES_128_CBC_SHA = & hC013

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA with AES 128 CBC SHA

38.25.69 TLSCipherSuite_ECDHE_RSA_WITH_AES_128_CBC_SHA256 = & hC027

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA with AES 128 CBC SHA256

38.25.70 TLSCipherSuite_ECDHE_RSA_WITH_AES_128_GCM_SHA256 = & hC02F

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA with AES 128 GCM SHA256

38.25.71 TLSCipherSuite_ECDHE_RSA_WITH_AES_256_CBC_SHA = & hC014

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA with AES 256 CBC SHA

38.25.72 TLSCipherSuite_ECDHE_RSA_WITH_AES_256_CBC_SHA384 = & hC028

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA with AES 256 CBC SHA384

38.25.73 TLSCipherSuite_ECDHE_RSA_WITH_AES_256_GCM_SHA384 = & hC030

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA with AES 256 GCM SHA384

38.25.74 TLSCipherSuite_ECDHE_RSA_WITH_CHACHA20_POLY1305_SHA256 = & hCCA8

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: ECDHE RSA WITH CHACHA20 POLY1305 SHA256

38.25.75 TLSCipherSuite_RSA_WITH_3DES_EDE_CBC_SHA = & h000A

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: RSA with 3DES EDE CBC SHA

38.25.76 TLSCipherSuite_RSA_WITH_AES_128_CBC_SHA = & h002F

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: RSA with AES 128 CBC SHA

38.25.77 TLSCipherSuite_RSA_WITH_AES_128_CBC_SHA256 = & h003C

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: RSA with AES 128 CBC SHA 256.

38.25.78 TLSCipherSuite_RSA_WITH_AES_128_GCM_SHA256 = & h009C

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: RSA with AES 1128 GCM SHA 256.

38.25.79 TLSCipherSuite_RSA_WITH_AES_256_CBC_SHA = & h0035

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: RSA with AES 256 CBC SHA

38.25.80 TLSCipherSuite_RSA_WITH_AES_256_CBC_SHA256 = & h003D

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: RSA with AES 256 CBC SHA256.

38.25.81 TLSCipherSuite_RSA_WITH_AES_256_GCM_SHA384 = & h009D

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the cipher suite constants.
Notes: RSA with AES 256 GCM SHA384

38.25.82 TLSProtocolVersionDTLSv10 = & hfeff

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the TLS Protocol Version constants.
Notes: The DTLS 1.0 protocol.

38.25.83 TLSProtocolVersionDTLSv12 = & hfefd

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the TLS Protocol Version constants.
Notes: The DTLS 1.2 protocol.

38.25.84 TLSProtocolVersionTLSv10 = & h0301

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the TLS Protocol Version constants.
Notes: The TLS 1.0 protocol.

38.25.85 TLSProtocolVersionTLSv11 = & h0302

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the TLS Protocol Version constants.
Notes: The TLS 1.1 protocol.

38.25.86 TLSProtocolVersionTLSv12 = & h0303

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the TLS Protocol Version constants.
Notes: The TLS 1.2 protocol.

38.25.87 TLSProtocolVersionTLSv13 = & h0304

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the TLS Protocol Version constants.
Notes: The TLS 1.3 protocol.

38.26 class NSURLSessionUploadTaskMBS

38.26.1 class NSURLSessionUploadTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A URL session task that uploads data to the network in a request body.
Notes:

The NSURLSessionUploadTaskMBS class is a subclass of NSURLSessionDataTaskMBS, which in turn is a concrete subclass of NSURLSessionTaskMBS. The methods associated with the NSURLSessionUpload-TaskMBS class are documented in NSURLSessionTaskMBS.
Upload tasks are used for making HTTP requests that require a request body (such as POST or PUT). They behave similarly to data tasks, but you create them by calling different methods on the session that are designed to make it easier to provide the content to upload. As with data tasks, if the server provides a response, upload tasks return that response as one or more MemoryBlock objects in memory.

Unlike data tasks, you can use upload tasks to upload content in the background.

When you create an upload task, you provide a NSURLRequestMBS instance that contains any additional headers that you might need to send alongside the upload, such as the content type, content disposition, and so on. In iOS, when you create an upload task for a file in a background session, the system copies that file to a temporary location and streams data from there.
While the upload is in progress, the task calls the session taskDidSendBodyData event in NSURLSession-MBS class periodically to provide you with status information.

When the upload phase of the request finishes, the task behaves like a data task, calling events on the session to provide you with the server,Äôs response,Äîheaders, status code, content data, and so on.
Subclass of the NSURLSessionDataTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.26.3 Blog Entries

- Adding NSURLSession classes for Xojo

38.26.4 Methods

38.26.5 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.27 class NSURLSessionWebSocketMessageMBS

38.27.1 class NSURLSessionWebSocketMessageMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The client can create a WebSocket message object that will be passed to the send calls and will be delivered from the receive calls.
Notes:

The message can be initialized with data or string. If initialized with data, the string property will be nil and vice versa.
Available on MacOS 10.15 or newer.

38.27.2 Methods

38.27.3 available as Boolean

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Whether this class is available.
Notes: Returns true on MacOS 10.15 or newer.

38.27.4 Constructor(data as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Create a message with data type
See also:

- 38.27.5 Constructor(text as string) 9222

38.27.5 Constructor(text as string)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Create a message with string type
See also:

- 38.27.4 Constructor(data as MemoryBlock) 9222

38.27.6 Properties

38.27.7 data as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The data for a data message.
Notes: (Read only property)

38.27.8 Handle as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

38.27.9 string as String

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The text of a text message.
Notes: (Read only property)

38.27.10 type as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The type of message.
Notes: (Read only property)

38.27.11 Constants

38.27.12 TypeData = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the type constants.
Notes: Data Message

38.27.13 TypeString = 1

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the type constants.
Notes: Text Message

38.28 class NSURLSessionWebSocketTaskMBS

38.28.1 class NSURLSessionWebSocketTaskMBS

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A WebSocket task can be created with a ws or wss url.
Notes:

A client can also provide a list of protocols it wishes to advertise during the WebSocket handshake phase.
Once the handshake is successfully completed the client will be notified through an optional delegate.
All reads and writes enqueued before the completion of the handshake will be queued up and executed once the hanshake succeeds. Before the handshake completes, the client can be called to handle redirection or authentication using the same delegates as NSURLSessionTask. WebSocket task will also provide support for cookies and will store cookies to the cookie storage on the session and will attach cookies to outgoing HTTP handshake requests.

Available on MacOS 10.15 or newer.
Subclass of the NSURLSessionTaskMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

38.28.4 Methods

38.28.5 cancel(closeCode as Integer, reason as MemoryBlock)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Sends a close frame with the given closeCode.
Notes:

An optional reason can be provided while sending the close frame.
Simply calling cancel on the task will result in a cancellation frame being sent without any reason.

38.28.6 Constructor

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The private constructor.

38.28.7 receiveMessage(Handler as NSURLSessionWebSocketTaskReceiveMessageCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Reads a WebSocket message once all the frames of the message are available.
Notes:

If the maximumMessage size is hit while buffering the frames, the receiveMessage call will error out and all outstanding work will also fail resulting in the end of the task.

Calls handler later when job is done.

38.28.8 sendMessage(message as NSURLSessionWebSocketMessageMBS, Handler as NSURLSessionWebSocketTaskSendMessageCompletedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Sends a WebSocket message.
Notes:

If an error occurs, any outstanding work will also fail.
Note that invocation of the completion handler does not guarantee that the remote side has received all the bytes, only that they have been written to the kernel.

Calls handler on completion.

38.28.9 sendPing(Handler as NSURLSessionWebSocketTaskSendPingWithPongReceivedMBS, tag as variant = nil)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: Sends a ping frame from the client side.
Notes:

The pongReceiveHandler is invoked when the client receives a pong from the server endpoint.
If a connection is lost or an error occurs before receiving the pong from the endpoint, the handler will be invoked with an error.
Note - the pongReceiveHandler will always be called in the order in which the pings were sent.

38.28.10 Properties

38.28.11 closeCode as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A task can be queried for it's close code at any point.
Notes:

When the task is not closed, it will be set to CloseCodeInvalid.
(Read only property)

38.28.12 closeReason as MemoryBlock

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: A task can be queried for it's close reason at any point.
Notes:

A nil value indicates no closeReason or that the task is still running
(Read only property)

38.28.13 maximumMessageSize as Integer

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: All.

Function: The maximum number of bytes to be buffered before erroring out.
Notes:

This includes the sum of all bytes from continuation frames. Recieve calls will error out if this value is reached.
(Read and Write property)

38.28.14 Constants

38.28.15 CloseCodeAbnormalClosure = 1006

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Abnormal Closure

38.28.16 CloseCodeGoingAway = 1001

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Going Away

38.28.17 CloseCodeInternalServerError = 1011

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Internal Server Error

38.28.18 CloseCodeInvalid = 0

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Invalid

38.28.19 CloseCodeInvalidFramePayloadData = 1007

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Invalid Frame Payload Data

38.28.20 CloseCodeMandatoryExtensionMissing = 1010

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Mandatory Extension Missing

38.28.21 CloseCodeMessageTooBig = 1009

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Message Too Big

38.28.22 CloseCodeNormalClosure = 1000

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Normal Closure

38.28.23 CloseCodeNoStatusReceived = 1005

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: No Status Received

38.28.24 CloseCodePolicyViolation = 1008

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Policy Violation

38.28.25 CloseCodeProtocolError = 1002

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Protocol Error

38.28.26 CloseCodeTLSHandshakeFailure = 1015

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: TLS Handshake Failure

38.28.27 CloseCodeUnsupportedData = 1003

MBS MacFrameworks Plugin, Plugin Version: 20.2.

Function: One of the WebSocket close codes follow the close codes given in the RFC.
Notes: Unsupported Data

38.28.28 Delegates

38.28.29 NSURLSessionWebSocketTaskReceiveMessageCompletedMBS(webSocketTask as NSURLSessionWebSocketTaskMBS, message as NSURLSessionWebSocketMessageMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The handler to be called when receiving finished.

38.28.30 NSURLSessionWebSocketTaskSendMessageCompletedMBS(webSocketTask as NSURLSessionWebSocketTaskMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: Sending a web socket message succeeded.

38.28.31 NSURLSessionWebSocketTaskSendPingWithPongReceivedMBS(webSocketTask as NSURLSessionWebSocketTaskMBS, error as NSErrorMBS, tag as variant)

MBS MacFrameworks Plugin, Plugin Version: 20.2, Platform: macOS, Targets: Desktop only.

Function: The ping answer may have been received.

Chapter 39

Cocoa Printing

39.1 class NSPageLayoutMBS

39.1.1 class NSPageLayoutMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: NSPageLayout is a panel that queries the user for information such as paper type and orientation.
Notes: It is normally displayed in response to the user selecting the Page Setup menu item. You obtain an instance with the pageLayout class method. The pane can then be run as a sheet using beginSheetWithPrintInfo or modally using runModal or runModalWithPrintInfo.

39.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.4pr1

39.1.3 Blog Entries

- MBS Real Studio Plugins, version 12.4pr1

39.1.4 Methods

39.1.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window.
Notes:

printInfo: The NSPrintInfo object to use.
win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1).
See also:

- 39.1.6 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 9234
- 39.1.7 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 9234

39.1.6 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window.
Notes:

printInfo: The NSPrintInfo object to use.
win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1).
See also:

- 39.1.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 9233
- 39.1.7 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 9234

39.1.7 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Presents a page setup sheet for the given NSPrintInfo object, document-modal relative to the given window.
Notes:

printInfo: The NSPrintInfo object to use.
win: The window to which the sheet is attached.

This method calls the printPanelDidEnd event later passing returnCode which is either NSCancelButton (0) or NSOKButton (1).
See also:

- 39.1.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 9233
- 39.1.6 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 9234

39.1.8 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new page layout object.

39.1.9 pageLayout as NSPageLayoutMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a newly created NSPageLayout object.

39.1.10 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the NSPrintInfo object used when the receiver is run.
Notes: The NSPrintInfo object is set using the beginSheetWithPrintInfo or runModalWithPrintInfo method. The shared NSPrintInfo object is used if the receiver is run using runModal.

39.1.11 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver and begins the modal loop using the shared NSPrintInfo object.
Example:

```
dim p as new NSPageLayoutMBS
MsgBox str(p.runModal)
```

Notes:

Returns NSCancelButton (0) if the user clicks the Cancel button; otherwise, NSOKButton (1).
The receiver's values are recorded in the shared NSPrintInfo object.

39.1.12 runModalWithPrintInfo(printInfo as NSPrintInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver and begins the modal loop using the given NSPrintInfo object.
Notes:

printInfo: The NSPrintInfo object to use.

Returns NSCancelButton if the user clicks the Cancel button; otherwise, NSOKButton.
The receiver's values are recorded in printInfo.

39.1.13 runPageLayout

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the app's page layout panel, an instance of NSPageLayout.
Example:

NSPageLayoutMBS.runPageLayout

Notes: If the NSPageLayout instance does not exist, this method creates one. This method is typically invoked when the user chooses Page Setup from the application's FIle menu.

39.1.14 Properties

39.1.15 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

39.1.16 Events

39.1.17 printPanelDidEnd(returnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: .

Function: Called when the sheet is dismissed.

39.2 class NSPrinterMBS

39.2.1 class NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPrinter object describes a printer's capabilities as defined in its PPD file.
Example:

```
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name+EndOfLine+p.type
```

Notes: An NSPrinter object can be constructed by specifying either the printer name or the make and model of an available printer. You use a printer object to get information about printers, not to modify printer attributes or control a printing job.

39.2.2 Blog Entries

- MBS Real Studio Plugins, version 12.4pr1

39.2.3 Blog Entries

- MBS Real Studio Plugins, version 12.4pr1

39.2.4 Methods

39.2.5 booleanForKey(key as string, table as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the Boolean value associated with the specified key.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the Boolean value associated with the key. Returns false if the key is not in the table or the receiver lacks a PPD file.

39.2.6 Constructor(name as string = "")

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a printer object.
Notes:

On success the handle property is not zero.
Name can be empty to pick default printer. Else pass name of printer.

39.2.7 copy as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a clone of the printer object.

39.2.8 defaultPrinter as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default printer.
Example:

```
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name
```

39.2.9 deviceDescription as Dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a dictionary of keys and values describing the device.
Notes: A dictionary of the device properties. See NSGraphics.h for possible keys. The only key guaranteed to exist is NSDeviceIsPrinter.

39.2.10 floatForKey(key as string, table as string) as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the floating-point value associated with the specified key.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the floating-point value. Returns 0.0 if the key is not in the table or the receiver lacks a PPD file.

39.2.11 intForKey(key as string, table as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the integer value associated with the specified key.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the integer value. Returns 0 if the key is not in the table or the receiver lacks a PPD file.

39.2.12 isKey(key as string, table as string) as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the specified key is in the specified table.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.
Returns true if the key is in the table; otherwise, false.

39.2.13 languageLevel as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the PostScript language level recognized by the printer.
Example:

```
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox "languageLevel: "+str(p.languageLevel)
```

Notes: Returns the PostScript language level. The value is 0 if the receiver is not a PostScript printer.

39.2.14 name as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the printer's name.
Example:

```
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.name
```

39.2.15 pageSizeForPaper(paperName as string) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the size of the page for the specified paper type.
Notes:

paperName: Possible values are printer-dependent and are contained in the printer's PPD file. Typical values are "Letter" and "Legal".

Returns the size of the page, measured in points in the user coordinate space. The returned size is zero if the specified paper name is not recognized or its entry in the PPD file cannot be parsed.

39.2.16 printerNames as string()

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the names of all available printers.
Example:

```
MsgBox Join(NSPrinterMBS.printerNames, EndOfLine)
```

Notes:

An array of strings, each of which contains the name of an available printer.
The user constructs the list of available printers using the Print Center application.

39.2.17 printerTypes as string()

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns descriptions of the makes and models of all available printers.
Notes: An array of strings, each of which contains the make and model information for a supported printer.

39.2.18 printerWithName(name as string) as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPrinter object initialized with the specified printer name.
Notes:

name: The name of the printer.

Returns an initialized NSPrinter object, or nil if the specified printer was not available.

39.2.19 printerWithType(type as string) as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns an NSPrinter object initialized to the first available printer with the specified make and model information.
Notes:

type: A string describing the make and model information. You can get this string using the printerTypes method.

Returns an initialized NSPrinter object, or nil if the specified printer was not available.

39.2.20 rectForKey(key as string, table as string) as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the rectangle associated with the specified key.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the rectangle value. Returns NSRectMBS.Zero if the key is not in the table or the receiver lacks a PPD file.

39.2.21 sizeForKey(key as string, table as string) as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the size data type associated with the specified key.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the size value. Returns NSZeroSize if the key is not in the table or the receiver lacks a PPD file.

39.2.22 statusForTable(paperName as string) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the status of the specified table.
Notes:

table: The name of a table from the printer's PPD file.

Returns one of the return values described in Constants.

39.2.23 stringForKey(key as string, table as string) as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the first occurrence of a value associated with specified key.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns the value for the specified key, or nil if the key is not in the table. The returned string may also be empty.

If key is a main keyword only, and if that keyword has options in the PPD file, this method returns an empty string. Use stringListForKey to retrieve the values for all occurrences of a main keyword.

39.2.24 stringListForKey(key as string, table as string) as string()

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns an array of strings, one for each occurrence, associated with specified key.
Notes:

key: The key whose value you want.
table: The name of a table from the printer's PPD file.

Returns an array of strings, each containing a value associated with the specified key. Returns nil if the key is not in the table.

39.2.25 type as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a description of the printer's make and model.
Example:

```
dim p as NSPrinterMBS = NSPrinterMBS.defaultPrinter
MsgBox p.type
```

39.2.26 Properties

39.2.27 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

39.2.28 Constants

39.2.29 NSPrinterTableError = 2

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the state constants for printer information table.
Notes: Printer table is not valid.

39.2.30 NSPrinterTableNotFound = 1

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the state constants for printer information table.
Notes: Printer table was not found.

39.2.31 NSPrinterTableOK = 0

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the state constants for printer information table.
Notes: Printer table was found and is valid.

39.3 class NSPrintInfoMBS

39.3.1 class NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPrintInfo object stores information that's used to generate printed output.
Example:

```
// get Xojo printer setup
dim p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
dim n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
dim g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

Notes:

A shared NSPrintInfo object is automatically created for an application and is used by default for all printing jobs for that application.

The printing information in an NSPrintInfo object is stored in a dictionary. To access the standard attributes in the dictionary directly, this class defines a set of keys and provides the dictionary method. You can also initialize an instance of this class using the Constructor method.

You can use this dictionary to store custom information associated with a print job. Any non-object values should be stored as NSNumber or NSValue objects in the dictionary. See NSNumber Class Reference for a list of types which should be stored as numbers. For other non-object values, use the NSValue class.

Beginning with OS X v10.5, to store custom information that belongs in printing presets you should use the dictionary returned by the printSettings method.

39.3.4 Methods

39.3.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes the print info with a new instance.
Example:

```
// get Xojo printer setup
dim p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
dim n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
dim g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

See also:

- 39.3.6 Constructor(attributes as Dictionary) 9248
- 39.3.7 Constructor(Data as Memoryblock) 9248

39.3.6 Constructor(attributes as Dictionary)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize the print info with the parameters in the specified dictionary.
See also:

- 39.3.5 Constructor 9247
- 39.3.7 Constructor(Data as Memoryblock) 9248

39.3.7 Constructor(Data as Memoryblock)

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize the print info with serialized dictionary or NSPrintInfo.
Example:

```
dim p as new PrinterSetup
dim info as new NSPrintInfoMBS(p.SetupString)
MsgBox info.paperName
```

See also:

- 39.3.5 Constructor 9247
- 39.3.6 Constructor(attributes as Dictionary) 9248

39.3.8 copy as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a copy of the object.

39.3.9 defaultPrinter as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the default printer.

39.3.10 NSPrintAllPages as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean.

39.3.11 NSPrintBottomMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the bottom margin, in points.

39.3.12 NSPrintCancelJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Cancel print job.

39.3.13 NSPrintCopies as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: a number containing the number of copies of the print job to be printed

39.3.14 NSPrintDetailedErrorReporting as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean.

39.3.15 NSPrintFaxNumber as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A string containing a fax number.

39.3.16 NSPrintFirstPage as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A number containing the one-based index of the first job in the page to print.

39.3.17 NSPrintHeaderAndFooter as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean for whether the results of NSView pageHeader and NSView pageFooter should be drawn on pages

39.3.18 NSPrintHorizontallyCentered as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a Boolean value that is true if pages are centered horizontally.

39.3.19 NSPrintHorizontalPagination as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes:

Number, containing a NSPrintingPaginationMode value.
NSAutoPagination, NSFitPagination, or NSClipPagination. See HorizontalPagination for details.

39.3.20 NSPrintJobDisposition as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A string equal to NSPrintSpoolJob, NSPrintPreviewJob, NSPrintSaveJob, or NSPrintCancelJob.

39.3.21 NSPrintJobSavingFileNameExtensionHidden as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes:

A boolean for whether the job file's name extension should be hidden, for NSPrintSaveJob.
Available on Mac OS X 10.6.

39.3.22 NSPrintJobSavingURL as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes:

An URL containing the location to which the job file will be saved, for NSPrintSaveJob.
Available on Mac OS X 10.6.

39.3.23 NSPrintLastPage as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: An number containing the one-based index of the last job in the page to print.

39.3.24 NSPrintLeftMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the left margin, in points.

39.3.25 NSPrintMustCollate as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A boolean value.

39.3.26 NSPrintOrientation as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes:

A number containing an NSPrintingOrientation.
NSPortraitOrientation or NSLandscapeOrientation

39.3.27 NSPrintPagesAcross as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A number containing the number of logical pages to be placed across a physical sheet.

39.3.28 NSPrintPagesDown as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A number containing the number of logical pages to be placed down a physical sheet.

39.3.29 NSPrintPaperName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes: A string containing the paper name.

39.3.30 NSPrintPaperSize as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes: A size value specifying the height and width of paper in points.

39.3.31 NSPrintPreviewJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Send to Preview application.

39.3.32 NSPrintPrinter as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: Value in dictionary is a NSPrinterMBS.

39.3.33 NSPrintPrinterName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: A string containing the name of a printer.

39.3.34 NSPrintReversePageOrder as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: Value for this key is a boolean value.

39.3.35 NSPrintRightMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the right margin, in points.

39.3.36 NSPrintSaveJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Save to a file.

39.3.37 NSPrintScalingFactor as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access page format attributes.
Notes: Scale factor percentage before pagination.

39.3.38 NSPrintSelectionOnly as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes:

A boolean value.
Available on Mac OS X 10.6 or newer.

39.3.39 NSPrintSpoolJob as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the possible job disposition values.
Notes: Normal print job.

39.3.40 NSPrintTime as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the keys for print job attributes that are recognized by NSPrintInfo.
Notes: An NSDate containing the time at which printing should begin.

39.3.41 NSPrintTopMargin as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a floating-point value that specifies the top margin, in points.

39.3.42 NSPrintVerticallyCentered as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes: Number, containing a Boolean value that is true if pages are centered vertically.

39.3.43 NSPrintVerticalPagination as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the dictionary keys to access pagination attributes.
Notes:

Number, containing a NSPrintingPaginationMode value.
NSAutoPagination, NSFitPagination, or NSClipPagination. See VerticalPagination for details.

39.3.44 SetSaveDestination(file as folderitem)

MBS MacCocoa Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the print job to go to a PDF file.
Example:

```
// print to PDF in Xojo Cocoa app

// change print info to go to
dim s as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
dim d as MemoryBlock = s.data // save old
s.SetSaveDestination SpecialFolder.Desktop.Child("test.pdf")

// now print something
dim g as Graphics = OpenPrinter
if g<>Nil then
g.DrawString "Hello World PDF", 20, 20
end if

s.data = d // restore original settings

// now print something to regular printer
g = OpenPrinter
if g<>Nil then
g.DrawString "Hello World Printer", 20, 20
end if
```

39.3.45 setSharedPrintInfo(printInfo as NSPrintInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the shared NSPrintInfo object to the specified object.
Notes:

printInfo: The new shared printer information. This value must not be nil.

The shared NSPrintInfo object defines the settings for the NSPageLayout panel and print operations that will be used if no NSPrintInfo object is specified for those operations.

39.3.46 setUpPrintOperationDefaultValues

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Validates the attributes encapsulated by the receiver.
Notes: Invoked when the print operation is about to start. Subclasses may override this method to set default values for any attributes that are not set.

39.3.47 sharedPrintInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the shared NSPrintInfo object.

39.3.48 Properties

39.3.49 bottomMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The bottom margin, measured in points in the user coordinate space.
Notes: (Read and Write property)

39.3.50 data as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 14.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Query or set the current settings as data.
Example:

```
// print to PDF in Xojo Cocoa app

// change print info to go to
dim s as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
dim d as MemoryBlock = s.data // save old
s.SetSaveDestination SpecialFolder.Desktop.Child("test.pdf")

// now print something
dim g as Graphics = OpenPrinter
if g<>Nil then
g.DrawString "Hello World PDF", 20, 20
end if

s.data = d // restore original settings

// now print something to regular printer
```

```
g = OpenPrinter
if g<>Nil then
g.DrawString "Hello World Printer", 20, 20
end if
```

Notes:

The plugin archives the current settings and you can later assign them back.
(Read and Write property)

39.3.51 dictionary as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's dictionary that contains the printing attributes.
Notes:

The key-value pairs contained in the dictionary are described in Constants. Modifying the returned dictionary changes the receiver's attributes.

This dictionary is key-value observing compliant.
(Read and Write property)

39.3.52 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

39.3.53 HorizontallyCentered as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the image is centered horizontally.
Notes:

True if you want the image to be centered horizontally; otherwise, false.
(Read and Write property)

39.3.54 horizontalPagination as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The horizontal pagination to the specified mode.
Notes:

One of the pagination modes described in constants.
(Read and Write property)

39.3.55 imageablePageBounds as NSRectMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the imageable area of a sheet of paper specified by the receiver.
Notes:

Return the imageable area, measured in points in the user coordinate space.

This method takes into account the current printer, paper size, and orientation settings, but not scaling factors. Imageable area is the maximum area that can possibly be marked on by the printer hardware, not the area defined by the current margin settings.

The origin (0, 0) of the returned rectangle is in the lower-left corner of the oriented sheet. The imageable bounds may extend past the edges of the sheet when, for example, a printer driver specifies it so that borderless printing can be done reliably.
(Read only property)

39.3.56 jobDisposition as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The action specified for the job.
Notes:

One of the following value:

- NSPrintSpoolJob is a normal print job.
- NSPrintPreviewJob sends the print job to the Preview application.
- NSPrintSaveJob saves the print job to a file.
- NSPrintCancelJob aborts the print job.

(Read and Write property)

39.3.57 leftMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The left margin to the specified size.
Notes:

The size for the left margin, measured in points in the user coordinate space.
(Read and Write property)

39.3.58 localizedPaperName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the human-readable name of the currently selected paper size, suitable for presentation in user interfaces.
Notes:

This is typically different from the name returned by paperName, which is almost never suitable for presentation to the user.
(Read only property)

39.3.59 orientation as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The page orientation to the specified value.
Notes:

This printing orientation. See constants for possible values.
For consistency, this method may change either the paper name or the paper size.
(Read and Write property)

39.3.60 paperName as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The paper name to the specified value.
Notes:

The name for the paper size. The string contains a value such as Letter or Legal. Paper names are implementation specific.
For consistency, this method may change either the paper size or the page orientation.
(Read and Write property)

39.3.61 paperSize as NSSizeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The width and height of the paper to the specified size.
Notes:

The new size of the paper, measured in points in the user coordinate space.
For consistency, this method may change either the paper name or the page orientation.
(Read and Write property)

39.3.62 printer as NSPrinterMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The printer object used for subsequent printing jobs.
Notes:

This method iterates through the receiver's dictionary. If a feature in the dictionary is not supported by the new printer (as determined by a query to the PPD file), that feature is removed from the dictionary.
(Read and Write property)

39.3.63 printerName as String

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The printer name of printer used for subsequent printing jobs.
Notes: (Read only property)

39.3.64 printSettings as dictionary

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a mutable dictionary containing the print settings from Core Printing.
Notes:

A mutable dictionary containing the printing system's current settings.

You can use this method to get and set values from the system print settings. The keys in the returned dictionary represent the values returned by the Core Printing function PMPrintSettingsGetValue. They correspond to the settings currently in the print panel and include everything from custom values set by your accessory panels to values provided by the printer driver's print dialog extension.
(Read only property)

39.3.65 rightMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The right margin to the specified size.
Notes:

The size for the right margin, measured in points in the user coordinate space.
(Read and Write property)

39.3.66 scalingFactor as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The print info's scaling factor.
Notes:

Default is 1.0.
Using smaller value increases paper size.
(Read and Write property)

39.3.67 SelectionOnly as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether only the current selection should be printed.
Notes:

True if only the current selection should be printed, otherwise false.
(Read and Write property)

39.3.68 SetupString as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 14.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: Query or set the current settings as data.
Example:

```
// start with a printer setup
dim p as new PrinterSetup

// clone to NSPrintInfo
dim info as new NSPrintInfoMBS(p.SetupString)

// find out what name second printer has
dim printers() as string = NSPrinterMBS.printerNames
dim printer as NSPrinterMBS = NSPrinterMBS.printerWithName(printers(1))
System.DebugLog printers(1)

// now set a new paper size and this printer
info.paperSize = new NSSizeMBS(72*5, 72*6) // 5 by 6 inch
info.printer = printer

// and clone back
p.SetupString = info.SetupString

// now print to this printer with this paper
dim g as Graphics = OpenPrinter(p)

g.DrawString "Hello", 10, 10
```

Notes:

While data property encodes the dictionary, this property encodes the NSPrintInfo which is same format as PrinterSetup.SetupString in Xojo.
(Read and Write property)

39.3.69 topMargin as Double

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The top margin, measured in points in the user coordinate space.
Notes:

The size for the top margin, measured in points in the user coordinate space.
(Read and Write property)

39.3.70 VerticallyCentered as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the image is centered vertically.

Notes:

True if you want the image to be centered vertically; otherwise, false.
(Read and Write property)

39.3.71 verticalPagination as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The vertical pagination mode.
Notes:

One of the pagination modes described in constants.
(Read and Write property)

39.3.72 Constants

39.3.73 NSAutoPagination = 0

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the pagination mode constants.
Notes: The image is divided into equal-sized rectangles and placed in one column of pages.

39.3.74 NSClipPagination = 2

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the pagination mode constants.
Notes: The image is clipped to produce one column or row of pages.

39.3.75 NSFitPagination = 1

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the pagination mode constants.
Notes: The image is scaled to produce one column or one row of pages.

39.3.76 NSLandscapeOrientation = 1

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the page orientation constants.
Notes: Orientation is portrait (page is taller than it is wide).

39.3.77 NSPortraitOrientation = 0

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the page orientation constants.
Notes: Orientation is landscape (page is wider than it is tall).

39.4 class NSPrintOperationMBS

39.4.1 class NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: An NSPrintOperation object controls operations that generate Encapsulated PostScript (EPS) code, Portable Document Format (PDF) code, or print jobs.
Notes:

An NSPrintOperation object works in conjunction with two other objects: an NSPrintInfo object, which specifies how the code should be generated, and an NSView object, which generates the actual code.

It is important to note that the majority of methods in NSPrintOperation copy the instance of NSPrintInfo passed into them. Future changes to that print info are not reflected in the print info retained by the current NSPrintOperation object. All changes should be made to the print info before passing to the methods of this class.

39.4.4 Methods

39.4.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize the object the current print operation for this thread.
Notes: On success the handle property is not zero.
See also:

- 39.4.6 Constructor(other as NSPrintOperationMBS) 9267
- 39.4.7 Constructor(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) 9268
- 39.4.8 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 9268
- 39.4.9 Constructor(view as NSViewMBS) 9269
- 39.4.10 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 9270

39.4.6 Constructor(other as NSPrintOperationMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Special constructor to create new NSPrintOperationMBS for existing NSPrintOperationMBS object.
Notes: If you have a NSPrintOperationMBS and you want to use printOperationDidRun event, you can initialize a subclass of NSPrintOperationMBS with your existing object to get the event there.
See also:

- 39.4.5 Constructor 9267
- 39.4.7 Constructor(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) 9268
- 39.4.8 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 9268
- 39.4.9 Constructor(view as NSViewMBS) 9269
- 39.4.10 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 9270

39.4.7 Constructor(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
dim n as new NSPrintOperationMBS(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

Notes:

View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.5 Constructor 9267
- 39.4.6 Constructor(other as NSPrintOperationMBS) 9267
- 39.4.8 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 9268
- 39.4.9 Constructor(view as NSViewMBS) 9269
- 39.4.10 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 9270

39.4.8 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil)

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
dim n as new NSPrintOperationMBS(HTMLViewer1)
```

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)

Notes:

View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.5 Constructor 9267
- 39.4.6 Constructor(other as NSPrintOperationMBS) 9267
- 39.4.7 Constructor(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) 9268
- 39.4.9 Constructor(view as NSViewMBS) 9269
- 39.4.10 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 9270

39.4.9 Constructor(view as NSViewMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view.
Notes:

View: The view whose contents you want to print.

Returns the new NSPrintOperation object. You must run the operation to print the view.

The new NSPrintOperation object uses the settings stored in the shared NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

- 39.4.8 Constructor(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) 9268
- 39.4.10 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS) 9270

39.4.10 Constructor(view as NSViewMBS, printInfo as NSPrintInfoMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Notes:

View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

- 39.4.9 Constructor(view as NSViewMBS) 9269

39.4.11 context as NSGraphicsMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the graphics context object used for generating output.

39.4.12 currentOperation as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current print operation for this thread.
Notes: The print operation object, or nil if there is no current operation.

39.4.13 currentPage as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the current page number being printed.

39.4.14 data as Memoryblock

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the data in PDF/EPS after the operation finished.

39.4.15 Destructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

39.4.16 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view.
Notes:

View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.

After the job is run, use the Data function to get the EPS data.
Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.

The new NSPrintOperation object uses the default NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

39.4.17 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view using the specified print settings.
Notes:

View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.
PrintInfo: The print settings to use when generating the EPS data.

After the job is run, use the Data function to get the EPS data.
Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.16 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS 9271

39.4.18 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.
Notes:

View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.
path: The path to a file. After the job is run, this file contains the EPS data.
PrintInfo: The print settings to use when generating the EPS data.

Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.
This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

39.4.19 EPSOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of EPS graphics from the specified view and write the resulting data to the specified file.
Notes:

View: The view containing the data to be turned into EPS data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as EPS data.
path: The path to a file. After the job is run, this file contains the EPS data.
PrintInfo: The print settings to use when generating the EPS data.

Returns the new NSPrintOperation object. You must run the operation to generate the EPS data.
This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

39.4.20 isCopyingOperation as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns a Boolean value indicating whether the receiver is an EPS or PDF copy operation.
Notes: True if the receiver is an EPS or PDF copy operation; otherwise, false.

39.4.21 NSPrintOperationExistsException as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The name of an exception raised when there is already a print operation in process.
Notes: The methods that raise the NSExceptionMBS exception are the EPSOperation... and printOperation....

39.4.22 pageRange as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the print order for the pages.
Notes: The print order. For a list of possible values, see Constants.

39.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view.
Notes:

View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.

After the job is run, the data function gives you the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

The new NSPrintOperation object uses the default NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.

- 39.4.26 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS 9276

39.4.24 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view using the specified print settings.
Notes:

View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
PrintInfo: The print settings to use when generating the PDF data.

After the job is run, the data function returns the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.
This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS 9274

- 39.4.26 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS 9276

39.4.25 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.
Notes:

View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
path: The path to a file. After the job is run, this file contains the PDF data.
PrintInfo: The print settings to use when generating the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS 9274

- 39.4.26 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS 9276

39.4.26 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, path as string) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns a new NSPrintOperation object ready to control the copying of PDF graphics from the specified view and write the resulting data to the specified file.
Notes:

View: The view containing the data to be turned into PDF data.
rect: The portion of the view (specified in points in the view's coordinate space) to be rendered as PDF data.
path: The path to a file. After the job is run, this file contains the PDF data.
PrintInfo: The print settings to use when generating the PDF data.

Returns the new NSPrintOperation object. You must run the operation to generate the PDF data.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.23 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS) as NSPrintOperationMBS 9274

- 39.4.25 PDFOperationWithView(view as NSViewMBS, rect as NSRectMBS, printInfo as NSPrintInfoMBS, file as folderitem) as NSPrintOperationMBS 9275

39.4.27 preferredRenderingQuality as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the printing quality.
Notes:

The preferred printing quality. See constants for the possible values.

If the print sheet is unresponsive or sluggish due to the time is takes to fully render a page, you can check this method in drawRect: and other printing methods such as beginDocument and knowsPageRage: to determine if the print operation prefers speed over fidelity. Most applications render each page fast enough and do not need to call this method. Only use this method after establishing that best quality rendering does indeed make the user interface unresponsive.

39.4.28 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
dim n as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

Notes:

View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.29 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 9278
- 39.4.30 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS 9279
- 39.4.31 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 9279

39.4.29 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 14.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Example:

```
// print a HTMLViewer
dim n as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(HTMLViewer1)

n.showsPrintPanel = true
n.showsProgressPanel = true
n.runOperationModalForWindow(self)
```

Notes:

View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.28 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 9277
- 39.4.30 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS 9279
- 39.4.31 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 9279

39.4.30 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view.
Example:

```
// print a text area
dim textView as NSTextViewMBS = TextArea1.NSTextViewMBS
dim o as NSPrintOperationMBS = NSPrintOperationMBS.printOperationWithView(textView)

o.showsPrintPanel = true
o.runOperationModalForWindow(Window1)
o = nil
```

Notes:

View: The view whose contents you want to print.

Returns the new NSPrintOperation object. You must run the operation to print the view.

The new NSPrintOperation object uses the settings stored in the shared NSPrintInfo object. This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.28 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 9277
- 39.4.29 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 9278
- 39.4.31 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS 9279

39.4.31 printOperationWithView(view as NSViewMBS, printInfo as NSPrintInfoMBS) as NSPrintOperationMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Creates and returns an NSPrintOperation object ready to control the printing of the specified view using custom print settings.
Notes:

View: The view whose contents you want to print.
PrintInfo: The print settings to use when printing the view.

Returns the new NSPrintOperation object. You must run the operation to print the view.

This method raises an NSPrintOperationExistsException if there is already a print operation in progress; otherwise the returned object is made the current print operation for this thread.
See also:

- 39.4.28 printOperationWithView(view as DesktopHTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 9277
- 39.4.29 printOperationWithView(view as HTMLViewer, printInfo as NSPrintInfoMBS = nil) as NSPrintOperationMBS 9278
- 39.4.30 printOperationWithView(view as NSViewMBS) as NSPrintOperationMBS 9279

39.4.32 runOperation as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Runs the print operation on the current thread.
Notes:

Returns true if the operation was successful; otherwise, false.

The operation runs to completion in the current thread, blocking the application. A separate thread is not spawned, even if canSpawnSeparateThread is true. Use runOperationModalForWindow to use document-modal sheets and to allow a separate thread to perform the operation.

39.4.33 runOperationModalForWindow(win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Runs the print operation, calling your custom delegate method upon completion.
Notes:

win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.
See also:

- 39.4.34 runOperationModalForWindow(win as NSWindowMBS) 9281
- 39.4.35 runOperationModalForWindow(win as window) 9281

39.4.34 runOperationModalForWindow(win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Runs the print operation, calling your custom delegate method upon completion.
Notes:

win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.
See also:

- 39.4.33 runOperationModalForWindow(win as DesktopWindow) 9280
- 39.4.35 runOperationModalForWindow(win as window) 9281

39.4.35 runOperationModalForWindow(win as window)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Runs the print operation, calling your custom delegate method upon completion.
Notes:

win: The document window to receive a print progress sheet.

Calls the printOperationDidRun event.
See also:

- 39.4.33 runOperationModalForWindow(win as DesktopWindow) 9280
- 39.4.34 runOperationModalForWindow(win as NSWindowMBS) 9281

39.4.36 setCurrentOperation(operation as NSPrintOperationMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the current print operation for this thread.
Notes: operation: The print operation to make current. You may specify nil to clear the current print operation.

39.4.37 view as NSViewMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns the view object that generates the actual data for the print operation.

39.4.38 Properties

39.4.39 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

39.4.40 canSpawnSeparateThread as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver is allowed to spawn a separate printing thread.
Notes:

canSpawnSeparateThread: True if the receiver is allowed to spawn a separate thread; otherwise, false.

If canSpawnSeparateThread is true, an NSThread object is detached when the print panel is dismissed (or immediately, if the panel is not to be displayed). The new thread performs the print operation, so that control can return to your application. A thread is detached only if the print operation is run using the runOperationModalForWindow:delegate:didRunSelector:contextInfo: method. If canSpawnSeparateThread is false, the operation runs on the current thread, blocking the application until the operation completes.

If you send setCanSpawnSeparateThread: to an NSPrintOperation object with an argument of true, then the delegate specified in a subsequent invocation of runOperationModalForWindow may be messaged in that spawned, non-main thread.
(Read and Write computed property)

39.4.41 jobTitle as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The title of the print job.
Notes:

A string containing the print job title. If set, this value overrides the title returned by the printing view. Available in OS X v10.5 and later.
(Read and Write computed property)

39.4.42 pageOrder as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the print order for the pages.
Notes:

The print order. For a list of possible values, see Constants.
(Read and Write computed property)

39.4.43 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's NSPrintInfo object.
Notes: (Read and Write computed property)

39.4.44 printPanel as NSPrintPanelMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns the NSPrintPanel object used when running the operation.
Notes: (Read and Write computed property)

39.4.45 showsPrintPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Boolean value indicating whether a print panel is displayed during the operation,
Notes:

True if the operation displays a print panel; otherwise, false.
Operations that generate EPS or PDF data do no display a print panel (instance of NSPrintPanel), regardless of the value returned by this method.
(Read and Write computed property)

39.4.46 showsProgressPanel as boolean

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the receiver displays a progress panel for this operation.
Notes:

True if you want to display a progress panel; otherwise, false.
This method does not affect the display of a print panel; that operation is controlled by the ShowsPrintPanel method.
Operations that generate EPS or PDF data do no display a progress panel, regardless of the value in the flag parameter.
(Read and Write computed property)

39.4.47 Events

39.4.48 printOperationDidRun(success as boolean)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: .

Function: The event called when the print operation ends.

39.4.49 Constants

39.4.50 NSAscendingPageOrder = 1

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the page order constants.
Notes: Ascending (back to front) page order.

39.4.51 NSDescendingPageOrder = -1

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the page order constants.
Notes: Descending (front to back) page order.

39.4.52 NSPrintRenderingQualityBest = 0

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print quality constants.
Notes:

Renders the printing at the best possible quality, regardless of speed.
Available in OS X v10.7 and later.

39.4.53 NSPrintRenderingQualityResponsive = 1

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print quality constants.
Notes:

Sacrifices the least possible amount of rendering quality for speed to maintain a responsive user interface. This option should be used only after establishing that best quality rendering does indeed make the user interface unresponsive.
Available in OS X v10.7 and later.

39.4.54 NSSpecialPageOrder = 0

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the page order constants.
Notes: The spooler does not rearrange pages,Äîthey are printed in the order received by the spooler.

39.4.55 NSUnknownPageOrder = 2

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the page order constants.
Notes: No page order specified.

39.5 class NSPrintPanelMBS

39.5.1 class NSPrintPanelMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: An NSPrintPanel object creates the Print panel used to query the user for information about a print job.
Notes:

This panel may lets the user select the range of pages to print and the number of copies before executing the Print command.

Print panels can display a simplified interface when printing certain types of data. For example, the panel can display a list of print-setting presets, which lets the user enable print settings in groups as opposed to individually. The JobStyleHint property activates the simplified interface and identifies which presets to display.

39.5.3 Blog Entries

- MBS Real Studio Plugins, version 12.4pr1

39.5.4 Methods

39.5.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow)

MBS MacCocoa Plugin, Plugin Version: 22.0, Platform: macOS, Targets: Desktop only.

Function: Displays a Print panel sheet and runs it modally for the specified window.
Notes:

printInfo: The printing information for the current job.
win: The window on which to display the sheet.

When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

- 39.5.6 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 9287

• 39.5.7 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 9287

39.5.6 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Displays a Print panel sheet and runs it modally for the specified window.
Notes:

printInfo: The printing information for the current job.
win: The window on which to display the sheet.

When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

• 39.5.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 9286

• 39.5.7 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window) 9287

39.5.7 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as window)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Displays a Print panel sheet and runs it modally for the specified window.
Notes:

printInfo: The printing information for the current job.
win: The window on which to display the sheet.

When the modal session ends, if printPanelDidEnd event is invoked on the object.
See also:

• 39.5.5 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as DesktopWindow) 9286

• 39.5.6 beginSheetWithPrintInfo(printInfo as NSPrintInfoMBS, win as NSWindowMBS) 9287

39.5.8 Constructor

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes a new print panel.

39.5.9 NSPrintAllPresetsJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
Notes:

Output appropriate to all graphics types. Equivalent to Core Printing's kPMPresetGraphicsTypeAll.
Available in OS X v10.6 and later.

39.5.10 NSPrintNoPresetsJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
Notes:

Output excludes all graphics printing. Equivalent to Core Printing's kPMPresetGraphicsTypeNone.
Available in OS X v10.6 and later.

39.5.11 NSPrintPhotoJobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: One of the values can be passed to the jobStyleHint property to activate the simplified Print panel interface and specify which presets to display.
Notes: Output contains photographic data.

39.5.12 printInfo as NSPrintInfoMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the printing information associated with the running Print panel.
Notes:

The current printing information. May return nil if the Print panel is not currently running.
This method is a convenience method that your delegate can use to get the printing information while the Print Panel is visible.
Available in OS X v10.5 and later.

39.5.13 printPanel as NSPrintPanelMBS

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop only.

Function: Returns a new PrintPanel object.

39.5.14 runModal as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver's Print panel and begins the modal loop.
Notes:

NSCancelButton (0) if the user clicks the Cancel button; otherwise NSOKButton (1).
This method uses the printing information associated with the current printing operation.

39.5.15 runModalWithPrintInfo(printInfo as NSPrintInfoMBS) as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Displays the receiver's Print panel and runs the modal loop using the specified printing information.
Notes:

printInfo: The printing information to use while displaying the Print panel.

Returns NSCancelButton (0) if the user clicks the Cancel button; otherwise NSOKButton (1).

39.5.16 Properties

39.5.17 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

39.5.18 defaultButtonTitle as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The title of the Print panel's default button.
Notes:

defaultButtonTitle: The string to use for the button title.

You can use this method to change the default button title from "Print" to something more appropriate for your usage of the panel. For example, if you are using the Print panel to save a representation of the document to a file, you might change the title to "Save".
Available in OS X v10.5 and later.
(Read and Write computed property)

39.5.19 helpAnchor as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The HTML help anchor for the print panel.
Notes:

helpAnchor: The anchor name in your Apple Help file. This parameter should contain just the name portion of the HTML anchor element.

For information on how to insert anchors into your Apple Help files, see Authoring User Help in Apple Help Programming Guide.
Available in OS X v10.5 and later.
(Read and Write computed property)

39.5.20 jobStyleHint as string

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The type of content the Print panel is representing.
Notes:

hint: For a list of supported job style hints, see Job Style Hints functions. Pass nil to this method to deactivate the simplified Print panel interface and use the standard interface instead (the equivalent of Core Printing's kPMPresetGraphicsTypeGeneral).

This method controls the set of items that appear in the Presets menu of the simplified Print panel interface.
(Read and Write computed property)

39.5.21 options as Integer

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: The configuration options for the Print panel.
Notes:

The configuration options, which you specify by adding together the appropriate constant values.
Available in OS X v10.5 and later.
(Read and Write computed property)

39.5.22 Events

39.5.23 printPanelDidEnd(returnCode as Integer)

MBS MacCocoa Plugin, Plugin Version: 12.4, Platform: macOS, Targets: .

Function: The event called when the sheet ends.
Notes: The value passed as returnCode is either NSCancelButton or NSOKButton. The value NSOKButton is returned even if the user clicked the Preview button.

39.5.24 Constants

39.5.25 NSPrintPanelShowsCopies = 1

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel includes a field for manipulating the number of copies being printed. This field is separate from any accessory views.
Available in OS X v10.5 and later.

39.5.26 NSPrintPanelShowsOrientation = 8

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel includes a control for manipulating the page orientation. This control is separate from any accessory views.

Available in OS X v10.5 and later.

39.5.27 NSPrintPanelShowsPageRange = 2

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel includes a set of fields for manipulating the range of pages being printed. These fields are separate from any accessory views.
Available in OS X v10.5 and later.

39.5.28 NSPrintPanelShowsPageSetupAccessory = 256

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel includes a separate accessory view for manipulating the paper size, orientation, and scaling attributes. Page setup fields that are already configured for display on the main portion of the Print panel appear there and not on this accessory panel.
Available in OS X v10.5 and later.

39.5.29 NSPrintPanelShowsPaperSize = 4

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel includes a control for manipulating the paper size of the printer. This control is separate from any accessory views.
Available in OS X v10.5 and later.

39.5.30 NSPrintPanelShowsPreview = 131072

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel displays a built-in preview of the document contents. This option is only appropriate when the Print panel is used in conjunction with an NSPrintOperation object to print a document.
Available in OS X v10.5 and later.

39.5.31 NSPrintPanelShowsPrintSelection = 32

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel includes an additional selection option for paper range. This control is separate from any accessory views.
Available in OS X v10.6 and later.

39.5.32 NSPrintPanelShowsScaling = 16

MBS MacCocoa Plugin, Plugin Version: 12.4.

Function: One of the print panel option constants.
Notes:

The Print panel includes a control for scaling the printed output. This control is separate from any accessory views.
Available in OS X v10.5 and later.

Chapter 40

Cocoa Regular Expressions

40.1 class NSDataDetectorMBS

40.1.1 class NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: A specialized regular expression object that matches natural language text for predefined data patterns.
Example:

```
// create detector for links and emails
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeLink
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Email us at john@mbs.test today!"

// look for the links now
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first link
Dim r As NSTextCheckingResultMBS = m(0)
MsgBox r.URL
```

Notes:

Currently the NSDataDetectorMBS class can match dates, addresses, links, phone numbers and transit information.
(links includes email addresses)

The results of matching content is returned as NSTextCheckingResultMBS objects. However, the NSTextCheckingResultMBS objects returned by NSDataDetectorMBS are different from those returned by the base class NSRegularExpressionMBS. Results returned by NSDataDetector will be of one of the data detectors types, depending on the type of result being returned, and they will have corresponding properties. For example, results of type NSTextCheckingTypeDate have a date, timeZone, and duration; results of type NSTextCheckingTypeLink have a URL, and so forth.
Subclass of the NSRegularExpressionMBS class.

40.1.6 Methods

40.1.7 Constructor(checkingTypes as Integer, byref error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Initializes and returns a data detector instance.
Example:

```
// create detector for phone number
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypePhoneNumber
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Call us at (555)-555-555 today!"

// look for the phone number now
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first phone number found
Dim r As NSTextCheckingResultMBS = m(0)
MsgBox r.phoneNumber
```

Notes:

checkingTypes: The checking types. The supported checking types are a subset of the types NSTextCheckingType. Those constants can be combined using the BitWiseOR() function.
error: An out parameter that if an error occurs during initialization contains the encountered error.

Returns the newly initialized data detector. If an error was encountered returns nil, and error contains the error.

Currently, the supported data detectors checkingTypes are: NSTextCheckingTypeDate, NSTextCheckingTypeAddress, NSTextCheckingTypeLink, NSTextCheckingTypePhoneNumber, and NSTextCheckingTypeTransitInformation.
See also:

- 40.1.8 Constructor(script as string, options as Integer, byref error as NSErrorMBS) 9298

40.1.8 Constructor(script as string, options as Integer, byref error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Private constructor.
Notes: Here to prevent you from accidentally calling the constructor for NSRegularExpressionMBS class.
See also:

- 40.1.7 Constructor(checkingTypes as Integer, byref error as NSErrorMBS) 9297

40.1.9 copy as NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the object.

40.1.10 dataDetectorWithTypes(checkingTypes as Integer, byref error as NSErrorMBS) as NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates and returns a new data detector instance.
Example:

```
// create detector for time, date and duration
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeDate
Dim Error As NSErrorMBS
Dim DataDetector As NSDataDetectorMBS = NSDataDetectorMBS.dataDetectorWithTypes(types, error)

Dim s As String = "Let's meet sunday at 3 pm!"

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show time
Dim r As NSTextCheckingResultMBS = m(0)

Dim d As date = r.date
MsgBox d.SQLDateTime
```

Notes:

checkingTypes: The checking types. The supported checking types are a subset of the types specified in NSTextCheckingType. Those constants can be combined using the bitwise OR operator.

error: An out parameter that if an error occurs during initialization contains the encountered error.

Returns the newly initialized data detector. If an error was encountered returns nil, and error contains the error.
Discussion
Currently, the supported data detectors checkingTypes are: NSTextCheckingTypeDate, NSTextCheckingTypeAddress, NSTextCheckingTypeLink, NSTextCheckingTypePhoneNumber, and NSTextCheckingTypeTransitInformation.

40.1.11 Properties

40.1.12 checkingTypes as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the checking types for this data detector.
Notes:

The supported subset of checking types are specified in NSTextCheckingType. Those constants can be combined using the bitwise OR operator.
Currently, the supported data detectors checkingTypes are: NSTextCheckingTypeDate, NSTextCheckingTypeAddress, NSTextCheckingTypeLink, NSTextCheckingTypePhoneNumber, and NSTextCheckingTypeTransitInformation.
(Read only property)

40.2 class NSRegularExpressionMBS

40.2.1 class NSRegularExpressionMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: An immutable representation of a compiled regular expression that you apply to Unicode strings.
Notes:

The fundamental matching method for NSRegularExpressionMBS is a Block iterator method that allows clients to supply a Block object which will be invoked each time the regular expression matches a portion of the target string. There are additional convenience methods for returning all the matches as an array, the total number of matches, the first match, and the range of the first match.

An individual match is represented by an instance of the NSTextCheckingResultMBS class, which carries information about the overall matched range (via its range property), and the range of each individual capture group (via the rangeAtIndex: method). For basic NSRegularExpression objects, these match results will be of type NSTextCheckingTypeRegularExpression, but subclasses may use other types.

40.2.4 Methods

40.2.5 Constructor(script as string, options as Integer, byref error as NSErrorMBS)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an initialized NSRegularExpression instance with the specified regular expression pattern and options.
Notes:

pattern: The regular expression pattern to compile.
options: The regular expression options that are applied to the expression during matching. See NSRegularExpressionOptions for possible values.
error: An out value that returns any error encountered during initialization. Returns an NSErrorMBS object if the regular expression pattern is invalid; otherwise returns nil.

Returns an instance of NSRegularExpressionMBS for the specified regular expression and options

40.2.6 copy as NSRegularExpressionMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates a copy of the object.

40.2.7 enumerateMatches(text as string, options as Integer, range as NSRangeMBS = nil)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Enumerates the string allowing the event to handle each regular expression match.
Notes:

Calls enumerateMatch event.

text: The string.
options: The matching options to report. See MatchingOptions for the supported values.
range: The range of the string to test.

This method is the fundamental matching method for regular expressions and is suitable for overriding by subclassers. There are additional convenience methods for returning all the matches as an array, the total number of matches, the first match, and the range of the first match.

By default, the event iterator method calls the event precisely once for each match, with a non-nil result and the appropriate flags. The client may then stop the operation by setting the contents of stop to true. The stop argument is an out-only argument. You should only ever set this Boolean to true within the event.

If the MatchingReportProgress matching option is specified, the event will also be called periodically during long-running match operations, with nil result and MatchingProgress matching flag set in the event,Äôs flags parameter, at which point the client may again stop the operation by setting the contents of stop to true.

If the MatchingReportCompletion matching option is specified, the event object will be called once after

matching is complete, with nil result and the MatchingCompleted matching flag is set in the flags passed to the event, plus any additional relevant MatchingFlags from among MatchingHitEnd, MatchingRequiredEnd, or MatchingInternalError.

MatchingProgress and MatchingCompleted matching flags have no effect for methods other than this method. The MatchingHitEnd matching flag is set in the flags passed to the event if the current match operation reached the end of the search range. The MatchingRequiredEnd matching flag is set in the flags passed to the event if the current match depended on the location of the end of the search range.

The MatchingFlags matching flag is set in the flags passed to the event if matching failed due to an internal error (such as an expression requiring exponential memory allocations) without examining the entire search range.

The MatchingAnchored, MatchingWithTransparentBounds, and MatchingWithoutAnchoringBounds regular expression options, specified in the options property specified when the regular expression instance is created, can apply to any match or replace method.
If MatchingAnchored matching option is specified, matches are limited to those at the start of the search range.
If MatchingWithTransparentBounds matching option is specified, matching may examine parts of the string beyond the bounds of the search range, for purposes such as word boundary detection, lookahead, etc.

If MatchingWithoutAnchoringBounds matching option is specified, ^and $ will not automatically match the beginning and end of the search range, but will still match the beginning and end of the entire string.

MatchingWithTransparentBounds and MatchingWithoutAnchoringBounds matching options have no effect if the search range covers the entire string.

40.2.8 escapedPatternForString(text as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a string by adding backslash escapes as necessary to protect any characters that would match as pattern metacharacters.
Notes:

text: The string.

Returns the escaped string.

Returns a string by adding backslash escapes as necessary to the given string, to escape any characters that would otherwise be treated as pattern metacharacters. You typically use this method to match on a particular string within a larger pattern.

For example, the string "(N/A)" contains the pattern metacharacters (, /, and). The result of adding backslash escapes to this string is "\\(N\\/A\\)".

40.2.9 escapedTemplateForString(text as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a template string by adding backslash escapes as necessary to protect any characters that would match as pattern metacharacters.
Notes:

text: The template string

Returns the escaped template string.

Returns a string by adding backslash escapes as necessary to the given string, to escape any characters that would otherwise be treated as pattern metacharacters. You typically use this method to match on a particular string within a larger pattern.
For example, the string "(N/A)" contains the pattern metacharacters (, /, and). The result of adding backslash escapes to this string is "\\(N\\/A\\)".
See Flag Options for the format of the resulting template string.

40.2.10 firstMatch(text as string, options as Integer, range as NSRangeMBS = nil) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the first match of the regular expression within the specified range of the string.
Notes:

text: The string to search.
options: The matching options to use. See NSMatchingOptions for possible values.
range: The range of the string to search.

Returns an NSTextCheckingResultMBS object. This result gives the overall matched range via its range property, and the range of each individual capture group via its rangeAtIndex: method. The range { NSNotFound, 0 } is returned if one of the capture groups did not participate in this particular match.

This is a convenience method that calls enumerateMatches.

40.2.11 matches(text as string, options as Integer, range as NSRangeMBS = nil) as NSTextCheckingResultMBS()

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns an array containing all the matches of the regular expression in the string.
Notes:

text: The string to search.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.

Returns an array of NSTextCheckingResultMBS objects. Each result gives the overall matched range via its range property, and the range of each individual capture group via its rangeAtIndex: method. The range { NSNotFound, 0 } is returned if one of the capture groups did not participate in this particular match.

This is a convenience method that calls enumerateMatches passing the appropriate string, options, and range.

40.2.12 numberOfMatches(text as string, options as Integer, range as NSRangeMBS = nil) as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the number of matches of the regular expression within the specified range of the string.
Notes:

text: The string to search.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.

Returns the number of matches of the regular expression.

This is a convenience method that calls enumerateMatches.

40.2.13 rangeOfFirstMatch(text as string, options as Integer, range as NSRangeMBS = nil) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the range of the first match of the regular expression within the specified range of the string.
Notes:

string: The string to search.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.

Returns the range of the first match. Returns { NSNotFound, 0 } if no match is found.

This is a convenience method that calls enumerateMatches.

40.2.14 regularExpressionWithPattern(pattern as String, options as Integer, byref error as NSErrorMBS) as NSDataDetectorMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Creates an NSRegularExpression instance with the specified regular expression pattern and options.
Notes:

pattern: The regular expression pattern to compile.
options: The matching options. See constants for possible values. The values can be combined using the bitwise OR operator.
error: An out value that returns any error encountered during initialization. Returns an NSErrorMBS object if the regular expression pattern is invalid; otherwise returns nil.

Returns an instance of NSRegularExpression for the specified regular expression and options.

40.2.15 replaceMatches(byref text as string, options as Integer, range as NSRangeMBS = nil, template as String) as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Replaces regular expression matches within the mutable string using the template string.
Notes:

text: The Text to search and replace values within.
options: The matching options to use. See NSMatchingOptions for possible values.
range: The range of the string to search.
template: The substitution template used when replacing matching instances.

Returns the number of matches.

See Flag Options for the format of template.

40.2.16 replacementStringForResult(result as NSTextCheckingResultMBS, text as string, offset as Integer, template as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Used to perform template substitution for a single result for clients implementing their own replace functionality.
Notes:

result: The result of the single match.
text: The string from which the result was matched.
offset: The offset to be added to the location of the result in the string.
template: See Flag Options for the format of template.

Returns a replacement string.

For clients implementing their own replace functionality, this is a method to perform the template substitution for a single result, given the string from which the result was matched, an offset to be added to the location of the result in the string (for example, in cases that modifications to the string moved the result since it was matched), and a replacement template.
This is an advanced method that is used only if you wanted to iterate through a list of matches yourself and do the template replacement for each one, plus maybe some other calculation that you want to do in code, then you would use this at each step.

40.2.17 stringByReplacingMatches(text as string, options as Integer, range as NSRangeMBS = nil, template as String) as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns a new string containing matching regular expressions replaced with the template string.
Notes:

text: The string to search for values within.
options: The matching options to use. See Matching Options for possible values.
range: The range of the string to search.
template: The substitution template used when replacing matching instances.

Returns a string with matching regular expressions replaced by the template string.

See Flag Options for the format of template.

40.2.18 Properties

40.2.19 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

40.2.20 numberOfCaptureGroups as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the number of capture groups in the regular expression.
Notes:

A capture group consists of each possible match within a regular expression. Each capture group can then be used in a replacement template to insert that value into a replacement string.
This value puts a limit on the values of n for $ n in templates, and it determines the number of ranges in the returned NSTextCheckingResultMBS instances returned in the match... methods.
An exception will be generated if you attempt to access a result with an index value exceeding numberOfCaptureGroups-1.
(Read only property)

40.2.21 options as Integer

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the options used when the regular expression option was created.
Notes:

The options property specifies aspects of the regular expression matching that are always used when matching the regular expression. For example, if the expression is case sensitive, allows comments, ignores metacharacters, etc. See constants for a complete discussion of the possible constants and their meanings.
(Read only property)

40.2.22 pattern as String

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Returns the regular expression pattern.
Notes: (Read only property)

40.2.23 Events

40.2.24 enumerateMatch(text as String, options as Integer, result as NSTextCheckingResultMBS, flags as Integer, byref stop as Boolean)

MBS MacCocoa Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: .

Function: The event for enumerateMatches callback.
Notes:

We pass through text and options for debugging.
Set stop to true to exit early.
Can be used with addHandler if needed.

result: An NSTextCheckingResultMBS specifying the match. This result gives the overall matched range via its range property, and the range of each individual capture group via its rangeAtIndex: method. The range { NSNotFound, 0 } is returned if one of the capture groups did not participate in this particular match.
flags: The current state of the matching progress. See Matching Flags for the possible values.
stop: A reference to a Boolean value. The event can set the value to true to stop further processing of the array. The stop argument is an out-only argument. You should only ever set this Boolean to true within the event.

40.2.25 Constants

40.2.26 MatchingAnchored = 4

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the matching option constants.
Notes: Specifies that matches are limited to those at the start of the search range. See enumerateMatches for a description of the constant in context.

40.2.27 MatchingCompleted = 2

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular matching progress constants.
Notes: Set when the Block is called after matching has completed.

40.2.28 MatchingHitEnd = 4

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular matching progress constants.
Notes: Set when the current match operation reached the end of the search range.

40.2.29 MatchingInternalError = 16

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular matching progress constants.
Notes: Set when matching failed due to an internal error.

40.2.30 MatchingProgress = 1

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular matching progress constants.
Notes: Set when the Block is called to report progress during a long-running match operation.

40.2.31 MatchingReportCompletion = 2

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the matching option constants.
Notes: Call the Block once after the completion of any matching. This option has no effect for methods other than enumerateMatches. See enumerateMatches for a description of the constant in context.

40.2.32 MatchingReportProgress = 1

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the matching option constants.
Notes: Call the Block periodically during long-running match operations. This option has no effect for methods other than enumerateMatches. See enumerateMatches for a description of the constant in context.

40.2.33 MatchingRequiredEnd = 8

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular matching progress constants.
Notes: Set when the current match depended on the location of the end of the search range.

40.2.34 MatchingWithoutAnchoringBounds = 16

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the matching option constants.
Notes: Specifies that ^and $ will not automatically match the beginning and end of the search range, but will still match the beginning and end of the entire string. This constant has no effect if the search range contains the entire string. See enumerateMatches for a description of the constant in context.

40.2.35 MatchingWithTransparentBounds = 8

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the matching option constants.
Notes: Specifies that matching may examine parts of the string beyond the bounds of the search range, for purposes such as word boundary detection, lookahead, etc. This constant has no effect if the search range contains the entire string. See enumerateMatches for a description of the constant in context.

40.2.36 RegularExpressionAllowCommentsAndWhitespace = 2

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular expression options constants.
Notes: Ignore whitespace and # -prefixed comments in the pattern.

40.2.37 RegularExpressionAnchorsMatchLines = 16

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular expression options constants.
Notes: Allow ^and $ to match the start and end of lines.

40.2.38 RegularExpressionCaseInsensitive = 1

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular expression options constants.
Notes: Match letters in the pattern independent of case.

40.2.39 RegularExpressionDotMatchesLineSeparators = 8

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular expression options constants.
Notes: Allow . to match any character, including line separators.

40.2.40 RegularExpressionIgnoreMetacharacters = 4

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular expression options constants.
Notes: Treat the entire pattern as a literal string.

40.2.41 RegularExpressionUseUnicodeWordBoundaries = 64

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular expression options constants.
Notes: Use Unicode TR# 29 to specify word boundaries (otherwise, traditional regular expression word boundaries are used).

40.2.42 RegularExpressionUseUnixLineSeparators = 32

MBS MacCocoa Plugin, Plugin Version: 21.1.

Function: One of the regular expression options constants.
Notes: Treat only \n as a line separator (otherwise, all standard line separators are used).

40.3 class NSTextCheckingResultMBS

40.3.1 class NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: An occurrence of textual content found during the analysis of a block of text, such as when matching a regular expression.
Example:

```
// create detector for Address
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeAddress
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Let's meet at Hauptstra√üe 123 in 12345 Berlin, Deutschland."

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show Address
Dim r As NSTextCheckingResultMBS = m(0)

Dim dic As Dictionary = r.components
Dim lines() As String
For Each key As Variant In dic.keys
lines.Append key.StringValue+": "+dic.Value(key).StringValue
Next

MsgBox Join(lines,EndOfLine)
```

Notes:

On both iOS and macOS, instances of NSTextCheckingResultMBS are returned by the NSRegularExpression class and the NSDataDetectorMBS class to indicate the discovery of content. In those cases, what is found may be a match for a regular expression or a date, address, phone number, and so on. In macOS, instances of NSTextCheckingResultMBS are returned by the NSSpellCheckerMBS object to describe the results of spelling, grammar, or text-substitution actions.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

40.3.6 Methods

40.3.7 addressCheckingResult(Range as NSRangeMBS, components as Dictionary) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified address components.
Notes: components: A dictionary containing the address components. The dictionary keys are described in Keys for Address Components.

40.3.8 alternativeStrings as String()

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns alternative strings.

40.3.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The private constructor.

40.3.10 copy as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates a copy of the result.

40.3.11 correctionCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result after detecting a possible correction.
Notes:

range: The range of the detected result.
replacementString: The suggested replacement string.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingType-Spelling.
See also:

- 40.3.12 correctionCheckingResult(Range as NSRangeMBS, replacementString as String, alternativeStrings() as String) as NSTextCheckingResultMBS 9314

40.3.12 correctionCheckingResult(Range as NSRangeMBS, replacementString as String, alternativeStrings() as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result after detecting a possible correction.
Notes:

range: The range of the detected result.
replacementString: The suggested replacement string.

Returns an NSTextCheckingResultMBS with the specified range and a resultType of NSTextCheckingType-Spelling.
See also:

- 40.3.11 correctionCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS 9314

40.3.13 dashCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified dash corrected replacement string.
Notes:

range: The range of the detected result.
replacementString: The replacement string.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeDash.

40.3.14 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a text checking result with the specified date.
See also:

- 40.3.15 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 9315
- 40.3.16 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS 9316
- 40.3.17 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 9316

40.3.15 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and returns a text checking result with the specified date, time zone, and duration.
Notes:

range: The range of the detected result.
date: The detected date.
timeZone: The detected time zone.

duration: The detected duration.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeDate.
See also:

- 40.3.14 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS 9315
- 40.3.16 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS 9316
- 40.3.17 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 9316

40.3.16 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified date.
See also:

- 40.3.14 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS 9315
- 40.3.15 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 9315
- 40.3.17 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 9316

40.3.17 dateCheckingResult(Range as NSRangeMBS, date as DateTime, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified date, time zone, and duration.
Notes:

range: The range of the detected result.
date: The detected date.
timeZone: The detected time zone.
duration: The detected duration.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeDate.
See also:

- 40.3.14 dateCheckingResult(Range as NSRangeMBS, date as Date) as NSTextCheckingResultMBS 9315
- 40.3.15 dateCheckingResult(Range as NSRangeMBS, date as Date, timeZone as NSTimeZoneMBS, duration as double) as NSTextCheckingResultMBS 9315
- 40.3.16 dateCheckingResult(Range as NSRangeMBS, date as DateTime) as NSTextCheckingResultMBS 9316

40.3.18 grammarCheckingResult(Range as NSRangeMBS, details() as Dictionary) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified array of grammatical errors.
Notes:

range: The range of the detected result.
details: An array of details regarding the grammatical errors. This array of strings is suitable for presenting to the user.

Returns an NSTextCheckingResultMBS with the specified range and a resultType of NSTextCheckingTypeGrammar.

40.3.19 grammarDetails as Dictionary()

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The details of a located grammatical type checking result.
Notes: This array of strings is suitable for presenting to the user.

40.3.20 linkCheckingResult(Range as NSRangeMBS, URL as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified URL.

40.3.21 NSTextCheckingAirlineKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the components dictionary.
Notes: A key that corresponds to the airline of a transit result.

40.3.22 NSTextCheckingCityKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the city component of the address.

40.3.23 NSTextCheckingCountryKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the country component of the address.

40.3.24 NSTextCheckingFlightKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the components dictionary.
Example:

```
// create detector for transit information
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeTransitInformation
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Let's fly with LH444 to Atlanta!"

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show airline
Dim r As NSTextCheckingResultMBS = m(0)

Dim dic As Dictionary = r.components
Dim Airline As String = dic.Lookup(NSTextCheckingResultMBS.NSTextCheckingAirlineKey, "?")
Dim Flight As String = dic.Lookup(NSTextCheckingResultMBS.NSTextCheckingFlightKey, "?")

MsgBox Airline+" "+Flight
```

Notes: A key that corresponds to the flight component of a transit result.

40.3.25 NSTextCheckingJobTitleKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the job component of the address.

40.3.26 NSTextCheckingNameKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the name component of the address.

40.3.27 NSTextCheckingOrganizationKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the organization component of the address.

40.3.28 NSTextCheckingPhoneKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the phone number component of the address.

40.3.29 NSTextCheckingStateKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the state or province component of the address.

40.3.30 NSTextCheckingStreetKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the street address component of the address.

40.3.31 NSTextCheckingZIPKey as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: One of the constants to identify the possible keys returned in the addressComponents dictionary.
Notes: A key that corresponds to the zip code or postal code component of the address.

40.3.32 orthographyCheckingResult(Range as NSRangeMBS, orthography as NSOrthographyMBS) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified orthography.
Notes:

range: The range of the detected result.
orthography: An orthography object that describes the script.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeOrthography.

40.3.33 phoneNumberCheckingResult(Range as NSRangeMBS, phoneNumber as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified phone number.

40.3.34 quoteCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified quote-balanced replacement string.
Notes:

range: The range of the detected result.
replacementString: The replacement string.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeQuote.

40.3.35 rangeAtIndex(index as Integer) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the result type that the range represents.
Notes:

index: The index of the result.

Returns the range of the result.

A result must have at least one range, but may optionally have more (for example, to represent regular expression capture groups).
Passing rangeAtIndex the value 0 always returns the value of the the range property. Additional ranges, if any, will have indexes from 1 to numberOfRanges-1.

40.3.36 rangeWithName(name as string) as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns range with name.

40.3.37 replacementCheckingResult(Range as NSRangeMBS, replacementString as String) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified replacement string.

40.3.38 resultByAdjustingRangesWithOffset(offset as Integer) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns a new text checking result after adjusting the ranges as specified by the offset.
Notes:

offset: The amount the ranges are adjusted.

Returns a new NSTextCheckingResultMBS instance with the adjusted range or ranges.

40.3.39 spellCheckingResult(Range as NSRangeMBS) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the range of a misspelled word.
Notes:

range: The range of the detected result.

Returns an NSTextCheckingResult with the specified range and a resultType of NSTextCheckingTypeSpelling.

40.3.40 transitInformationCheckingResult(Range as NSRangeMBS, components as Dictionary) as NSTextCheckingResultMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Creates and returns a text checking result with the specified transit information.
Notes: components: A dictionary containing the transit components. The currently supported keys are NSTextCheckingAirlineKey and NSTextCheckingFlightKey.

40.3.41 Properties

40.3.42 addressComponents as Dictionary

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The address dictionary of a type checking result.
Notes:

The dictionary keys are described in Keys for Address Components.
(Read only property)

40.3.43 components as Dictionary

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: A dictionary containing the components of a type checking result.
Example:

```
// create detector for Address
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeAddress
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Let's meet at Hauptstra√üe 123 in 12345 Berlin, Deutschland."

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show Address
Dim r As NSTextCheckingResultMBS = m(0)

Dim dic As Dictionary = r.components
Dim lines() As String
For Each key As Variant In dic.keys
lines.Append key.StringValue+": "+dic.Value(key).StringValue
Next

MsgBox Join(lines,EndOfLine)
```

Notes:

Currently used by the transit checking result. The supported keys are located in Keys for Transit Components.
(Read only property)

40.3.44 date as Date

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: The date component of a type checking result.
Example:

```
// create detector for time, date and duration
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeDate
Dim Error As NSErrorMBS
Dim DataDetector As NSDataDetectorMBS = NSDataDetectorMBS.dataDetectorWithTypes(types, error)

Dim s As String = "Let's meet sunday at 3 pm!"

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show time
Dim r As NSTextCheckingResultMBS = m(0)

Dim d As date = r.date
MsgBox d.SQLDateTime
```

Notes: (Read only property)

40.3.45 dateTime as DateTime

MBS MacCocoa Plugin, Plugin Version: 20.5, Platform: macOS, Targets: All.

Function: The date component of a type checking result.
Notes: (Read only property)

40.3.46 duration as Double

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The duration component of a type checking result.
Notes: (Read only property)

40.3.47 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

40.3.48 numberOfRanges as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the number of ranges.
Notes:

A result must have at least one range, but may optionally have more (for example, to represent regular expression capture groups).
Passing rangeAtIndex the value 0 always returns the value of the the range property. Additional ranges, if any, will have indexes from 1 to numberOfRanges-1.
(Read only property)

40.3.49 orthography as NSOrthographyMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The detected orthography of a type checking result.
Notes: (Read only property)

40.3.50 phoneNumber as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The phone number of a type checking result.
Example:

```
// create detector for phone number
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypePhoneNumber
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Call us at (555)-555-555 today!"

// look for the phone number now
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first phone number found
Dim r As NSTextCheckingResultMBS = m(0)
MsgBox r.phoneNumber
```

Notes: (Read only property)

40.3.51 range as NSRangeMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the range of the result that the receiver represents.
Notes:

This property will be present for all returned NSTextCheckingResultMBS instances.
(Read only property)

40.3.52 regularExpression as NSRegularExpressionMBS

MBS MacCocoa Plugin, Plugin Version: 21.1, Platform: macOS, Targets: All.

Function: The regular expression of a type checking result.
Notes: (Read only property)

40.3.53 replacementString as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: A replacement string from one of a number of replacement checking results.
Notes: (Read only property)

40.3.54 resultType as Integer

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: Returns the text checking result type that the receiver represents.
Notes:

The possible result types for the built in checking capabilities are described in NSTextCheckingType.
This property will be present for all returned NSTextCheckingResultMBS instances.
(Read only property)

40.3.55 timeZone as NSTimeZoneMBS

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The time zone component of a type checking result.
Notes: (Read only property)

40.3.56 URL as String

MBS MacCocoa Plugin, Plugin Version: 19.1, Platform: macOS, Targets: All.

Function: The URL of a type checking result.
Example:

```
// create detector for links and emails
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeLink
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Email us at john@mbs.test today!"

// look for the links now
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first link
Dim r As NSTextCheckingResultMBS = m(0)
MsgBox r.URL
```

Notes: (Read only property)

40.3.57 Constants

40.3.58 NSTextCheckingAllCustomTypes = & hffffffff00000000

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking type constant mask.
Notes: Checking types that can be used by clients.

40.3.59 NSTextCheckingAllSystemTypes = & hffffffff

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking type constant mask.
Notes: Checking types supported by the system. The first 32 types are reserved.

40.3.60 NSTextCheckingAllTypes = & hffffffffffffffff

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking type constant mask.
Notes: All possible checking types, both system- and user-supported.

40.3.61 NSTextCheckingTypeAddress = 16

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Example:

```
// create detector for Address
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeAddress
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Let's meet at Hauptstra√üe 123 in 12345 Berlin, Deutschland."

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show Address
Dim r As NSTextCheckingResultMBS = m(0)

Dim dic As Dictionary = r.components
Dim lines() As String
For Each key As Variant In dic.keys
lines.Append key.StringValue+": "+dic.Value(key).StringValue
Next

MsgBox Join(lines,EndOfLine)
```

Notes: Attempts to locate addresses.

40.3.62 NSTextCheckingTypeCorrection = 512

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Performs autocorrection on misspelled words.

40.3.63 NSTextCheckingTypeDash = 128

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Replaces dashes with em-dashes.

40.3.64 NSTextCheckingTypeDate = 8

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Example:

```
// create detector for time, date and duration
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeDate
Dim Error As NSErrorMBS
Dim DataDetector As NSDataDetectorMBS = NSDataDetectorMBS.dataDetectorWithTypes(types, error)

Dim s As String = "Let's meet sunday at 3 pm!"

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show time
Dim r As NSTextCheckingResultMBS = m(0)

Dim d As date = r.date
MsgBox d.SQLDateTime
```

Notes: Attempts to locate dates.

40.3.65 NSTextCheckingTypeGrammar = 4

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Checks grammar.

40.3.66 NSTextCheckingTypeLink = 32

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Example:

```
// create detector for links and emails
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeLink
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Email us at john@mbs.test today!"

// look for the links now
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first link
Dim r As NSTextCheckingResultMBS = m(0)
MsgBox r.URL
```

Notes: Attempts to locate URL links or emails.

40.3.67 NSTextCheckingTypeOrthography = 1

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Attempts to identify the language

40.3.68 NSTextCheckingTypePhoneNumber = 2048

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Example:

```
// create detector for phone number
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypePhoneNumber
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Call us at (555)-555-555 today!"

// look for the phone number now
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show first phone number found
```

```
Dim r As NSTextCheckingResultMBS = m(0)
MsgBox r.phoneNumber
```

Notes: Matches a phone number.

40.3.69 NSTextCheckingTypeQuote = 64

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Replaces quotes with smart quotes.

40.3.70 NSTextCheckingTypeRegularExpression = 1024

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Matches a regular expression.

40.3.71 NSTextCheckingTypeReplacement = 256

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Replaces characters such as (c) with the appropriate symbol (in this case ¬©).

40.3.72 NSTextCheckingTypeSpelling = 2

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Notes: Checks spelling.

40.3.73 NSTextCheckingTypeTransitInformation = 4096

MBS MacCocoa Plugin, Plugin Version: 19.1.

Function: One of the checking types constants.
Example:

```
// create detector for transit information
Dim types As Integer = NSTextCheckingResultMBS.NSTextCheckingTypeTransitInformation
Dim Error As NSErrorMBS
Dim DataDetector As New NSDataDetectorMBS(types, error)

Dim s As String = "Let's fly with LH444 to Atlanta!"

// look for it:
Dim m() As NSTextCheckingResultMBS = DataDetector.matches(s, 0)

// show airline
Dim r As NSTextCheckingResultMBS = m(0)

Dim dic As Dictionary = r.components
Dim Airline As String = dic.Lookup(NSTextCheckingResultMBS.NSTextCheckingAirlineKey, "?")
Dim Flight As String = dic.Lookup(NSTextCheckingResultMBS.NSTextCheckingFlightKey, "?")

MsgBox Airline+" "+Flight
```

Notes: Matches a transit information, for example, flight information.

Chapter 41

Cocoa Tasks

41.1 class NSFileHandleMBS

41.1.1 class NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: NSFileHandle objects provide an object-oriented wrapper for accessing open files or communications channels.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataToEndOfFile
end if
```

Notes:

Please call closeFile on the end if you want to close the file.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

41.1.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 14.1

- MBS Xojo / Real Studio Plugins, version 14.1pr4

41.1.3 Blog Entries

- MonkeyBread Software Releases the MBS Xojo / Real Studio plug-ins in version 14.1
- MBS Xojo / Real Studio Plugins, version 14.1pr4

41.1.4 Methods

41.1.5 acceptConnectionInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Accepts a socket connection (for stream-type sockets only) in the background and creates a file handle for the "near" (client) end of the communications channel.
Notes:

This method is asynchronous. In a separate "safe" thread it accepts a connection, creates a file handle for the other end of the connection, and returns that object to the client by posting an NSFileHandleConnectionAcceptedNotification in the run loop of the client. The notification includes as data a userInfo dictionary containing the created NSFileHandle object; access this object using the NSFileHandleNotificationFileHandleItem key.
The receiver must be created by an fileHandleWithFileDescriptor message that takes as an argument a stream-type socket created by the appropriate system routine. The object that will write data to the returned file handle must add itself as an observer of NSFileHandleConnectionAcceptedNotification.
Note that this method does not continue to listen for connection requests after it posts NSFileHandleConnectionAcceptedNotification. If you want to keep getting notified, you need to call acceptConnectionInBackgroundAndNotify again in your observer method.

41.1.6 AvailableBytes as Integer

MBS MacCocoa Plugin, Plugin Version: 14.1, Platform: macOS, Targets: All.

Function: Queries number of available bytes.
Notes:

Returns -1 if query failed.
You can use this value with readDataOfLength function to have it not block.

41.1.7 availableData as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the data available through the receiver.
Notes: If the receiver is a file, returns the data obtained by reading the file from the file pointer to the end of the file. If the receiver is a communications channel, reads up to a buffer of data and returns it; if no data is available, the method blocks. Returns an empty data object if the end of file is reached. Raises NSFileHandleOperationException if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.

41.1.8 closeFile

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Disallows further access to the represented file or communications channel and signals end of file on communications channels that permit writing.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim e as NSErrorMBS
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then
MsgBox e.localizedDescription
end if

if n<>Nil then
MsgBox n.readDataOfLength(5)
n.closeFile
end if
```

Notes:

The file or communications channel is available for other uses after the file handle represented by the receiver is closed. Further read and write messages sent to a file handle to which closeFile has been sent raises an exception.
Sending closeFile to a file handle does not cause its deallocation. The deallocation of an NSFileHandle object deletes its descriptor and closes the represented file or channel unless the NSFileHandle object was created with fileHandleWithFileDescriptor with false as the parameter argument.

41.1.9 Constructor

MBS MacCocoa Plugin, Plugin Version: 13.1, Platform: macOS, Targets: All.

Function: The private constructor.

41.1.10 fileDescriptor as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file descriptor associated with the receiver.
Notes:

Returns the POSIX file descriptor associated with the receiver.

You can send this message to file handles originating from both file descriptors and file handles and receive a valid file descriptor so long as the file handle is open. If the file handle has been closed by sending it closeFile, this method raises an exception.

41.1.11 fileHandleForReadingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified path.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataToEndOfFile
end if
```

Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandle read... messages.

41.1.12 fileHandleForReadingAtPath(path as string) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified path.
Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandle read... messages.

41.1.13 fileHandleForReadingFromFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified URL.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim e as NSErrorMBS
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then
MsgBox e.localizedDescription
end if

if n<>Nil then
MsgBox n.readDataOfLength(5)
MsgBox str(n.offsetInFile) // shows 5
end if
```

Notes:

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandleread... messages.

41.1.14 fileHandleForReadingFromURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading the file, device, or named socket at the specified URL.
Notes:

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to NSFileHandleread... messages.

41.1.15 fileHandleForUpdatingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified path.
Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandle read... messages and writeData.

41.1.16 fileHandleForUpdatingAtPath(path as string) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at

the specified path.
Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandle read... messages and writeData.

41.1.17 fileHandleForUpdatingFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.
Notes:

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

The initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandleread... messages and writeData.

41.1.18 fileHandleForUpdatingURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for reading and writing to the file, device, or named socket at the specified URL.
Notes:

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

The initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds to both NSFileHandleread...

messages and writeData.

41.1.19 fileHandleForWritingAtFile(path as folderitem) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified path.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingAtFile(f)

if n<>Nil then
n.writeData "Hello World"
n.closeFile
end if
```

Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

41.1.20 fileHandleForWritingAtPath(path as string) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified path.
Notes:

path: The path to the file, device, or named socket to access.

Returns the initialized file handle, or nil if no file exists at path.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

41.1.21 fileHandleForWritingToFile(URL as folderitem, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim e as NSErrorMBS
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingToFile(f, e)

if e<>Nil then
MsgBox e.localizedDescription
else
n.writeData "Hello World"
n.closeFile
end if
```

Notes:

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

41.1.22 fileHandleForWritingToURL(URL as string, byref error as NSErrorMBS) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized for writing to the file, device, or named socket at the specified URL.
Notes:

url: The URL of the file, device, or named socket to access.
error: If an error occurs, upon return contains an NSError object that describes the problem.

Returns the initialized file handle, or nil if no file exists at url.

The file pointer is set to the beginning of the file. The returned object responds only to writeData.

41.1.23 fileHandleWithFileDescriptor(fd as Integer) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized with a file descriptor.
Notes:

You can create a file handle for a socket by using the result of a socket call as fileDescriptor.
The object creating a file handle using this method owns fileDescriptor and is responsible for its disposition.
See also:

- 41.1.24 fileHandleWithFileDescriptor(fd as Integer, closeOnDealloc as boolean) as NSFileHandleMBS 9342

41.1.24 fileHandleWithFileDescriptor(fd as Integer, closeOnDealloc as boolean) as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle initialized with a file descriptor.
Notes:

You can create a file handle for a socket by using the result of a socket call as fileDescriptor.
The object creating a file handle using this method owns fileDescriptor and is responsible for its disposition.

closeOnDealloc: True if the file descriptor should be closed when the receiver is deallocated, otherwise false.
See also:

- 41.1.23 fileHandleWithFileDescriptor(fd as Integer) as NSFileHandleMBS 9342

41.1.25 fileHandleWithNullDevice as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns a file handle associated with a null device.
Notes: You can use null-device file handles as "placeholders" for standard-device file handles or in collection objects to avoid exceptions and other errors resulting from messages being sent to invalid file handles. Read messages sent to a null-device file handle return an end-of-file indicator (an empty NSData object) rather than raise an exception. Write messages are no-ops, whereas fileDescriptor returns an illegal value. Other methods are no-ops or return "sensible" values.

41.1.26 fileHandleWithStandardError as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file handle associated with the standard error file.
Example:

```
// for GUI apps this ends on the console: (see console.app)

dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleWithStandardError

n.writeData "Hello World"
```

Notes: Conventionally this is a terminal device to which error messages are sent. There is one standard error file handle per process; it is a shared instance.

41.1.27 fileHandleWithStandardInput as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file handle associated with the standard input file.
Notes: Conventionally this is a terminal device on which the user enters a stream of data. There is one standard input file handle per process; it is a shared instance.

41.1.28 fileHandleWithStandardOutput as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the file handle associated with the standard output file.
Example:

```
// for GUI apps this ends on the console: (see console.app)

dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleWithStandardOutput

n.writeData "Hello World"
```

Notes: Conventionally this is a terminal device that receives a stream of data from a program. There is one standard output file handle per process; it is a shared instance.

41.1.29 NSFileHandleConnectionAcceptedNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: This notification is posted when an NSFileHandle object establishes a socket connection between two processes, creates an NSFileHandle object for one end of the connection, and makes this object available to observers by putting it in the userInfo dictionary.
Notes:

To cause the posting of this notification, you must send either acceptConnectionInBackgroundAndNotify to an NSFileHandle object representing a server stream-type socket.
The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

NSFileHandleNotificationFileHandleItem	The NSFileHandle object representing the "near" end of a socket connection
NSFileHandleError	An integer representing the UNIX-type error which occurred

41.1.30 NSFileHandleDataAvailableNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: This notification is posted when the background thread determines that data is currently available for reading in a file or at a communications channel.
Notes:

The observers can then issue the appropriate messages to begin reading the data. To cause the posting of this notification, you must send either waitForDataInBackgroundAndNotify or waitForDataInBackgroundAndNotifyForModes: to an appropriate NSFileHandle object.
The notification object is the NSFileHandle object that sent the notification. This notification does not contain a userInfo dictionary.

41.1.31 NSFileHandleNotificationDataItem as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: A key in the userinfo dictionary in a NSFileHandleReadCompletionNotification and NSFileHandleReadToEndOfFileCompletionNotification.
Notes: The corresponding value is an memoryblock containing the available data read from a socket connection.

41.1.32 NSFileHandleNotificationFileHandleItem as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: A key in the userinfo dictionary in a NSFileHandleConnectionAcceptedNotification notification.
Notes: The corresponding value is the NSFileHandle object handle representing the "near" end of a socket connection.

41.1.33 NSFileHandleNotificationMonitorModes as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Currently unused.

41.1.34 NSFileHandleOperationException as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Constant that defines the name of a file operation exception.
Notes: Raised by NSFileHandle if attempts to determine file-handle type fail or if attempts to read from a file or channel fail.

41.1.35 NSFileHandleReadCompletionNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: One of the notification strings for the file handle class.
Notes:

This notification is posted when the background thread reads the data currently available in a file or at a communications channel. It makes the data available to observers by putting it in the userInfo dictionary. To cause the posting of this notification, you must send either readInBackgroundAndNotify to an appropriate NSFileHandle object.
The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

NSFileHandleNotificationDataItem	An string containing the available data read from a socket connection
NSFileHandleError	An integer representing the UNIX-type error which occurred

41.1.36 NSFileHandleReadToEndOfFileCompletionNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: This notification is posted when the background thread reads all data in the file or, if a communications channel, until the other process signals the end of data.

Notes:

It makes the data available to observers by putting it in the userInfo dictionary. To cause the posting of this notification, you must send either readToEndOfFileInBackgroundAndNotify to an appropriate NSFileHandle object.
The notification object is the NSFileHandle object that sent the notification. The userInfo dictionary contains the following information:

NSFileHandleNotificationDataItem: A string containing the available data read from a socket connection

NSFileHandleError An integer representing the UNIX-type error which occurred

41.1.37 readDataOfLength(length as Integer) as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Reads data up to a specified number of bytes from the receiver.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataOfLength(5)
end if
```

Notes:

length: The number of bytes to read from the receiver.

Returns the data available through the receiver up to a maximum of length bytes.

If the receiver is a file, returns the data obtained by reading from the file pointer to length or to the end of the file, whichever comes first. If the receiver is a communications channel, the method reads data from the channel up to length. Returns an empty memoryblock if the file is positioned at the end of the file or if an end-of-file indicator is returned on a communications channel. Raises NSFileHandleOperationException if attempts to determine file-handle type fail or if attempts to read from the file or channel fail.

41.1.38 readDataToEndOfFile as MemoryBlock

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the data available through the receiver up to the end of file or maximum number of bytes.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

if n<>Nil then
MsgBox n.readDataToEndOfFile
end if
```

Notes:

Returns the data available through the receiver up to UINT_MAX bytes (the maximum value for unsigned integers) or, if a communications channel, until an end-of-file indicator is returned.

This method invokes readDataOfLength as part of its implementation.

41.1.39 readInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Reads from the file or communications channel in the background and posts a notification when finished.
Notes:

This method performs an asynchronous availableData operation on a file or communications channel and posts an NSFileHandleReadCompletionNotification to the client process's run loop.
The length of the data is limited to the buffer size of the underlying operating system. The notification includes a userInfo dictionary that contains the data read; access this object using the NSFileHandleNotificationDataItem key.
Any object interested in receiving this data asynchronously must add itself as an observer of NSFileHandleReadCompletionNotification. In communication via stream-type sockets, the receiver is often the object returned in the userInfo dictionary of NSFileHandleConnectionAcceptedNotification.
Note that this method does not cause a continuous stream of notifications to be sent. If you wish to keep getting notified, you'll also need to call readInBackgroundAndNotify in your observer method.

41.1.40 readToEndOfFileInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Reads to the end of file from the file or communications channel in the background and posts a notification when finished.
Example:

```
dim path as string = "/tmp/NSFileHandle async reading.txt"
dim f as FolderItem = GetFolderItem(path, FolderItem.PathTypeShell)
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingAtFile(f)

n.readToEndOfFileInBackgroundAndNotify
```

Notes:

This method performs an asynchronous readToEndOfFile operation on a file or communications channel and posts an NSFileHandleReadToEndOfFileCompletionNotification to the client process's run loop.
The notification includes a userInfo dictionary that contains the data read; access this object using the NSFileHandleNotificationDataItem key.
Any object interested in receiving this data asynchronously must add itself as an observer of NSFileHandleReadToEndOfFileCompletionNotification. In communication via stream-type sockets, the receiver is often the object returned in the userInfo dictionary of NSFileHandleConnectionAcceptedNotification.

41.1.41 seekToEndOfFile as UInt64

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Puts the file pointer at the end of the file referenced by the receiver and returns the new file offset.
Notes:

Returns the file offset with the file pointer at the end of the file. This is therefore equal to the size of the file.

Raises an exception if the message is sent to an NSFileHandle object representing a pipe or socket or if the file descriptor is closed.

41.1.42 seekToFileOffset(offset as UInt64)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Moves the file pointer to the specified offset within the file represented by the receiver.
Notes: Raises an exception if the message is sent to an NSFileHandle object representing a pipe or socket,

if the file descriptor is closed, or if any other error occurs in seeking.

41.1.43 synchronizeFile

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Causes all in-memory data and attributes of the file represented by the receiver to be written to permanent storage.
Notes: This method should be invoked by programs that require the file to always be in a known state. An invocation of this method does not return until memory is flushed.

41.1.44 truncateFileAtOffset(offset as UInt64)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Truncates or extends the file represented by the receiver to a specified offset within the file and puts the file pointer at that position.
Notes:

offset: The offset within the file that will mark the new end of the file.

If the file is extended (if offset is beyond the current end of file), the added characters are null bytes.

41.1.45 waitForDataInBackgroundAndNotify

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Checks to see if data is available in a background thread.
Notes: When the data becomes available, the thread notifies all observers with NSFileHandleDataAvailableNotification. After the notification has been posted, the thread is terminated.

41.1.46 writeData(data as MemoryBlock)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Synchronously writes data to the file, device, pipe, or socket represented by the receiver.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
```

```
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForWritingAtFile(f)

if n<>Nil then
n.writeData "Hello World"
n.closeFile
end if
```

Notes: If the receiver is a file, writing takes place at the file pointer's current position. After it writes the data, the method advances the file pointer by the number of bytes written. Raises an exception if the file descriptor is closed or is not valid, if the receiver represents an unconnected pipe or socket endpoint, if no free space is left on the file system, or if any other writing error occurs.

41.1.47 Properties

41.1.48 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal handle to the NSFileHandle object.
Notes: (Read and Write property)

41.1.49 offsetInFile as UInt64

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the position of the file pointer within the file represented by the receiver.
Example:

```
// file must exist for this sample:

dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim e as NSErrorMBS
dim n as NSFileHandleMBS = NSFileHandleMBS.fileHandleForReadingFromFile(f,e)

if e<>Nil then
MsgBox e.localizedDescription
end if

if n<>Nil then
MsgBox n.readDataOfLength(5)
MsgBox str(n.offsetInFile) // shows 5
end if
```

Notes:

The position of the file pointer within the file represented by the receiver.

Raises an exception if the message is sent to a file handle representing a pipe or socket or if the file descriptor is closed.
(Read and Write computed property)

41.2 class NSPipeMBS

41.2.1 class NSPipeMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: NSPipe objects provide an object-oriented interface for accessing pipes.
Notes: An NSPipe object represents both ends of a pipe and enables communication through the pipe. A pipe is a one-way communications channel between related processes; one process writes data, while the other process reads that data. The data that passes through the pipe is buffered; the size of the buffer is determined by the underlying operating system. NSPipe is an abstract class, the public interface of a class cluster.

- MBS Xojo Plugins, version 17.4pr2

41.2.4 Methods

41.2.5 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The constructor to create a new pipe.
Notes: Handle is not zero on success.

41.2.6 fileHandleForReading as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the receiver's read file handle.
Notes:

You use the returned file handle to read from the pipe using NSFileHandle's read methods,ÄîavailableData, readDataToEndOfFile, and readDataOfLength.
You don't need to send closeFile to this object or explicitly release the object after you have finished using it.

41.2.7 fileHandleForWriting as NSFileHandleMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns the receiver's write file handle.
Notes: You use the returned file handle to write to the pipe using NSFileHandle's writeData: method. When you are finished writing data to this object, send it a closeFile message to delete the descriptor. Deleting the descriptor causes the reading process to receive an end-of-data signal (an empty memoryblock).

41.2.8 pipe as NSPipeMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: Returns an initialized NSPipe object.
Notes: Returns nil if the method encounters errors while attempting to create the pipe or the NSFileHandle objects that serve as endpoints of the pipe.

41.2.9 Properties

41.2.10 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: All.

Function: The internal reference to the NSPipe object.
Notes: (Read and Write property)

41.3 class NSTaskMBS

41.3.1 class NSTaskMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Using the NSTask class, your program can run another program as a subprocess and can monitor that program's execution.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

dim task as new NSTaskMBS

task.launchPath = "/bin/ls"

dim arguments(-1) as string = array("-l", "-a", "-t")

task.setArguments arguments

dim pipe as new NSPipeMBS

task.setStandardOutput pipe

dim file as NSFileHandleMBS = pipe.fileHandleForReading

task.launch

dim data as string = file.readDataToEndOfFile
dim text as string = DefineEncoding(data, encodings.UTF8)

MsgBox text
```

Notes:

An NSTask object creates a separate executable entity; it differs from NSThread in that it does not share memory space with the process that creates it.
A task operates within an environment defined by the current values for several items: the current directory, standard input, standard output, standard error, and the values of any environment variables. By default, an NSTask object inherits its environment from the process that launches it. If there are any values that should be different for the task, for example, if the current directory should change, you must change the value before you launch the task. A task's environment cannot be changed while it is running.
An NSTask object can only be run once. Subsequent attempts to run the task raise an error.

This class is comparable to the shell classe built into Xojo.
See also WindowsProcessMBS and WindowsShellExecuteMBS (Windows only), ConsoleExecuteMBS and

ShellMBS (cross platform).

41.3.2 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.3pr1

41.3.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 15.3pr1

41.3.4 Methods

41.3.5 arguments as string()

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The command arguments that should be used to launch the executable.

41.3.6 Constructor

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: On success the handle value is not zero.

41.3.7 Destructor

MBS MacCocoa Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The destructor.

41.3.8 interrupt

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends an interrupt signal to the receiver and all of its subtasks.
Notes:

If the task terminates as a result, which is the default behavior, an NSTaskDidTerminateNotification gets sent to the default notification center. This method has no effect if the receiver was already launched and

has already finished executing. If the receiver has not been launched yet, this method raises an NSInvalidArgumentException.
It is not always possible to interrupt the receiver because it might be ignoring the interrupt signal. interrupt sends SIGINT.

41.3.9 launch

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Launches the task represented by the receiver.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

dim task as new NSTaskMBS

task.launchPath = "/bin/ls"

dim arguments(-1) as string = array("-l", "-a", "-t")

task.setArguments arguments

dim pipe as new NSPipeMBS

task.setStandardOutput pipe

dim file as NSFileHandleMBS = pipe.fileHandleForReading

task.launch

dim data as string = file.readDataToEndOfFile
dim text as string = DefineEncoding(data, encodings.UTF8)

MsgBox text
```

Notes:

Raises an NSInvalidArgumentException if the launch path has not been set or is invalid or if it fails to create a process.
If you get an exception with posix_spawn and error 13, that's a permission denied.

41.3.10 launchedTaskWithLaunchPath(path as string, arguments() as string) as NSTaskMBS

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates and launches a task with a specified executable and arguments.
Example:

```
dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)
```

Notes:

path: The path to the executable.
arguments: An array of strings that supplies the arguments to the task.

The task inherits its environment from the process that invokes this method.
The NSTask object converts both path and the strings in arguments to appropriate C-style strings (using fileSystemRepresentation) before passing them to the task via argv [ ]) . The strings in arguments do not undergo shell expansion, so you do not need to do special quoting, and shell variables, such as $ PWD, are not resolved.

41.3.11 NSTaskDidTerminateNotification as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The notification name used to notify you that the task terminated.
Notes:

Posted when the task has stopped execution. This notification can be posted either when the task has exited normally or as a result of terminate being sent to the NSTask object. If the NSTask object gets released, however, this notification will not get sent, as the port the message would have been sent on was released as part of the task release. The observer method can use terminationStatus to determine why the task died. See "Ending an NSTask" for an example.

The notification object is the NSTask object that was terminated. This notification does not contain a userInfo dictionary.

41.3.12 resume as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Resumes execution of the receiver task that had previously been suspended with a suspend

message.
Notes: If multiple suspend messages were sent to the receiver, an equal number of resume messages must be sent before the task resumes execution.

41.3.13 setArguments(arguments() as string)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the command arguments that should be used to launch the executable.
Example:

```
// Performing complex pipelines.
// You can create multiple NSTasks and a bunch of NSPipes and hook them together,
// or you can use the "sh -c" trick to feed a shell a command, and let it parse
// it and set up all the IPC. This pipeline cats /usr/share/dict/words, finds
// all the words with 'ham' in them, reverses them, and shows you the last 5.

dim task as new NSTaskMBS

task.LaunchPath="/bin/sh"

dim arguments(-1) as string

arguments.Append "-c"
arguments.Append "cat /usr/share/dict/words | grep -i ham | rev | tail -5"

task.setArguments arguments
```

41.3.14 setStandardError(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard error for the receiver.
Notes:

This method can be used with NSPipeMBS or NSFileHandleMBS object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard error is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

• 41.3.15 setStandardError(p as NSPipeMBS) 9359

41.3.15 setStandardError(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard error for the receiver.
Notes:

This method can be used with NSPipeMBS or NSFileHandleMBS object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard error is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

• 41.3.14 setStandardError(p as NSFileHandleMBS) 9358

41.3.16 setStandardInput(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard input for the receiver.
Notes:

file: The standard input for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the read end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the read end of the pipe won't be closed automatically.
If this method isn't used, the standard input is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

• 41.3.17 setStandardInput(p as NSPipeMBS) 9359

41.3.17 setStandardInput(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard input for the receiver.
Notes:

file: The standard input for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the read end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the read end of the pipe won't be closed automatically.
If this method isn't used, the standard input is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 41.3.16 setStandardInput(p as NSFileHandleMBS) 9359

41.3.18 setStandardOutput(p as NSFileHandleMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard output for the receiver.
Notes:

file: The standard output for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard output is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 41.3.19 setStandardOutput(p as NSPipeMBS) 9360

41.3.19 setStandardOutput(p as NSPipeMBS)

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sets the standard output for the receiver.
Notes:

file: The standard output for the receiver, which can be either an NSFileHandle or an NSPipe object.

If file is an NSPipe object, launching the receiver automatically closes the write end of the pipe in the current task. Don't create a handle for the pipe and pass that as the argument, or the write end of the pipe won't be closed automatically.
If this method isn't used, the standard output is inherited from the process that created the receiver. This method raises an NSInvalidArgumentException if the receiver has already been launched.
See also:

- 41.3.18 setStandardOutput(p as NSFileHandleMBS) 9360

41.3.20 standardError as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the standard error file used by the receiver.
Notes:

The standard error file used by the receiver.

Standard error is where all diagnostic messages are sent. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to setStandardError.

41.3.21 standardInput as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the standard input file used by the receiver.
Notes:

The standard input file used by the receiver.

Standard input is where the receiver takes its input from unless otherwise specified. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to the setStandardInput method.

41.3.22 standardOutput as Variant

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the standard output file used by the receiver.
Notes: Standard output is where the receiver displays its output. The object returned is either an NSFileHandle or an NSPipe instance, depending on what type of object was passed to the setStandardOutput method.

41.3.23 suspend as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Suspends execution of the receiver task.
Notes:

Returns true if the receiver was successfully suspended, false otherwise.

Multiple suspend messages can be sent, but they must be balanced with an equal number of resume messages before the task resumes execution.

41.3.24 terminate

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Sends a terminate signal to the receiver and all of its subtasks.
Notes:

If the task terminates as a result, which is the default behavior, an NSTaskDidTerminateNotification gets sent to the default notification center. This method has no effect if the receiver was already launched and has already finished executing. If the receiver has not been launched yet, this method raises an NSInvalidArgumentException.
It is not always possible to terminate the receiver because it might be ignoring the terminate signal. terminate sends SIGTERM.

41.3.25 waitUntilExit

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Block until the receiver is finished.
Example:

```
dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

task.waitUntilExit

MsgBox "done"
```

Notes: This method first checks to see if the receiver is still running using isRunning. Then it polls the current run loop using NSDefaultRunLoopMode until the task completes.

41.3.26 Properties

41.3.27 currentDirectoryPath as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The task's current directory.
Notes: (Read and Write property)

41.3.28 Handle as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal reference to the NSTask object.
Notes: (Read and Write property)

41.3.29 isRunning as boolean

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns whether the receiver is still running.
Notes: (Read only property)

41.3.30 launchPath as string

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: The path of the receiver's executable.
Notes: (Read and Write property)

41.3.31 processIdentifier as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the receiver's process identifier.
Example:

```
dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

MsgBox "PID: "+str(task.processIdentifier)
```

Notes: (Read only property)

41.3.32 qualityOfService as Integer

MBS MacCocoa Plugin, Plugin Version: 15.3, Platform: macOS, Targets: Desktop, Console & Web.

Function: The quality of service setting for this application.
Notes:

read-only after the task is launched.
(Read and Write property)

41.3.33 terminationReason as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the reason the task was terminated.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

if not task.isRunning then
dim status as Integer = Task.terminationReason

MsgBox "Task termination reason is: "+str(status)
end if
```

Notes:

Available in Mac OS X v10.6 and later.

see this constants:

NSTaskTerminationReasonExit	= 1	The task exited normally.
NSTaskTerminationReasonUncaughtSignal	= 2	The task exited due to an uncaught signal.

(Read only property)

41.3.34 terminationStatus as Integer

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the exit status returned by the receiver's executable.
Example:

```
// Launch "ls -l -a -t" in the current directory, and then read the result into a string:

dim args(-1) as string
dim task as NSTaskMBS = NSTaskMBS.launchedTaskWithLaunchPath("/bin/ls", args)

if not task.isRunning then
dim status as Integer = Task.terminationStatus

MsgBox "Task return value is: "+str(status)
end if
```

Notes:

The exit status returned by the receiver's executable.

Each task defines and documents how its return value should be interpreted. For example, many commands return 0 if they complete successfully or an error code if they don't. You'll need to look at the documentation for that task to learn what values it returns under what circumstances.
This method raises an NSInvalidArgumentException if the receiver is still running. Verify that the receiver is not running before you use it.
(Read only property)

41.3.35 environment as dictionary

MBS MacCocoa Plugin, Plugin Version: 9.7, Platform: macOS, Targets: Desktop, Console & Web.

Function: A dictionary of variables for the environment from which the receiver was launched.
Notes:

The dictionary keys are the environment variable names.
(Read and Write computed property)

41.3.36 Events

41.3.37 Terminated

MBS MacCocoa Plugin, Plugin Version: 15.3, Platform: macOS, Targets: .

Function: Event called when task terminated.

41.3.38 Constants

41.3.39 NSQualityOfServiceBackground = & h09

MBS MacCocoa Plugin, Plugin Version: 15.3.

Function: One of the quality of service constants.
Notes: Background QoS is used for work that is not user initiated or visible. In general, a user is unaware that this work is even happening and it will run in the most efficient manner while giving the most deference to higher QoS work. For example, pre-fetching content, search indexing, backups, and syncing of data with external systems.

41.3.40 NSQualityOfServiceDefault = -1

MBS MacCocoa Plugin, Plugin Version: 15.3.

Function: One of the quality of service constants.
Notes: Default QoS indicates the absence of QoS information. Whenever possible QoS information will be inferred from other sources. If such inference is not possible, a QoS between UserInitiated and Utility will be used.

41.3.41 NSQualityOfServiceUserInitiated = & h19

MBS MacCocoa Plugin, Plugin Version: 15.3.

Function: One of the quality of service constants.
Notes: UserInitiated QoS is used for performing work that has been explicitly requested by the user and for which results must be immediately presented in order to allow for further user interaction. For example, loading an email after a user has selected it in a message list.

41.3.42 NSQualityOfServiceUserInteractive = & h21

MBS MacCocoa Plugin, Plugin Version: 15.3.

Function: One of the quality of service constants.
Notes: UserInteractive QoS is used for work directly involved in providing an interactive UI such as processing events or drawing to the screen.

41.3.43 NSQualityOfServiceUtility = & h11

MBS MacCocoa Plugin, Plugin Version: 15.3.

Function: One of the quality of service constants.
Notes: Utility QoS is used for performing work which the user is unlikely to be immediately waiting for the results. This work may have been requested by the user or initiated automatically, does not prevent the user from further interaction, often operates at user-visible timescales and may have its progress indicated to the user by a non-modal progress indicator. This work will run in an energy-efficient manner, in deference to higher QoS work when resources are constrained. For example, periodic content updates or bulk file operations such as media import.

41.3.44 NSTaskTerminationReasonExit = 1

MBS MacCocoa Plugin, Plugin Version: 9.7.

Function: One of the constants used to specify the values that are returned by terminationReason.
Notes: The task exited normally.

41.3.45 NSTaskTerminationReasonUncaughtSignal = 2

MBS MacCocoa Plugin, Plugin Version: 9.7.

Function: One of the constants used to specify the values that are returned by terminationReason.
Notes: The task exited due to an uncaught signal.

41.4 class NSUserAppleScriptTaskMBS

41.4.1 class NSUserAppleScriptTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to run an AppleScript script.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("Hello.scpt")
dim e as NSErrorMBS
dim n as new NSUserAppleScriptTaskMBS(file, e)

if e <>nil then
MsgBox e.localizedDescription
end if

n.execute

exception u as UnsupportedOperationException

if e <>nil then
MsgBox e.localizedDescription
end if
```

Notes:

These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.
Subclass of the NSUserScriptTaskMBS class.

41.4.2 Methods

41.4.3 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a folderitem for a script file.
Notes: The returned object will be of one of the specific sub-classes, or raises exception if the file does not appear to match any of the known types. (If used from a sub-class, the result will be of that class, or raises exception.)
See also:

- 41.4.4 Constructor(URL as String, byref error as NSErrorMBS) 9369

41.4.4 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be of one of the specific sub-classes, or raises exception if the file does not appear to match any of the known types. (If used from a sub-class, the result will be of that class, or raises exception.)
See also:

- 41.4.3 Constructor(file as folderitem, byref error as NSErrorMBS) 9368

41.4.5 executeWithAppleEvent(eventDesc as NSAppleEventDescriptorMBS, tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the AppleScript script by sending it the given Apple event.
Notes:

Pass nil for eventDesc to execute the script's default "run" handler.
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

41.5 class NSUserAutomatorTaskMBS

41.5.1 class NSUserAutomatorTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to run an Automator workflow.
Notes:

These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.
Subclass of the NSUserScriptTaskMBS class.

41.5.2 Methods

41.5.3 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 41.5.4 Constructor(URL as String, byref error as NSErrorMBS) 9370

41.5.4 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 41.5.3 Constructor(file as folderitem, byref error as NSErrorMBS) 9370

41.5.5 executeWithInput(input as Variant, tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the Automator workflow, passing it the given input.
Notes:

Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

41.5.6 Properties

41.5.7 Variables as Dictionary

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Workflow variables.
Notes:

If you want to change, query the current dictionary, change it and assign it back to the variables property.
(Read and Write property)

41.6 class NSUserScriptTaskMBS

41.6.1 class NSUserScriptTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: A class to run a script.
Notes:

These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.

41.6.2 Methods

41.6.3 Available as Boolean

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Whether the class is available.
Notes: Should return true on OS X 10.8 and newer.

41.6.4 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 41.6.5 Constructor(URL as String, byref error as NSErrorMBS) 9372

41.6.5 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 41.6.4 Constructor(file as folderitem, byref error as NSErrorMBS) 9372

41.6.6 execute(tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the script with no input and ignoring any result.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("Hello.scpt")
dim e as NSErrorMBS
dim n as new NSUserScriptTaskMBS(file, e)

n.execute
```

Notes:

This and the other "execute" methods may be called at most once on any given instance. If the script completed normally, the ExecuteFinished event's "error" parameter will be nil.
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

41.6.7 ScriptFolder as FolderItem

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The script folder for the application.

41.6.8 Properties

41.6.9 Handle as Integer

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

41.6.10 scriptURL as String

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The script URL used for initialization.
Notes: (Read only property)

41.6.11 Events

41.6.12 executeFinished(error as NSErrorMBS, tag as Variant, result as Variant, input as Variant)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: .

Function: The event called when execution is finished.
Notes:

For AppleEvent call the result and input are NSAppleEventDescriptorMBS objects.
For Automator scripts the result and input are set to the values.
For all other scripts, they are nil.

While a script executes the plugin keeps a reference tot he tag and itself, so the script object is not released too early.

41.7 class NSUserUnixTaskMBS

41.7.1 class NSUserUnixTaskMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: The class to run a Unix executable file, typically a shell script.
Notes:

These classes are intended to execute user-supplied scripts, and will execute them outside of the application's sandbox, if any. (They are *not* intended to execute scripts built into an application; for that, use NSTaskMBS, NSAppleScript classes, or AMWorkflow classes.) If the application is sandboxed, then the script must be in the "application scripts" folder, which you can get using ScriptFolder function. A sandboxed application may read from, but not write to, this folder.

If you simply need to execute scripts without regard to input or output, use NSUserScriptTaskMBS, which can execute any of the specific types. If you need specific control over the input to or output from the script, use one of the sub-classes, which have more detailed "execute" methods.

The script should have a valid file extension like ".sh" and the executable bit set (chmod +x) to be able to run. First line of the script should have the shebang line like "# !/bin/bash" and line endings should be Chr(10) as in EndOfLine.Unix.
Subclass of the NSUserScriptTaskMBS class.

41.7.4 Methods

41.7.5 Constructor(file as folderitem, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes:

The returned object will be, or raises exception if the file does not appear to match any of the known types.

The script should have a valid file extension like ".sh" and the executable bit set (chmod +x) to be able to run. First line of the script should have the shebang line like "# !/bin/bash" and line endings should be Chr(10) as in EndOfLine.Unix.
See also:

- 41.7.6 Constructor(URL as String, byref error as NSErrorMBS) 9376

41.7.6 Constructor(URL as String, byref error as NSErrorMBS)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initialize given a URL for a script file.
Notes: The returned object will be, or raises exception if the file does not appear to match any of the known types.
See also:

- 41.7.5 Constructor(file as folderitem, byref error as NSErrorMBS) 9375

41.7.7 executeWithArguments(arguments() as string, tag as Variant = nil)

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Execute the file with the given arguments.
Notes:

The arguments do not undergo shell expansion, so you do not need to do special quoting, and shell variables are not resolved.
Calls later ExecuteFinished event.
The tag value is passed to the executeFinished event.

41.7.8 Properties

41.7.9 standardError as NSFileHandleMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Standard I/O stream for error.
Notes:

Setting this to nil (the default) will bind it to /dev/null.

Can be redirected to file via NSFileHandleMBS.fileHandleForWritingToFile() function.
(Read and Write property)

41.7.10 standardInput as NSFileHandleMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Standard I/O stream for input.
Notes:

Setting this to nil (the default) will bind it to /dev/null.
(Read and Write property)

41.7.11 standardOutput as NSFileHandleMBS

MBS MacExtras Plugin, Plugin Version: 16.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Standard I/O stream for output.
Notes:

Setting this to nil (the default) will bind it to /dev/null.

Can be redirected to file via NSFileHandleMBS.fileHandleForWritingToFile() function.
(Read and Write property)

Chapter 42

Cocoa Text

42.1 class NSAttributedStringMBS

42.1.1 class NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: A class to represent a string in the Cocoa world with attached attributes.
Example:

```
dim a as new NSAttributedStringMBS

if a.initWithHTML("<B>Hello</B>") then
MsgBox a.htmlString
end if
```

42.1.6 Methods

42.1.7 AsCFAttributedString as Variant

MBS MacBase Plugin, Plugin Version: 14.2, Platform: macOS, Targets: All.

Function: Returns a new CFAttributedStringMBS object pointing to same attributed string.
Example:

```
// make NS version
dim n as new NSAttributedStringMBS

if n.initWithString("Hello World") then
// convert
dim c as CFAttributedStringMBS = n.AsCFAttributedString

// and check content
MsgBox c.String
end if
```

Notes: For passing to functions which need a CFAttributedStringMBS.

42.1.8 attributeAtIndex(name as string, location as UInt64) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes:

name: The name of an attribute.
location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute's value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn't necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.

See also:

- 42.1.9 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant 9382

42.1.9 attributeAtIndex(name as string, location as UInt64, inRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes:

name: The name of an attribute.
location: The index at which to test for attributeName.
longestEffectiveRange: Optional. If the named attribute exists at index, upon return aRange contains the full range over which the value of the named attribute is the same as that at index, clipped to rangeLimit. If the named attribute does not exist at index, upon return aRange contains the full range over which the attribute does not exist, clipped to rangeLimit.
inRange: The range over which to search for continuous presence of attributeName. This value must not exceed the bounds of the receiver.

Returns the value for the attribute named attributeName of the character at index, or nil if there is no such attribute.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.

If you don't need the longest effective range, it's far more efficient to use the other variant method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 42.1.8 attributeAtIndex(name as string, location as UInt64) as Variant 9381

42.1.10 attributeAtIndex2(name as string, location as UInt64, byref effectiveRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for an attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.

Example:

```
// list all links
Dim n As NSAttributedStringMBS = TextArea1.NSTextViewMBS.textStorage

Dim pos As Integer = 0
Dim Len As Integer = n.Length
Dim effectiveRange As NSRangeMBS

While pos <Len

Dim v As Variant = n.attributeAtIndex2(n.NSLinkAttributeName, pos, effectiveRange)

If v <>Nil Then
Dim url As String = v
Listbox1.AddRow url
End If

pos = pos + effectiveRange.Length

Wend
```

Notes:

name: The name of an attribute.
location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
effectiveRange: Optional. If the named attribute exists at index, upon return aRange contains a range over which the named attribute's value applies. If the named attribute does not exist at index, upon return aRange contains the range over which the attribute does not exist.
The range isn't necessarily the maximum range covered by attributeName, and its extent is implementation-dependent. If you need the maximum range, use the other variant of this method.

Returns the value for the attribute named attributeName of the character at index index, or nil if there is no such attribute.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 42.1.11 attributeAtIndex2(name as string, location as UInt64, byref longestEffectiveRange as NSRangeMBS, inRange as NSRangeMBS) as Variant 9384

42.1.11 attributeAtIndex2(name as string, location as UInt64, byref longestEffectiveRange as NSRangeMBS, inRange as NSRangeMBS) as Variant

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the value for the attribute with a given name of the character at a given index, and by reference the range over which the attribute applies.
Notes:

name: The name of an attribute.
location: The index at which to test for attributeName.
longestEffectiveRange: Optional. If the named attribute exists at index, upon return aRange contains the full range over which the value of the named attribute is the same as that at index, clipped to rangeLimit. If the named attribute does not exist at index, upon return aRange contains the full range over which the attribute does not exist, clipped to rangeLimit.
inRange: The range over which to search for continuous presence of attributeName. This value must not exceed the bounds of the receiver.

Returns the value for the attribute named attributeName of the character at index, or nil if there is no such attribute.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.

If you don't need the longest effective range, it's far more efficient to use the other variant method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 42.1.10 attributeAtIndex2(name as string, location as UInt64, byref effectiveRange as NSRangeMBS) as Variant 9382

42.1.12 attributedStringWithAttachment(attachment as NSTextAttachmentMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 15.0, Platform: macOS, Targets: All.

Function: Creates an attributed string with an attachment.
Example:

```
dim content as MemoryBlock = "Hello World"
dim f as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(content)
f.filename = "HelloWorld.txt"
```

```
dim a as new NSTextAttachmentMBS(f)
dim s as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(a)
```

Notes: This is a convenience method for creating an attributed string containing an attachment using NSAttachmentCharacter as the base character.

42.1.13 attributedStringWithAttributedString(text as NSAttributedStringMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of the given attributed string.

42.1.14 attributedStringWithDocFormat(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.15 attributedStringWithDocFormat(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9385

42.1.15 attributedStringWithDocFormat(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.14 attributedStringWithDocFormat(data as memoryblock) as NSAttributedStringMBS 9385

42.1.16 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.17 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 9386
- 42.1.18 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9386
- 42.1.19 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9387

42.1.17 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.16 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 9385
- 42.1.18 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9386
- 42.1.19 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9387

42.1.18 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.16 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 9385
- 42.1.17 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 9386
- 42.1.19 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9387

42.1.19 attributedStringWithHTML(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.16 attributedStringWithHTML(data as memoryblock) as NSAttributedStringMBS 9385
- 42.1.17 attributedStringWithHTML(data as memoryblock, BaseURL as string) as NSAttributedStringMBS 9386
- 42.1.18 attributedStringWithHTML(data as memoryblock, BaseURL as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9386

42.1.20 attributedStringWithHTMLOld(data as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: With plugin version 9.4 the attributedStringWithHTML method uses the system function to parse html. The old plugin function is available with the name attributedStringWithHTMLOld.

42.1.21 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Example:

```
// load rtfd file into textarea
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(file)
dim t as NSTextViewMBS = TextArea1.NSTextViewMBS
t.textStorage.setAttributedString(n)
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.22 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9388
- 42.1.23 attributedStringWithPath(path as string) as NSAttributedStringMBS 9388

- 42.1.24 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9388

42.1.22 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.21 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 9387
- 42.1.23 attributedStringWithPath(path as string) as NSAttributedStringMBS 9388
- 42.1.24 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9388

42.1.23 attributedStringWithPath(path as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.21 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 9387
- 42.1.22 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9388
- 42.1.24 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9388

42.1.24 attributedStringWithPath(path as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.21 attributedStringWithPath(file as folderitem) as NSAttributedStringMBS 9387

- 42.1.22 attributedStringWithPath(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9388
- 42.1.23 attributedStringWithPath(path as string) as NSAttributedStringMBS 9388

42.1.25 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.26 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9389

42.1.26 attributedStringWithRTF(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.25 attributedStringWithRTF(data as memoryblock) as NSAttributedStringMBS 9389

42.1.27 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.28 attributedStringWithRTFD(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9389

42.1.28 attributedStringWithRTFD(data as memoryblock, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.27 attributedStringWithRTFD(data as memoryblock) as NSAttributedStringMBS 9389

42.1.29 attributedStringWithString(text as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.30 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS 9390

42.1.30 attributedStringWithString(text as string, withAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.29 attributedStringWithString(text as string) as NSAttributedStringMBS 9390

42.1.31 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.32 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9391
- 42.1.33 attributedStringWithURL(url as string) as NSAttributedStringMBS 9391
- 42.1.34 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9391

42.1.32 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.31 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 9390
- 42.1.33 attributedStringWithURL(url as string) as NSAttributedStringMBS 9391
- 42.1.34 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9391

42.1.33 attributedStringWithURL(url as string) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 11.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.31 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 9390
- 42.1.32 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9391
- 42.1.34 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9391

42.1.34 attributedStringWithURL(url as string, byref DocumentAttributes as dictionary) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes: documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.31 attributedStringWithURL(file as folderitem) as NSAttributedStringMBS 9390
- 42.1.32 attributedStringWithURL(file as folderitem, byref DocumentAttributes as dictionary) as NSAttributedStringMBS 9391
- 42.1.33 attributedStringWithURL(url as string) as NSAttributedStringMBS 9391

42.1.35 attributedSubstringFromRange(range as NSRangeMBS) as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns an NSAttributedString object consisting of the characters and attributes within a given range in the receiver.
Notes:

Range: The range from which to create a new attributed string. aRange must lie within the bounds of the receiver.

Returns an NSAttributedString object consisting of the characters and attributes within aRange in the receiver.

Raises an NSRangeException if any part of aRange lies beyond the end of the receiver's characters. This method treats the length of the string as a valid range value that returns an empty string.

42.1.36 attributesAtIndex(location as UInt64) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index.
Notes:

location: The index for which to return attributes. This value must lie within the bounds of the receiver.
Range: Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn't necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.
See also:

- 42.1.37 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary 9393

42.1.37 attributesAtIndex(location as UInt64, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.
Notes:

location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
range: Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.
inRange: The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.
If you don't need the range information, it's far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 42.1.36 attributesAtIndex(location as UInt64) as dictionary 9392

42.1.38 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index.
Notes:

location: The index for which to return attributes. This value must lie within the bounds of the receiver.
Range: Optional. Upon return, the range over which the attributes and values are the same as those at index. This range isn't necessarily the maximum range covered, and its extent is implementation-dependent. If you need the maximum range, use other variant of this method.

Returns the attributes for the character at index.
Raises an NSRangeException if index lies beyond the end of the receiver's characters.
See also:

- 42.1.39 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary 9394

42.1.39 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS, inRange as NSRangeMBS) as dictionary

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Returns the attributes for the character at a given index, and by reference the range over which the attributes apply.
Notes:

location: The index for which to return attributes. This value must not exceed the bounds of the receiver.
range: Optional. Upon return contains the maximum range over which the attributes and values are the same as those at index, clipped to range Limit.
inRange: The range over which to search for continuous presence of the attributes at index. This value must not exceed the bounds of the receiver.

Raises an NSRangeException if index or any part of rangeLimit lies beyond the end of the receiver's characters.
If you don't need the range information, it's far more efficient to use the other variant of this method to retrieve the attribute value.

For information about where to find the attribute keys for the returned dictionary, see the overview section of this document.
See also:

- 42.1.38 attributesAtIndex2(location as UInt64, byref range as NSRangeMBS) as dictionary 9393

42.1.40 Constructor

MBS MacBase Plugin, Plugin Version: 19.0, Platform: macOS, Targets: All.

Function: The constructor to create empty attributed string.

42.1.41 Convert_Operator as string

MBS MacBase Plugin, Plugin Version: 18.4, Platform: macOS, Targets: All.

Function: Converts to string by just returning string part.

42.1.42 copy as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a copy of the attributed string.

42.1.43 CopyToClipboard as Boolean

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Copies styled text to clipboard.

42.1.44 dataFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref error as NSErrorMBS) as memoryblock

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Returns an data object that contains a text stream corresponding to the characters and attributes within the given range.
Notes:

offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.
error: An in-out variable containing an encountered error, if any.

Returns the data for the attributed string, or nil if failure. When nil, error encapsulates the error information.
Raises an NSRangeException if any part of range lies beyond the end of the receiver,Äôs characters.

42.1.45 docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates DOC data from the whole string.
Notes:

Same as docFormatFromRange(0,length)
Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 42.1.46 docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock 9396

42.1.46 docFormatFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates DOC data from the current string range.
Notes:

Returns nil on failure.
documentAttributes can optionally be a dictionary with document attributes like author or title.
See also:

- 42.1.45 docFormatFromRange(documentAttributes as dictionary = nil) as MemoryBlock 9395

42.1.47 fileWrapperFromRange(offset as Integer, length as Integer, documentAttributes as dictionary = nil, byref Error as NSErrorMBS) as NSFileWrapperMBS

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: Returns an NSFileWrapper object that contains a text stream corresponding to the characters and attributes within the given range.
Example:

```
// get styled text from htmlviewer
dim w as WebViewMBS = HTMLViewer1.WebViewMBS
dim f as WebFrameMBS = w.mainFrame
dim v as WebFrameViewMBS = f.frameView
dim d as WebDocumentViewMBS = v.documentView
dim n as NSAttributedStringMBS = d.attributedString

// package it
dim da as new Dictionary
da.Value(n.NSDocumentTypeDocumentAttribute) = n.NSRTFDTextDocumentType

dim e as NSErrorMBS
dim fw as NSFileWrapperMBS = n.fileWrapperFromRange(0, n.Length, da, e)
if e <>nil then
MsgBox e.LocalizedDescription
Return
end if

// write to disk
dim file as FolderItem = SpecialFolder.Desktop.Child("test.rtfd")
if fw.writeToFile(file, e) then
MsgBox "OK"
else
```

```
MsgBox e.LocalizedDescription
end if
```

Notes:

offset and length: The range.
documentAttributes: A required dictionary specifying the document attributes. The dictionary contains values from Document Types and must at least contain NSDocumentTypeDocumentAttribute.
error: An in-out variable containing an encountered error, if any.

Returns a file wrapper for the appropriate document type, or nil if failure. When nil, error encapsulates the error information.

Raises an NSRangeException if any part of range lies beyond the end of the receiver,Äôs characters.

42.1.48 FromClipboard as NSAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 18.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Queries attributed string from clipboard.

42.1.49 GeneratePDF(PrintOptions as Variant = nil) as MemoryBlock

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Creates a PDF for attributed string.
Example:

```
// read file
dim fi as FolderItem = SpecialFolder.Desktop.Child("test.docx")

dim d as new Dictionary
dim n as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithPath(fi, d)

// write pdf
dim p as MemoryBlock = n.GeneratePDF(nil)

dim fo as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
dim bo as BinaryStream = BinaryStream.Create(fo)
bo.Write p
```

Notes: PrintOptions is optional NSPrintInfoMBS object for print settings like margin.

42.1.50 htmlString as string

MBS MacBase Plugin, Plugin Version: 7.8, Platform: macOS, Targets: All.

Function: A self made function to return the text content as html string preserving the style information.
Example:

```
dim s as NSAttributedStringMBS

s=new NSAttributedStringMBS

if s.initwithhtml("<b>Hello</b>") then
MsgBox s.htmlstring // shows "<b>Hello</b>"
MsgBox s.text // shows "Hello"
end if
```

Notes:

Does not always work well, but can help.
(Apple has no official function for this)

42.1.51 initWithAttributedString(text as NSAttributedStringMBS) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of the given attributed string.
Notes: Returns true on success.

42.1.52 initWithDocFormat(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.53 initWithDocFormat(data as memoryblock, byref documentAttributes as dictionary) as boolean 9399

42.1.53 initWithDocFormat(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: Desktop, Console & Web.

Function: Initializes string with content of given DOC file data.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.52 initWithDocFormat(data as MemoryBlock) as boolean 9398

42.1.54 initWithHTML(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("<b>test</b>") then
MsgBox n.text
else
MsgBox "failed"
end if

dim attribText as new NSAttributedStringMBS
dim text as string = "<P>Hello √√§√º</P>"

text = ConvertEncoding(text, encodings.ISOLatin1)

If attribText.initWithHTML(text) Then
MsgBox attribText.text
End If
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.

With plugin version 9.4 this uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

On Mac OS X 10.6 the text encoding expected is ISO Latin 1 as far as I see.
See also:

- 42.1.55 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 9400
- 42.1.56 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 9401
- 42.1.57 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 9401
- 42.1.58 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 9402

42.1.55 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("<b>test</b>","http://www.apple.com") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.54 initWithHTML(data as MemoryBlock) as boolean 9399
- 42.1.56 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 9401
- 42.1.57 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 9401
- 42.1.58 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 9402

42.1.56 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes the object with html code from a given url.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.54 initWithHTML(data as MemoryBlock) as boolean 9399
- 42.1.55 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 9400
- 42.1.57 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 9401
- 42.1.58 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 9402

42.1.57 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes:

Returns true on success.
documentAttributes: Optional dictionary to receive the attributes.

With plugin version 9.4 this uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

On Mac OS X 10.6 the text encoding expected is ISO Latin 1 as far as I see.
See also:

- 42.1.54 initWithHTML(data as MemoryBlock) as boolean 9399
- 42.1.55 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 9400
- 42.1.56 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 9401
- 42.1.58 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean 9402

42.1.58 initWithHTML(data as memoryblock, options as Dictionary, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 22.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Example:

```
Dim theBody As String = "<html><body>Test √§√√º</body></html>"

Dim documentAttributes As Dictionary
Dim documentOptions As New Dictionary

// define the text encoding
Const NSUTF8StringEncoding = 4
documentOptions.Value(NSAttributedStringMBS.NSCharacterEncodingDocumentOption) = NSUTF8StringEncoding
// and a default base URL for finding images
documentOptions.Value(NSAttributedStringMBS.NSBaseURLDocumentOption) = NSURLMBS.URLWithString("https://monkeybreadsoftware.de/")
// and a timeout for network queries
documentOptions.Value(NSAttributedStringMBS.NSTimeoutDocumentOption) = 30

Dim BodyAttributed As New NSAttributedStringMBS
If BodyAttributed.initWithHTML(theBody, documentOptions, documentAttributes) Then
MessageBox BodyAttributed.Text
Else
Break // failed?
End If
```

Notes:

Returns true on success.
options: Put in some options for parsing the document like NSCharacterEncodingDocumentOption or NSTextEncodingNameDocumentOption.
documentAttributes: Optional dictionary to receive the attributes.
See also:

- 42.1.54 initWithHTML(data as MemoryBlock) as boolean 9399
- 42.1.55 initWithHTML(data as MemoryBlock, BaseURL as string) as boolean 9400
- 42.1.56 initWithHTML(data as memoryblock, BaseURL as string, byref documentAttributes as dictionary) as boolean 9401
- 42.1.57 initWithHTML(data as memoryblock, byref documentAttributes as dictionary) as boolean 9401

42.1.59 initWithHTMLOld(data as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Initializes string with content of given HTML file data.
Notes: With plugin version 9.4 the initWithHTML method uses the system function to parse html. The old plugin function is available with the name initWithHTMLOld.

42.1.60 initWithPath(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.61 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 9403
- 42.1.62 initWithPath(path as string) as boolean 9403
- 42.1.63 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 9404

42.1.61 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.60 initWithPath(file as folderitem) as boolean 9403
- 42.1.62 initWithPath(path as string) as boolean 9403
- 42.1.63 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 9404

42.1.62 initWithPath(path as string) as boolean

MBS MacBase Plugin, Plugin Version: 9.4, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.60 initWithPath(file as folderitem) as boolean 9403
- 42.1.61 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 9403
- 42.1.63 initWithPath(path as string, byref documentAttributes as dictionary) as boolean 9404

42.1.63 initWithPath(path as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given path string.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.60 initWithPath(file as folderitem) as boolean 9403
- 42.1.61 initWithPath(file as folderitem, byref documentAttributes as dictionary) as boolean 9403
- 42.1.62 initWithPath(path as string) as boolean 9403

42.1.64 initWithRTF(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.65 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean 9404

42.1.65 initWithRTF(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTF file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.64 initWithRTF(data as MemoryBlock) as boolean 9404

42.1.66 initWithRTFD(data as MemoryBlock) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.67 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean 9405

42.1.67 initWithRTFD(data as memoryblock, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given RTFD file data.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.66 initWithRTFD(data as MemoryBlock) as boolean 9405

42.1.68 initWithString(text as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("test") then
MsgBox n.text
```

```
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.69 initWithString(text as string, withAttributes as Dictionary) as boolean 9406

42.1.69 initWithString(text as string, withAttributes as Dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of given plain text.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithHTML("test") then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.68 initWithString(text as string) as boolean 9405

42.1.70 initWithURL(file as folderitem) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Example:

```
dim n as NSAttributedStringMBS
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile")) then
```

```
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.71 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 9407
- 42.1.72 initWithURL(url as string) as boolean 9408
- 42.1.73 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 9408

42.1.71 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given file.
Example:

```
dim n as NSAttributedStringMBS
dim documentAttributes as dictionary
n=new NSAttributedStringMBS
if n.initWithURL(SpecialFolder.Desktop.Child("testfile"), documentAttributes) then
MsgBox n.text
else
MsgBox "failed"
end if
```

Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.70 initWithURL(file as folderitem) as boolean 9406
- 42.1.72 initWithURL(url as string) as boolean 9408
- 42.1.73 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 9408

42.1.72 initWithURL(url as string) as boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.70 initWithURL(file as folderitem) as boolean 9406
- 42.1.71 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 9407
- 42.1.73 initWithURL(url as string, byref documentAttributes as dictionary) as boolean 9408

42.1.73 initWithURL(url as string, byref documentAttributes as dictionary) as boolean

MBS MacBase Plugin, Plugin Version: 12.0, Platform: macOS, Targets: All.

Function: Initializes string with content of file at the given url.
Notes:

documentAttributes: Optional dictionary to receive the attributes.
Returns true on success.
See also:

- 42.1.70 initWithURL(file as folderitem) as boolean 9406
- 42.1.71 initWithURL(file as folderitem, byref documentAttributes as dictionary) as boolean 9407
- 42.1.72 initWithURL(url as string) as boolean 9408

42.1.74 isEqualToAttributedString(other as NSAttributedStringMBS) as Boolean

MBS MacBase Plugin, Plugin Version: 7.2, Platform: macOS, Targets: All.

Function: Compares both strings.
Example:

```
dim n as NSAttributedStringMBS
dim m as NSAttributedStringMBS

n=new NSAttributedStringMBS
if n.initWithString("test") then
MsgBox n.text
else
```

```
MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test") then
MsgBox n.text
else
MsgBox "failed"
end if

if m.isEqualToAttributedString(n) then
MsgBox "Ok"
else
MsgBox "failed"
end if

m=new NSAttributedStringMBS
if m.initWithString("test2") then
MsgBox n.text
else
MsgBox "failed"
end if

if m.isEqualToAttributedString(n) then
MsgBox "failed"
else
MsgBox "Ok"
end if
```

Notes: Returns true if they are equal in content.

42.1.75 itemNumberInTextList(list as NSTextListMBS, location as Integer) as Integer

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: Desktop, Console & Web.

Function: Returns the index of the item at the given location within the list.
Notes:

list: The text list.
location: The location of the item.

Returns the index within the list.

42.1.76 lineRangeForRange(range as NSRangeMBS) as NSRangeMBS

MBS MacBase Plugin, Plugin Version: 18.1, Platform: macOS, Targets: All.

Function: Returns the range of characters representing the line or lines containing a given range.
Notes:

Range: A range within the receiver. The value must not exceed the bounds of the receiver.

The range of characters representing the line or lines containing aRange, including the line termination characters.

42.1.77 mutableCopy as NSMutableAttributedStringMBS

MBS MacBase Plugin, Plugin Version: 9.6, Platform: macOS, Targets: All.

Function: Creates a mutable copy of the attributed string.
Example:

```
// create Hello World in red
dim a as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithString("Hello World")
dim m as NSMutableAttributedStringMBS = a.mutableCopy

m.addAttribute(a.NSForegroundColorAttributeName, NSColorMBS.redColor, new NSRangeMBS(0, m.length))

// put it in a textarea
TextArea1.NSTextViewMBS.textStorage.setAttributedString m
```

42.1.78 NSAttachmentAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

NSTextAttachment
Default nil, no attachment

42.1.79 NSAuthorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Example:

```
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes:

string containing author name.
Available in Mac OS X v10.4 and later.

42.1.80 NSBackgroundColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
// add background color for text in text area:

TextArea1.Text = "Hello"

Dim tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Dim ts As NSTextStorageMBS = tv.TextStorage

Dim value As Color = & cFF0000

Dim offset As Integer = 0
Dim length As Integer = 5

Dim range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSBackgroundColorAttributeName, value, range )
```

Notes:

NSColor
Default nil, no background

42.1.81 NSBackgroundColorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

NSColor, representing the document-wide page background color.
Mac OS X v10.3 and earlier string constant is "BackgroundColor".
For applications linked on versions prior to Mac OS X v10.5, HTML import sets the NSBackgroundColorDocumentAttribute to NSColorMBS.whiteColor in cases in which the HTML does not specify a background color. For applications linked on Mac OS X v10.5 and later, no NSBackgroundColorDocumentAttribute is set in these cases.
Available in Mac OS X v10.4 and later.

42.1.82 NSBaselineOffsetAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

Number containing floating point value, as points offset from baseline
Default 0.0

42.1.83 NSBaseURLDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

For HTML documents; NSURL containing base URL. Previous string constant was @"BaseURL"
Available in Mac OS X v10.4 and later.

42.1.84 NSBottomMarginDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Example:

```
// get some attributed text:
dim t as new NSAttributedStringMBS
call t.initWithString("Hello World")

// set document attributes
dim dic as new Dictionary
dic.Value(t.NSBottomMarginDocumentAttribute) = 20
dic.Value(t.NSLeftMarginDocumentAttribute) = 20
dic.Value(t.NSRightMarginDocumentAttribute) = 20
dic.Value(t.NSTopMarginDocumentAttribute) = 20
dic.Value(t.NSAuthorDocumentAttribute) = "Test User"

// get rtf
dim rtf as string = t.RTFFromRange(dic)

// write to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.rtf")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write rtf
```

Notes:

Number, containing a float, in points.
Mac OS X v10.3 and earlier string constant is "BottomMargin".
Available in Mac OS X v10.4 and later.

42.1.85 NSCategoryDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing the document's category.
Available in Mac OS X v10.6 and later.

42.1.86 NSCharacterEncodingDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing an int specifying the stringEncoding for the file; for reading and writing plain text files and writing HTML; default for plain text is the default encoding; default for HTML is UTF-8.
Mac OS X v10.3 and earlier string constant is "CharacterEncoding".
Available in Mac OS X v10.4 and later.

42.1.87 NSCharacterEncodingDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

For plain text documents; Number containing the unsigned int stringEncoding to override any encoding specified in an HTML document. Previous string constant was @"CharacterEncoding".
Available in Mac OS X v10.4 and later.

42.1.88 NSCharacterShapeAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

An integer value. The value is interpreted as Apple Type Services kCharacterShapeType selector + 1.
The default value is 0 (disable). 1 is kTraditionalCharactersSelector, and so on. Refer to <ATS/SFNTLayoutTypes.h>and "Font Features" in ATSUI Programming Guide for additional information.
Available in Mac OS X v10.0 and later.

42.1.89 NSCocoaVersionDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing a float. For RTF files only, stores the version of Cocoa with which the file was created. Absence of this value indicates RTF file not created by Cocoa or its predecessors.
Values less than 100 are pre,ÄìMac OS X; 100 is Mac OS X v10.0 or v10.1; 102 is Mac OS X v10.2 and 10.3;

values greater than 102 correspond to values of NSAppKitVersionNumber on Mac OS X v10.4 and later.
Mac OS X v10.3 and earlier string constant is "CocoaRTFVersion".
Available in Mac OS X v10.4 and later.

42.1.90 NSCommentDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing document comments.
Available in Mac OS X v10.4 and later.

42.1.91 NSCompanyDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing company or organization name.
Available in Mac OS X v10.4 and later.

42.1.92 NSConvertedDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing an int. Indicates whether the file was converted by a filter service.
If missing or 0, the file was originally in the format specified by document type. If negative, the file was originally in the format specified by document type, but the conversion to NSAttributedString may have been lossy. If 1 or more, it was converted to this type by a filter service.
Mac OS X v10.3 and earlier string constant is @"Converted".
Available in Mac OS X v10.4 and later.

42.1.93 NSCopyrightDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing document copyright info.
Available in Mac OS X v10.4 and later.

42.1.94 NSCreationTimeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

NSDate containing the creation date of the document; note that this is not the file system creation date of the file, but of the document.
Available in Mac OS X v10.4 and later.

42.1.95 NSCursorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

NSCursor
Default as returned by the NSCursor method IBeamCursor
Available in Mac OS X v10.3 and later.

42.1.96 NSDefaultAttributesDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 16.0, Platform: macOS, Targets: All.

Function: One of the document attributes.
Notes:

NSDictionary containing attributes to be applied to plain files. Used by reader methods. This key in options can specify the default attributes applied to the entire document contents. The document attributes can contain this key indicating the actual attributes used.
Available on Mac OS X 10.11.

42.1.97 NSDefaultAttributesDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

For plain text documents; Dictionary containing attributes to be applied to plain files. Previous string constant was @"DefaultAttributes".
Available in Mac OS X v10.4 and later.

42.1.98 NSDefaultTabIntervalDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

Number containing a float. Represents the document-wide default tab stop interval.
Mac OS X v10.3 and earlier string constant is "DefaultTabInterval".
Available in Mac OS X v10.4 and later.

42.1.99 NSDocFormatTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Microsoft Word document.

42.1.100 NSDocumentTypeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

How the document was interpreted; one of the values in "Document Types."
Mac OS X v10.3 and earlier string constant is "DocumentType".
Available in Mac OS X v10.4 and later.

42.1.101 NSDocumentTypeDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

One of the document types described in "Document Types," indicating a document type to be forced when loading the document. Previous string constant was @"DocumentType".
Available in Mac OS X v10.4 and later.

42.1.102 NSEditorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

string containing name of person who last edited the document.
Available in Mac OS X v10.4 and later.

42.1.103 NSExcludedElementsDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString related to HTML generation.
Notes:

An Array object containing string objects, representing HTML elements not to be used in generated HTML.
Available in Mac OS X v10.4 and later.

NSExcludedElementsDocumentAttribute allows control over the tags used. The recognized values in the NSExcludedElementsDocumentAttribute array are (case-insensitive) HTML tags, plus DOCTYPE (representing a doctype declaration) and XML (representing an XML declaration). By default, if this attribute is not present, the excluded elements will be those deprecated in HTML 4 (APPLET, BASEFONT, CENTER, DIR, FONT, ISINDEX, MENU, S, STRIKE, and U) plus XML. If XML is on the list, HTML forms are used; if XML is not on the list, XHTML forms are used where there is a distinction.

42.1.104 NSExpansionAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

Number containing floating point value, as log of expansion factor to be applied to glyphs
Default 0.0, no expansion
Available in Mac OS X v10.3 and later.

42.1.105 NSFileTypeDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

string indicating which document type was used to interpret the document, specified as a UTI; for reading, this is available along with NSDocumentTypeDocumentAttribute, but for writing the two are mutually exclusive.
Available in Mac OS X v10.6 and later.

42.1.106 NSFileTypeDocumentOption as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

string indicating a document type to be forced when loading the document, specified as a UTI string; mutually exclusive with NSDocumentTypeDocumentOption.
Available in Mac OS X v10.6 and later.

42.1.107 NSFontAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
MsgBox NSAttributedStringMBS.NSFontAttributeName

Dim NSGraphics as New NSGraphicsMBS()
Dim NSFont as NSFontMBS = NSFontMBS.fontWithName("Helvetica", 11.0)
Dim NSAttributes as New Dictionary

NSAttributes.value(NSAttributedStringMBS.NSFontAttributeName) = nsfont

Dim stringWidth as Double = NSGraphics.sizeWithAttributes("Hello World", NSAttributes).Width
MsgBox("StringWidth from NSGraphicsMBS: " + Str(stringWidth))
```

Notes:

NSFont
Default Helvetica 12-point

42.1.108 NSForegroundColorAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Example:

```
TextArea1.Text = "Hello"

Dim tv As NSTextViewMBS = TextArea1.NSTextViewMBS
Dim ts As NSTextStorageMBS = tv.TextStorage

Dim value As Color = & cFF0000

Dim offset As Integer = 0
Dim length As Integer = 5

Dim range As NSRangeMBS = NSMakeRangeMBS( offset, length )
ts.AddAttribute( NSAttributedStringMBS.NSForegroundColorAttributeName, value, range )
```

Notes:

NSColor
Default blackColor
Available in Mac OS X v10.0 and later.

42.1.109 NSGlyphInfoAttributeName as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the attribute names for NSAttributedString.
Notes:

The name of an NSGlyphInfo object.
NSLayoutManager assigns the glyph specified by this glyph info to the entire attribute range, provided that its contents match the specified base string, and that the specified glyph is available in the font specified by NSFontAttributeName.
Available in Mac OS X v10.2 and later.

42.1.110 NSHTMLTextDocumentType as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the values for the NSDocumentTypeDocumentAttribute key in the document attributes dictionary.
Notes: Hypertext Markup Language (HTML) document.

42.1.111 NSHyphenationFactorDocumentAttribute as string

MBS MacBase Plugin, Plugin Version: 11.3, Platform: macOS, Targets: All.

Function: One of the names for document wide attributes in a NSAttributedString.
Notes:

Number, containing a float; 0 = off, 1 = full hyphenation.
