Note The Launch folder windows in a separate process setting in Folder Options affects ShellExecute. If that option is disabled (the default setting), ShellExecute uses an open Explorer window rather than launch a new one. If no Explorer window is open, ShellExecute launches a new one.

See also ConsoleExecuteMBS, WindowsShellExecuteAsAdminMBS, WindowsProcessMBS (Windows only),

NSTask (Mac only) and ShellMBS (cross platform).

196.9.17 DriveToUNCPathMBS(Driver as string) as string

MBS Win Plugin, Plugin Version: 13.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the system tables for which UNC network path belongs to a mapped drive.
Example:

msgbox DriveToUNCPathMBS("W:")

Notes:

Please pass the local drive name, which is drive letter and double colon.
Returns empty string on any error.

196.9.18 Blog Entries

- MBS Xojo / Real Studio Plugins, version 13.2pr5

196.9.19 GetFullWindowsNameMBS(UserName as string, Domain as string) as string

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the full username of an user in a domain.
Example:

```
dim ShortName as string = "your short name"
dim Domain as string = "your domain"

MsgBox GetFullWindowsNameMBS(ShortName, Domain)
```

Notes:

Returns an empty string on any error.

Use a current Windows NT-style domain, and a username that exists on the PDC.

This will work with any NT-Style PDC (tested on XP bound to Mac OS X Server running SMB as PDC). Windows 2000/2003 and 2008 should also work.

196.10 class WindowsADSystemInfoMBS

196.10.1 class WindowsADSystemInfoMBS

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class retrieves data about the local computer if it is running a Windows operating system in a Windows domain.
Notes: For example, you can get the domain, site, and distinguished name of the local computer.

196.10.6 Methods

196.10.7 AnyDCName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the DNS name of a domain controller in the local computer's domain.
Notes: Lasterror is set.

196.10.8 Constructor

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Raises unsupportedOperationException on failure.

196.10.9 DCSiteName(Server as String) as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the name of the Active Directory site that contains the local computer.
Notes:

Server: DNS name of the service server.

An Active Directory site is one or more well-connected TCP/IP subnets holding Active Directory domain controllers
Lasterror is set.

196.10.10 RefreshSchemaCache

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Refreshes the Active Directory schema cache.
Notes:

When you call this method, it does a Put() of the schemaUpdateNow function on the RootDSE. Normally, when you make changes to the schema, they are not updated to the RootDSE until the next automatic update. This method does an immediate update to the schema so that you can view the changes to the schema.
Lasterror is set.

196.10.11 Properties

196.10.12 ComputerName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the distinguished name of the local computer.
Notes:

Lasterror is set.
(Read only property)

196.10.13 DomainDNSName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the DNS name of the local computer's domain, such as "domainName.companyName.com".
Notes:

Lasterror is set.
(Read only property)

196.10.14 DomainShortName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the short name of the local computer's domain, such as "domainName".
Notes:

Lasterror is set.
(Read only property)

196.10.15 ForestDNSName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the DNS name of the local computer's forest.
Notes:

Lasterror is set.
(Read only property)

196.10.16 Handle as Integer

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

196.10.17 IsNativeMode as Boolean

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines whether the local computer's domain is in native or mixed mode.
Notes:

Lasterror is set.
(Read only property)

196.10.18 Lasterror as Integer

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error reported by any of the properties/methods.
Notes: (Read and Write property)

196.10.19 PDCRoleOwner as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the distinguished name of the directory service agent (DSA) object for the DC that owns the primary domain controller role in the local computer's domain.
Notes:

Lasterror is set.
(Read only property)

196.10.20 SchemaRoleOwner as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the distinguished name of the directory service agent (DSA) object for the DC that owns the schema master role in the local computer's forest.
Notes:

Lasterror is set.
(Read only property)

196.10.21 SiteName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the site name of the local computer.
Notes:

Lasterror is set.
(Read only property)

196.10.22 UserName as String

MBS Win Plugin, Plugin Version: 19.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the Active Directory distinguished name of the current user, which is the logged-on user or the user impersonated by the calling thread.
Notes:

Lasterror is set.
(Read only property)

Constant	Value	Description
CREATE_BREAKAWAY_FROM_JOB	& h01000000	The child processes of a process associated with a job are not associated with the job. If the calling process is not associated with a job, this constant has no effect. If the calling process is associated with a job, the job must set the JOB_OBJECT_LIMIT_BREAKAWAY_OK limit.
CREATE_DEFAULT_ERROR_MODE	& h04000000	The new process does not inherit the error mode of the calling process. Instead, the new process gets the default error mode. This feature is particularly useful for multi-threaded shell applications that run with hard errors disabled. The default behavior is for the new process to inherit the error mode of the caller. Setting this flag changes that default behavior.
CREATE_NEW_CONSOLE	& h00000010	The new process has a new console, instead of inheriting its parent's console (the default). For more information, see Creation of a Console. This flag cannot be used with DETACHED_PROCESS.
CREATE_NEW_PROCESS_GROUP	& h00000200	The new process is the root process of a new process group. The process group includes all processes that are descendants of this root process. The process identifier of the new process group is the same as the process identifier, which is returned in the lpProcessInformation parameter. Process groups are used by the GenerateConsoleCtrlEvent function to enable sending a CTRL+BREAK signal to a group of console processes. If this flag is specified, CTRL+C signals will be disabled for all processes within the new process group. This flag is ignored if specified with CREATE_NEW_CONSOLE.
CREATE_NO_WINDOW	& h08000000	The process is a console application that is being run without a console window. Therefore, the console handle for the application is not set. This flag is ignored if the application is not a console application, or if it is used with either CREATE_NEW_CONSOLE or DETACHED_PROCESS.
CREATE_PROTECTED_PROCESS	& h00040000	The process is to be run as a protected process. The system restricts access to protected processes and the threads of protected processes. For more information on how processes can interact with protected processes, see Process Security and Access Rights. To activate a protected process, the binary must have a special signature. This signature is provided by Microsoft but not currently available for non-Microsoft binaries. There are currently four protected processes: media foundation, audio engine, Windows error reporting, and system. Components that load into these binaries must also be signed. Multimedia companies can leverage the first two protected processes. For more information, see Overview of the Protected Media Path. Windows Server 2003 and Windows XP/2000: This value is not supported.
CREATE_PRESERVE_CODE_AUTHZ_LEVEL	& h02000000	Allows the caller to execute a child process that bypasses the process restrictions that would normally be applied automatically to the process. Windows 2000: This value is not supported.
CREATE_SEPARATE_WOW_VDM	& h00000800	This flag is valid only when starting a 16-bit Windows-based application. If set, the new process runs in a private Virtual DOS Machine (VDM). By default, all 16-bit Windows-based applications run as threads in a single, shared VDM. The advantage of running separately is that a crash only terminates the single VDM; any other programs running in distinct VDMs continue to function normally. Also, 16-bit Windows-based applications that are run in separate VDMs have separate input queues. That means that if one application stops responding momentarily, applications in separate VDMs continue to receive input. The disadvantage of running separately is that it takes significantly more memory to do so. You should use this flag only if the user requests that 16-bit applications should run in their own VDM.
CREATE_SHARED_WOW_VDM	& h00001000	The flag is valid only when starting a 16-bit Windows-based application. If the DefaultSeparateVDM switch in the Windows section of WIN.INI is TRUE, this flag overrides the switch. The new process is run in the shared Virtual DOS Machine.
CREATE_SUSPENDED	& h00000004	The primary thread of the new process is created in a suspended state, and does not run until the ResumeThread function is called.
CREATE_UNICODE_ENVIRONMENT	& h00000400	If this flag is set, the environment block pointed to by lpEnvironment uses Unicode characters. Otherwise, the environment block uses ANSI characters.
DEBUG_ONLY_THIS_PROCESS	& h00000002	The calling thread starts and debugs the new process. It can receive all related debug events using the WaitForDebugEvent function.
DEBUG_PROCESS	& h00000001	The calling thread starts and debugs the new process and all child processes created by the new process. It can receive all related debug events using the WaitForDebugEvent function. A process that uses DEBUG_PROCESS becomes the root of a debugging chain. This continues until another process in the chain is created with DEBUG_PROCESS. If this flag is combined with DEBUG_ONLY_THIS_PROCESS, the caller debugs only the new process, not any child processes.
DETACHED_PROCESS	& h00000008	For console processes, the new process does not inherit its parent's console (the default). The new process can call the AllocConsole function at a later time to create a console. For more information, see Creation of a Console. This value cannot be used with CREATE_NEW_CONSOLE.
EXTENDED_STARTUPINFO_PRESENT	& h00080000	The process is created with extended startup information; the lpStartupInfo parameter specifies a STARTUPINFOEX structure. Windows Server 2003 and Windows XP/2000: This value is not supported.
INHERIT_PARENT_AFFINITY	& h00010000	The process inherits its parent's affinity. If the parent process has threads in more than one processor group, the new process inherits the group-relative affinity of an arbitrary group in use by the parent. Windows Server 2008, Windows Vista, Windows Server 2003, and Windows XP/2000: This value is not supported.
ABOVE_NORMAL_PRIORITY_CLASS	& h00008000	Process that has priority above NORMAL_PRIORITY_CLASS but below HIGH_PRIORITY_CLASS.
BELOW_NORMAL_PRIORITY_CLASS	& h00004000	Process that has priority above IDLE_PRIORITY_CLASS but below NORMAL_PRIORITY_CLASS.
HIGH_PRIORITY_CLASS	& h00000080	Process that has priority above [illegible]

Constants	Value	Meaning
SW_FORCEMINIMIZE	11	Minimizes a window, even if the thread that owns the window is not responding. This flag should only be used when minimizing windows from a different thread.
SW_HIDE	0	Hides the window and activates another window.
SW_MAXIMIZE	3	Maximizes the specified window.
SW_MINIMIZE	6	Minimizes the specified window and activates the next top-level window in the Z order.
SW_RESTORE	9	Activates and displays the window. If the window is minimized or maximized, the system restores it to its original size and position. An application should specify this flag when restoring a minimized window.
SW_SHOW	5	Activates the window and displays it in its current size and position.
SW_SHOWDEFAULT	10	Sets the show state based on the SW_ value specified in the STARTUPINFO structure passed to the CreateProcess function by the program that started the application.
SW_SHOWMAXIMIZED	3	Activates the window and displays it as a maximized window.
SW_SHOWMINIMIZED	2	Activates the window and displays it as a minimized window.
SW_SHOWMINNOACTIVE	7	Displays the window as a minimized window. This value is similar to SW_SHOWMINIMIZED, except the window is not activated.
SW_SHOWNA	8	Displays the window in its current size and position. This value is similar to SW_SHOW, except that the window is not activated.
SW_SHOWNOACTIVATE	4	Displays a window in its most recent size and position. This value is similar to SW_SHOWNORMAL, except that the window is not activated.
SW_SHOWNORMAL	1	Activates and displays a window. If the window is minimized or maximized, the system restores it to its original size and position. An application should specify this flag when displaying the window for the first time.

Name	Value	Meaning
COLOR_3DDKSHADOW	21	Dark shadow for three-dimensional display elements.
COLOR_3DFACE	15	Face color for three-dimensional display elements and for dialog box backgrounds.
COLOR_3DHIGHLIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DHILIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DLIGHT	22	Light color for three-dimensional display elements (for edges facing the light source.)
COLOR_3DSHADOW	16	Shadow color for three-dimensional display elements (for edges facing away from the light source).
COLOR_ACTIVEBORDER	10	Active window border.
COLOR_ACTIVECAPTION	2	Active window title bar.

COLOR_APPWORKSPACE	12	Background color of multiple document interface (MDI) applications.
COLOR_BACKGROUND	1	Desktop.
COLOR_BTNFACE	15	Face color for three-dimensional display elements and for dialog box backgrounds.
COLOR_BTNHIGHLIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_BTNHILIGHT	20	Highlight color for three-dimensional display elements (for edges facing the light source.)
COLOR_BTNSHADOW	16	Shadow color for three-dimensional display elements (for edges facing away from the light source).
COLOR_BTNTEXT	18	Text on push buttons.
COLOR_CAPTIONTEXT	9	Text in caption, size box, and scroll bar arrow box.
COLOR_DESKTOP	1	Desktop.
COLOR_GRADIENTACTIVECAPTION	27	Right side color in the color gradient of an active window's title bar. COLOR_ACTIVECAPTION specifies the left side color. Use SPI_GETGRADIENTCAPTIONS with the SystemParametersInfo function to determine whether the gradient effect is enabled.
COLOR_GRADIENTINACTIVECAPTION	28	Right side color in the color gradient of an inactive window's title bar. COLOR_INACTIVECAPTION specifies the left side color.
COLOR_GRAYTEXT	17	Grayed (disabled) text. This color is set to 0 if the current display driver does not support a solid gray color.
COLOR_HIGHLIGHT	13	Item(s) selected in a control.
COLOR_HIGHLIGHTTEXT	14	Text of item(s) selected in a control.
COLOR_HOTLIGHT	26	Color for a hyperlink or hot-tracked item.
COLOR_INACTIVEBORDER	11	Inactive window border.
COLOR_INACTIVECAPTION	3	Inactive window caption.
COLOR_INACTIVECAPTIONTEXT	19	Color of text in an inactive caption.
COLOR_INFOBK	24	Background color for tooltip controls.
COLOR_INFOTEXT	23	Text color for tooltip controls.
COLOR_MENU	4	Menu background.
COLOR_MENUHILIGHT	29	The color used to highlight menu items when the menu appears as a flat menu (see SystemParametersInfo). The highlighted menu item is outlined with COLOR_HIGHLIGHT.
COLOR_MENUBAR	30	The background color for the menu bar when menus appear as flat menus (see SystemParametersInfo). However, COLOR_MENU continues to specify the background color of the menu popup.
COLOR_MENUTEXT	7	Text in menus.
COLOR_SCROLLBAR	0	Scroll bar gray area.
COLOR_WINDOW	5	Window background.
COLOR_WINDOWFRAME	6	Window frame.
COLOR_WINDOWTEXT	8	Text in windows.

edit	Launches an editor and opens the document for editing. If File is not a document file, the function will fail.
explore	Explores a folder specified by File.
find	Initiates a search beginning in the directory specified by Directory.
open	Opens the item specified by the File parameter. The item can be a file or folder.
print	Prints the file specified by File. If File is not a document file, the function fails.
""	In systems prior to Windows 2000, the default verb is used if it is valid and available in the registry. If not, the "open" verb is used. In Windows 2000 and later, the default verb is used if available. If not, the "open" verb is used. If neither verb is available, the system uses the first verb listed in the registry.

SW_HIDE	0	Hides the window and activates another window.
SW_MAXIMIZE	3	Maximizes the specified window.
SW_MINIMIZE	6	Minimizes the specified window and activates the next top-level window in the z-order.
SW_RESTORE	9	Activates and displays the window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when restoring a minimized window.
SW_SHOW	5	Activates the window and displays it in its current size and position.
SW_SHOWDEFAULT	10	Sets the show state based on the SW_ flag specified in the STARTUPINFO structure passed to the CreateProcess function by the program that started the application. An application should call ShowWindow with this flag to set the initial show state of its main window.
SW_SHOWMAXIMIZED	3	Activates the window and displays it as a maximized window.
SW_SHOWMINIMIZED	2	Activates the window and displays it as a minimized window.
SW_SHOWMINNOACTIVE	7	Displays the window as a minimized window. The active window remains active.
SW_SHOWNA	8	Displays the window in its current state. The active window remains active.
SW_SHOWNOACTIVATE	4	Displays a window in its most recent size and position. The active window remains active.
SW_SHOWNORMAL	1	Activates and displays a window. If the window is minimized or maximized, Windows restores it to its original size and position. An application should specify this flag when displaying the window for the first time.

Return code	Description
0	The operating system is out of memory or resources.
ERROR_FILE_NOT_FOUND = 2	The specified file was not found.
ERROR_PATH_NOT_FOUND = 3	The specified path was not found.
ERROR_BAD_FORMAT = 11	The .exe file is invalid (non-Win32 .exe or error in .exe image).
SE_ERR_ACCESSDENIED = 5	The operating system denied access to the specified file.
SE_ERR_ASSOCINCOMPLETE = 27	The file name association is incomplete or invalid.
SE_ERR_DDEBUSY = 30	The DDE transaction could not be completed because other DDE transactions were being processed.
SE_ERR_DDEFAIL = 29	The DDE transaction failed.
SE_ERR_DDETIMEOUT = 28	The DDE transaction could not be completed because the request timed out.
SE_ERR_DLLNOTFOUND = 32	The specified DLL was not found.
SE_ERR_FNF = 2	The specified file was not found.
SE_ERR_NOASSOC = 31	There is no application associated with the given file name extension. This error will also be returned if you attempt to print a file that is not printable.
SE_ERR_OOM = 8	There was not enough memory to complete the operation.
SE_ERR_PNF = 3	The specified path was not found.
SE_ERR_SHARE = 26	A sharing violation occurred.

196.11 module WindowsBitmapMBS

196.11.1 module WindowsBitmapMBS

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Windows bitmap handling module.
Notes:

In this module we collect a few useful conversion functions for handling bitmap in Xojo.
Please contact us if you have idea for new function.

196.11.2 Blog Entries

- MBS Releases the MBS Xojo / Real Studio plug-ins in version 15.1

- 13.4, page 10: News

196.11.4 Blog Entries

- MBS Releases the MBS Xojo / Real Studio plug-ins in version 15.1

196.11.5 Xojo Developer Magazine

- 13.4, page 10: News

196.11.6 Methods

196.11.7 BitmapToDIB(HBitmap as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HBitmap to a HDIB.
Notes: HPalette is optional a color palette handle for images with 8 bit or less per pixel.

196.11.8 DeleteBitmap(HBitmap as Ptr)

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Frees a HDIB or HBITMAP.
Notes: You need to free the images you allocate to make sure memory is released.

196.11.9 DIBToBitmap(HDIB as Ptr, HPalette as Ptr = nil) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HDIB to HBitmap.
Notes:

HPalette is optional a color palette handle for images with 8 bit or less per pixel.
Returns nil in case of no memory.

196.11.10 DuplicateHBitmap(HBitmap as Ptr, Width as Integer, Height as Integer) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Duplicates a bitmap handle.
Notes: Please use DeleteBitmap later to free bitmap.

196.11.11 HBitmapInfo(HBitmap as Ptr, byref Width as Integer, byref Height as Integer, byref WidthBytes as Integer, byref Planes as Integer, byref BitsPixel as Integer) as Boolean

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Queries details about a bitmap handle.
Notes: Returns true on success.

196.11.12 HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HBITMAP to Xojo picture.
Notes:

If UsingDraw is true, the plugin creates a new HBitmap and draws picture inside.
Else if UsingDraw is false, the plugin copies picture and mask into a new picture.

UsingDraw with false works only for 24 or 32 bit images with one plane.
See also:

- 196.11.13 HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture 27553

196.11.13 HBitmapToPicture(HBitmap as Ptr, Width as Integer, Height as Integer) as Picture

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Converts a HBITMAP to Xojo picture.
Notes:

Draws the HBitmap in a new picture of the given size.
This method can be used to resize the bitmap on the fly while drawing.
See also:

- 196.11.12 HBitmapToPicture(HBitmap as Ptr, UsingDraw as boolean = false) as Picture 27552

196.11.14 PictureToHBitmap(Pic as Picture) as Ptr

MBS Picture Plugin, Plugin Version: 15.1, Platform: Windows, Targets: All.

Function: Queries HBitmap of a picture.
Notes:

As Xojo picture's are internally HBitmaps, the plugin returns the handle of the picture.
No copy is made and you should not free the image. If you need a copy, please use DuplicateHBitmap function.

Please use DeleteBitmap later to free bitmap.

196.12 class WindowsClipboardMBS

196.12.1 class WindowsClipboardMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The windows clipboard class.
Notes:

Use it to access the clipboard on Windows.

Be aware that in the constructor we open the clipboard connection. Since Xojo may itself like to look into the clipboard to decide whether to enable copy & paste events, our clipboard connection may get taken or times out. Only one app at a time can have clipboard access.

196.12.8 Methods

196.12.9 Clear

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears the contents of the clipboard.

196.12.10 ClipboardFormats as Integer()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an array with all clipboard formats currently in the clipboard.

196.12.11 ClipboardSequenceNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the clipboard sequence number for the current window station.
Notes:

The return value is the clipboard sequence number. If you do not have WINSTA_ACCESSCLIPBOARD access to the window station, the function returns zero.

The system keeps a serial number for the clipboard for each window station. This number is incremented whenever the contents of the clipboard change or the clipboard is emptied. You can track this value to determine whether the clipboard contents have changed and optimize creating DataObjects. If clipboard rendering is delayed, the sequence number is not incremented until the changes are rendered.

196.12.12 Constructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Connects to the clipboard.
Notes: As the clipboard has exclusive access, do not keep WindowsClipboardMBS objects around. Best you only use them within a method so once the method ends, everything is released.

196.12.13 CountClipboardFormats as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the number of different data formats currently on the clipboard.
Notes:

If the function succeeds, the return value is the number of different data formats currently on the clipboard.

If the function fails, the return value is zero.

196.12.14 Destructor

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Automatically closes the clipboard.

196.12.15 EnumClipboardFormats(format as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enumerates the data formats currently available on the clipboard.
Notes:

Clipboard data formats are stored in an ordered list. To perform an enumeration of clipboard data formats, you make a series of calls to the EnumClipboardFormats function. For each call, the format parameter specifies an available clipboard format, and the function returns the next available clipboard format.

format: A clipboard format that is known to be available.

To start an enumeration of clipboard formats, set format to zero. When format is zero, the function retrieves the first available clipboard format. For subsequent calls during an enumeration, set format to the result of the previous EnumClipboardFormats call.

If the function succeeds, the return value is the clipboard format that follows the specified format, namely the next available clipboard format.

If the function fails, the return value is zero.
If there are no more clipboard formats to enumerate, the return value is zero.

You must open the clipboard before enumerating its formats. Use the OpenClipboard function to open the clipboard. The EnumClipboardFormats function fails if the clipboard is not open.

The EnumClipboardFormats function enumerates formats in the order that they were placed on the clipboard. If you are copying information to the clipboard, add clipboard objects in order from the most descriptive clipboard format to the least descriptive clipboard format. If you are pasting information from the clipboard, retrieve the first clipboard format that you can handle. That will be the most descriptive clipboard format that you can handle.

The system provides automatic type conversions for certain clipboard formats. In the case of such a format, this function enumerates the specified format, then enumerates the formats to which it can be converted. For more information, see Standard Clipboard Formats and Synthesized Clipboard Formats.

196.12.16 GetClipboardFormatName(format as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves from the clipboard the name of the specified registered format. The function copies the name to the specified buffer.
Example:

```
// show items on clipboard

dim w as new WindowsClipboardMBS
dim types(-1) as integer = w.ClipboardFormats
dim names() as string

for each type as integer in types
dim n as string = w.GetClipboardFormatName(type)

n = str(type)+" "+n

names.append n
next

MsgBox Join(names,EndOfLine)
```

196.12.17 GetData(type as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves data from the clipboard in a specified format.
Notes:

Format: A clipboard format.

If the function succeeds, the return value is the string with the clipboard data in the specified format.

If the function fails, the return value is "".

An application can enumerate the available formats in advance by using the EnumClipboardFormats function.

196.12.18 GetDIB as Picture

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop only.

Function: Queries DIB picture on the clipboard.
Notes:

Returns nil on any error.
This is using DIB type in clipboard for a Device Independent Bitmap.

Please use GetPicture for bitmap handles.

196.12.19 GetFiles as string()

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries list of file paths on the clipboard.
Notes: This is for working with Explorers copy & paste feature.

196.12.20 GetPicture as Picture

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop only.

Function: Queries bitmap on the clipboard.
Notes:

Returns nil on any error.
This is using BITMAP type in clipboard for a bitmap handle.

Please use GetDIB for Device Independent Bitmap.

196.12.21 IsClipboardFormatAvailable(type as Integer) as boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Determines whether the clipboard contains data in the specified format.
Notes:

type: A standard or registered clipboard format.

If the clipboard format is available, the return value is true.
If the clipboard format is not available, the return value is false.

Typically, an application that recognizes only one clipboard format would call this function when processing the EnableMenuItems event. The application would then enable or disable the Paste menu item, depending on the return value.

196.12.22 RegisterClipboardFormat(type as string) as Integer

MBS Win Plugin, Plugin Version: 13.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers a new clipboard format. This format can then be used as a valid clipboard format.
Example:

```
dim TypeHTML as Integer
dim TypeRTF as Integer

TypeHTML = WindowsClipboardMBS.RegisterClipboardFormat("HTML Format")
TypeRTF = WindowsClipboardMBS.RegisterClipboardFormat("Rich Text Format")
```

Notes:

If the function succeeds, the return value identifies the registered clipboard format.
If the function fails, the return value is zero.

If a registered format with the specified name already exists, a new format is not registered and the return value identifies the existing format. This enables more than one application to copy and paste data using the same registered clipboard format. Note that the format name comparison is case-insensitive.
Registered clipboard formats are identified by values in the range & hC000 through & hFFFF.

196.12.23 SetData(type as Integer, rawData as string) as boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Places data on the clipboard in a specified clipboard format.
Notes:

Format: The clipboard format. This parameter can be a registered format or any of the standard clipboard formats.
rawData: A string with the data in the specified format.

If the function succeeds, the return value is true.
If the function fails, the return value is false.

The system performs implicit data format conversions between certain clipboard formats when an application calls the GetClipboardData function. For example, if the kTypeOEMTEXT format is on the clipboard, a window can retrieve data in the kTypeTEXT format. The format on the clipboard is converted to the requested format on demand. For more information, see Synthesized Clipboard Formats.

196.12.24 SetDIB(pic as Picture) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop only.

Function: Puts a DIB picture on the clipboard.
Notes:

Returns true on success.
This is using DIB type in clipboard for a bitmap handle.

Please use SetPicture for Device Independent Bitmap.

196.12.25 SetFiles(paths() as string) as boolean

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Puts a list of file paths on the clipboard.
Notes:

This is for working with Explorers copy & paste feature.
Returns true on success.
Folder paths may work better if they have no training backslash.

196.12.26 SetPicture(pic as Picture) as boolean

MBS Win Plugin, Plugin Version: 14.4, Platform: Windows, Targets: Desktop only.

Function: Puts a bitmap picture on the clipboard.
Notes:

Returns true on success.
This is using BITMAP type in clipboard for a bitmap handle.

Please use SetDIB for Device Independent Bitmap.

196.12.27 Properties

196.12.28 Valid as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A flag whether the constructor got a clipboard connection.
Notes: (Read and Write property)

196.12.29 Constants

196.12.30 kTypeBitmap = 2

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: A handle to a bitmap (HBITMAP).

196.12.31 kTypeDIB = 8

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: A memory object containing a BITMAPINFO structure followed by the bitmap bits.

196.12.32 kTypeDIBV5 = 17

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: A memory object containing a BITMAPV5HEADER structure followed by the bitmap color space information and the bitmap bits.

196.12.33 kTypeDIF = 5

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Software Arts' Data Interchange Format.

196.12.34 kTypeENHMetaFile = 14

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: A handle to an enhanced metafile (HENHMETAFILE).

196.12.35 kTypeHDROP = 15

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: A handle to type HDROP that identifies a list of files. An application can retrieve information about the files by passing the handle to the DragQueryFile function.

196.12.36 kTypeLocale = 16

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes:

The data is a handle to the locale identifier associated with text in the clipboard. When you close the clipboard, if it contains kTypeText data but no kTypeLocale data, the system automatically sets the kTypeLocale format to the current input language. You can use the kTypeLocale format to associate a different locale with the clipboard text.

An application that pastes text from the clipboard can retrieve this format to determine which character set was used to generate the text.

Note that the clipboard does not support plain text in multiple character sets. To achieve this, use a formatted text data type such as RTF instead.

The system uses the code page associated with kTypeLocale to implicitly convert from kTypeText to kTypeUnicodeText. Therefore, the correct code page table is used for the conversion.

196.12.37 kTypeMetaFilePict = 3

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Handle to a metafile picture format as defined by the METAFILEPICT structure. When passing a kTypeMetaFilePict handle by means of DDE, the application responsible for deleting hMem should also free the metafile referred to by the kTypeMetaFilePict handle.

196.12.38 kTypeOEMText = 7

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Text format containing characters in the OEM character set. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.

196.12.39 kTypePalette = 9

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes:

Handle to a color palette. Whenever an application places data in the clipboard that depends on or assumes a color palette, it should place the palette on the clipboard as well.

If the clipboard contains data in the kTypePalette (logical color palette) format, the application should use the SelectPalette and RealizePalette functions to realize (compare) any other data in the clipboard against that logical palette.

When displaying clipboard data, the clipboard always uses as its current palette any object on the clipboard that is in the kTypePalette format.

196.12.40 kTypePenData = 10

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Data for the pen extensions to the Microsoft Windows for Pen Computing

196.12.41 kTypeRIFF = 11

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Represents audio data more complex than can be represented in a CF_WAVE standard wave format.

196.12.42 kTypeSylk = 4

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.

Notes: Microsoft Symbolic Link (SYLK) format.

196.12.43 kTypeText = 1

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Text format. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data. Use this format for ANSI text.

196.12.44 kTypeTIFF = 6

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Tagged-image file format.

196.12.45 kTypeUnicodeText = 13

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Unicode text format. Each line ends with a carriage return/linefeed (CR-LF) combination. A null character signals the end of the data.

196.12.46 kTypeWAVE = 12

MBS Win Plugin, Plugin Version: 10.4.

Function: One of standard clipboard formats defined by the system.
Notes: Represents audio data in one of the standard wave formats, such as 11 kHz or 22 kHz PCM.

196.13 class WindowsDeviceMBS

196.13.1 class WindowsDeviceMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class is for device
Example:

```
dim devices(-1) as WindowsDeviceMBS = WindowsDeviceMBS.Devices
for each device as WindowsDeviceMBS in devices
msgbox device.Description
next
```

Notes:

For Mac you can take a look on the MacUSBDeviceMBS class and the IORegistryMBS class.
See also WinUSBDeviceMBS and WinUSBMBS classes.
For cross platform development also check LibUSBDeviceMBS classes.

196.13.4 Methods

196.13.5 CompatibleIDs as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The list of compatible IDs for a device.
Notes: A device has only one device ID that is the most specific ID for a device. A device can also have less specific hardware IDs and compatible IDs. Windows first tries to find an INF file that matches the device ID. If it does not find such a match, Windows next tries to find a match to one of the less specific hardware IDs or compatible IDs.

196.13.6 Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS()

MBS Win Plugin, Plugin Version: 11.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all devices on the system matching the given Class GUID.
Example:

```
const PortsGUID = " { 4D36E978-E325-11CE-BFC1-08002BE10318 } "
dim devices(-1) as WindowsDeviceMBS = WindowsDeviceMBS.Devices(PortsGUID)
```

Notes:

If present is true, only devices currently present on the system are returned.
The array is empty on any error.

Class	{ GUID }	Device Description
CDROM	{ 4D36E965-E325-11CE-BFC1-08002BE10318 }	CD/DVD/Blu-ray drives
DiskDrive	{ 4D36E967-E325-11CE-BFC1-08002BE10318 }	Hard drives
Display	{ 4D36E968-E325-11CE-BFC1-08002BE10318 }	Video adapters
FDC	{ 4D36E969-E325-11CE-BFC1-08002BE10318 }	Floppy controllers
FloppyDisk	{ 4D36E980-E325-11CE-BFC1-08002BE10318 }	Floppy drives
HDC	{ 4D36E96A-E325-11CE-BFC1-08002BE10318 }	Hard drive controllers
HIDClass	{ 745A17A0-74D3-11D0-B6FE-00A0C90F57DA }	Some USB devices
1394	{ 6BDD1FC1-810F-11D0-BEC7-08002BE2092F }	IEEE 1394 host controller
Image	{ 6BDD1FC6-810F-11D0-BEC7-08002BE2092F }	Cameras and scanners

• 196.13.7 Devices(present as boolean = true) as WindowsDeviceMBS() 27568

196.13.7 Devices(present as boolean = true) as WindowsDeviceMBS()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all devices on the system.
Notes:

If present is true, only devices currently present on the system are returned.
The array is empty on any error.
See also:

• 196.13.6 Devices(ClassGUID as string, present as boolean = true) as WindowsDeviceMBS() 27567

196.13.8 HardwareID as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The list of hardware IDs for a device.

196.13.9 LocationPaths as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the device in the device tree.
Notes: Windows Server 2003 and later.

196.13.10 LowerFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The names of a device's lower-filter drivers.

196.13.11 UpperFilters as string()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The names of a device's upper filter drivers.

196.13.12 Properties

196.13.13 Address as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's address.
Notes: (Read and Write property)

196.13.14 BusNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's bus number.
Notes: (Read and Write property)

196.13.15 BusTypeGUID as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GUID for the device's bus type.
Notes: (Read and Write property)

196.13.16 Capabilities as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device capabilities.
Notes:

A combination of the kDeviceCapability* constants.
(Read and Write property)

196.13.17 Characteristics as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device characteristics.
Notes: (Read and Write property)

196.13.18 ClassGUID as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GUID that represents the device setup class of a device.
Notes: (Read and Write property)

196.13.19 ClassName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device setup class of a device.
Notes:

(This property should be named Class, but was renamed ClassName as Class is a reserved word in Xojo)
(Read and Write property)

196.13.20 ConfigFlags as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's configuration flags.
Notes: (Read and Write property)

196.13.21 Description as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description of a device.
Notes:

Maybe localized.
(Read and Write property)

196.13.22 DeviceID as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: If a device is associated with this device entry, here you have the ID string for this device.
Notes: (Read and Write property)

196.13.23 DevicePath as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: For devices with device ID, this is the device path.
Notes: (Read and Write property)

196.13.24 DeviceType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's type.
Notes:

See kDeviceType* constants.
(Read and Write property)

196.13.25 Driver as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that identifies the device's software key (sometimes called the driver key).
Notes: (Read and Write property)

196.13.26 EnumeratorName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The string that contains the name of the device's enumerator.
Notes: (Read and Write property)

196.13.27 Exclusive as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a user can obtain exclusive use of the device.
Notes:

The value is true if exclusive use is allowed, or false otherwise.
(Read and Write property)

196.13.28 FriendlyName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The friendly name of a device.
Notes: (Read and Write property)

196.13.29 HID as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the plugin found additional HID details on the device.
Notes: (Read and Write property)

196.13.30 HIDAccessible as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the plugin was able to access the device and query the properties.
Notes:

HIDAccessible is true if and only if HID is also true.
(Read and Write property)

196.13.31 HIDFeatureReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the HID feature reports for this USB HID device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.32 HIDInputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the HID input reports for this USB HID device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.33 HIDManufacturerName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The manufacturer name for this device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.34 HIDOutputReportByteLength as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The length of the HID output reports for this USB HID device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.35 HIDProductID as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product ID for this USB device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.36 HIDProductName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product name for this HID Device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.37 HIDSerialNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number for this USB device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.38 HIDVendorID as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vendor ID for this USB device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.39 HIDVersionNumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The version number for this HID Device.
Notes:

Only valid if HID and HIDAccessible are true.
(Read and Write property)

196.13.40 InstallState as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The install state of this device.
Notes:

See kInstallState* constants.
(Read and Write property)

196.13.41 LegacyBusType as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's legacy bus type.
Notes: (Read and Write property)

196.13.42 LocationInformation as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The hardware location of a device.
Notes: (Read and Write property)

196.13.43 Manufacturer as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the device manufacturer.
Notes: (Read and Write property)

196.13.44 PhysicalDeviceObjectName as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name that is associated with the device's PDO.
Notes: (Read and Write property)

196.13.45 RemovalPolicy as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's current removal policy.
Notes:

Windows XP and later
(Read and Write property)

196.13.46 RemovalPolicyHWDefault as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's hardware-specified default removal policy.
Notes:

Windows XP and later
(Read and Write property)

196.13.47 RemovalPolicyOverride as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's override removal policy (if it exists) from the registry.
Notes:

Windows XP and later
(Read and Write property)

196.13.48 SecurityDescriptor as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device's security descriptor.
Notes:

The format of security descriptor strings is described in Microsoft Windows SDK documentation.
(Read and Write property)

196.13.49 Service as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The service name for a device.
Notes: (Read and Write property)

196.13.50 UINumber as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The UINumber.
Notes:

Specifies a number associated with the device that can be displayed in the user interface.

This number is typically a user-perceived slot number, such as a number printed next to the slot on the board, or some other number that makes locating the physical device easier for the user. For buses with no such convention, or when the UINumber is unknown, the bus driver leaves this member at its default value

of -1.
(Read and Write property)

196.13.51 Constants

196.13.52 kDeviceCapabilityDockDevice = 8

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Dock Device

196.13.53 kDeviceCapabilityEjectSupported = 2

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Eject Supported

196.13.54 kDeviceCapabilityHardwareDisabled = 256

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Hardware Disabled

196.13.55 kDeviceCapabilityLockSupported = 1

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Lock Supported

196.13.56 kDeviceCapabilityNonDynamic = 512

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Non Dynamic

196.13.57 kDeviceCapabilityRAWDeviceOK = 64

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Raw Device OK

196.13.58 kDeviceCapabilityRemovable = 4

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Removable

196.13.59 kDeviceCapabilitySilentInstall = 32

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Silent Install

196.13.60 kDeviceCapabilitySurpriseRemovalOK = 128

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Surprise Removal OK

196.13.61 kDeviceCapabilityUniqueID = 16

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the capabilities constants.
Notes: Unique ID

196.13.62 kDeviceType8042Port = & h27

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

Function: One of the device type constants.

196.13.110 kDeviceTypeTape = & h1f

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.111 kDeviceTypeTapeFileSystem = & h20

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.112 kDeviceTypeTermsrv = & h38

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.113 kDeviceTypeTransport = & h21

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.114 kDeviceTypeUnknown = & h22

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.115 kDeviceTypeVDM = & h2c

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.116 kDeviceTypeVideo = & h23

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.117 kDeviceTypeVirtualDisk = & h24

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.118 kDeviceTypeWaveIn = & h25

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.119 kDeviceTypeWaveOut = & h26

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the device type constants.

196.13.120 kInstallStateFailedInstall = 2

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the device's installation state.
Notes: The device did not install properly.

196.13.121 kInstallStateFinishInstall = 3

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the device's installation state.
Notes: The installation of this device is not yet complete.

196.13.122 kInstallStateInstalled = 0

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the device's installation state.
Notes: The device is installed.

196.13.123 kInstallStateNeedsReinstall = 1

MBS Win Plugin, Plugin Version: 10.4.

Function: One of the constants for the device's installation state.
Notes: The system will try to reinstall the device on a later enumeration.

196.14 class WindowsDiscInfoMBS

196.14.1 class WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to query details on a disc drive on Windows.
Example:

```
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices

for each disc as WindowsDiscInfoMBS in discs
MsgBox disc.ModelNumber
next
```

196.14.2 Blog Entries

196.14.4 Methods

196.14.5 Device(file as folderitem) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the device with the given path.
Example:

```
// volume(0) is boot volume
dim disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device(volume(0))
```

Notes:

Returns nil on any error (like missing permissions).
Seems like on Windows Vista/7 you need admin rights to query this.
The path of the folderitem must be something starting with a drive letter.
See also:

- 196.14.6 Device(path as string) as WindowsDiscInfoMBS 27591

196.14.6 Device(path as string) as WindowsDiscInfoMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the device with the given path.
Example:

```
dim disc as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Device("C")
```

Notes:

Returns nil on any error (like missing permissions).
Seems like on Windows Vista/7 you need admin rights to query this.
Path must be something starting with a drive letter.
See also:

- 196.14.5 Device(file as folderitem) as WindowsDiscInfoMBS 27590

196.14.7 Devices() as WindowsDiscInfoMBS()

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the device list.
Example:

```
// enumerate all drives
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices
```

Notes:

Returns empty array on error.
May get more information on Windows Vista/7 if application runs as administrator.

196.14.8 Properties

196.14.9 BufferSize as Int64

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The buffer size of the disc controller.
Notes:

This value is set if Mode contains 1.
(Read only property)

196.14.10 BytesPerSector as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of bytes per sector.
Notes:

This value is set if Mode contains 4.
Typically 512 bytes, but that can increase in the future.
(Read and Write property)

196.14.11 Drive as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The drive number.
Notes: (Read and Write property)

196.14.12 Fixed as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this device is fixed.
Notes:

This value is set if Mode contains 1 or 4.
(Read and Write property)

196.14.13 Mode as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This value shows which properties of the instance have been set with values.
Notes:

Mode is a bitwise or combination of values 1, 2 or 4. So value is 6 if mode 2 and 4 are set. You can test with bitwiseand(mode,mask). For example if bitwiseAnd(mode,4)=4 then BytesPerSector is valid.
(Read and Write property)

196.14.14 ModelNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The model number string for this device.
Example:

```
dim discs(-1) as WindowsDiscInfoMBS = WindowsDiscInfoMBS.Devices

for each disc as WindowsDiscInfoMBS in discs
MsgBox disc.ModelNumber
next
```

Notes:

This string is not available for all discs.
This value is set if Mode contains 1 or 2.
(Read and Write property)

196.14.15 ProductRevision as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product revision string.
Notes:

This string is not available for all discs.
This value is set if Mode contains 2.
(Read and Write property)

196.14.16 Removable as Boolean

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this device is removable.
Notes:

This value is set if Mode contains 1 or 4.
(Read and Write property)

196.14.17 RevisionNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The revision number of the disc.
Notes:

This string is not available for all discs.
This value is set if Mode contains 1.
(Read and Write property)

196.14.18 SectorsPerTrack as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of sectors per track.
Notes:

This value is set if Mode contains 4.
(Read and Write property)

196.14.19 SerialNumber as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number of the device.
Notes:

This string is not available for all discs.
This value is set if Mode contains 1 or 2.
(Read and Write property)

196.14.20 Size as Int64

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of this disc in bytes.
Notes:

This value is set if Mode contains 1 or 4.
(Read only property)

196.14.21 TracksPerCylinder as Integer

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of tracks per cylinder.
Notes:

This value is set if Mode contains 4.
(Read and Write property)

196.14.22 VendorId as String

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vendor ID of the disc.
Notes:

This value is set if Mode contains 2.
This string is not available for all discs.
(Read and Write property)

196.15 class WindowsDisplayMBS

196.15.1 class WindowsDisplayMBS

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for details on displays.

196.15.6 Methods

196.15.7 Displays as WindowsDisplayMBS()

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries list of displays.
Notes: Returns nil in case of error.

196.15.8 Properties

196.15.9 DeviceInstanceID as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device instance ID in setup database.
Notes: (Read only property)

196.15.10 DeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device name of display.
Notes: (Read only property)

196.15.11 DisplayAdapterActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a monitor is presented as being "on" by the respective GDI view.
Notes: (Read only property)

196.15.12 DisplayAdapterDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device ID for the display adapter.
Notes: (Read only property)

196.15.13 DisplayAdapterDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The display adapter device key.
Notes: (Read only property)

196.15.14 DisplayAdapterDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The adapter device name.
Notes: (Read only property)

196.15.15 DisplayAdapterDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device context string.
Notes:

This is a description of the display adapter.
(Read only property)

196.15.16 DisplayAdapterRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device is removable; it cannot be the primary display.
Notes: (Read only property)

196.15.17 DisplayAdapterStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state flags.
Notes: (Read only property)

196.15.18 DisplayMonitorActive as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether a monitor is presented as being "on" by the respective GDI view.
Notes: (Read only property)

196.15.19 DisplayMonitorDeviceID as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device ID for the display monitor.
Notes: (Read only property)

196.15.20 DisplayMonitorDeviceKey as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The display monitor device key.
Notes: (Read only property)

196.15.21 DisplayMonitorDeviceName as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The monitor device name.
Notes: (Read only property)

196.15.22 DisplayMonitorDeviceString as String

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device context string.
Notes:

This is a description of the display monitor.
(Read only property)

196.15.23 DisplayMonitorRemovable as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device is removable; it cannot be the primary display.
Notes: (Read only property)

196.15.24 DisplayMonitorStateFlags as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state flags.
Notes: (Read only property)

196.15.25 Height as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the display in pixels.
Notes: (Read only property)

196.15.26 HeightDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DPI for the display.
Notes:

Calculated based on HeightInch property.
Value is zero if we don't know.
(Read only property)

196.15.27 HeightInch as Double

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical height of the screen in inches.
Notes:

Value is zero if we don't know.
(Read only property)

196.15.28 HeightMM as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical height of the screen in millimeters.
Notes:

Value is zero if we don't know.
(Read only property)

196.15.29 LogPixelsX as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen width.
Notes:

In a system with multiple display monitors, this value is the same for all monitors.

e.g. 200% is 96 * 2 = 192
(Read only property)

196.15.30 LogPixelsY as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of pixels per logical inch along the screen height.
Notes:

In a system with multiple display monitors, this value is the same for all monitors.

e.g. 200% is 96 * 2 = 192
(Read only property)

196.15.31 MonitorHandle as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle for the monitor.
Notes: (Read only property)

196.15.32 MonitorHeight as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The monitor height.
Notes: (Read only property)

196.15.33 MonitorWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The monitor width.
Notes: (Read only property)

196.15.34 MonitorX as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of monitor.
Notes:

The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

196.15.35 MonitorY as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of monitor.
Notes:

The display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

196.15.36 Primary as Boolean

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is primary display.
Notes: (Read only property)

196.15.37 Width as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the display in pixels.
Notes: (Read only property)

196.15.38 WidthDPI as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DPI for the display.
Notes:

Calculated based on WidthInch property.
Value is zero if we don't know.
(Read only property)

196.15.39 WidthInch as Double

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical width of the screen in inches.
Notes:

Value is zero if we don't know.
(Read only property)

196.15.40 WidthMM as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The physical width of the screen in millimeters.
Notes:

Value is zero if we don't know.
(Read only property)

196.15.41 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area height in pixels.
Notes: (Read only property)

196.15.42 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area width in pixels.
Notes: (Read only property)

196.15.43 WorkX as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area position.
Notes:

The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

196.15.44 WorkY as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The work area position.
Notes:

The work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area in rcMonitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read only property)

196.15.45 X as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of the display in the virtual desktop space.
Notes:

Primary display is always at 0/0.
(Read only property)

196.15.46 Y as Integer

MBS Win Plugin, Plugin Version: 18.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The position of the display in the virtual desktop space.
Notes:

Primary display is always at 0/0.
(Read only property)

196.16 class WindowsFileCopyMBS

196.16.1 class WindowsFileCopyMBS

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to help you copying files on Windows using system functions.

196.16.4 Methods

196.16.5 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file, notifying the application of its progress through the progress event.
Notes:

Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

- 196.16.6 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean 27607

196.16.6 CopyFileEx(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file, notifying the application of its progress through the progress event.
Notes:

Returns true on success and false on failure.

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
Flags: Flags that specify how the file is to be copied. This parameter can be a combination of the CopyFile* constants.
See also:

- 196.16.5 CopyFileEx(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean 27606

196.16.7 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file.
Notes:

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function

fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.
See also:

- 196.16.8 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean 27608

196.16.8 CopyFileSimple(ExistingFileName as String, NewFileName as String, FailIfExists as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies an existing file to a new file.
Notes:

ExistingFileName: The name of an existing file.
NewFileName: The name of the new file.
FailIfExists: If this parameter is true and the new file specified by NewFileName already exists, the function fails. If this parameter is false and the new file already exists, the function overwrites the existing file and succeeds.

Returns true on success and false on failure.
See also:

- 196.16.7 CopyFileSimple(ExistingFileName as folderitem, NewFileName as folderitem, FailIfExists as boolean=false) as boolean 27607

196.16.9 FileOperationCopy(source as folderitem, dest as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copy the files specified in the source parameter to the location specified in the dest parameter.
Notes:

This method has several varations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

Function: Deletes files and folders.
Notes:

This method has several varations so you can call it with a folderitem or a string to specify a file or folder.
You can also pass an array of folderitems or strings to delete several files/folders in one operation.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

196.16.21 FileOperationMove(source as folderitem, dest as folderitem, Flags as Integer, ProgressTitle as string="") as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Move the files specified in the source parameter to the location specified in the dest parameter.
Notes:

This method has several varations so you can call it with a folderitem or a string to specify a file or folder. You can also pass an array of folderitems or strings to delete several files/folders in one operation.

source:
These names should be fully-qualified paths to prevent unexpected results.
Standard Microsoft MS-DOS wildcard characters, such as "*", are permitted only in the file-name position. Using a wildcard character elsewhere in the string will lead to unpredictable results.

dest:
The destination file or directory name. Wildcard characters are not allowed. Their use will lead to unpredictable results.

Copy and Move operations can specify destination directories that do not exist. In those cases, the system attempts to create them and normally displays a dialog box to ask the user if they want to create the new

directory. To suppress this dialog box and have the directories created silently, set the FileOperationNoConfirmationMkDir flag in Flags.
For Copy and Move operations, the buffer can contain multiple destination file names if the fFlags member specifies FileOperationMultiDestFiles.
Use fully-qualified paths. Using relative paths is not prohibited, but can have unpredictable results.

Use the FileOperation* constants for the flags.
If a dialog is displayed, the window used in the parent property is used for the parent window.
If ProgressTitle is not empty, this string is used to specify the progress window title text.

Returns true on success and false on failure.

196.16.29 MoveFileSimple(ExistingFileName as folderitem, NewFileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves an existing file or a directory, including its children.
Notes:

ExistingFileName:The current name of the file or directory on the local computer.

NewFileName: The new name for the file or directory. The new name must not already exist. A new file may be on a different file system or drive. A new directory must be on the same drive.

Returns true on success and false on failure.

The MoveFile function will move (rename) either a file or a directory (including its children) either in the same directory or across directories. The one caveat is that the MoveFile function will fail on directory moves when the destination is on a different volume.

If a file is moved across volumes, MoveFile does not move the security descriptor with the file. The file will be assigned the default security descriptor in the destination directory.

The MoveFile function coordinates its operation with the link tracking service, so link sources can be tracked as they are moved.

196.16.31 MoveFileWithProgress(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves a file or directory, including its children.
Notes:

ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is nil, MoveFileWithProgress registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESS_CANCEL due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESS_STOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

- 196.16.32 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean 27632

196.16.32 MoveFileWithProgress(ExistingFileName as String, NewFileName as String, Flags as Integer) as boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves a file or directory, including its children.
Notes:

ExistingFileName: The name of the existing file or directory on the local computer.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT, the file cannot exist on a remote share because delayed operations are performed before the network is available.

NewFileName: The new name of the file or directory on the local computer.

When moving a file, NewFileName can be on a different file system or volume. If NewFileName is on another drive, you must set the MOVEFILE_COPY_ALLOWED flag in Flags.

When moving a directory, ExistingFileName and NewFileName must be on the same drive.

If Flags specifies MOVEFILE_DELAY_UNTIL_REBOOT and NewFileName is "", MoveFileWithProgress registers ExistingFileName to be deleted when the system restarts. The function fails if it cannot access the registry to store the information about the delete operation. If ExistingFileName refers to a directory, the system removes the directory at restart only if the directory is empty.

Flags: The move options. This parameter can be one or more of the following values: MoveFileCopyAllowed, MoveFileReplaceExisting, MoveFileCreateHardLink, MoveFileDelayUntilReboot and MoveFileWriteThrough.

Return Value: If the function succeeds, the return value is true. If the function fails, the return value is false.

When moving a file across volumes, if the Progress event returns PROGRESS_CANCEL due to the user canceling the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

When moving a file across volumes, if the Progress event returns PROGRESS_STOP due to the user stopping the operation, MoveFileWithProgress will return zero and GetLastError will return ERROR_REQUEST_ABORTED. The existing file is left intact.

- 196.16.31 MoveFileWithProgress(ExistingFileName as folderitem, NewFileName as folderitem, Flags as Integer) as boolean 27631

196.16.33 Properties

196.16.34 Lasterror as Integer

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes:

This value is typically zero on success and -1 if the function is not supported by the plugin.

The FileOperation* functions have special error codes as following, but other methods have normal Windows Error codes:

(Read and Write property)

196.16.35 MultiThreaded as Boolean

MBS Win Plugin, Plugin Version: 12.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to use helper thread for better GUI responsiveness.
Notes:

This property allows you to call this method in a Thread. The plugin will perform the actual operation on a helper thread, so it does not block Xojo's threading. Your GUI can continue to run this way. Progress event fires asynchronously.
(Read and Write property)

DE_SAMEFILE	= & h71	The source and destination files are the same file.
DE_MANYSRC1DEST	= & h72	Multiple file paths were specified in the source buffer, but only one destination file path.
DE_DIFFDIR	= & h73	Rename operation was specified but the destination path is a different directory. Use the move operation instead.
DE_ROOTDIR	= & h74	The source is a root directory, which cannot be moved or renamed.
DE_OPCANCELLED	= & h75	The operation was cancelled by the user, or silently cancelled if the appropriate flags were supplied to SHFileOperation.
DE_DESTSUBTREE	= & h76	The destination is a subtree of the source.
DE_ACCESSDENIEDSRC	= & h78	Security settings denied access to the source.
DE_PATHTOODEEP	= & h79	The source or destination path exceeded or would exceed MAX_PATH.
DE_MANYDEST	= & h7A	The operation involved multiple destination paths, which can fail in the case of a move operation.
DE_INVALIDFILES	= & h7C	The path in the source or destination or both was invalid.
DE_DESTSAMETREE	= & h7D	The source and destination have the same parent folder.
DE_FLDDESTISFILE	= & h7E	The destination path is an existing file.
DE_FILEDESTISFLD	= & h80	The destination path is an existing folder.
DE_FILENAMETOOLONG	= & h81	The name of the file exceeds MAX_PATH.
DE_DEST_IS_CDROM	= & h82	The destination is a read-only CD-ROM, possibly unformatted.
DE_DEST_IS_DVD	= & h83	The destination is a read-only DVD, possibly unformatted.
DE_DEST_IS_CDRECORD	= & h84	The destination is a writable CD-ROM, possibly unformatted.
DE_FILE_TOO_LARGE	= & h85	The file involved in the operation is too large for the destination media or file system.
DE_SRC_IS_CDROM	= & h86	The source is a read-only CD-ROM, possibly unformatted.
DE_SRC_IS_DVD	= & h87	The source is a read-only DVD, possibly unformatted.
DE_SRC_IS_CDRECORD	= & h88	The source is a writable CD-ROM, possibly unformatted.
DE_ERROR_MAX	= & hB7	MAX_PATH was exceeded during the operation.
UnknownError	= & h402	An unknown error occurred. This is typically due to an invalid path in the source or destination. This error does not occur on Windows Vista and later.
ERRORONDEST	= & h10000	An unspecified error occurred on the destination.
DE_ROOTDIR | ERRORONDEST	= & h10074	Destination is a root directory and cannot be renamed.

196.16.36 OperationsAborted as Boolean

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: This flag is set by the FileOperation method to indicate whether the operation was aborted.
Notes: (Read and Write property)

196.16.37 Parent as Variant

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: Desktop only.

Function: The parent window for the FileOperation methods.
Notes:

Can reference a Window or DesktopWindow object.
(Read and Write property)

196.16.38 Events

196.16.39 Progress(TotalFileSize as int64, TotalBytesTransferred as int64, StreamSize as int64, StreamBytesTransferred as Int64, StreamNumber as Integer, Reason as Integer) as Integer

MBS Win Plugin, Plugin Version: 9.2, Platform: Windows, Targets: .

Function: It is called when a portion of a copy or move operation is completed.
Notes:

This event is called by the CopyFileEx and the MoveFileWithProgress methods.

TotalFileSize: The total size of the file, in bytes.
TotalBytesTransferred: The total number of bytes transferred from the source file to the destination file since the copy operation began.
StreamSize: The total size of the current file stream, in bytes.
StreamBytesTransferred: The total number of bytes in the current stream that have been transferred from the source file to the destination file since the copy operation began.
StreamNumber: A handle to the current stream. The first time CopyProgressRoutine is called, the stream number is 1.
Reason: CallbackChunkFinished or CallbackStreamSwitched.

Return ProgressCancel, ProgressStop, ProgressContinue or ProgressQuiet.
If you use multithreading option, you may receive additional events after you cancelled or stopped the operation due to the events coming asynchronously.

196.16.40 Constants

196.16.41 CallbackChunkFinished=0

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the reason constants for the Progress event.
Notes: Another part of the data file was copied.

196.16.42 CallbackStreamSwitched=1

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the reason constants for the Progress event.
Notes: Another stream was created and is about to be copied. This is the callback reason given when the callback routine is first invoked.

196.16.43 CopyFileAllowDecryptedDestination=8

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants used with CopyFileEx.
Notes: An attempt to copy an encrypted file will succeed even if the destination copy cannot be encrypted. Windows 2000: This value is not supported.

196.16.44 CopyFileCopySymLink=& h800

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants used with CopyFileEx.
Notes: If the source file is a symbolic link, the destination file is also a symbolic link pointing to the same file that the source symbolic link is pointing to. Windows Server 2003 and Windows XP/2000: This value is not supported.

196.16.45 CopyFileFailIfExists=1

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants used with CopyFileEx.
Notes: The copy operation fails immediately if the target file already exists.

196.16.46 CopyFileOpenSourceForWrite=4

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants used with CopyFileEx.
Notes: The file is copied and the original file is opened for write access.

196.16.47 CopyFileRestartable=2

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants used with CopyFileEx.
Notes: Progress of the copy is tracked in the target file in case the copy fails. The failed copy can be restarted at a later time by specifying the same values for source and dest as those used in the call that

failed.

196.16.48 FileOperationAllowUndo=& h40

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes:

Preserve undo information, if possible.
Prior to Windows Vista, operations could be undone only from the same process that performed the original operation.

In Windows Vista and later systems, the scope of the undo is a user session. Any process running in the user session can undo another operation. The undo state is held in the Explorer.exe process, and as long as that process is running, it can coordinate the undo functions.

If the source file parameter does not contain fully qualified path and file names, this flag is ignored.

196.16.49 FileOperationFilesOnly=& h80

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Perform the operation only on files (not on folders) if a wildcard file name (*.*) is specified.

196.16.50 FileOperationMultiDestFiles=1

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: The destination multiple destination files (one for each source file in from) rather than one directory where all source files are to be deposited.

196.16.51 FileOperationNoConfirmation=& h10

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Respond with Yes to All for any dialog box that is displayed.

196.16.52 FileOperationNoConfirmationMkDir=& h200

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Do not ask the user to confirm the creation of a new directory if the operation requires one to be created.

196.16.53 FileOperationNoConnectedElements=& H2000

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Do not move connected files as a group. Only move the specified files.

196.16.54 FileOperationNoCopySecurityAttributes=& h800

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Do not copy the security attributes of the file. The destination file receives the security attributes of its new folder.

196.16.55 FileOperationNoErrorUI=& h400

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Do not display a dialog to the user if an error occurs.

196.16.56 FileOperationNoRecursion=& h1000

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Only perform the operation in the local directory. Don't operate recursively into subdirectories, which is the default behavior.

196.16.57 FileOperationRenameCollision=8

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Give the file being operated on a new name in a move, copy, or rename operation if a file with the target name already exists at the destination.

196.16.58 FileOperationSilent=4

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Do not display a progress dialog box.

196.16.59 FileOperationSimpleProgress=& h100

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes:

Display a progress dialog box but do not show individual file names as they are operated on.

The plugin activates this flag if you pass in a window title.

196.16.60 FileOperationWantNukeWarning=& H4000

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the flag constants for the FileOperation methods.
Notes: Send a warning if a file is being permanently destroyed during a delete operation rather than recycled. This flag partially overrides FileOperationNoConfirmation.

196.16.61 MoveFileCopyAllowed=2

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the MoveFileWithProgress method.
Notes:

If the file is to be moved to a different volume, the function simulates the move by using the CopyFile and DeleteFile functions.
This value cannot be used with MoveFileDelayUntilReboot.

196.16.62 MoveFileCreateHardLink=16

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the MoveFileWithProgress method.
Notes: Reserved for future use.

196.16.63 MoveFileDelayUntilReboot=4

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the MoveFileWithProgress method.
Notes:

The system does not move the file until the operating system is restarted. The system moves the file immediately after AUTOCHK is executed, but before creating any paging files. Consequently, this parameter enables the function to delete paging files from previous startups.
This value can only be used if the process is in the context of a user who belongs to the administrators group or the LocalSystem account.
This value cannot be used with MoveFileCopyAllowed.

196.16.64 MoveFileReplaceExisting=1

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the MoveFileWithProgress method.
Notes:

If a file named lpNewFileName exists, the function replaces its contents with the contents of the lpExistingFileName file.
This value cannot be used if NewFileName or ExistingFileName names a directory.

196.16.65 MoveFileWriteThrough=8

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the MoveFileWithProgress method.
Notes:

The function does not return until the file has actually been moved on the disk.
Setting this value guarantees that a move performed as a copy and delete operation is flushed to disk before the function returns. The flush occurs at the end of the copy operation.
This value has no effect if MoveFileDelayUntilReboot is set.

196.16.66 ProgressCancel=1

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the Progress Event return value.
Notes: Cancel the copy operation and delete the destination file.

196.16.67 ProgressContinue=0

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the Progress Event return value.
Notes: Continue the copy operation.

196.16.68 ProgressQuiet=3

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the Progress Event return value.
Notes: Continue the copy operation, but stop invoking the event to report progress.

196.16.69 ProgressStop=2

MBS Win Plugin, Plugin Version: 9.2.

Function: One of the constants for the Progress Event return value.
Notes: Stop the copy operation. It can be restarted at a later time.

196.17 class WindowsFileInfoMBS

196.17.1 class WindowsFileInfoMBS

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The window file information class.
Example:

```
dim f as FolderItem = SelectFolder

if f<>Nil then
dim w as new WindowsFileInfoMBS(f)
MsgBox str(w.FileIndex)
end if
```

Notes:

The identifier that is stored in the FileIndex members is called the file ID. Support for file IDs is file system-specific. File IDs are not guaranteed to be unique over time, because file systems are free to reuse them. In some cases, the file ID for a file can change over time.

In the FAT file system, the file ID is generated from the first cluster of the containing directory and the byte offset within the directory of the entry for the file. Some defragmentation products change this byte offset. (Windows in-box defragmentation does not.) Thus, a FAT file ID can change over time. Renaming a file in the FAT file system can also change the file ID, but only if the new file name is longer than the old one.

In the NTFS file system, a file keeps the same file ID until it is deleted. You can replace one file with another file without changing the file ID by using the ReplaceFile function. However, the file ID of the replacement file, not the replaced file, is retained as the file ID of the resulting file.

Not all file systems can record creation and last access time, and not all file systems record them in the same manner. For example, on a Windows FAT file system, create time has a resolution of 10 milliseconds, write time has a resolution of 2 seconds, and access time has a resolution of 1 day (the access date). On the NTFS file system, access time has a resolution of 1 hour. For more information, see File Times.

196.17.8 Methods

196.17.9 Constructor(file as folderitem)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a folderitem.
Notes: On success the valid property is set to true.
See also:

- 196.17.10 Constructor(handle as Integer) 27644
- 196.17.11 Constructor(path as string) 27644
- 196.17.12 Constructor(stream as BinaryStream) 27644

196.17.10 Constructor(handle as Integer)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a Windows File Handle.
Notes: On success the valid property is set to true.
See also:

- 196.17.9 Constructor(file as folderitem) 27643
- 196.17.11 Constructor(path as string) 27644
- 196.17.12 Constructor(stream as BinaryStream) 27644

196.17.11 Constructor(path as string)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a file path.
Notes: On success the valid property is set to true.
See also:

- 196.17.9 Constructor(file as folderitem) 27643
- 196.17.10 Constructor(handle as Integer) 27644
- 196.17.12 Constructor(stream as BinaryStream) 27644

196.17.12 Constructor(stream as BinaryStream)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor using a binarystream.
Notes: On success the valid property is set to true.
See also:

- 196.17.9 Constructor(file as folderitem) 27643
- 196.17.10 Constructor(handle as Integer) 27644
- 196.17.11 Constructor(path as string) 27644

196.17.13 Properties

196.17.14 CreationDate as Date

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: A date that specifies when a file or directory is created.
Notes:

If the underlying file system does not support creation time, this member is nil.
(Read only property)

196.17.15 CreationTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: An UInt64 that specifies when a file or directory is created.
Notes:

If the underlying file system does not support creation time, this member is zero (0).
(Read only property)

196.17.16 FileAttributes as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file attributes.
Notes:

For possible values and their descriptions, see kFileAttribute* constants.
(Read only property)

196.17.17 FileIndex as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The unique identifier that is associated with a file.
Notes:

The identifier and the volume serial number uniquely identify a file on a single computer. To determine whether two open handles represent the same file, combine the identifier and the volume serial number for each file and compare them.
(Read only property)

196.17.18 FileSize as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file size.
Notes: (Read only property)

196.17.19 LastAccessDate as Date

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is read from or written to.
Notes:

For a directory, the structure specifies when the directory is created. For both files and directories, the specified date is correct, but the time of day is always set to midnight. If the underlying file system does not support the last access time, this member is nil.
(Read only property)

196.17.20 LastAccessTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is read from or written to.
Notes:

For a directory, the structure specifies when the directory is created. For both files and directories, the specified date is correct, but the time of day is always set to midnight. If the underlying file system does not support the last access time, this member is zero (0).
(Read only property)

196.17.21 LastWriteDate as Date

MBS Win Plugin, Plugin Version: 18.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is written to.
Notes:

For a directory, the structure specifies when the directory is created. If the underlying file system does not support the last write time, this member is nil.
(Read only property)

196.17.22 LastWriteTime as UInt64

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: For a file, the structure specifies the last time that a file is written to.
Notes:

For a directory, the structure specifies when the directory is created. If the underlying file system does not support the last write time, this member is zero (0).
(Read only property)

196.17.23 NumberOfLinks as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of links to this file.
Notes:

For the FAT file system this member is always 1. For the NTFS file system, it can be more than 1.
(Read only property)

196.17.24 Valid as Boolean

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the constructor got the values.
Notes: (Read only property)

196.17.25 VolumeSerialNumber as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The serial number of the volume that contains a file.
Notes: (Read only property)

196.17.26 Constants

196.17.27 kFileAttributeArchive = 32

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file or directory that is an archive file or directory. Applications typically use this attribute to mark files for backup or removal.

196.17.28 kFileAttributeCompressed = 2048

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file or directory that is compressed. For a file, all of the data in the file is compressed. For a directory, compression is the default for newly created files and subdirectories.

196.17.29 kFileAttributeDevice = 64

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: This value is reserved for system use.

196.17.30 kFileAttributeDirectory = 16

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: The handle that identifies a directory.

196.17.31 kFileAttributeEncrypted = 16384

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file or directory that is encrypted. For a file, all data streams in the file are encrypted. For a directory, encryption is the default for newly created files and subdirectories.

196.17.32 kFileAttributeHidden = 2

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: The file or directory is hidden. It is not included in an ordinary directory listing.

196.17.33 kFileAttributeNormal = 128

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file that does not have other attributes set. This attribute is valid only when used alone.

196.17.34 kFileAttributeNotContentIndexed = 8192

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: The file or directory is not to be indexed by the content indexing service.

196.17.35 kFileAttributeOffline = 4096

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: The data of a file is not available immediately. This attribute indicates that the file data is physically moved to offline storage. This attribute is used by Remote Storage, which is the hierarchical storage management software. Applications should not arbitrarily change this attribute.

196.17.36 kFileAttributeReadonly = 1

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file that is read-only. Applications can read the file, but cannot write to it or delete it. This attribute is not honored on directories. For more information, see "You cannot view or change the Read-only or the System attributes of folders in Windows Server 2003, in Windows XP, or in Windows Vista".

196.17.37 kFileAttributeReparsePoint = 1024

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file or directory that has an associated reparse point, or a file that is a symbolic link.

196.17.38 kFileAttributeSparseFile = 512

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file that is a sparse file.

196.17.39 kFileAttributeSystem = 4

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file or directory that the operating system uses a part of, or uses exclusively.

196.17.40 kFileAttributeTemporary = 256

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: A file that is being used for temporary storage. File systems avoid writing data back to mass storage if sufficient cache memory is available, because typically, an application deletes a temporary file after the handle is closed. In that scenario, the system can entirely avoid writing the data. Otherwise, the data is written after the handle is closed.

196.17.41 kFileAttributeVirtual = 65536

MBS Win Plugin, Plugin Version: 10.1.

Function: One of the file attribute constants.
Notes: This value is reserved for system use.

196.18 class WindowsFileStreamMBS

196.18.1 class WindowsFileStreamMBS

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for file streams on Windows.
Notes:

Windows can store more than one data stream in a file.

(on Mac/Linux, please check the ExtendedAttributesMBS module)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

196.18.2 Blog Entries

196.18.3 Blog Entries

- MBS Xojo / Real Studio Plugins, version 16.4pr5

196.18.4 Methods

196.18.5 Constructor

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

196.18.6 List(file as folderitem) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Lists file streams in a file at given folderitem.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim w() as WindowsFileStreamMBS = WindowsFileStreamMBS.List(f)
```

Break

Notes:

Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.
See also:

- 196.18.7 List(Path as String) as WindowsFileStreamMBS() 27652

196.18.7 List(Path as String) as WindowsFileStreamMBS()

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Lists file streams in a file at given path.
Notes:

Returns nil in case of error.
Else returns an array with stream details.

Requires Windows Vista or newer. Raises exception on Windows XP.
See also:

- 196.18.6 List(file as folderitem) as WindowsFileStreamMBS() 27651

196.18.8 Properties

196.18.9 Name as String

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the stream.
Notes: (Read only property)

196.18.10 Size as UInt64

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size in bytes.
Notes: (Read only property)

196.19 class WindowsFileVersionMBS

196.19.1 class WindowsFileVersionMBS

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to read Windows version information from a file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetInternalName
end if
```

196.19.2 Blog Entries

- Tipp of the day: WindowsFileVersionMBS

196.19.3 Blog Entries

- MBS Plugins 10.3 Release Notes
- Tipp of the day: WindowsFileVersionMBS

196.19.4 Methods

196.19.5 FileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file version in an user readable string.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.FileVersion
end if
```

Notes: format is "1.2.3.4".

196.19.6 GetCompanyName as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key CompanyName.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetCompanyName
end if
```

196.19.7 GetFileDescription as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key FileDescription.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetFileDescription
end if
```

196.19.8 GetFileVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key FileVersion.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetFileVersion
end if
```

196.19.9 GetInternalName as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key InternalName.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetInternalName
end if
```

196.19.10 GetLegalCopyright as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key LegalCopyright.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetLegalCopyright
end if
```

196.19.11 GetOriginalFilename as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key OriginalFilename.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetOriginalFilename
end if
```

196.19.12 GetProductName as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key ProductName.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetProductName
end if
```

196.19.13 GetProductVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns value for key ProductVersion.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetProductVersion
end if
```

196.19.14 OpenFile(file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads file information from a given file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.GetCompanyName
end if
```

Notes: Returns true on success and false on failure.

196.19.15 ProductVersion as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The product version in an user readable string.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox w.ProductVersion
end if
```

Notes: format is "1.2.3.4"

196.19.16 QueryBinaryValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Low level function to read a binary item from the information resource.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
// we define encoding as UTF16 as we know the value for ProductName is an UTF16 string.
MsgBox DefineEncoding(w.QueryBinaryValue("ProductName"), encodings.UTF16)
end if
```

Notes: Returns "" on any error.

196.19.17 QueryUnicodeValue(key as string) as string

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Low level function to read an unicode string item from the information resource.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.QueryUnicodeValue("ProductName"))
end if
```

Notes: Returns "" on any error.

196.19.18 Properties

196.19.19 FileDateLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File date number. Lower part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileDateLS)
end if
```

Notes:

Filedate is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file's 64-bit binary creation date and time stamp.
(Read and Write property)

196.19.20 FileDateMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File date number. Higher part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileDateMS)
end if
```

Notes:

Filedate is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file's 64-bit binary creation date and time stamp.
(Read and Write property)

196.19.21 FileFlags as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file flags.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileFlags)
end if
```

Notes:

Contains a bitmask that specifies the Boolean attributes of the file. This member can include one or more of the following values.

VS_FF_DEBUG	= 1	The file contains debugging information or is compiled with debugging features enabled.
VS_FF_INFOINFERRED	= 16	The file's version structure was created dynamically; therefore, some of the members in this structure may be empty or incorrect. This flag should never be set in a file's VS_VERSIONINFO data.
VS_FF_PATCHED	= 4	The file has been modified and is not identical to the original shipping file of the same version number.
VS_FF_PRERELEASE	= 2	The file is a development version, not a commercially released product.
VS_FF_PRIVATEBUILD	= 8	The file was not built using standard release procedures. If this flag is set, the StringFileInfo structure should contain a PrivateBuild entry.
VS_FF_SPECIALBUILD	= 32	The file was built by the original company using standard release procedures but is a variation of the normal file of the same version number. If this flag is set, the StringFileInfo structure should contain a SpecialBuild entry.

(Read and Write property)

196.19.22 FileOS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file os settings.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileOS)
end if
```

Notes:

Specifies the operating system for which this file was designed. This member can be one of the following values.

VOS_DOS	= & h00010000	The file was designed for MS-DOS.
VOS_NT	= & h00040000	The file was designed for Windows NT.
VOS___WINDOWS16	= & h00000001	The file was designed for 16-bit Windows.
VOS___WINDOWS32	= & h00000004	The file was designed for 32-bit Windows.
VOS_OS216	= & h00020000	The file was designed for 16-bit OS/2.
VOS_OS232	= & h00030000	The file was designed for 32-bit OS/2.
VOS___PM16	= & h00000002	The file was designed for 16-bit Presentation Manager.
VOS___PM32	= & h00000003	The file was designed for 32-bit Presentation Manager.
VOS_UNKNOWN	= & h00000000	The operating system for which the file was designed is unknown to the system.

An application can combine these values to indicate that the file was designed for one operating system running on another. The following FileOS values are examples of this, but are not a complete list.

VOS_DOS_WINDOWS16	= & h00010001	The file was designed for 16-bit Windows running on MS-DOS.
VOS_DOS_WINDOWS32	= & h00010004	The file was designed for 32-bit Windows running on MS-DOS.
VOS_NT_WINDOWS16	= ?	The file was designed for Windows NT.
VOS_OS216_PM16	= & h00020002	The file was designed for 16-bit Presentation Manager running on 16-bit OS/2.
VOS_OS232_PM32	= & h00030003	The file was designed for 32-bit Presentation Manager running on 32-bit OS/2.

(Read and Write property)

196.19.23 FileSubtype as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Windows file subtype code.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
```

```
MsgBox str(w.FileSubType)
end if
```

Notes:

Specifies the function of the file. The possible values depend on the value of FileType. For all values of FileType not described in the following list, FileSubtype is zero.

If FileType is VFT_DRV, FileSubtype can be one of the following values.

VFT2_UNKNOWN	= 0	The driver type is unknown by the system.
VFT2_DRV_COMM	= 10	The file contains a communications driver.
VFT2_DRV_PRINTER	= 1	The file contains a printer driver.
VFT2_DRV_KEYBOARD	= 2	The file contains a keyboard driver.
VFT2_DRV_LANGUAGE	= 3	The file contains a language driver.
VFT2_DRV_DISPLAY	= 4	The file contains a display driver.
VFT2_DRV_MOUSE	= 5	The file contains a mouse driver.
VFT2_DRV_NETWORK	= 6	The file contains a network driver.
VFT2_DRV_SYSTEM	= 7	The file contains a system driver.
VFT2_DRV_INSTALLABLE	= 8	The file contains an installable driver.
VFT2_DRV_SOUND	= 9	The file contains a sound driver.
VFT2_DRV_VERSIONED_PRINTER	= 10	The file contains a versioned printer driver.

If FileType is VFT_FONT, FileSubtype can be one of the following values.

VFT2_UNKNOWN	= 0	The font type is unknown by the system.
VFT2_FONT_RASTER	= 1	The file contains a raster font.
VFT2_FONT_VECTOR	= 2	The file contains a vector font.
VFT2_FONT_TRUETYPE	= 3	The file contains a TrueType font.

If FileType is VFT_VXD, FileSubtype contains the virtual device identifier included in the virtual device control block.
All FileSubtype values not listed here are reserved.
(Read and Write property)

196.19.24 FileType as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Windows file type code.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
```

```
if w.OpenFile(f) then
MsgBox str(w.FileType)
end if
```

Notes:

Specifies the general type of file. This member can be one of the following values. All other values are reserved.

VFT_UNKNOWN	= 0	The file type is unknown to the system.
VFT_APP	= 1	The file contains an application.
VFT_DLL	= 2	The file contains a DLL.
VFT_DRV	= 3	The file contains a device driver. If dwFileType is VFT_DRV, FileSubtype contains a more specific description of the driver.
VFT_FONT	= 4	The file contains a font. If dwFileType is VFT_FONT, FileSubtype contains a more specific description of the font file.
VFT_VXD	= 5	The file contains a virtual device.
VFT_STATIC_LIB	= 7	The file contains a static-link library.

(Read and Write property)

196.19.25 FileVersionLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File version number. Lower part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileVersionLS)
end if
```

Notes:

Fileversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the file's binary version number. This member is used with FileVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

196.19.26 FileVersionMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: File version number. Higher part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.FileVersionMS)
end if
```

Notes:

Fileversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the file's binary version number. This member is used with FileVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

196.19.27 LangCharset as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The language charset to use.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.LangCharset)
end if
```

Notes:

OpenFile sets this to the default value.
You can change it later.
Value is used on each call of GetOriginalFilename, GetFileVersion, GetCompanyName, GetProductName, GetInternalName, GetProductVersion, GetFileDescription, GetLegalCopyright, QueryUnicodeValue and QueryBinaryValue.
(Read and Write property)

196.19.28 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes:

Lasterror means no error has happend.
Normally a Windows error code.
(Read and Write property)

196.19.29 ProductVersionLS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Product version number. Lower part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.ProductVersionLS)
end if
```

Notes:

Productversion is a 64 bit integer. This is the lower 32 bit part.

Specifies the least significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionMS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

196.19.30 ProductVersionMS as Integer

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Product version number. Higher part.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.ProductVersionMS)
```

```
end if
```

Notes:

Productversion is a 64 bit integer. This is the higher 32 bit part.

Specifies the most significant 32 bits of the binary version number of the product with which this file was distributed. This member is used with ProductVersionLS to form a 64-bit value used for numeric comparisons.
(Read and Write property)

196.19.31 RawData as String

MBS Win Plugin, Plugin Version: 10.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the data of the file version record as string.
Notes: (Read only property)

196.19.32 Success as Boolean

MBS Win Plugin, Plugin Version: 6.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether last call to OpenFile was successful.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("dbgview.exe")
dim w as new WindowsFileVersionMBS
if w.OpenFile(f) then
MsgBox str(w.Success)
end if
```

Notes: (Read and Write property)

196.20 class WindowsGraphicsDeviceContextMBS

196.20.1 class WindowsGraphicsDeviceContextMBS

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The class to safely access a HDC of a graphics object.
Notes: The plugin will get the handle in constructor and release it in destructor/close.

- MBS Xojo Plugins, version 20.3pr5

196.20.4 Methods

196.20.5 Close

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Closes the handle by releasing memory.
Notes: Same as destructor.

196.20.6 Constructor(c as control)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop only.

Function: The constructor for a control object.
Notes:

Queries HDC for control object.
Raises exceptions on failure.
See also:

- 196.20.7 Constructor(c as DesktopControl) 27667
- 196.20.8 Constructor(g as graphics) 27667
- 196.20.9 Constructor(p as Picture) 27668
- 196.20.10 Constructor(w as DesktopWindow) 27668
- 196.20.11 Constructor(w as window) 27668

196.20.7 Constructor(c as DesktopControl)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor for a control object.
Notes:

Queries HDC for control object.
Raises exceptions on failure.
See also:

- 196.20.6 Constructor(c as control) 27666
- 196.20.8 Constructor(g as graphics) 27667

- 196.20.10 Constructor(w as DesktopWindow) 27668
- 196.20.11 Constructor(w as window) 27668

196.20.8 Constructor(g as graphics)

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor for a graphics object.
Notes:

Queries HDC for graphics object.
Raises exceptions on failure.
See also:

- 196.20.6 Constructor(c as control) 27666

- 196.20.10 Constructor(w as DesktopWindow) 27668
- 196.20.11 Constructor(w as window) 27668

196.20.9 Constructor(p as Picture)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop only.

Function: The constructor for a picture object.
Notes:

Queries HDC for picture object.
Raises exceptions on failure.
See also:

- 196.20.6 Constructor(c as control) 27666
- 196.20.7 Constructor(c as DesktopControl) 27667
- 196.20.8 Constructor(g as graphics) 27667
- 196.20.10 Constructor(w as DesktopWindow) 27668
- 196.20.11 Constructor(w as window) 27668

196.20.10 Constructor(w as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor for a window object.
Notes:

Queries HDC for window object.
Raises exceptions on failure.
See also:

- 196.20.6 Constructor(c as control) 27666
- 196.20.7 Constructor(c as DesktopControl) 27667
- 196.20.8 Constructor(g as graphics) 27667
- 196.20.9 Constructor(p as Picture) 27668
- 196.20.11 Constructor(w as window) 27668

196.20.11 Constructor(w as window)

MBS Win Plugin, Plugin Version: 21.1, Platform: Windows, Targets: Desktop only.

Function: The constructor for a window object.
Notes:

Queries HDC for window object.
Raises exceptions on failure.
See also:

- 196.20.6 Constructor(c as control) 27666
- 196.20.7 Constructor(c as DesktopControl) 27667
- 196.20.8 Constructor(g as graphics) 27667
- 196.20.9 Constructor(p as Picture) 27668
- 196.20.10 Constructor(w as DesktopWindow) 27668

196.20.12 Properties

196.20.13 Graphics as Graphics

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The references graphics object.
Notes: (Read only property)

196.20.14 Handle as Integer

MBS Win Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The handle.
Notes:

This is HDC to be used with declares.
(Read only property)

196.21 class WindowsGUIResourcesMBS

196.21.1 class WindowsGUIResourcesMBS

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Class to retrieves the count of handles to graphical user interface (GUI) objects in use by the specified process.
Notes:

Allows you to monitor how many handles you use from GDI.
As they are limited, your app will crash if it hits a limit.

196.21.6 Methods

196.21.7 Constructor

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes:

Examines current process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.

A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.
See also:

- 196.21.8 Constructor(ProcessID as integer) 27671

196.21.8 Constructor(ProcessID as integer)

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes:

Examines given process and sets properties.

If the constructor succeeds, the properties are set to the count of handles to GUI objects in use by the process. If no GUI objects are in use, the return value is zero.

A process without a graphical user interface does not use GUI resources, therefore, GetGuiResources will return zero.
See also:

- 196.21.7 Constructor 27671

196.21.9 Properties

196.21.10 GDIObjectCount as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The count of GDI objects.
Notes: (Read only property)

196.21.11 GDIObjectPeak as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak count of GDI objects.
Notes: (Read only property)

196.21.12 LastError as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error from Windows.
Notes:

Should be zero on success.
But could give error code like permissions denied, if you want to examine another process.
(Read only property)

196.21.13 UserObjectCount as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The count of USER objects.
Notes: (Read only property)

196.21.14 UserObjectPeak as Integer

MBS Win Plugin, Plugin Version: 18.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The peak count of USER objects.
Notes: (Read only property)

196.22 class WindowsIniMBS

196.22.1 class WindowsIniMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to handle INI files on Windows.
Notes:

Ini files are build by this:

[Sectionname]
key1=value1

[Appname]
key2=value2

An ini file contains one or more sections which are labeled with a name of a section or in the Win.ini file with the application name.
Each section is filled with one or more key = value pairs.

196.22.4 Methods

196.22.5 GetPrivateProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads an integer value from the ini file.
Notes:

This is the function to work on a private ini file.
Returns the default value on any error.

196.22.6 GetPrivateProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a section from an ini file.
Notes:

This is the function to work on a private ini file.
The string is built using CStrings (with ending chr(0)).
Returns "" on any error.

196.22.7 GetPrivateProfileString(appname as string, keyname as string, defaultValue as string = "") as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads a string from an ini file.
Example:

```
dim l as new WindowsIniMBS

l.filename="c:\test.ini"

dim value as string = l.GetPrivateProfileString("appname","keyname")
msgBox "Read: "+value
```

Notes:

This is the function to work on a private ini file.
Returns the default value on any error.

196.22.8 GetPrivateProfileStruct(section as string, keyname as string, size as Integer) as memoryblock

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads a structure from an ini file.
Notes:

This is the function to work on a private ini file.
Size is the size of the memoryblock returned.
Returns nil on any error.
A checksum is checked to verify that the data is unchanged.

196.22.9 GetProfileInt(appname as string, keyname as string, defaultValue as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an integer value of the Win.ini file.
Notes: Returns the default value on any error.

196.22.10 GetProfileSection(appname as string) as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns a profile section of the Win.ini file.
Notes:

The string is built using CStrings (with ending chr(0)).
Returns "" on any error.

196.22.11 GetProfileString(appname as string, keyname as string, defaultValue as string = "") as string

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an integer value of the Win.ini file.
Example:

```
dim l as new WindowsIniMBS

l.filename="c:\test.ini"

dim value as string = l.GetProfileString("appname","keyname")
msgBox "Read: "+value
```

Notes:

Searches for a string.
All three parameters are not allowed to be empty. And you must pass trimmed strings (no space on the left and/or right side)
Returns the default string on any error.

196.22.12 WritePrivateProfileSection(appname as string, value as string) as boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Write a section to an ini file.
Notes:

This is the function to work on a private ini file.
Value is an array of strings concated with chr(0) as the delimiter.
Returns true if successfull.

196.22.13 WritePrivateProfileString(appname as string, keyname as string, value as string) as boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes a string to an ini file.
Example:

```
dim l as windowsIniMBS

l=new windowsIniMBS
l.filename="c:\test.ini"

if l.writePrivateProfileString("appname","keyname","value") then
msgBox "ok"
end if
```

Notes: This is the function to work on a private ini file.

196.22.14 WritePrivateProfileStruct(section as string, keyname as string, mem as memoryblock, size as Integer) as boolean

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes a memoryblock as a structure to a ini file.
Notes:

This is the function to work on a private ini file.
Returns true if successfull.
A checksum is stored to verify later whether the data was changed.

196.22.15 Properties

196.22.16 BufferSize as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the buffer used for reading strings from the INI files.
Notes:

Should not be bigger than 32767 bytes on Windows 95/98/ME.
Default size is 32000.
(Read and Write property)

196.22.17 Filename as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file path of the private profile file to use.
Notes:

e.g. "C:\Test.ini" or just "myapp.ini".
(Read and Write property)

196.23 class WindowsKeyboardLayoutMBS

196.23.1 class WindowsKeyboardLayoutMBS

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a keyboard layout on Windows.

196.23.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

196.23.3 Blog Entries

- MBS Real Studio Plugins, version 12.5pr8

196.23.4 Methods

196.23.5 Constructor

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new keyboard layout object with current layout.
Example:

```
dim w as new WindowsKeyboardLayoutMBS
MsgBox w.name
```

See also:

- 196.23.6 Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer) 27678

196.23.6 Constructor(SubLanguageID as Integer, PrimaryLanguageID as Integer)

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new keyboard layout object with the given ID.
See also:

- 196.23.5 Constructor 27678

196.23.7 KeyboardLayoutName as string

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop only.

Function: Returns the name of the current keyboard layout name.
Example:

msgbox WindowsKeyboardLayoutMBS.KeyboardLayoutName

196.23.8 List as WindowsKeyboardLayoutMBS()

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop only.

Function: Returns a list of all keyboard layouts installed.
Example:

```
dim list() as WindowsKeyboardLayoutMBS = WindowsKeyboardLayoutMBS.List
MsgBox str(UBound(list)+1)+" keyboard layouts."
```

196.23.9 Properties

196.23.10 Handle as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal ID of the keyboard layout.
Notes: (Read only property)

196.23.11 Name as String

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the name of the keyboard layout.
Example:

```
dim w as new WindowsKeyboardLayoutMBS
MsgBox w.name
```

Notes: (Read only property)

196.23.12 PrimaryLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The primary ID for this language.
Notes: (Read and Write property)

196.23.13 SubLanguageID as Integer

MBS Win Plugin, Plugin Version: 12.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The sub language ID.
Notes:

This is needed as there are for example 16 different English variants.
(Read and Write property)

196.24 class WindowsKeyFilterMBS

196.24.1 class WindowsKeyFilterMBS

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to filter several windows keyboard shortcuts with a low level event filter.
Notes:

There is no need to keep the instance as all internal data is stored in global variables.

Key codes for Windows:

196.24.2 Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- MBS Xojo Plugins, version 21.5pr5

196.24.3 Blog Entries

- News from the MBS Xojo Plugins in version 21.5
- MBS Xojo Plugins, version 21.5pr5

196.24.4 Methods

196.24.5 Install as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Install the event filter.
Notes:

Returns true on success and false on failure.
Second call in an application will return false unless Uninstall was called between.

196.24.6 Uninstall as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Uninstalls the event filter.
Notes: You only call this after Install returned true.

196.24.7 Properties

196.24.8 BlockAlt as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the alt key.
Notes: (Read and Write property)

196.24.9 BlockAltEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Alt-Escape key combination.
Notes: (Read and Write property)

196.24.10 BlockAltF4 as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the ALT-F4 key combination.
Notes:

By default this one closes the application.
(Read and Write property)

196.24.11 BlockAltTab as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the ALT-Tab key combination.
Notes:

This combination is for task switching.
(Read and Write property)

196.24.12 BlockApplicationWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the application windows key.
Notes: (Read and Write property)

196.24.13 BlockBack as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the back key.
Notes: (Read and Write property)

196.24.14 BlockCancel as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Cancel key.
Notes: (Read and Write property)

196.24.15 BlockCapital as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the CapsLock key.
Notes: (Read and Write property)

196.24.16 BlockClear as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Clear key.
Notes: (Read and Write property)

196.24.17 BlockControl as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the control key.
Notes: (Read and Write property)

196.24.18 BlockControlAltDelete as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Control-Alt-Delete key combination.
Notes:

Sorry, does not have any effect as this key combination is processed earlier in event chain.
(Read and Write property)

196.24.19 BlockControlEscape as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Control-Escape key combination.
Notes: (Read and Write property)

196.24.20 BlockDelete as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the delete key.
Notes: (Read and Write property)

196.24.21 BlockDown as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the down key.
Notes: (Read and Write property)

196.24.22 BlockEnd as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the end key.
Notes: (Read and Write property)

196.24.23 BlockEscape as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the escape key.
Notes: (Read and Write property)

196.24.24 BlockExecute as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the execute key.
Notes: (Read and Write property)

196.24.25 BlockF1 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F1 key.
Notes: (Read and Write property)

196.24.26 BlockF10 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F10 key.
Notes: (Read and Write property)

196.24.27 BlockF11 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F11 key.
Notes: (Read and Write property)

196.24.28 BlockF12 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F12 key.
Notes: (Read and Write property)

196.24.29 BlockF13 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F13 key.
Notes: (Read and Write property)

196.24.30 BlockF14 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F14 key.
Notes: (Read and Write property)

196.24.31 BlockF15 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F15 key.
Notes: (Read and Write property)

196.24.32 BlockF16 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F16 key.
Notes: (Read and Write property)

196.24.33 BlockF17 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F17 key.
Notes: (Read and Write property)

196.24.34 BlockF18 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F18 key.
Notes: (Read and Write property)

196.24.35 BlockF19 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F19 key.
Notes: (Read and Write property)

196.24.36 BlockF2 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F2 key.
Notes: (Read and Write property)

196.24.37 BlockF20 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F20 key.
Notes: (Read and Write property)

196.24.38 BlockF21 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F21 key.
Notes: (Read and Write property)

196.24.39 BlockF22 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F22 key.
Notes: (Read and Write property)

196.24.40 BlockF23 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F23 key.
Notes: (Read and Write property)

196.24.41 BlockF24 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F24 key.
Notes: (Read and Write property)

196.24.42 BlockF3 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F3 key.
Notes: (Read and Write property)

196.24.43 BlockF4 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F4 key.
Notes: (Read and Write property)

196.24.44 BlockF5 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F5 key.
Notes: (Read and Write property)

196.24.45 BlockF6 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F6 key.
Notes: (Read and Write property)

196.24.46 BlockF7 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F7 key.
Notes: (Read and Write property)

196.24.47 BlockF8 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F8 key.
Notes: (Read and Write property)

196.24.48 BlockF9 as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the F9 key.
Notes: (Read and Write property)

196.24.49 BlockHelp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the help key.
Notes: (Read and Write property)

196.24.50 BlockHome as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the home key.
Notes: (Read and Write property)

196.24.51 BlockInsert as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the insert key.
Notes: (Read and Write property)

196.24.52 BlockLeft as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the left key.
Notes: (Read and Write property)

196.24.53 BlockLeftButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the left mouse button.
Notes: (Read and Write property)

196.24.54 BlockLeftWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the left windows key.
Notes: (Read and Write property)

196.24.55 BlockMiddleButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the middle mouse button.
Notes: (Read and Write property)

196.24.56 BlockPause as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the pause key.
Notes: (Read and Write property)

196.24.57 BlockPrint as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the print key.
Notes:

BlockSnapshot is to block screenshots.
(Read and Write property)

196.24.58 BlockReturn as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the return key.
Notes: (Read and Write property)

196.24.59 BlockRight as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the right key.
Notes: (Read and Write property)

196.24.60 BlockRightButton as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the right mouse button.
Notes: (Read and Write property)

196.24.61 BlockRightWindowsKey as boolean

MBS Win Plugin, Plugin Version: 6.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the right windows key.
Notes: (Read and Write property)

196.24.62 BlockSelect as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the select key.
Notes: (Read and Write property)

196.24.63 BlockShift as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the shift key.
Notes: (Read and Write property)

196.24.64 BlockShiftSpace as boolean

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the Shift-Space key combination.
Notes:

This combination is for making non-breakable spaces.
(Read and Write property)

196.24.65 BlockSleep as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the sleep key.
Notes: (Read and Write property)

196.24.66 BlockSnapshot as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the snapshot key.
Notes:

This is the print key to do screenshots.
(Read and Write property)

196.24.67 BlockSpace as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the space key.
Notes: (Read and Write property)

196.24.68 BlockTab as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the tab key.
Notes: (Read and Write property)

196.24.69 BlockUp as Boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to filter the up key.
Notes: (Read and Write property)

196.24.70 BlockKey(virtualkeycode as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to block a key with a specific virtual key code.
Notes:

You can set this to true for all keys you want to block.
The virtual key codes are in the windows header files.
For most common keys this class has properties. More can be added.

(Read and Write computed property)

196.24.71 Events

196.24.72 KeyDown(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: .

Function: The key down event.
Notes:

vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.

the flag bits are like this:
bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.

We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it.
Please have this event being as fast as possible. Do not put msgbox there. Better detect a key shortcut and launch a timer to perform the action a millisecond later, so you don't block the keyboard event system.
Blocks only KeyUp or only KeyDown can lead to trouble if the internal counters for special keys get our of sync.

196.24.73 KeyUp(vkCode as Integer, scanCode as Integer, flags as Integer, time as Integer) as Boolean

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: .

Function: The key up event.
Notes:

vkCode: Specifies a virtual-key code. The code must be a value in the range 1 to 254.
scanCode: Specifies a hardware scan code for the key.
flags: Specifies the extended-key flag, event-injected flag, context code, and transition-state flag. This member is specified as follows.
time: Specifies the time stamp for this message.

the flag bits are like this:
bit 0: Specifies whether the key is an extended key, such as a function key or a key on the numeric keypad. The value is 1 if the key is an extended key; otherwise, it is 0.
bit 4: Specifies whether the event was injected. The value is 1 if the event was injected; otherwise, it is 0.
bit 5: Specifies the context code. The value is 1 if the ALT key is pressed; otherwise, it is 0.
bit 7: Specifies the transition state. The value is 0 if the key is pressed and 1 if it is being released.
Other bits are reserved.

There can be only one WindowsKeyFilterMBS object in your application which receives this events.

We have currently no idea in what context this event is received. And you should return as soon as possible as this event may be called a lot of times and can block user input.

Return true if you handled the key and false if you did not handle it.
Please have this event being as fast as possible. Do not put msgbox there. Better detect a key shortcut and launch a timer to perform the action a millisecond later, so you don't block the keyboard event system.
Blocks only KeyUp or only KeyDown can lead to trouble if the internal counters for special keys get our of sync.

196.25 class WindowsListMBS

196.25.1 class WindowsListMBS

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to list all the windows on a Windows system.
Notes:

To find all processes on Mac, use the ProcessMBS class.
To find all windows on Mac OS X, use the CGSWindowListMBS class.

196.25.2 Blog Entries

- MBS Xojo Plugins, version 19.2pr1
- SetFrontMost for Windows
- MBS Xojo / Real Studio Plugins, version 16.4pr1

196.25.3 Blog Entries

- MBS Xojo Plugins, version 19.2pr1
- SetFrontMost for Windows
- MBS Xojo / Real Studio Plugins, version 16.4pr1

196.25.4 Methods

196.25.5 ActivateWindow(index as integer)

MBS Win Plugin, Plugin Version: 19.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Activates the window.
Notes:

This function does more than just show. if the window has been minimized, it will restore it. Also the window is moved to front and made the current window for keyboard input.

Sadly windows limits which windows can go to front, so some windows may not come to front unless they are clicked on.

As activation can be asynchronously, the window may activate later, e.g. after current method ends.

196.25.6 Constructor

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which queries the values.
See also:

- 196.25.7 Constructor(win as DesktopWindow) 27756
- 196.25.8 Constructor(win as window) 27756
- 196.25.9 Constructor(WindowHandle as Integer) 27756

196.25.7 Constructor(win as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor which queries the values.
Notes: If win is not nil, we lookup child windows of this window.
See also:

- 196.25.6 Constructor 27756
- 196.25.8 Constructor(win as window) 27756
- 196.25.9 Constructor(WindowHandle as Integer) 27756

196.25.8 Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop only.

Function: The constructor which queries the values.
Notes: If win is not nil, we lookup child windows of this window.
See also:

- 196.25.6 Constructor 27756
- 196.25.7 Constructor(win as DesktopWindow) 27756
- 196.25.9 Constructor(WindowHandle as Integer) 27756

196.25.9 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which queries the values.
Notes: If WindowHandle is not zero, we lookup child windows of this window.
See also:

- 196.25.6 Constructor 27756
- 196.25.7 Constructor(win as DesktopWindow) 27756
- 196.25.8 Constructor(win as window) 27756

196.25.10 Focus as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the handle to the window that has the keyboard focus, if the window is attached to the calling thread's message queue.
Notes: If the calling thread's message queue does not have an associated window with the keyboard focus, the return value is 0.

196.25.11 ForegroundWindow as Integer

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a handle to the foreground window (the window with which the user is currently working).
Notes:

The system assigns a slightly higher priority to the thread that creates the foreground window than it does to other threads.
The return value is a handle to the foreground window. The foreground window can be 0 in certain circumstances, such as when a window is losing activation.

196.25.12 Update

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the values and returns true on success.

196.25.13 WindowClassName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the window class name of the window with the given index.
Notes:

For example "SciCalc" for the calc.exe main window.

This may send a message to the thread owning the window and if that one doesn't answer quickly, the call may wait for an answer.
You may want to skip your own process windows to not wait for your own threads.

196.25.14 WindowClassNameFromHandle(Handle as Integer) as String

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the window class name of the window with the given handle.
Notes: For example "SciCalc" for the calc.exe main window.

196.25.15 WindowHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

196.25.16 WindowHeight(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

196.25.17 WindowIconic(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the window with the given index is minimized.

196.25.18 WindowImageFileName(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the path to the execuable file of the process which owns the window with the given index.
Notes:

Requires Windows XP or newer.
Returns an empty string on any error.

196.25.19 WindowLeft(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The x position of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

196.25.20 WindowProcessID(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The process ID of the process which ows the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

196.25.21 WindowText(index as Integer) as string

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the title of the window with the given index.
Notes:

This may send a message to the thread owning the window and if that one doesn't answer quickly, the call may wait for an answer.
You may want to skip your own process windows to not wait for your own threads.

196.25.22 WindowTextFromHandle(Handle as Integer) as String

MBS Win Plugin, Plugin Version: 15.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the title of the window with the given handle.
Notes:

This may send a message to the thread owning the window and if that one doesn't answer quickly, the call may wait for an answer.
You may want to skip your own process windows to not wait for your own threads.

196.25.23 WindowThreadHandle(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The thread handle of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

196.25.24 WindowTop(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y position of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

196.25.25 WindowVisible(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the window with the given index is visible.

196.25.26 WindowWidth(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the window with the given index.
Notes: This value is updated by the Constructor and the Update method.

196.25.27 WindowZoomed(index as Integer) as boolean

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the window with the given index is zoomed.

196.25.28 Properties

196.25.29 CurrentProcessID as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current process ID.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

196.25.30 CurrentThreadID as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current thread ID.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

196.25.31 DesktopWindowHandle as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the desktop window.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

196.25.32 ForegroundWindowHandle as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the foreground window.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

196.25.33 ParentWindowHandle as Integer

MBS Win Plugin, Plugin Version: 16.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the parent window.
Notes:

This value is set by the Constructor.
(Read and Write property)

196.25.34 WindowCount as Integer

MBS Win Plugin, Plugin Version: 8.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of windows.
Notes:

This value is updated by the Constructor and the Update method.
(Read and Write property)

196.26 class WindowsMonitorMBS

196.26.1 class WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to query monitor details on Windows.
Example:

```
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
MsgBox m.DeviceName+": "+str(m.Left)+"x"+str(m.top)+" "+str(m.Width)+"x"+str(m.Height)
next
```

196.26.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr2

196.26.3 Blog Entries

- MBS Real Studio Plugins, version 11.3pr2

196.26.4 Methods

196.26.5 AllMonitors as WindowsMonitorMBS()

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all monitors.
Example:

```
for each m as WindowsMonitorMBS in WindowsMonitorMBS.AllMonitors
MsgBox m.DeviceName+": "+str(m.Left)+"x"+str(m.top)+" "+str(m.Width)+"x"+str(m.Height)
next
```

Notes: Returns an array with an entry for each monitor connected to this computer.
See also:

- 196.26.6 AllMonitors(monitors() as WindowsMonitorMBS) as Integer 27763

196.26.6 AllMonitors(monitors() as WindowsMonitorMBS) as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries all monitors.
Notes:

Returns the number of monitors found and sets the monitor objects in the array.
if the array is too short, you get the first ubound(monitors)+1 fonts set there.
See also:

- 196.26.5 AllMonitors as WindowsMonitorMBS() 27763

196.26.7 MonitorFromPoint(x as Integer, y as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MonitorFromPoint function retrieves a handle to the display monitor that contains a specified point.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromPoint(1900, 1000)

if m = nil then
MsgBox "Your display is smaller than 1900 x 1000"
else
MsgBox m.DeviceName
end if
```

Notes:

x and y: The point of interest in virtual-screen coordinates.
Flags: Determines the function's return value if the point is not contained within any display monitor.

This parameter can be one of the following values.

Value	Meaning
kDefaultToNearest	Returns a handle to the display monitor that is nearest to the point.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns a handle to the primary display monitor.

If the point is contained by a display monitor, the return value is that display monitor.
If the point is not contained by a display monitor, the return value depends on the value of flags.

196.26.8 MonitorFromRect(left as Integer, top as Integer, width as Integer, height as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MonitorFromRect function retrieves the display monitor that has the largest area of intersection with a specified rectangle.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromRect(0,0,100,100)
MsgBox m.DeviceName
```

Notes:

left, top, width, height: The rectangle of interest in virtual-screen coordinates.
Flags: Determines the function's return value if the rectangle does not intersect any display monitor.

This parameter can be one of the following values.

Value	Meaning
kDefaultToNearest	Returns a handle to the display monitor that is nearest to the rectangle.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns a handle to the primary display monitor.

If the rectangle intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the rectangle.
If the rectangle does not intersect a display monitor, the return value depends on the value of Flags.

196.26.9 MonitorFromWindow(win as DesktopWindow, flags as integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Notes:

win: The window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 196.26.10 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS 27766
- 196.26.11 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS 27767

196.26.10 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop only.

Function: The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1)
MsgBox m.DeviceName
```

Notes:

win: The window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was minimized.
See also:

- 196.26.9 MonitorFromWindow(win as DesktopWindow, flags as integer = 0) as WindowsMonitorMBS 27765
- 196.26.11 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS 27767

196.26.11 MonitorFromWindow(WindowHandle as Integer, flags as Integer = 0) as WindowsMonitorMBS

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The MonitorFromWindow function retrieves the display monitor that has the largest area of intersection with the bounding rectangle of a specified window.
Example:

```
dim m as WindowsMonitorMBS = WindowsMonitorMBS.MonitorFromWindow(window1.handle)
MsgBox m.DeviceName
```

Notes:

WindowHandle: A handle to the window of interest.
Flags: Determines the function's return value if the window does not intersect any display monitor.

This parameter can be one of the following values:

Value	Meaning
kDefaultToNearest	Returns the display monitor that is nearest to the window.
kDefaultToNull	Returns nil.
kDefaultToPrimary	Returns the primary display monitor.

If the window intersects one or more display monitor rectangles, the return value is the display monitor that has the largest area of intersection with the window.

If the window does not intersect a display monitor, the return value depends on the value of Flags.
If the window is currently minimized, MonitorFromWindow uses the rectangle of the window before it was

minimized.
See also:

- 196.26.9 MonitorFromWindow(win as DesktopWindow, flags as integer = 0) as WindowsMonitorMBS 27765
- 196.26.10 MonitorFromWindow(win as window, flags as Integer = 0) as WindowsMonitorMBS 27766

196.26.12 Properties

196.26.13 Bottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The bottom value of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.14 DeviceName as String

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that specifies the device name of the monitor being used.
Notes: (Read and Write property)

196.26.15 Height as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.16 HMonitor as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal window handle for this monitor.
Notes: (Read and Write property)

196.26.17 IsPrimary as Boolean

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is the primary display monitor.
Notes: (Read and Write property)

196.26.18 Left as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left position of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.19 Right as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The right value of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.20 Top as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top position of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.21 Width as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the display monitor.
Notes:

Specifies the display monitor rectangle, expressed in virtual-screen coordinates. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.22 WorkBottom as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The bottom value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.23 WorkHeight as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.24 WorkLeft as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in

virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.25 WorkRight as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The right value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.26 WorkTop as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.27 WorkWidth as Integer

MBS Win Plugin, Plugin Version: 11.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width value from useable screen area.
Notes:

Specifies the work area rectangle of the display monitor that can be used by applications, expressed in virtual-screen coordinates. Windows uses this rectangle to maximize an application on the monitor. The rest of the area of the monitor contains system windows such as the task bar and side bars. Note that if the monitor is not the primary display monitor, some of the rectangle's coordinates may be negative values.
(Read and Write property)

196.26.28 Constants

196.26.29 kDefaultToNearest = 2

MBS Win Plugin, Plugin Version: 11.3.

Function: One of the flag constants.
Notes: Return the display monitor that is nearest to the window, point or rectangle.

196.26.30 kDefaultToNull = 0

MBS Win Plugin, Plugin Version: 11.3.

Function: One of the flag constants.
Notes: Returns nil if no monitor matches is located at point, window or rectangle.

196.26.31 kDefaultToPrimary = 1

MBS Win Plugin, Plugin Version: 11.3.

Function: One of the flag constants.
Notes: Returns the primary display monitor if point, rect or window does not point to a monitor.

196.27 class WindowsPipeMBS

196.27.1 class WindowsPipeMBS

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a Windos Pipe.
Notes:

A replacement for IPCSocket on Windows.
Can be used in two applications to exchange data.

196.27.8 Methods

196.27.9 Close

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Closes the pipe.
Notes: Called by destructor automatically.

196.27.10 Constructor

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

196.27.11 CreatePipe(Name as string, MessageMode as Boolean = false, BufferSize as Integer = & h100000, AllowAllUsers as Boolean = false) as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a named pipe.
Notes:

Buffersize defines the size for input/output buffers.
Returns true on success or false on failure.
Lasterror is set.

Normally the pipe allows only same user.
But if AllowAllUsers is true, you can talk to other users or from service to user.

If name does not start with \then we prefix it with "\\.\Pipe\".

196.27.12 OpenPipe(Name as string) as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Opens an existing named pipe from client side.
Notes:

Returns true on success or false on failure.
Lasterror is set.

If name does not start with \then we prefix it with "\\.\Pipe\".

196.27.13 Peek(ByteCount as Integer) as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads data without removing it from the buffer.
Notes:

Reads up to the given number of bytes.
BytesRead property is set and data is returned.
LastError property is set.

196.27.14 PeekAll as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads all data without removing it from the buffer.
Notes:

Reads whole message or in byte mode
BytesRead property is set and data is returned.
LastError property is set.

196.27.15 Read(ByteCount as Integer) as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads data.
Notes:

Reads up to the given number of bytes.
BytesRead property is set and data is returned.
LastError property is set.

196.27.16 ReadAll as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads all data.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Dim r As String = pipe.ReadAll
Dim d As String = DefineEncoding(r, Encodings.UTF8)

List.AddRow d
```

Notes:

Reads whole message or in byte mode what is available.
BytesRead property is set and data is returned.
LastError property is set.

196.27.17 Write(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes data.
Notes:

Lasterror is set.
BytesWritten is set to number of bytes sent.
See also:

- 196.27.18 Write(data as string) 27776

196.27.18 Write(data as string)

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes data.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Dim d As String = ConvertEncoding(MessageField.Text, encodings.UTF8)
If d.Len >0 Then
pipe.Write d
MessageField.Text = ""
End If
```

Notes:

Lasterror is set.

BytesWritten is set to number of bytes sent.
See also:

- 196.27.17 Write(data as MemoryBlock) 27776

196.27.19 Properties

196.27.20 BytesAvailable as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries number of bytes available in buffer.
Notes: (Read only property)

196.27.21 BytesRead as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of bytes read.
Notes: (Read and Write property)

196.27.22 BytesWritten as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of bytes written.
Notes: (Read and Write property)

196.27.23 Handle as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle for the pipe.
Notes: (Read only property)

196.27.24 InputBufferSize as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The input buffer size.
Notes: (Read only property)

196.27.25 IsClient as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is client or server side.
Notes:

True if this is client side.
(Read only property)

196.27.26 IsMessageMode as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this pipe is in message mode.
Notes: (Read only property)

196.27.27 IsOpen as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether pipe is open.
Notes: (Read only property)

196.27.28 IsServer as Boolean

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this is client or server side.
Notes:

True if this is server side.
(Read only property)

196.27.29 LastError as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes:

A Windows error code.
(Read and Write property)

196.27.30 MessageBytesAvailable as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries number of bytes available for current message.
Notes: (Read only property)

196.27.31 Name as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the pipe.
Notes:

This is name as used in CreatePipe or OpenPipe method.
(Read and Write property)

196.27.32 NamedPipeClientComputerName as String

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the client computer name for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientComputerName: "+pipe.NamedPipeClientComputerName
```

Notes: (Read only property)

196.27.33 NamedPipeClientProcessId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the client process identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientProcessId: "+str(pipe.NamedPipeClientProcessId)
```

Notes: (Read only property)

196.27.34 NamedPipeClientSessionId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the client session identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeClientSessionId: "+str(pipe.NamedPipeClientSessionId)
```

Notes: (Read only property)

196.27.35 NamedPipeServerProcessId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the server process identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeServerProcessId: "+str(pipe.NamedPipeServerProcessId)
```

Notes: (Read only property)

196.27.36 NamedPipeServerSessionId as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the server session identifier for the specified named pipe.
Example:

```
dim Pipe as WindowsPipeMBS // your pipe

Msgbox "NamedPipeServerSessionId: "+str(pipe.NamedPipeServerSessionId)
```

Notes: (Read only property)

196.27.37 OutputBufferSize as Integer

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The output buffer size.
Notes: (Read only property)

196.27.38 Events

196.27.39 Connected

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: .

Function: The connected event.
Notes: Called when pipe is connected on either client or server side.

196.27.40 DataAvailable(BytesAvailable as Integer, MessageBytesAvailable as Integer)

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: .

Function: The event called when new data is available.

196.27.41 PipeBroken

MBS Win Plugin, Plugin Version: 19.5, Platform: Windows, Targets: .

Function: The event called when pipe breaks.
Notes:

The plugin will stop calling DataAvailable handler.
You can call Close and CreatePipe method to open pipe again.

196.28 class WindowsPreviewHandlerMBS

196.28.1 class WindowsPreviewHandlerMBS

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The class for showing previews on windows.
Notes:

This is linke a control which you can put into a window to show a preview for a file.

Uses IPreviewHandler class from Microsoft, so also see here:
https://docs.microsoft.com/en-us/windows/win32/api/shobjidl_core/nn-shobjidl_core-ipreviewhandler
https://docs.microsoft.com/de-de/windows/win32/shell/preview-handlers

The preview handlers we find are those listed in the registry here:
Computer\HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\PreviewHandlers

See WinPreviewControlMBS control to use this class as a control.

196.28.6 Methods

196.28.7 Constructor(ClassID as string)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Initializes the object with loading the class with the given classid.
Notes:

You find those ClassIDs in the registry (See example project).

See HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\PreviewHandlers in the registry.

196.28.8 DoPreview

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to load data from the source specified in an earlier Initialize method call, and to begin rendering to the previewer window.
Notes:

Lasterror is set.

If the previewer window has not yet been created, then it must be created after this method has been called. The preview handler is responsible for painting the area specified in SetWindow or SetRect. If these methods are called while the preview handler is rendering, the window must be reparented/resized without stopping or restarting the rendering of the item.

This method should be called only after SetWindow has been called.
Aditionally, this method should be called only after Constructor has been called.

196.28.9 InitWithData(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes:

Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.

You need to call Preview next on success to show a preview.
See also:

- 196.28.10 InitWithData(data as string) 27785

196.28.10 InitWithData(data as string)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes:

Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.

You need to call Preview next on success to show a preview.
See also:

- 196.28.9 InitWithData(data as MemoryBlock) 27785

196.28.11 InitWithFile(file as folderitem)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given file.
Notes:

Lasterror is set.
If the preview handler does not support reading file, the plugin reads the file and passes as data.

You need to call Preview next on success to show a preview.

If the file path is invalid, the preview will show a file not found error message.

196.28.12 SetBackgroundColor(red as Integer, green as Integer, blue as Integer)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Sets the background color of the preview handler.
Notes:

Lasterror is set.
Not all preview handlers implement this method.

196.28.13 SetFocus

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to set focus to itself.
Notes: Lasterror is set.

196.28.14 SetFont(size as Integer, font as string)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Sets the font attributes to be used for text within the preview handler.
Notes:

Lasterror is set.
Not all preview handlers implement this method.

196.28.15 SetRect(left as Integer, top as Integer, width as Integer, height as Integer)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to change the area within the parent hwnd that it draws into.
Notes:

Lasterror is set.

If called before the preview handler window has been created, the new rectangle replaces the rectangle previously received in the SetWindow call.
If called after the preview handler window has been created, the preview handler window must be resized.

If the preview handler is already rendering, then the preview must be resized without interrupting the render process.

196.28.16 SetTextColor(red as Integer, green as Integer, blue as Integer)

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Sets the color of the text within the preview handler.
Notes:

Lasterror is set.
Not all preview handlers implement this method.

196.28.17 SetWindow(win as ContainerControl)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Sets the parent of the preview to be the container with it's size.
Notes: We query size of the container automatically to set the right size independent of the screen scaling.
See also:

- 196.28.18 SetWindow(win as ContainerControl, left as integer, top as integer, width as integer, height as integer) 27788
- 196.28.19 SetWindow(win as Control) 27788
- 196.28.20 SetWindow(win as Control, left as integer, top as integer, width as integer, height as integer) 27789
- 196.28.21 SetWindow(win as DesktopContainer) 27790
- 196.28.22 SetWindow(win as DesktopContainer, left as integer, top as integer, width as integer, height as integer) 27790
- 196.28.23 SetWindow(win as DesktopControl) 27791
- 196.28.24 SetWindow(win as DesktopControl, left as integer, top as integer, width as integer, height as integer) 27792
- 196.28.25 SetWindow(win as DesktopWindow) 27792
- 196.28.26 SetWindow(win as DesktopWindow, left as integer, top as integer, width as integer, height as integer) 27793
- 196.28.28 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer) 27794

196.28.18 SetWindow(win as ContainerControl, left as integer, top as integer, width as integer, height as integer)

MBS Win Plugin, Plugin Version: 22.1, Platform: Windows, Targets: Desktop only.

Function: Sets the parent to a container control.
Notes: Coordinates in pixels.
See also:

- 196.28.17 SetWindow(win as ContainerControl) 27787
- 196.28.19 SetWindow(win as Control) 27788
- 196.28.21 SetWindow(win as DesktopContainer) 27790
- 196.28.22 SetWindow(win as DesktopContainer, left as integer, top as integer, width as integer, height as integer) 27790
- 196.28.23 SetWindow(win as DesktopControl) 27791
- 196.28.24 SetWindow(win as DesktopControl, left as integer, top as integer, width as integer, height as integer) 27792
- 196.28.25 SetWindow(win as DesktopWindow) 27792
- 196.28.26 SetWindow(win as DesktopWindow, left as integer, top as integer, width as integer, height as integer) 27793
- 196.28.27 SetWindow(win as Window) 27794
- 196.28.28 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer) 27794

196.28.19 SetWindow(win as Control)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Sets the parent of the preview to be the control with it's size.
Notes:

e.g. use a Canvas to host the preview.

We query size of the container automatically to set the right size independent of the screen scaling.
See also:

- 196.28.17 SetWindow(win as ContainerControl) 27787
- 196.28.18 SetWindow(win as ContainerControl, left as integer, top as integer, width as integer, height as integer) 27788

- 196.28.20 SetWindow(win as Control, left as integer, top as integer, width as integer, height as integer) 27789
- 196.28.21 SetWindow(win as DesktopContainer) 27790
- 196.28.22 SetWindow(win as DesktopContainer, left as integer, top as integer, width as integer, height as integer) 27790
- 196.28.23 SetWindow(win as DesktopControl) 27791
- 196.28.24 SetWindow(win as DesktopControl, left as integer, top as integer, width as integer, height as integer) 27792
- 196.28.25 SetWindow(win as DesktopWindow) 27792
- 196.28.27 SetWindow(win as Window) 27794
- 196.28.28 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer) 27794

196.28.20 SetWindow(win as Control, left as integer, top as integer, width as integer, height as integer)

MBS Win Plugin, Plugin Version: 22.1, Platform: Windows, Targets: Desktop only.

Function: Sets the parent to a control.
Notes: Coordinates in pixels.
See also:

- 196.28.17 SetWindow(win as ContainerControl) 27787
- 196.28.18 SetWindow(win as ContainerControl, left as integer, top as integer, width as integer, height as integer) 27788

- 196.28.22 SetWindow(win as DesktopContainer, left as integer, top as integer, width as integer, height as integer) 27790
- 196.28.23 SetWindow(win as DesktopControl) 27791
- 196.28.25 SetWindow(win as DesktopWindow) 27792
- 196.28.26 SetWindow(win as DesktopWindow, left as integer, top as integer, width as integer, height as integer) 27793
- 196.28.27 SetWindow(win as Window) 27794

196.28.25 SetWindow(win as DesktopWindow)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Sets the parent window of the previewer window.
Notes: We query size of the container automatically to set the right size independent of the screen scaling.
See also:

- 196.28.17 SetWindow(win as ContainerControl) 27787
- 196.28.18 SetWindow(win as ContainerControl, left as integer, top as integer, width as integer, height as integer) 27788
- 196.28.19 SetWindow(win as Control) 27788
- 196.28.20 SetWindow(win as Control, left as integer, top as integer, width as integer, height as integer) 27789

- 196.28.22 SetWindow(win as DesktopContainer, left as integer, top as integer, width as integer, height as integer) 27790
- 196.28.23 SetWindow(win as DesktopControl) 27791
- 196.28.24 SetWindow(win as DesktopControl, left as integer, top as integer, width as integer, height as integer) 27792
- 196.28.26 SetWindow(win as DesktopWindow, left as integer, top as integer, width as integer, height as integer) 27793
- 196.28.27 SetWindow(win as Window) 27794
- 196.28.28 SetWindow(win as window, left as Integer, top as Integer, width as Integer, height as Integer) 27794

196.28.26 SetWindow(win as DesktopWindow, left as integer, top as integer, width as integer, height as integer)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Sets the parent window of the previewer window, as well as the area within the parent to be used for the previewer window.
Notes:

Pass the window and the area for the previewer.
Lasterror is set.

The preview handler is responsible for painting the entire area. If the previewer window has been created, the preview handler must associate the previewer window to the new parent hwnd and resize the previewer window to the area defined by the rectangle. If the previewer window has not yet been created, the preview handler must remember this information for when the previewer window is created in DoPreview.
It is preferred that this information be stored prior to calling DoPreview. Doing so increases performance at setup time for any cases where the preview does not start.

Coordinates in pixels.

196.28.29 Unload

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Directs the preview handler to cease rendering a preview and to release all resources that have been allocated based on the item passed in during the initialization.
Notes:

Lasterror is set.
When called, the preview window will be destroyed.

This method should be called only after Constructor has been called. All resources associated with this initialization will be released. Prior to calling DoPreview, this preview handler will be re-initialized with a call to one of the initialization interfaces and a call to SetWindow.

196.28.30 Properties

196.28.31 Handle as Integer

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

196.28.32 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

196.28.33 LasterrorString as String

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The error message for the error number in the lasterror property.
Notes: (Read only property)

196.28.34 SupportsDataLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Whether the preview handler supports loading data from a string or memoryblock.
Notes: (Read only property)

196.28.35 SupportsFileLoading as Boolean

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: Whether the preview handler supports loading files.
Notes:

As the plugin can also load file and pass as data if needed, this function also returns true if SupportsDataLoading is also true.
(Read only property)

196.28.36 Window as Variant

MBS Win Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop only.

Function: The parent window.
Notes:

Can reference a Window or DesktopWindow object.
(Read only property)

196.29 class WindowsPropertiesMBS

196.29.1 class WindowsPropertiesMBS

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The class for window properties.
Example:

```
dim w as new WindowsPropertiesMBS(self)

dim key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true

dim c as integer = w.count
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

196.29.6 Methods

196.29.7 Close

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Closes properties.
Notes: Same as destructor.

196.29.8 Commit

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Commits values.
Notes:

Optional as window properties are set directly.
LastError and LastErrorMessage are set.

196.29.9 Constructor(Win as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves an object that represents a specific window's collection of properties, which allows those properties to be queried or set.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.

An application can use this function to obtain access to a window's property store so that it can set an explicit Application User Model ID (AppUserModelID) in the System.AppUserModel.ID property.

Raises FunctionNotFoundException if function is not available, PlatformNotSupportedException if not running on Windows, NilObjectException if window is nil or invalid and UnsupportedOperationException if Window properties can't be queried.
See also:

- 196.29.10 Constructor(Win as Window) 27800

196.29.10 Constructor(Win as Window)

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Retrieves an object that represents a specific window's collection of properties, which allows those properties to be queried or set.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.

An application can use this function to obtain access to a window's property store so that it can set an explicit Application User Model ID (AppUserModelID) in the System.AppUserModel.ID property.

Raises FunctionNotFoundException if function is not available, PlatformNotSupportedException if not running on Windows, NilObjectException if window is nil or invalid and UnsupportedOperationException if Window properties can't be queried.
See also:

- 196.29.9 Constructor(Win as DesktopWindow) 27799

196.29.11 Count as Integer

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Queries number of values.
Example:

```
dim w as new WindowsPropertiesMBS(self)

// show all keys with values
dim c as integer = w.count
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

Notes: LastError and LastErrorMessage are set.

196.29.12 EdgeGestureDisableTouchWhenFullscreen as String

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The property name used to disable touch gesture with full screen window.
Example:

```
dim w as new WindowsPropertiesMBS(self)
dim key as string = w.EdgeGestureDisableTouchWhenFullscreen

w.Value(key) = true
```

196.29.13 Key(Index as Integer) as String

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The key with given index.
Notes:

Index from 0 to Count-1.
Keys are passed as UUID followed by property ID.
LastError and LastErrorMessage are set.

196.29.14 Values as Dictionary

MBS Win Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Queries all values as dictionary.
Notes: The dictionary is a copy, so changes to the dictionary are not going back to the window.

196.29.15 Properties

196.29.16 Handle as Integer

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

196.29.17 LastError as Integer

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

196.29.18 LastErrorMessage as String

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: The last error message.
Notes: (Read and Write property)

196.29.19 Value(Key as String) as Variant

MBS Win Plugin, Plugin Version: 17.5, Platform: Windows, Targets: Desktop only.

Function: Set or query property value.
Example:

```
dim w as new WindowsPropertiesMBS(self)

// show all keys with values
dim c as integer = w.count
for i as integer = 0 to c-1
dim k as string = w.key(i)
MsgBox k+" "+w.Value(k)
next
```

Notes:

Keys are passed as UUID followed by property ID.
LastError and LastErrorMessage are set.
(Read and Write computed property)

196.30 class WindowsReportErrorMBS

196.30.1 class WindowsReportErrorMBS

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an event source on Windows to report errors.
Example:

```
// early on app start, setup this
dim r as new WindowsReportErrorMBS("Application")

// later report something
const Category = 1
const EventID = 1000
r.Report r.kEventLogWarningType, Category, EventID, array("Hello World")
```

196.30.6 Methods

196.30.7 Constructor(SourceName as String, UNCServerName as String = "")

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a registered handle to the specified event log.
Notes:

UNCServerName: The Universal Naming Convention (UNC) name of the remote server on which this operation is to be performed. If this parameter is "", the local computer is used.
SourceName: The name of the event source whose handle is to be retrieved. The source name must be a subkey of a log under the Eventlog registry key. Note that the Security log is for system use only.
Note This string must not contain characters prohibited in XML Attributes, with the exception of XML Escape sequences such as & lt & gl.

If the source name cannot be found, the event logging service uses the Application log. Although events will be reported , the events will not include descriptions because there are no message and category message files for looking up descriptions related to the event identifiers.

Raises exception on failure.

196.30.8 Report(Type as Integer, Category as Integer, EventID as Integer, Strings() as string = nil, RawData as MemoryBlock = nil)

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes an entry at the end of the event log.
Notes:

Type: The type of event to be logged. See kEventLog* constants.
Category: The event category. This is source-specific information; the category can have any value.
EventID: The event identifier. The event identifier specifies the entry in the message file associated with the event source.
Strings: An array of strings that are merged into the message before Event Viewer displays the string to the user. This parameter must can be nil for no strings. Each string is limited to 31,839 characters.
RawData:

196.30.9 Properties

196.30.10 Handle as Integer

MBS Win Plugin, Plugin Version: 21.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle to the event source.
Notes: (Read and Write property)

196.30.11 Constants

196.30.12 kEventLogAuditFailure = 16

MBS Win Plugin, Plugin Version: 21.0.

Function: One of the event type constants.
Notes: Failure Audit event

196.30.13 kEventLogAuditSuccess = 8

MBS Win Plugin, Plugin Version: 21.0.

Function: One of the event type constants.
Notes: Success Audit event

196.30.14 kEventLogErrorType = 1

MBS Win Plugin, Plugin Version: 21.0.

Function: One of the event type constants.
Notes: Error event

196.30.15 kEventLogInformationType = 4

MBS Win Plugin, Plugin Version: 21.0.

Function: One of the event type constants.
Notes: Information event

196.30.16 kEventLogSuccess = 0

MBS Win Plugin, Plugin Version: 21.0.

Function: One of the event type constants.
Notes: Information event

196.30.17 kEventLogWarningType = 2

MBS Win Plugin, Plugin Version: 21.0.

Function: One of the event type constants.
Notes: Warning event

196.31 class WindowsScriptErrorExceptionMBS

196.31.1 class WindowsScriptErrorExceptionMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The exception class raised when an error happens while executing a script.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

Notes: Subclass of the RuntimeException class.

196.31.2 Blog Entries

- Windows Scripts in REALbasic

196.31.3 Blog Entries

- Windows Scripts in REALbasic

196.32 class WindowsScriptErrorMBS

196.32.1 class WindowsScriptErrorMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for error details.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "JScript"

try
w.AddCode "function Test(a,b) { 1 return a+b; } " // 1 is there to make error

dim p(-1) as string = array("Hello ", "World from JavaScript")
dim x as string = w.Run("Test", p)
catch e as WindowsScriptErrorExceptionMBS
dim error as WindowsScriptErrorMBS = w.Error
MsgBox error.Description+EndOfLine+"in "+str(error.Line)+":"+str(error.Column)
end try
```

196.32.2 Properties

196.32.3 Column as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Source code column position where the error occurred.
Notes: (Read and Write property)

196.32.4 Description as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Friendly description of error.
Notes: (Read and Write property)

196.32.5 Line as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Source code line number where the error occurred.
Notes: (Read and Write property)

196.32.6 Number as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Error number.
Notes: (Read and Write property)

196.32.7 Source as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Source of the error.
Notes: (Read and Write property)

196.32.8 Text as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Line of source code on which the error occurred.
Notes: (Read and Write property)

196.33 class WindowsScriptMBS

196.33.1 class WindowsScriptMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to run Windows Scripts.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "JScript"
w.AddCode "function Test(a,b) { return a+b; } "

dim p(-1) as string = array("Hello ", "World from JavaScript")
dim x as string = w.Run("Test", p)

MsgBox x
```

196.33.4 Methods

196.33.5 AddCode(code as string)

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Add code to the global module.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1" // define some global variables
w.AddCode "b = 2"
```

Notes: If you use VBScript, you don't need "dim" keyword for defining variables.

196.33.6 ClearError

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears the current error.

196.33.7 Eval(code as string) as string

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Evaluate an expression within the context of the global module.

196.33.8 ExecuteStatement(statement as string)

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Execute a statement within the context of the global module.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
```

```
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

196.33.9 Reset

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reset the scripting engine to a newly created state.

196.33.10 Run(functionName as string, parameters() as string) as string

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Call a procedure defined in the global module.
Example:

```
dim w as new WindowsScriptMBS

// First try VBScript
w.Language = "VBScript"

dim lines(-1) as string

lines.append "Function Test(a,b)"
lines.append "Test = a+b"
lines.append "End Function"

w.AddCode Join(lines, EndOfLine.Windows)

dim p(-1) as string = array("Hello ", "World from VBScript")
dim x as string = w.Run("Test", p)

'MsgBox x

// Second try JScript
w.Language = "JScript"
```

```
redim lines(-1)
lines.append "function Test(a,b)"
lines.Append " { "
lines.append "return a+b;"
lines.append " } "

w.AddCode Join(lines, EndOfLine.Windows)

p = array("Hello ", "World from JavaScript")
x = w.Run("Test", p)

MsgBox x

Exception e as WindowsScriptErrorExceptionMBS
MsgBox "Exception: "+e.message
```

196.33.11 Properties

196.33.12 AllowUI as Boolean

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enable or disable display of the UI.
Example:

```
dim w as new WindowsScriptMBS

w.Language = "VBScript"

w.AddCode "a = 1"
w.AddCode "b = 2"

w.AllowUI = true
w.ExecuteStatement "msgbox a+b" // shows 3

w.AllowUI = false
w.ExecuteStatement "msgbox a+b" // shows exception with access denied

Exception e as WindowsScriptErrorExceptionMBS
MsgBox e.message
```

Notes: (Read and Write property)

196.33.13 Error as WindowsScriptErrorMBS

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current error status.
Notes: (Read only property)

196.33.14 Language as String

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Language engine to use.
Example:

```
dim w as new WindowsScriptMBS

w.Language = w.kLanguageJScript

MsgBox w.Language // shows "JScript"

w.Language = w.kLanguageVBScript

MsgBox w.Language // shows "VBScript"
```

Notes:

Use kLanguageVBScript or kLanguageJScript constants.
Setting this property calls reset internally.
(Read and Write property)

196.33.15 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes:

0 is no error. -1 is a parameter error on the plugin side. All other codes are from Windows.
(Read and Write property)

196.33.16 SitehWnd as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The window handle for the window being parent to any window the scripts create.
Example:

```
dim w as new WindowsScriptMBS
w.SitehWnd = window1.handle
```

Notes:

The window is used as the parent window for message boxes, alerts, etc.
(Read and Write property)

196.33.17 Timeout as Integer

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Length of time in milliseconds that a script can execute before being considered hung.
Notes: (Read and Write property)

196.33.18 UseSafeSubset as Boolean

MBS Win Plugin, Plugin Version: 10.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Force script to execute in safe mode and disallow potentially harmful actions.
Notes: (Read and Write property)

196.33.19 Constants

196.33.20 kLanguageJScript = "JScript"

MBS Win Plugin, Plugin Version: 10.0.

Function: One of the language constants.
Notes: Using this constant you can switch to JavaScript.

196.33.21 kLanguageVBScript = "VBScript"

MBS Win Plugin, Plugin Version: 10.0.

Function: One of the language constants.
Notes: Using this constant you can switch to VBScript.

196.34 class WindowsSerialPortsMBS

196.34.1 class WindowsSerialPortsMBS

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This is a class to query the serial ports on a Windows system.
Notes: This class was created in response to feedback report 8212: Serial Port Hangup on Windows.

196.34.2 Blog Entries

- MBS Xojo Plugins, version 19.0pr7
- MBS Xojo / Real Studio Plugins, version 14.0pr5

196.34.6 Methods

196.34.7 Constructor(OnlyPresent as boolean = true)

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor which builds the list of devices.

196.34.8 Description(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description of this serial port.

196.34.9 DevicePath(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device path of this serial port.

196.34.10 FriendlyName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The display name of this serial port.

196.34.11 Location(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of this serial port.

196.34.12 QueryComDevices as String()

MBS Win Plugin, Plugin Version: 19.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries list of DOS COM Port names.
Notes:

While Constructor builds a list based on registry information (setup database), this function will use QueryDosDevice to ask Windows about device names for DOS starting with COM in their name and return the list.

Returns nil in case of failure.

196.34.13 Properties

196.34.14 Count as Integer

MBS Win Plugin, Plugin Version: 10.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The number of serial ports found.
Notes: (Read and Write property)

196.35 class WindowsTaskbarListMBS

196.35.1 class WindowsTaskbarListMBS

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for windows with methods that control the taskbar.
Notes: It allows you to dynamically add, remove, and activate items on the taskbar.

196.35.2 Blog Entries

- Show progress in task bar on Windows
- SetProgressState on Windows
- MBS REALbasic plug-ins version 10.2

196.35.3 Blog Entries

- Show progress in task bar on Windows
- SetProgressState on Windows
- MBS REALbasic plug-ins version 10.2

196.35.4 Methods

196.35.5 ActivateTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Activates an item on the taskbar.
Notes:

The window is not actually activated; the window's item on the taskbar is merely displayed as active.
Lasterror is set.

196.35.6 AddTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds an item to the taskbar.
Notes:

Any type of window can be added to the taskbar, but it is recommended that the window at least have the WS_CAPTION style.

Any window added with this method must be removed with the DeleteTab method when the added window is destroyed.

Lasterror is set.

196.35.7 DeleteTab(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes an item from the taskbar.

196.35.8 MarkFullscreenWindow(WindowHandle as Integer, Fullscreen as Boolean)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Marks a window as full-screen.
Notes:

Fullscreen: A Boolean value marking the desired full-screen status of the window.

Setting the value of fFullscreen to TRUE, the Shell treats this window as a full-screen window, and the taskbar is moved to the bottom of the z-order when this window is active. Setting the value of fFullscreen to FALSE removes the full-screen marking, but does not cause the Shell to treat the window as though it were definitely not full-screen. With a FALSEfFullscreen value, the Shell depends on its automatic detection facility to specify how the window should be treated, possibly still flagging the window as full-screen.

Requires Windows XP or Windows Server 2003 or newer.
Lasterror is set.

196.35.9 RegisterTab(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Informs the taskbar that a new tab or document thumbnail has been provided for display in an application's taskbar group flyout.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
By itself, registering a tab thumbnail alone will not result in its being displayed. You must also call SetTabOrder to instruct the group where to display it.

196.35.10 SetActiveAlt(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Marks a taskbar item as active but does not visually activate it.
Notes: SetActiveAlt marks the item associated with hwnd as the currently active item for the window's process without changing the pressed state of any item. Any user action that would activate a different tab in that process will activate the tab associated with hwnd instead. The active state of the window's item is not guaranteed to be preserved when the process associated with this window is not active. To ensure that a given tab is always active, call SetActiveAlt whenever any of your windows are activated. Calling SetActiveAlt with a nil window handle clears this state.

196.35.11 SetOverlayIcon(TabWindowHandle as Integer, IconHandle as Integer, Description as string)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies an overlay to a taskbar button to indicate application status or a notification to the user.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle:
The handle of the window whose associated taskbar button receives the overlay. This handle must belong to a calling process associated with the button's application and must be a valid HWND or the call is ignored.

IconHandle:
The handle of an icon to use as the overlay. This should be a small icon, measuring 16x16 pixels at 96 dpi. If an overlay icon is already applied to the taskbar button, that existing overlay is replaced.

This value can be 0. How a 0 value is handled depends on whether the taskbar button represents a single window or a group of windows.

- If the taskbar button represents a single window, the overlay icon is removed from the display.
- If the taskbar button represents a group of windows and a previous overlay is still available (received

earlier than the current overlay, but not yet freed by a 0 value), then that previous overlay is displayed in place of the current overlay.

It is the responsibility of the calling application to free hIcon when it is no longer needed. This can generally be done after you've called SetOverlayIcon because the taskbar makes and uses its own copy of the icon.

Description:
A string that provides an alt text version of the information conveyed by the overlay, for accessibility purposes.

In versions of Windows earlier than Windows 7, applications often used icons in the notification area of the taskbar to display application status and notifications to the user. The Windows 7 taskbar allows an application to provide that same sort of user feedback through its taskbar button, centralizing more of the application information in one place. These overlays are similar to existing overlays used for shortcut icons or security notifications, displayed at the lower-right corner of the button.

The following illustration shows an overlay (the small, green square that indicates the user status as "Available") applied to the far-right taskbar button.

Windows Messenger taskbar button with an overlay to indicate an Available status.

Icon overlays serve as a contextual notification of status, and are intended to negate the need for a separate notification area status icon to communicate that information to the user. The application designer must decide during the development cycle which method,Äîicon overlay or notification area status icon,Äîbest serves that application. Overlay icons are intended to supply important, long-standing status or notifications such as network status, messenger status, or new mail. They should not be frequently changed, nor should they be animated.

To display an overlay icon, the taskbar must be in the default large icon mode. If the taskbar is configured through Taskbar and Start Menu Properties to show small icons, overlays cannot be applied and calls to this method are ignored.

Because a single overlay is applied to the taskbar button instead of to the individual window thumbnails, this is a per-group feature rather than per-window. Requests for overlay icons can be received from individual windows in a taskbar group, but they do not queue. The last overlay received is the overlay shown. If the last overlay received is removed, the overlay that it replaced is restored so long as it is still active. As an example, windows 1, 2, and 3 set, in order, overlays A, B, and C. Because overlay C was received last, it is shown on the taskbar button. Window 2 calls SetOverlayIcon with a 0 value to remove overlay B. Window 3 then does the same to remove overlay C. Because window 1's overlay A is still active, that overlay is then displayed on the taskbar button.

If Windows Explorer shuts down unexpectedly, overlays are not restored when Windows Explorer is restored. The application should wait to receive the TaskbarButtonCreated message that indicates that Windows Explorer has restarted and the taskbar button has been re-created, and then call SetOverlayIcon again to

reapply the overlay.

196.35.12 SetProgressState(WindowHandle as Integer, Flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the type and state of the progress indicator displayed on a taskbar button.
Notes:

Use the ProgressStateFlag* constants. Flags that control the current state of the progress button. Specify only one of the following flags; all states are mutually exclusive of all others.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

Progress bar information is not shown in high contrast color schemes to guarantee that no accessibility needs are compromised.

Developers accustomed to the existing progress bar control should find the taskbar button progress indicator to be a similar experience both in concept and visuals. Here, the taskbar button itself becomes a progress bar. A taskbar button's progress indicator should be a reflection of a more detailed progress bar in the associated window. This allows the user to see specifics, such as the percentage number and the amount of time remaining, that cannot be shown in a taskbar button. Also, because a taskbar button can show the progress of only a single window in a group, it allows the user to check the progress of individual windows. It also provides progress information to the user when the taskbar button cannot, such as in a high-contrast color scheme.

Note that a taskbar button progress bar is not intended for use with normally peripheral actions such as the loading of a Web page or the printing of a document. That type of progress should continue to be shown in a window's status bar.

The progress indicator is displayed between the taskbar button's icon or text and the background. If progress is shown for both the active taskbar button and an inactive button, shading in the respective progress bars is such that the active button is still obvious to the user. Also, button functionality such as the display of thumbnails continues to work normally when the button is being used to display progress.

When exiting an error or paused state, call this method again with the ProgressStateFlagNormal or ProgressStateFlagIndeterminate flag to continue in the original state or TBPF_NOPROGRESS if the operation is cancelled.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. This includes the situation where the taskbar button represents a group and more than one window in that group is broadcasting progress information. In that case, the taskbar button chooses its progress display based on state priority. State priority is shown in the following table with priority 1 being the highest.

Priority	State
1	ProgressStateFlagError
2	ProgressStateFlagPaused
3	ProgressStateFlagNormal
4	ProgressStateFlagIndeterminate

Changing a window's state changes its priority in relation to other windows in the group which in turn might change which window in a group is used for the progress indicator in the taskbar button.

In the case of a priority collision between two windows that are broadcasting determinate progress, the window with the least progress is used.

Based on this priority, the indeterminate progress indicator can be displayed in the taskbar button only in these cases:

- The taskbar button does not represent a group and the single window that it represents has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window has set ProgressStateFlagIndeterminate.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, and all of those windows have set ProgressStateFlagIndeterminate.

A determinate progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting determinate progress information, and no window has set ProgressStateFlagError or ProgressStateFlagPaused.

Note that a call to SetProgressValue will switch a progress indicator currently in an indeterminate mode (ProgressStateFlagIndeterminate) to a normal (determinate) display and clear the ProgressStateFlagIndeterminate flag.

If the handle is a ptr, you need to cast it with Integer(YourPtr) to pass it.

196.35.13 SetProgressValue(WindowHandle as Integer, Completed as UInt64, Total as UInt64)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Displays or updates a progress bar hosted in a taskbar button to show the specific percentage completed of the full operation.
Notes:

Completed: An application-defined value that indicates the proportion of the operation that has been completed at the time the method is called.
Total: An application-defined value that specifies the value ullCompleted will have when the operation is complete.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

Determinate Progress Bar Lifecycle

An application first calls SetProgressValue to begin the display of a determinate progress bar, and then calls it again as needed to update the bar as the progress changes. When progress is complete, the application must call SetProgressState with the TBPF_NOPROGRESS flag to dismiss the progress bar.

How the Taskbar Button Chooses the Progress Indicator for a Group

The taskbar button can show a progress indicator for only one window at a time. When the taskbar button represents a group and more than one of the windows in that group are broadcasting progress information, the taskbar button chooses its progress display based on the following state priority.

Priority	State
1	ProgressStateFlagError
2	ProgressStateFlagPaused
3	ProgressStateFlagNormal
4	ProgressStateFlagIndeterminate

Unless SetProgressState has set a blocking state (ProgressStateFlagError or ProgressStateFlagPaused) for the window, a call to SetProgressValue assumes the ProgressStateFlagNormal state even if it is not explicitly set. A call to SetProgressValue overrides and clears the ProgressStateFlagIndeterminate state.

In the case of a priority collision where two windows are broadcasting determinate progress, the window with the least progress is used.

Based on that priority, this determinate (specific percentage) progress indicator can be displayed in these cases:

- The taskbar button does not represent a group and the single window that it represents is broadcasting determinate progress information through this method.
- The taskbar button represents a group, only one window in that group is broadcasting progress information, and that window is broadcasting determinate progress information through this method.
- The taskbar button represents a group, multiple windows in that group are broadcasting progress information, at least one of those windows is broadcasting progress information through this method, and none of those windows has set the ProgressStateFlagError or ProgressStateFlagPaused state.

If a window in the group has set ProgressStateFlagError or ProgressStateFlagPaused, that state will be used for the button display. However, you can still make calls to SetProgressValue on other, unblocked windows in the group to update their progress in the background.

If the handle is a ptr, you need to cast it with Integer(YourPtr) to pass it.

196.35.14 SetTabActive(TabWindowHandle as Integer, MDIWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Informs the taskbar that a tab or document window has been made the active window.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle: Handle of the active tab window. This handle must already be registered through RegisterTab. This value can be 0 if no tab is active.

MDIWindowHandle: Handle of the application's main window. This value tells the taskbar which group the thumbnail is a member of. This value is required and cannot be 0.

196.35.15 SetTabOrder(TabWindowHandle as Integer, InsertBeforeWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Inserts a new thumbnail into a tabbed-document interface (TDI) or multiple-document interface (MDI) application's group flyout or moves an existing thumbnail to a new position in the application's group.
Notes:

TabWindowHandle: The handle of the tab window whose thumbnail is being placed. This value is required, must already be registered through RegisterTab, and cannot be 0.
InsertBeforeWindowHandle: The handle of the tab window whose thumbnail that hwndTab is inserted to the left of. This handle must already be registered through RegisterTab. If this value is 0, the new thumbnail is added to the end of the list.

196.35.16 SetTabProperties(TabWindowHandle as Integer, flags as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Allows a tab to specify whether the main application frame window or the tab window should be used as a thumbnail or in the peek feature under certain circumstances.
Notes:

An application might want to use the thumbnail or peek representation of its associated parent window if the application cannot generate its own thumbnail for a tab or for its active tab content (such as an animation) to appear live.

flags: One of the TabPropertyFlag* constants.
Available on Windows 7 or Windows Server 2008 R2 or newer.

196.35.17 SetThumbnailClip(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects a portion of a window's client area to display as that window's thumbnail in the taskbar.
Notes:

This variant of the method clears the clip that is already in place and return to the default display of the thumbnail.

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
See also:

- 196.35.18 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h

as Integer) 27829

196.35.18 SetThumbnailClip(TabWindowHandle as Integer, x as Integer, y as Integer, w as Integer, h as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects a portion of a window's client area to display as that window's thumbnail in the taskbar.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.
See also:

- 196.35.17 SetThumbnailClip(TabWindowHandle as Integer) 27828

196.35.19 SetThumbnailTooltip(TabWindowHandle as Integer, tip as string)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies or updates the text of the tooltip that is displayed when the mouse pointer rests on an individual preview thumbnail in a taskbar button flyout.
Notes:

Requires Windows 7 or Windows Server 2008 R2 or newer.
Lasterror is set.

TabWindowHandle: The handle to the window whose thumbnail displays the tooltip. This handle must belong to the calling process.

tip: The text to be displayed in the tooltip. This value can be empty, in which case the title of the window specified by WindowHandle is used as the tooltip.

196.35.20 UnregisterTab(TabWindowHandle as Integer)

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes a thumbnail from an application's preview group when that tab or document is closed in the application.
Notes:

It is the responsibility of the calling application to free hwndTab through DestroyWindow. UnregisterTab must be called before the handle is freed.
Requires Windows 7 or Windows Server 2008 R2 or newer.

Lasterror is set.

196.35.21 Properties

196.35.22 Handle1 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList interface.
Notes:

The ITaskbarList interface is available on Windows 2000 Professional, Windows XP or Windows 2000 Server or newer.
(Read and Write property)

196.35.23 Handle2 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList2 interface.
Notes:

The ITaskbarList4 interface is available on Windows XP or Windows Server 2003 or newer.
(Read and Write property)

196.35.24 Handle3 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList3 interface.
Notes:

The ITaskbarList3 interface is available on Windows 7 or Windows Server 2008 R2 or newer.
none
(Read and Write property)

196.35.25 Handle4 as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference for the ITaskbarList4 interface.
Notes:

The ITaskbarList4 interface is available on Windows 7 or Windows Server 2008 R2 or newer.
(Read and Write property)

196.35.26 Lasterror as Integer

MBS Win Plugin, Plugin Version: 10.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code from one of the methods.
Notes: (Read and Write property)

196.35.27 Constants

196.35.28 ProgressStateFlagError = 4

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the progress state flag constants.
Notes: The progress indicator turns red to show that an error has occurred in one of the windows that is broadcasting progress. This is a determinate state. If the progress indicator is in the indeterminate state, it switches to a red determinate display of a generic percentage not indicative of actual progress.

196.35.29 ProgressStateFlagIndeterminate = 1

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the progress state flag constants.
Notes: The progress indicator does not grow in size, but cycles repeatedly along the length of the taskbar button. This indicates activity without specifying what proportion of the progress is complete. Progress is taking place, but there is no prediction as to how long the operation will take.

196.35.30 ProgressStateFlagNoProgress = 0

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the progress state flag constants.
Notes: Stops displaying progress and returns the button to its normal state. Call this method with this flag to dismiss the progress bar when the operation is complete or cancelled.

196.35.31 ProgressStateFlagNormal = 2

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the progress state flag constants.
Notes: The progress indicator grows in size from left to right in proportion to the estimated amount of the operation completed. This is a determinate progress indicator; a prediction is being made as to the duration of the operation.

196.35.32 ProgressStateFlagPaused = 8

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the progress state flag constants.
Notes: he progress indicator turns yellow to show that progress is currently stopped in one of the windows but can be resumed by the user. No error condition exists and nothing is preventing the progress from continuing. This is a determinate state. If the progress indicator is in the indeterminate state, it switches to a yellow determinate display of a generic percentage not indicative of actual progress.

196.35.33 TabPropertyFlagNone = 0

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the flag values you can use with SetTabProperties.
Notes: No specific property values are specified. The default behavior is used: the tab window provides a thumbnail and peek image, either live or static as appropriate.

196.35.34 TabPropertyFlagUseAppPeekAlways = 4

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the flag values you can use with SetTabProperties.
Notes: Always use the peek image provided by the main application frame window rather than a peek image provided by the individual tab window. Do not combine this value with TabPropertyFlagUseAppPeekWhen-Active; doing so will result in an error.

196.35.35 TabPropertyFlagUseAppPeekWhenActive = 8

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the flag values you can use with SetTabProperties.
Notes: When the application tab is active and a live representation of its window is available, show the

main application frame in the peek feature. At other times, use the tab window. Do not combine this value with TabPropertyFlagUseAppPeekAlways; doing so will result in an error.

196.35.36 TabPropertyFlagUseAppThumbnailAlways = 1

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the flag values you can use with SetTabProperties.
Notes: Always use the thumbnail provided by the main application frame window rather than a thumbnail provided by the individual tab window. Do not combine this value with TabPropertyFlagUseAppThumbnailWhenActive; doing so will result in an error.

196.35.37 TabPropertyFlagUseAppThumbnailWhenActive = 2

MBS Win Plugin, Plugin Version: 10.2.

Function: One of the flag values you can use with SetTabProperties.
Notes: When the application tab is active and a live representation of its window is available, use the main application frame window thumbnail. At other times, use the tab window thumbnail. Do not combine this value with TabPropertyFlagUseAppThumbnailAlways; doing so will result in an error.

196.36 class WindowsThreadExecutionStateMBS

196.36.1 class WindowsThreadExecutionStateMBS

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the thread execution state.
Example:

```
dim flags as integer = WindowsThreadExecutionStateMBS.kSystemRequired
dim w as new WindowsThreadExecutionStateMBS(flags)
window1.WindowsThreadExecutionState = w // store it in property
```

Notes:

The state is set in constructor and reset in destructor, so you can put this object in a property of a window, so when the window is destroyed, the state is reset automatically.

Enables an application to inform the system that it is in use, thereby preventing the system from entering sleep or turning off the display while the application is running.

For macOS, please check NSProcessInfoMBS class.

The system automatically detects activities such as local keyboard or mouse input, server activity, and changing window focus. Activities that are not automatically detected include disk or CPU activity and video display.

To run properly on a power-managed computer, applications such as fax servers, answering machines, backup agents, and network management applications must use both kSystemRequired when they process events. Multimedia applications, such as video players and presentation applications, must use kDisplayRequired when they display video for long periods of time without user input. Applications such as word processors, spreadsheets, browsers, and games do not need to use this.

The kAwayModeRequired value should be used only when absolutely necessary by media applications that require the system to perform background tasks such as recording television content or streaming media to other devices while the system appears to be sleeping. Applications that do not require critical background processing or that run on portable computers should not enable away mode because it prevents the system from conserving power by entering true sleep.

To enable away mode, an application uses both kAwayModeRequired; to disable away mode, let the destructor reset. When away mode is enabled, any operation that would put the computer to sleep puts it in away mode instead. The computer appears to be sleeping while the system continues to perform tasks that do not require user input. Away mode does not affect the sleep idle timer; to prevent the system from entering sleep when the timer expires, an application must also set the kSystemRequired value.

This class cannot be used to prevent the user from putting the computer to sleep. Applications should respect that the user expects a certain behavior when they close the lid on their laptop or press the power button.

This function does not stop the screen saver from executing.

196.36.6 Methods

196.36.7 Constructor(Flags as Integer)

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the state and stores old state in property.
Example:

```
dim flags as integer = WindowsThreadExecutionStateMBS.kSystemRequired
dim w as new WindowsThreadExecutionStateMBS(flags)
window1.WindowsThreadExecutionState = w // store it in property
```

Notes: Does nothing if called on macOS, iOS or Linux.

196.36.8 Destructor

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes:

Puts back the old state.
Does nothing if called on macOS, iOS or Linux.

196.36.9 Properties

196.36.10 newState as Integer

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The new state set.
Notes: (Read only property)

196.36.11 oldState as Integer

MBS Win Plugin, Plugin Version: 23.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The old state before.
Notes: (Read only property)

196.36.12 Constants

196.36.13 kAwayModeRequired = 64

MBS Win Plugin, Plugin Version: 23.0.

Function: One of the flag constants.
Notes: Enables away mode. Away mode should be used only by media-recording and media-distribution

applications that must perform critical background processing on desktop computers while the computer appears to be sleeping.

196.36.14 kDisplayRequired = 2

MBS Win Plugin, Plugin Version: 23.0.

Function: One of the flag constants.
Notes: Forces the display to be on by resetting the display idle timer.

196.36.15 kSystemRequired = 1

MBS Win Plugin, Plugin Version: 23.0.

Function: One of the flag constants.
Notes: Forces the system to be in the working state by resetting the system idle timer.

196.37 class WindowsVerticalBlankMBS

196.37.1 class WindowsVerticalBlankMBS

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for checking on Windows with the retrace of the display.
Notes: Sometimes you may want to draw only if the device is currently not touching the video memory.

196.37.2 Blog Entries

- MBS Real Studio Plugins, version 12.3pr10

196.37.3 Blog Entries

- MBS Real Studio Plugins, version 12.3pr10

196.37.4 Methods

196.37.5 Constructor

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes the class.

196.37.6 GetMonitorFrequency as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the frequency of the monitor that the DirectDraw object controls.
Notes:

Returns the monitor frequency, in Hz.
Lasterror is set.

196.37.7 GetScanLine as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method retrieves the scan line that is currently being drawn on the monitor.
Notes:

To synchronize with the vertical blank, use the WaitForVerticalBlank method.
Lasterror is set.

Scan lines are reported as zero-based integers.
The returned scan line value is between 0 and n, where scan line 0 is the first visible scan line on the screen and n is the last visible scan line, plus scan lines that occur during the vertical blank period.
So, in a case where an application is running at 640x480, and there are 12 scan lines during the vertical blank period, the values returned by this method will range from 0 to 491.

196.37.8 GetVerticalBlankStatus as boolean

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the status of the vertical blank.
Notes:

Returns the status of the vertical blank. True if a vertical blank is occurring, and false otherwise.
Lasterror is set.

196.37.9 WaitForVerticalBlankBegin

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Helps the application synchronize itself with the vertical-blank interval.
Notes:

WaitForVerticalBlank returns when the vertical-blank interval begins.
Lasterror is set.

196.37.10 WaitForVerticalBlankEnd

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Helps the application synchronize itself with the vertical-blank interval.
Notes:

WaitForVerticalBlank returns when the vertical-blank interval ends and the display begins.
Lasterror is set.

196.37.11 Properties

196.37.12 Available as Boolean

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this class will work.
Notes: (Read and Write property)

196.37.13 Lasterror as Integer

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last windows error string.
Notes: (Read and Write property)

196.37.14 LasterrorString as String

MBS ComputerControl Plugin, Plugin Version: 12.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last windows error string.
Notes: (Read only property)

196.38 class WindowsWMIMBS

196.38.1 class WindowsWMIMBS

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to run queries in the Windows Management Interface.
Example:

```
dim w as WindowsWMIMBS

w=new WindowsWMIMBS

if w.ConnectServer("root\cimv2") then
MsgBox "ConnectServer: ok"

if w.query("WQL","SELECT * FROM Win32_Processor") then
MsgBox "query: ok"

if w.NextItem then
MsgBox "NextItem: ok"

MsgBox w.GetPropertyString("Name") // string
MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
MsgBox str(w.GetPropertyInteger("ProcessorType")) // uint16

else
MsgBox "NextItem: fail"
end if
else
MsgBox "query: fail"
end if

else
MsgBox "ConnectServer: fail"
end if
```

Notes:

In Windows 8.1 (or later) it looks like WindowsWMIMBS.InitSecurity(false) must be called at app.Constructor time as Xojo will do some things in background when opening first window which block our queries. Subclass of the WMIObjectMBS class.

196.38.4 Methods

196.38.5 CancelAsyncCall as boolean

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops events being delivered to this WindowsWMIMBS object.
Notes: Lasterror is set.

196.38.6 ConnectServer(NetworkResource as string, Username as string="", Password as string="", Locale as string="", Authority as string="") as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Connect to WMI server.
Example:

```
dim w as WindowsWMIMBS // your WMI object
call w.ConnectServer("root\cimv2")
```

Notes:

Returns true on success and false on failure.
Authority parameter added in plugin version 12.2.

196.38.7 Constructor

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

196.38.8 ExecNotificationQueryAsync(QueryLanguage as string, QueryText as string) as boolean

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ExecNotificationQueryAsync method executes a query to receive events.
Notes:

The plugin receives events and enqueues them in a queue. You read objects from this queue in a timer and process them.
NextItem returns nil if the queue is empty.

Returns true on success and false on failure.
Lasterror is set. e.g. & h80041018 if you have syntax error in the query or & h80041058 if the query can't be parsed.

196.38.9 InitAuthentication(User as string, Domain as string, Password as string) as boolean

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes authentication data.
Notes:

Call before ConnectServer.
This settings are passed to objects for authentication.

196.38.10 InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Registers security and sets the default security values for the process.
Notes:

You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.

AuthnLevel:
The default authentication level for the process. Both servers and clients use this parameter when they call CoInitializeSecurity. COM will fail calls that arrive with a lower authentication level. By default, all proxies will use at least this authentication level. This value should contain one of the authentication level constants. By default, all calls to IUnknown are made at this level.

ImpLevel:
The default impersonation level for proxies. The value of this parameter is used only when the process is a client. It should be a value from the impersonation level constants, except for kImpersonationLevelDefault, which is not for use with CoInitializeSecurity.
Outgoing calls from the client always use the impersonation level as specified. (It is not negotiated.) Incoming calls to the client can be at any impersonation level. By default, all IUnknown calls are made with this impersonation level, so even security-aware applications should set this level carefully. To determine which impersonation levels each authentication service supports, see the description of the authentication services in COM and Security Packages. For more information about impersonation levels, see Impersonation.

Please call in App.Constructor before Xojo can initialize COM and prevent our function from working!
See also:

- 196.38.11 InitSecurity(remote as boolean) as boolean

196.38.11 InitSecurity(remote as boolean) as boolean

MBS Win Plugin, Plugin Version: 12.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Initializes security.
Notes:

You can call this method before creating WindowsWMIMBS object, you can prepare security settings for remote connections.

Calling InitSecurity with remote=true will initialize security with kImpersonationLevelImpersonate. If remote=false, we use kImpersonationLevelIdentity which is the default.

Please call in App.Constructor before Xojo can initialize COM and prevent our function from working!
See also:

- 196.38.10 InitSecurity(AuthnLevel as Integer, ImpLevel as Integer) as boolean 27844

196.38.12 NextItem as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Moves to next item in the list.
Notes:

You need to call this at least once to move to the first item.
Returns false if no more items are there.

196.38.13 Query(QueryLanguage as string, QueryText as string) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Runs a query.
Example:

```
dim w as WindowsWMIMBS
call w.query("WQL","SELECT * FROM Win32_Processor")
```

Notes: Returns true on success and false on failure.

196.38.14 Properties

196.38.15 EnumeratorHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the used IEnumWbemClassObject object.
Notes: (Read only property)

196.38.16 LocatorHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the used IWbemLocator object.
Notes: (Read only property)

196.38.17 ServiceHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle to the used IWbemServices object.
Notes: (Read only property)

196.38.18 Constants

196.38.19 kAuthenticationLevelCall = 3

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the authentication level constants.
Notes: Authenticates only at the beginning of each remote procedure call when the server receives the request. Datagram transports use kAuthenticationLevelPaket instead.

196.38.20 kAuthenticationLevelConnect = 2

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the authentication level constants.
Notes: Authenticates the credentials of the client only when the client establishes a relationship with the server. Datagram transports always use kAuthenticationLevelPacket instead.

196.38.21 kAuthenticationLevelDefault = 0

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the authentication level constants.
Notes: Tells DCOM to choose the authentication level using its normal security blanket negotiation algorithm. For more information, see Security Blanket Negotiation.

196.38.22 kAuthenticationLevelNone = 1

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the authentication level constants.
Notes: Performs no authentication.

196.38.23 kAuthenticationLevelPacket = 4

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the authentication level constants.
Notes: Authenticates that all data received is from the expected client.

196.38.24 kAuthenticationLevelPacketIntegrity = 5

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the authentication level constants.
Notes: Authenticates and verifies that none of the data transferred between client and server has been modified.

196.38.25 kAuthenticationLevelPacketPrivacy = 6

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the authentication level constants.
Notes: Authenticates all previous levels and encrypts the argument value of each remote procedure call.

196.38.26 kImpersonationLevelAnonymous = 1

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the impersonation level constants.
Notes: The client is anonymous to the server. The server process can impersonate the client, but the impersonation token will not contain any information and cannot be used.

196.38.27 kImpersonationLevelDefault = 0

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the impersonation level constants.
Notes: DCOM can choose the impersonation level using its normal security blanket negotiation algorithm. For more information, see Security Blanket Negotiation.

196.38.28 kImpersonationLevelDelegate = 4

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the impersonation level constants.
Notes: The server process can impersonate the client's security context while acting on behalf of the client. The server process can also make outgoing calls to other servers while acting on behalf of the client, using cloaking. The server may use the client's security context on other machines to access local and remote resources as the client. When impersonating at this level, the impersonation token can be passed across any number of computer boundaries.

196.38.29 kImpersonationLevelIdentity = 2

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the impersonation level constants.
Notes: The server can obtain the client's identity. The server can impersonate the client for ACL checking, but it cannot access system objects as the client.

196.38.30 kImpersonationLevelImpersonate = 3

MBS Win Plugin, Plugin Version: 13.1.

Function: One of the impersonation level constants.
Notes: The server process can impersonate the client's security context while acting on behalf of the client. This level of impersonation can be used to access local resources such as files. When impersonating at this level, the impersonation token can only be passed across one machine boundary. The Schannel authentication service only supports this level of impersonation.

196.39 class WinExceptionMBS

196.39.1 class WinExceptionMBS

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to catch windows system exceptions.
Notes:

This class was made to intercept crashes in a Xojo application.
Whenever the application crashes, this class will fire its event so you have a chance to report that crash to your user and maybe save a crash report.

Do not try to save data as this could overwrite good data with bad data. Remember your application already crashed. Maybe because of data corruption!

Only one instance can exist in your application.

196.39.2 Methods

196.39.3 Close

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the exception handler from the system.

196.39.4 Properties

196.39.5 ExceptionAddress as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The address in memory where the exception was raised.
Notes: (Read only property)

196.39.6 ExceptionCode as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code of this exception.
Notes:

Normally one of the kException* constants.
(Read only property)

196.39.7 ExceptionFlags as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The exception flags.
Notes: (Read only property)

196.39.8 ExceptionIsNonContinuable as Boolean

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this exception allows to continue in code.
Notes:

For example a division by zero can be continued.
(Read only property)

196.39.9 ExceptionName as String

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name of the exception.
Notes:

If ExceptionCode=kExceptionAccessViolation then returns "ExceptionAccessViolation".

This is a convenience function which you can use to show the exception to the user.
(Read only property)

196.39.10 Events

196.39.11 GotException() as Integer

MBS Win Plugin, Plugin Version: 8.7, Platform: Windows, Targets: .

Function: The event called when an exception was received.
Notes:

Your application has crashed on this point, but instead of seeing the Microsoft dialog to tell you that the application crashed, your application has the chance to report that problem.

Return one of the following constants: kExecuteHandler, kContinueCode, kNextHandler, kExecuteHandlerNoDialog.

The plugin already removed the crash callback from the system so if the code in this event crashes again, the system dialog shows.

196.39.12 Constants

196.39.13 kContinueCode = 2

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants you can use for the GotException event return value.
Notes: This one is not recommented as it can raise the same exception again or crash your application.

196.39.14 kExceptionAccessViolation = & hC0000005

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread attempts to read from or write to a virtual address for which it does not have access.

196.39.15 kExceptionArrayBoundsExceeded = & hC000008C

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread attempts to access an array element that is out of bounds, and the underlying hardware supports bounds checking.

196.39.16 kExceptionBreakPoint = & h80000003

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: A breakpoint is encountered.

196.39.17 kExceptionDataTypeMisalignment = & h80000002

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread attempts to read or write data that is misaligned on hardware that does not provide alignment. For example, 16-bit values must be aligned on 2-byte boundaries, 32-bit values on 4-byte boundaries, and so on.

196.39.18 kExceptionFloatDenormalOperand = & hC000008D

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: One of the operands in a floating point operation is denormal. A denormal value is one that is too small to represent as a standard floating point value.

196.39.19 kExceptionFloatDivideByZero = & hC000008E

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread attempts to divide a floating point value by a floating point divisor of 0 (zero).

196.39.20 kExceptionFloatInexactResult = & hC000008F

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The result of a floating point operation cannot be represented exactly as a decimal fraction.

196.39.21 kExceptionFloatInvalidOperation = & hC0000090

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: A floating point exception that is not included in this list.

196.39.22 kExceptionFloatOverflow = & hC0000091

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The exponent of a floating point operation is greater than the magnitude allowed by the corresponding type.

196.39.23 kExceptionFloatStackCheck = & hC0000092

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The stack has overflowed or underflowed, because of a floating point operation.

196.39.24 kExceptionFloatUnderflow = & hC0000093

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The exponent of a floating point operation is less than the magnitude allowed by the corresponding type.

196.39.25 kExceptionIllegalInstruction = & hC000001D

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread tries to execute an invalid instruction.

196.39.26 kExceptionInPageError = & hC0000006

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread tries to access a page that is not present, and the system is unable to load the page. For example, this exception might occur if a network connection is lost while running a program over a network.

196.39.27 kExceptionIntegerDivideByZero = & hC0000094

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread attempts to divide an integer value by an integer divisor of 0 (zero).

196.39.28 kExceptionIntegerOverflow = & hC0000095

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The result of an integer operation causes a carry out of the most significant bit of the result.

196.39.29 kExceptionInvalidDisposition = & hC0000026

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: An exception handler returns an invalid disposition to the exception dispatcher. Programmers using a high-level language such as C should never encounter this exception.

196.39.30 kExceptionNonContinueableException = & hC0000025

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread attempts to continue execution after a non-continuable exception occurs.

196.39.31 kExceptionPrivilegedInstruction = & hC0000096

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread attempts to execute an instruction with an operation that is not allowed in the current computer mode.

196.39.32 kExceptionSingleStep = & h80000004

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: A trace trap or other single instruction mechanism signals that one instruction is executed.

196.39.33 kExceptionStackOverflow = & hC00000FD

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants for exception codes.
Notes: The thread uses up its stack.

196.39.34 kExecuteHandler = 1

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants you can use for the GotException event return value.
Notes:

Windows will execute the default handler for this exception.
This can show a Windows error dialog.

196.39.35 kExecuteHandlerNoDialog = 4

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants you can use for the GotException event return value.
Notes: Windows will execute the default handler for this exception, but not show a dialog.

196.39.36 kNextHandler = 3

MBS Win Plugin, Plugin Version: 8.7.

Function: One of the constants you can use for the GotException event return value.
Notes: Windows will call the next exception handler.

196.40 class WinGestureConfigMBS

196.40.1 class WinGestureConfigMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: ets and sets the configuration for enabling gesture messages and the type of this configuration.
Example:

```
// make a config for accepting pan/rotate gestures
dim c1 as new WinGestureConfigMBS

c1.ID = c1.kGestureIDPan
c1.Want = c1.kPan
c1.Block = 0

dim c2 as new WinGestureConfigMBS
c2.ID = c2.kGestureIDRotate
c2.Want = c2.kRotate
c2.Block = 0

dim configs() as WinGestureConfigMBS
configs.Append c1
configs.Append c2

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
MsgBox "OK"
end if
```

Notes:

It is impossible to disable two-finger panning and keep single finger panning. You must set the want bits for GC_PAN before you can set them for GC_PAN_WITH_SINGLE_FINGER_HORIZONTALLY or GC_PAN_WITH_SINGLE_FINGER_VERTICALLY.
An inertia vector is included in the GID_PAN message with the GF_END flag if inertia was disabled by a call to SetGestureConfig.
When you pass this structure, the dwID member contains information for a set of gestures. This determines what the other flags will mean. If you set flags for pan messages, they will be different from those flags that are set for rotation messages.
The following table indicates the various identifiers for gestures that are supported by the dwID member of the GESTURECONFIG structure. Note that setting dwID to 0 indicates that global gesture configuration flags are set.

The following flags are used when dwID is set to 0.

Name	Value	Description
GID_ZOOM	3	Indicates configuration settings for the zoom gesture.
GID_PAN	4	Indicates the pan gesture.
GID_ROTATE	5	Indicates the rotation gesture.
GID_TWOFINGERTAP	6	Indicates the two-finger tap gesture.
GID_PRESSANDTAP	7	Indicates the press and tap gesture.

Name	Value	Description
GC_ALLGESTURES	0x00000001	Indicates all of the gestures.

The following flags are used when dwID is set to GID_ZOOM.

Name	Value	Description
GC_ZOOM	0x00000001	Indicates the zoom gesture.

The following flags are used when dwID is set to GID_PAN.

Note Setting the GID_PAN flags in SetGestureConfig will affect the default gesture handler for panning. You should not have both dwWant and dwBlock set for the same flags; this will result in unexpected behavior. See Windows Touch Gestures for more information on panning and legacy panning support; see SetGestureConfig for examples of enabling and blocking gestures.

The following flags are used when dwID is set to GID_ROTATE.

The following flags are used when dwID is set to GID_TWOFINGERTAP.

The following flags are used when dwID is set to GID_PRESSANDTAP.

196.40.2 Blog Entries

- Windows Touch Events

196.40.3 Videos

- Presentation from Munich conference about MBS Plugins.

Name	Value	Description
GC_PAN	0x00000001	Indicates all pan gestures.
GC_PAN_WITH_SINGLE_FINGER_VERTICALLY	0x00000002	Indicates vertical pans with one finger.
GC_PAN_WITH_SINGLE_FINGER_HORIZONTALLY	0x00000004	Indicates horizontal pans with one finger.
GC_PAN_WITH_GUTTER	0x00000008	Limits perpendicular movement to primary direction until a threshold is reached to break out of the gutter.
GC_PAN_WITH_INERTIA	0x00000010	Indicates panning with inertia to smoothly slow when pan gestures stop.

Name	Value	Description
GC_ROTATE	0x00000001	Indicates the rotation gesture.

196.40.5 Videos

- Presentation from Munich conference about MBS Plugins.

196.40.6 Properties

196.40.7 Block as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The messages to disable.
Example:

```
// make a config for accepting some pan gestures
dim c as new WinGestureConfigMBS

c.ID = kGestureIDPan
c.Want = c.kPanWithSingleFingerVertically + c.kPanWithGutter + c.kPanWithInteria
c.Block = c.kPanWithSingleFingerHorizontally
```

Notes: (Read and Write property)

196.40.8 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identifier for the type of configuration that will have messages enabled or disabled.
Example:

Name	Value	Description
GC_TWOFINGERTAP	0x00000001	Indicates the two-finger tap gesture.

Name	Value	Description
GC_PRESSANDTAP	0x00000001	Indicates the press and tap gesture.

```
// make a config for accepting some pan/rotate gestures
dim c1 as new WinGestureConfigMBS

c1.ID = 0
c1.Want = c1.kAllGestures
c1.Block = 0

dim configs() as WinGestureConfigMBS
configs.Append c1

// and add to window
if WinPointerEventsMBS.SetGestureConfig(window1, configs) then
MsgBox "OK"
end if
```

Notes: (Read and Write property)

196.40.9 Want as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The messages to enable.
Example:

```
// make a config for accepting all gestures
dim c as new WinGestureConfigMBS

c.ID = 0 // catch all IDs
c.Want = c.kAllGestures
```

Notes: (Read and Write property)

196.40.10 Constants

196.40.11 kAllGestures = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates all of the gestures. (for ID = 0)

196.40.12 kGestureIDBegin = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Begin of gesture.

196.40.13 kGestureIDEnd = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: End of a gesture

196.40.14 kGestureIDPan = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Pan gesture

196.40.15 kGestureIDPressAndTap = 7

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Press and Tap gesture

196.40.16 kGestureIDRotate = 5

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Rotate gesture

196.40.17 kGestureIDTwoFingerTap = 6

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Two-Finger Tap

196.40.18 kGestureIDZoom = 3

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Zoom gesture

196.40.19 kPan = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates all pan gestures.

196.40.20 kPanWithGutter = 8

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Limits perpendicular movement to primary direction until a threshold is reached to break out of the gutter.

196.40.21 kPanWithInteria = 16

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates panning with inertia to smoothly slow when pan gestures stop.

196.40.22 kPanWithSingleFingerHorizontally = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates horizontal pans with one finger.

196.40.23 kPanWithSingleFingerVertically = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates vertical pans with one finger.

196.40.24 kPressAndTap = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates the press and tap gesture.

196.40.25 kRotate = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates the rotation gesture.

196.40.26 kTwoFingerTap = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates the two-finger tap gesture.

196.40.27 kZoom = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture option flags.
Notes: Indicates the zoom gesture. (for ID = kGestureIDZoom)

196.41 class WinGestureInfoMBS

196.41.1 class WinGestureInfoMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stores information about a gesture.
Notes:

Parameters for touches:
If kFlagBegin flag is set, save Location so you have first point. And save argument to check later.

For Zoom, get second point from this class. Than you can calculate center point and zoom factor is OldArgumentsLower/NewArgumentsLower.

For Pan, check difference between last point and new point to know how much moved.

For Rotate, please check difference between old RotateAngle and new RotateAngle.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

196.41.4 Methods

196.41.5 Constructor

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

196.41.6 Properties

196.41.7 Arguments as Int64

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A 64-bit unsigned integer that contains the arguments for gestures that fit into 8 bytes.
Notes: (Read only property)

196.41.8 ArgumentsHigher as UInt32

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The higher 32bits from Arguments.
Notes: (Read only property)

196.41.9 ArgumentsLower as UInt32

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The lower 32bits from Arguments.
Notes:

Most events just use lower bits.
(Read only property)

196.41.10 Flags as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The state of the gesture.
Notes:

See kFlagBegin/kFlagInertia/kFlagEnd constants.
(Read only property)

196.41.11 ID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identifier of the gesture command.
Notes:

see kGestureID* constants.
(Read only property)

196.41.12 InstanceID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An internally used identifier for the structure.
Notes: (Read only property)

196.41.13 LocationInWindowX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes:

This is LocationX relative to target window.
(Read only property)

196.41.14 LocationInWindowY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes:

This is LocationY relative to target window.
(Read only property)

196.41.15 LocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes:

These coordinates are always relative to the origin of the screen.
(Read only property)

196.41.16 LocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A x coordinate associated with the gesture.
Notes:

These coordinates are always relative to the origin of the screen.
(Read only property)

196.41.17 RotateAngle as Double

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The argument as angle for rotate gesture.
Notes: (Read only property)

196.41.18 SequenceID as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An internally used identifier for the sequence.
Notes: (Read only property)

196.41.19 TargetWindow as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A handle to the window that is targeted by this gesture.
Notes: (Read only property)

196.41.20 Constants

196.41.21 kFlagBegin = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag values.
Notes: A gesture is starting.

196.41.22 kFlagEnd = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag values.
Notes: A gesture has finished.

196.41.23 kFlagInertia = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag values.
Notes: A gesture has triggered inertia.

196.41.24 kGestureIDBegin = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Begin of a gesture

196.41.25 kGestureIDEnd = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: End of a gesture

196.41.26 kGestureIDPan = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Pan gesture

196.41.27 kGestureIDPressAndTap = 7

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Press and Tap gesture

196.41.28 kGestureIDRotate = 5

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Rotate gesture

196.41.29 kGestureIDTwoFingerTap = 6

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Two-Finger Tap

196.41.30 kGestureIDZoom = 3

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the gesture IDs.
Notes: Zoom gesture

196.42 class WinMouseFilterMBS

196.42.1 class WinMouseFilterMBS

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to filter mouse events in the whole application.
Notes:

You may be able to intercept all mouse actions and block mouse events.

You can only have one instance to receive events at a time.

196.42.6 Methods

196.42.7 Constructor

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

196.42.8 Properties

196.42.9 Enabled as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Global flag to enable/disable it.
Notes:

Set true to enable or false to disable.
(Read and Write property)

196.42.10 IncludeMouseHOver as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to include hover events.
Notes:

By default false to disable hover events.
Set to true to include those.
(Read and Write property)

196.42.11 IncludeMouseMove as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to include move events.
Notes:

By default false to disable move events.
Set to true to include those.
(Read and Write property)

196.42.12 IncludeMouseWheel as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to include wheel events.
Notes:

By default false to disable wheel events.
Set to true to include those.
(Read and Write property)

196.42.13 Events

196.42.14 ReceivedEvent(Message as Integer, mouseX as Integer, mouseY as Integer, windowHandle as Integer, HitTestCode as Integer, ExtraInfo as Integer) as Boolean

MBS Win Plugin, Plugin Version: 21.4, Platform: Windows, Targets: .

Function: Received an event.
Notes:

Message: The identifier of the mouse message. See constants.
mouseX and mouseY: The x- and y-coordinates of the cursor, in screen coordinates.
WindowHandle: A handle to the window that will receive the mouse message corresponding to the mouse event.
HitTestCode: The hit-test value. For a list of hit-test values, see the description of the WM_NCHITTEST message.
ExtraInfo: Additional information associated with the message.

196.42.15 Constants

196.42.16 kLButtonDoubleClick = & h0203

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Left mouse button double click

196.42.17 kLButtonDown = & h0201

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Left mouse button down

196.42.18 kLButtonUp = & h0202

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Left mouse button up

196.42.19 kMButtonDoubleClick = & h0209

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Middle mouse button double click

196.42.20 kMButtonDown = & h0207

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Middle mouse button down

196.42.21 kMButtonUp = & h0208

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Middle mouse button up

196.42.22 kMouseHOver = & h02a1

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Mouse hover

196.42.23 kMouseHWheel = & h020e

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Horizontal mouse wheel

196.42.24 kMouseLeave = & h02a3

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Mouse Leave

196.42.25 kMouseMove = & h0200

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Mouse moved

196.42.26 kMouseWheel = & h020a

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Vertical mouse wheel

196.42.27 kRButtonDoubleClick = & h0206

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Right mouse button double click

196.42.28 kRButtonDown = & h0204

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Right mouse button down

196.42.29 kRButtonUp = & h0205

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Right mouse button up

196.42.30 kXButtonDoubleClick = & h020d

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Other mouse button double click

196.42.31 kXButtonDown = & h020b

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Other mouse button down

196.42.32 kXButtonUp = & h020c

MBS Win Plugin, Plugin Version: 21.4.

Function: One of the mouse event constants.
Notes: Other mouse button up

196.43 class WinPointerEventsMBS

196.43.1 class WinPointerEventsMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to capture touch events on Windows.
Notes: The plugin can only deliver events the Xojo runtime doesn't consume.

196.43.6 Methods

196.43.7 Close

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Cleans up.
Notes:

Optional and does same as destructor, but now.
You can call this in a window's close event to shutdown the event handler class.

196.43.8 Constructor(control as DesktopUIControl)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a control.
Notes: Call in a control's open event to attach event listener to the control.
See also:

- 196.43.9 Constructor(control as RectControl) 27877
- 196.43.10 Constructor(win as DesktopWindow) 27877
- 196.43.11 Constructor(win as window) 27878
- 196.43.12 Constructor(WindowHandle as Integer) 27878

196.43.9 Constructor(control as RectControl)

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a control.
Notes: Call in a control's open event to attach event listener to the control.
See also:

- 196.43.8 Constructor(control as DesktopUIControl) 27877
- 196.43.10 Constructor(win as DesktopWindow) 27877
- 196.43.11 Constructor(win as window) 27878
- 196.43.12 Constructor(WindowHandle as Integer) 27878

196.43.10 Constructor(win as DesktopWindow)

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a window.
Notes: Call in a window's open event to attach event listener to the window.
See also:

- 196.43.8 Constructor(control as DesktopUIControl) 27877
- 196.43.9 Constructor(control as RectControl) 27877
- 196.43.11 Constructor(win as window) 27878
- 196.43.12 Constructor(WindowHandle as Integer) 27878

196.43.11 Constructor(win as window)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The constructor events to a window.
Notes: Call in a window's open event to attach event listener to the window.
See also:

- 196.43.8 Constructor(control as DesktopUIControl) 27877
- 196.43.9 Constructor(control as RectControl) 27877
- 196.43.10 Constructor(win as DesktopWindow) 27877
- 196.43.12 Constructor(WindowHandle as Integer) 27878

196.43.12 Constructor(WindowHandle as Integer)

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes:

This method allows you to attach to any window.
So this works in console projects, too.
With any window, not just xojo windows.
See also:

- 196.43.8 Constructor(control as DesktopUIControl) 27877
- 196.43.9 Constructor(control as RectControl) 27877
- 196.43.10 Constructor(win as DesktopWindow) 27877
- 196.43.11 Constructor(win as window) 27878

196.43.13 EnableMouseInPointer(enable as boolean) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Enables the mouse to act as a pointer input device and send pointer events.
Notes:

Requires Windows 8 or newer.

If the function succeeds, the return value is true.
If the function fails, the return value is false.
To get extended error information, call GetLastError.

This function can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.

On the first call in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls, the state will not change. If the current state is not equal to the specified state, the call fails.

Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

196.43.14 GetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: Same as other GetGestureConfig, but for a control, not a window.
See also:

- 196.43.15 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27879
- 196.43.16 GetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27880
- 196.43.17 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27880

196.43.15 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes: Same as other GetGestureConfig, but for a control, not a window.
See also:

- 196.43.14 GetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27879
- 196.43.16 GetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27880
- 196.43.17 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27880

196.43.16 GetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes:

win: The window to get the gesture configuration from.
Flags: A gesture command flag value indicating options for retrieving the gesture configuration. Can be 1 to return consolidated configuration for the specified window and its parent window chain.
Config: an array of gesture configuration structures that specify the gesture configuration.

Please pass an empty array and the plugin appends config objects.

Return function returns number of configs found.
Returns -1 in case of error.
See also:

- 196.43.14 GetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27879
- 196.43.15 GetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer 27879

196.43.17 GetGestureConfig(win as window, config() as WinGestureConfigMBS, flags as Integer = 0) as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: Retrieves the configuration for which Windows Touch gesture messages are sent from a window.
Notes:

win: The window to get the gesture configuration from.
Flags: A gesture command flag value indicating options for retrieving the gesture configuration. Can be 1 to return consolidated configuration for the specified window and its parent window chain.
Config: an array of gesture configuration structures that specify the gesture configuration.

Please pass an empty array and the plugin appends config objects.

Return function returns number of configs found.
Returns -1 in case of error.

196.43.18 IsMouseInPointerEnabled as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates whether EnableMouseInPointer is set for the mouse to act as a pointer input device and send pointer events.
Notes:

Requires Windows 8 or newer.

If EnableMouseInPointer is set, the return value is true.
If EnableMouseInPointer is not set, the return value is false.

EnableMouseInPointer can be called only once in the context of a process lifetime. Prior to the first call, Windows Store apps run with mouse-in-pointer enabled, as do any desktop applications that consume mshtml.dll. All other desktop applications run with mouse-in-pointer disabled.
On the first call to EnableMouseInPointer in the process lifetime, the state is changed as specified and the call succeeds.
On subsequent calls to EnableMouseInPointer, the state will not change. If the current state is not equal to the specified state, the call fails.
Call IsMouseInPointerEnabled to verify the mouse-in-pointer state.

196.43.19 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes: Same as other SetGestureConfig, but for a control, not a window.
See also:

- 196.43.20 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean 27882
- 196.43.21 SetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS = nil) as boolean 27882
- 196.43.22 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean 27882

196.43.20 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 17.0, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes: Same as other SetGestureConfig, but for a control, not a window.
See also:

- 196.43.19 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean 27881
- 196.43.21 SetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS = nil) as boolean 27882
- 196.43.22 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean 27882

196.43.21 SetGestureConfig(win as DesktopWindow, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes:

Win: The window to set the gesture configuration on.
config: An array of gesture configuration structures that specify the gesture configuration.

If the function succeeds, the return value is true, else false.

If you don't expect to change the gesture configuration, call SetGestureConfig at window creation time. If you want to dynamically change the gesture configuration, call SetGestureConfig in response to GestureNotify event.
See also:

- 196.43.19 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean 27881
- 196.43.20 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean 27882
- 196.43.22 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean 27882

196.43.22 SetGestureConfig(win as window, config() as WinGestureConfigMBS = nil) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: Configures the messages that are sent from a window for Windows Touch gestures.
Notes:

Win: The window to set the gesture configuration on.
config: An array of gesture configuration structures that specify the gesture configuration.

If the function succeeds, the return value is true, else false.

If you don't expect to change the gesture configuration, call SetGestureConfig at window creation time. If you want to dynamically change the gesture configuration, call SetGestureConfig in response to GestureNotify event.
See also:

- 196.43.19 SetGestureConfig(Control as DesktopUIControl, config() as WinGestureConfigMBS = nil) as boolean 27881
- 196.43.20 SetGestureConfig(Control as RectControl, config() as WinGestureConfigMBS = nil) as boolean 27882

196.43.23 Properties

196.43.24 WindowHandle as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The window handle.
Notes: (Read only property)

196.43.25 Events

196.43.26 Gesture(info as WinGestureInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Passes information about a gesture.
Notes: Return true, if you processed the message, else false.

196.43.27 GestureNotify

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Gives you a chance to set the gesture configuration.
Notes: When the GestureNotify event is received, the application can use SetGestureConfig to specify the gestures to receive.

196.43.28 PointerDeviceChange(Change as Integer, Param as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Sent to a window when there is a change in the settings of a monitor that has a digitizer attached to it.
Notes:

This message contains information regarding the scaling of the display mode.
See kDeviceChange* constants.

196.43.29 PointerDeviceInRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Sent to a window when a pointer device is detected within range of an input digitizer.
Notes:

This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.

196.43.30 PointerDeviceOutOfRange(Param1 as Integer, Param2 as Integer) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Sent to a window when a pointer device has departed the range of an input digitizer.
Notes:

This message contains information regarding the device and its proximity.

If the application processes this message, it should return true, else false.

196.43.31 PointerDown(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Posted when a pointer makes contact over the client area of a window.
Notes:

This input message targets the window over which the pointer makes contact, and the pointer is implicitly captured to the window so that the window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down. A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Important When a window loses capture of a pointer and it receives the PointerCaptureChanged notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event.
When a pointer is aborted, kFlagCanceled is set.
A WM_POINTERLEAVE message may also be generated when a non-captured pointer moves outside the bounds of a window.

To convert the lParam parameter to a POINTS structure, use the MAKEPOINTS macro.
To retrieve further information associated with the message, use the GetPointerInfo function.
To determine the keyboard modifier key states associated with this message, use the GetKeyState function.
For example, to detect that the ALT key was pressed, check whether GetKeyState(VK_MENU) <0.
Note that if the application does not process this message, DefWindowProc may generate one or more WM_GESTURE messages if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input.
If an application selectively consumes some pointer input and passes the rest to DefWindowProc, the resulting behavior is undefined.
When a window loses capture of a pointer and receives the WM_POINTERCAPTURECHANGED notification, it will typically not receive any further notifications. Therefore, it is important that a window does not make any assumptions of its pointer status, regardless of whether it receives evenly paired DOWN / UP or ENTER / LEAVE notifications.

196.43.32 PointerEnter(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Sent to a window when a new pointer enters detection range over the window (hover) or when an existing pointer moves within the boundaries of the window.
Notes:

We provide Pointer ID, Flags, X and Y.

Contains the point location of the pointer.
Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	Indicates whether this message is the first message generated by a new pointer entering detection range (hover).
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Indicates whether this message was generated by a pointer that has not left detection range. This flag is always set for PointerEnter messages.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerEnter notification can be used by a window to provide feedback to the user while the pointer is over its surface or to otherwise react to the presence of a pointer over its surface.
This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.

Action	Flags Set	Notifications Sent To
A new pointer enters detection range (hover).	kFlagNew and kFlagInRange	Window over which the pointer enters detection range.
A hovering pointer crosses within the window boundaries.	kFlagInRange	Window within which the pointer has crossed.

Important:
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

When inputs come from the mouse, as a result of mouse and pointer message integration, PointerEnter is not sent.

196.43.33 PointerHWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Posted to the window with foreground keyboard focus when a horizontal scroll wheel is rotated.
Notes:

We provide, the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of application,Äôs

window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window of the foregournd message queue receives the wheel messages.

196.43.34 PointerLeave(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Sent to a window when a pointer leaves detection range over the window (hover) or when a pointer moves outside the boundaries of the window.
Notes:

We provide the pointer ID, Flags, X and Y values.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Indicates whether this message was generated by a pointer that has not left detection range. This flag is not set when the pointer leaves the detection range of the window.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact. This flag is not set for a pointer in detection range (hover).

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

The PointerLeave notification can be used by a window to change mode or stop any feedback to the user while the pointer is over the window surface.
This notification is only sent to the window that is receiving input for the pointer. The following table lists some of the situations in which this notification is sent.

Action	Flags Set	Notifications Sent To
A hovering pointer crosses window boundaries.	BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	Window outside of whose boundary the pointer moved.
A pointer goes out of detection range.	N/A	Window for which the pointer leaves detection range.

Important:
When a window loses capture of a pointer and it receives the PointerCaptureChange notification, it typically will not receive any further notifications. For this reason, it is important that you not make any assumptions based on evenly paired PointerDown/PointerUp or PointerEnter/PointerLeave notifications.

If contact is maintained with the input digitizer and the pointer moves outside the window, PointerLeave is not generated. PointerLeave is generated only when a hovering pointer crosses window boundaries or contact is terminated.

PointerLeave is posted to the posted message queue if the input is originated from a mouse device.

196.43.35 PointerUp(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Posted when a pointer that made contact over the client area of a window breaks contact.
Notes:

This input message targets the window over which the pointer makes contact and the pointer is, at that point, implicitly captured to the window so that the window continues to receive input messages including the WM_POINTERUP notification for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down. A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

See Pointer Flags for more details.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling

GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnter event is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.
During its lifetime, a pointer may generate a series of PointerUpdate event while it is hovering or in contact.
The lifetime of a pointer ends when it is no longer detected. This generates a WM_POINTERLEAVE message.
When a pointer is aborted, kFlagCanceled is set.
A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window.
To obtain the horizontal and vertical position of a pointer, use the following:

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, DefWindowProc may generate mouse input.
If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.

196.43.36 PointerUpdate(PointerID as Integer, Flags as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Posted to provide an update on a pointer that made contact over the client area of a window or on a hovering uncaptured pointer over the client area of a window.
Notes:

While the pointer is hovering, the message targets whichever window the pointer happens to be over. While the pointer is in contact with the surface, the pointer is implicitly captured to the window over which the pointer made contact and that window continues to receive input for the pointer until it breaks contact.

We provide pointer ID, flags, X and Y.

A pen pointer will have this set when it is in contact with the digitizer surface with the pen barrel button

BitwiseAnd(flags, WinPointerInfoMBS.kFlagNew) <>0	A flag that indicates whether this message represents the first input generated by a new pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInRange) <>0	A flag that indicates whether this message was generated by a pointer during its lifetime. This flag is not set on messages that indicate that the pointer has left detection range
BitwiseAnd(flags, WinPointerInfoMBS.kFlagInContact) <>0	A flag that indicates whether this message was generated by a pointer that is in contact with the window surface. This flag is not set on messages that indicate a hovering pointer.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagPrimary) <>0	Indicates that this pointer has been designated as primary.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFirstButton) <>0	A flag that indicates whether there is a primary action. This is analogous to a mouse left button down. A touch pointer will have this set when it is in contact with the digitizer surface. A pen pointer will have this set when it is in contact with the digitizer surface with no buttons pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagSecondButton) <>0	A flag that indicates whether there is a secondary action. This is analogous to a mouse right button down.

pressed.

BitwiseAnd(flags, WinPointerInfoMBS.kFlagThirdButton) <>0	A flag that indicates whether there are one or more tertiary actions based on the pointer type; applications that wish to respond to tertiary actions must retrieve information specific to the pointer type to determine which tertiary buttons are pressed. For example, an application can determine the buttons states of a pen by calling GetPointerPenInfo and examining the flags that specify button states.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFourthButton) <>0	A flag that indicates whether the specified pointer took fourth action. Applications that wish to respond to fourth actions must retrieve information specific to the pointer type to determine if the first extended mouse (XButton1) button is pressed.
BitwiseAnd(flags, WinPointerInfoMBS.kFlagFifthButton) <>0	A flag that indicates whether the specified pointer took fifth action. Applications that wish to respond to fifth actions must retrieve information specific to the pointer type to determine if the second extended mouse (XButton2) button is pressed.

See Pointer Flags for more details.

Note:
A hovering pointer has none of the button flags set. This is analogous to a mouse move with no mouse buttons down. An application can determine the buttons states of a hovering pen, for example, by calling GetPointerPenInfo and examining the flags that specify button states.

Note:
Because the pointer may make contact with the device over a non-trivial area, this point location may be a simplification of a more complex pointer area. Whenever possible, an application should use the complete pointer area information instead of the point location.

If an application processes this message, it should return true, else false.

Each pointer has a unique pointer identifier during its lifetime. The lifetime of a pointer begins when it is first detected.
A PointerEnterevent is generated if a hovering pointer is detected. A PointerDown event followed by a PointerEnter event is generated if a non-hovering pointer is detected.

During its lifetime, a pointer may generate a series of PointerUpdate events while it is hovering or in contact. The lifetime of a pointer ends when it is no longer detected. This generates a PointerLeave event.
When a pointer is aborted, kFlagCanceled is set.
A PointerLeave event may also be generated when a non-captured pointer moves outside the bounds of a window.

If the application does not process this message, Windows may generate one or more Gesture event if the sequence of input from this and, possibly, other pointers is recognized as a gesture. If a gesture is not recognized, Windows may generate mouse input.
If an application selectively consumes some pointer input and passes the rest back to Windows, the resulting behavior is undefined.
If the application does not process these messages as fast as they are generated, some moves may be coalesced. The history of inputs that were coalesced into this message can be retrieved using the GetPointerInfoHistory function.

196.43.37 PointerWheel(PointerID as Integer, Delta as Integer, X as Integer, Y as Integer, info as WinPointerInfoMBS) as boolean

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: .

Function: Posted to the window with foreground keyboard focus when a vertical scroll wheel is rotated.
Notes:

We provide, the pointer ID, the delta and x/y coordinate.
Info object provides pointer details.

To retrieve the wheel scroll units, use the inputData filed of the WinPointerInfoMBS object. This field contains a signed value and is expressed in a multiple of WHEEL_DELTA (120). A positive value indicates a rotation forward and a negative value indicates a rotation backward.
Note that the wheel inputs may be delivered even if the mouse cursor is located outside of application,Äôs window. The wheel messages are delivered in a way very similar to the keyboard inputs. The focus window of the foregournd message queue receives the wheel messages.

196.43.38 Constants

196.43.39 kDeviceChangeArrival = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: A new device is attached.

196.43.40 kDeviceChangeAspectRatioPreserved = 2048

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: The display aspect ratio.

196.43.41 kDeviceChangeMapping = 256

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: The change in display to digitizer mapping.

196.43.42 kDeviceChangeModeCentered = 128

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: Centered display mode.

196.43.43 kDeviceChangeModeDefault = 64

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: The default display mode.

196.43.44 kDeviceChangeOrientation0 = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: Orientation of the device: 0¬∞

196.43.45 kDeviceChangeOrientation180 = 16

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: Orientation of the device: 180¬∞

196.43.46 kDeviceChangeOrientation270 = 32

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: Orientation of the device: 270¬∞

196.43.47 kDeviceChangeOrientation90 = 8

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: Orientation of the device: 90¬∞

196.43.48 kDeviceChangeOrigin = 1024

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: The display origin.

196.43.49 kDeviceChangeRemoval = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: A device has been detached.

196.43.50 kDeviceChangeResolution = 512

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the device change flags.
Notes: Display resolution.

196.44 class WinPointerInfoMBS

196.44.1 class WinPointerInfoMBS

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for pointer input details.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

196.44.2 Blog Entries

- Windows Touch Events

196.44.3 Blog Entries

196.44.4 Methods

196.44.5 Constructor

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

196.44.6 Properties

196.44.7 ButtonChangeType as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Specifies the change in button state between this input and the previous input.
Notes:

See kPointerChange* constants.
(Read only property)

196.44.8 frameId as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An identifier common to multiple pointers for which the source device reported an update in a single input frame.
Notes:

For example, a parallel-mode multi-touch digitizer may report the positions of multiple touch contacts in a single update to the system.
Note that frame identifier is assigned as input is reported to the system for all pointers across all devices. Therefore, this field may not contain strictly sequential values in a single series of messages that a window receives. However, this field will contain the same numerical value for all input updates that were reported in the same input frame by a single device.
(Read only property)

196.44.9 HimetricLocationRawX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in HIMETRIC units.
Notes:

For adjusted screen coordinates, see HimetricLocation.
(Read only property)

196.44.10 HimetricLocationRawY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in HIMETRIC units.
Notes:

For adjusted screen coordinates, see HimetricLocation.
(Read only property)

196.44.11 HimetricLocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in HIMETRIC units.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

196.44.12 HimetricLocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in HIMETRIC units.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptHimetricLocationRaw).
(Read only property)

196.44.13 historyCount as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Count of inputs that were coalesced into this message.
Notes:

This count matches the total count of entries that can be returned by a call to GetPointerInfoHistory. If no coalescing occurred, this count is 1 for the single input represented by the message.
(Read only property)

196.44.14 hwndTarget as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Window to which this message was targeted.
Notes:

If the pointer is captured, either implicitly by virtue of having made contact over this window or explicitly using the pointer capture API, this is the capture window. If the pointer is uncaptured, this is the window over which the pointer was when this message was generated.
(Read only property)

196.44.15 InputData as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: A value whose meaning depends on the nature of input.
Notes:

When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multiples or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated forward and a negative

value indicates that the wheel was rotated backward.
When flags indicate kFlagWheel, this value indicates the distance the wheel is rotated, expressed in multiples or factors of WHEEL_DELTA. A positive value indicates that the wheel was rotated to the right and a negative value indicates that the wheel was rotated to the left.
(Read only property)

196.44.16 KeyStates as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates which keyboard modifier keys were pressed at the time the input was generated.
Notes:

May be zero or a combination of the following values:

8	A SHIFT key was pressed.
4	A CTRL key was pressed.

(Read only property)

196.44.17 PerformanceCount as Int64

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The value of the high-resolution performance counter when the pointer message was received (high-precision, 64 bit alternative to Time).
Notes:

The value can be calibrated when the touch digitizer hardware supports the scan timestamp information in its input report.
(Read only property)

196.44.18 PixelLocationRawX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in pixels.
Notes:

For adjusted screen coordinates, see PixelLocation.
(Read only property)

196.44.19 PixelLocationRawY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The screen coordinates of the pointer, in pixels.
Notes:

For adjusted screen coordinates, see PixelLocation.
(Read only property)

196.44.20 PixelLocationX as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in pixels.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

196.44.21 PixelLocationY as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The predicted screen coordinates of the pointer, in pixels.
Notes:

The predicted value is based on the pointer position reported by the digitizer and the motion of the pointer. This correction can compensate for visual lag due to inherent delays in sensing and processing the pointer location on the digitizer. This is applicable to pointers of type touch. For other pointer types, the predicted value will be the same as the non-predicted value (see ptPixelLocationRaw).
(Read only property)

196.44.22 pointerFlags as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: May be any reasonable combination of flags from the flags constants.
Notes:

See kFlag* constants.
(Read only property)

196.44.23 pointerId as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: An identifier that uniquely identifies a pointer during its lifetime.
Notes:

A pointer comes into existence when it is first detected and ends its existence when it goes out of detection range. Note that if a physical entity (finger or pen) goes out of detection range and then returns to be detected again, it is treated as a new pointer and may be assigned a new pointer identifier.
(Read only property)

196.44.24 pointerType as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The pointer type.
Notes:

See kType* constants.
(Read only property)

196.44.25 sourceDevice as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Handle to the source device that can be used in calls to the raw input device API and the digitizer device API.
Notes: (Read only property)

196.44.26 Time as Integer

MBS Win Plugin, Plugin Version: 16.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The time of the event.
Notes:

Value is 0 or the time stamp of the message, based on the system tick count when the message was received. The application can specify the input time stamp in either Time or PerformanceCount. The value cannot be more recent than the current tick count or QueryPerformanceCount (QPC) value of the injection thread. Once a frame is injected with a time stamp, all subsequent frames must include a timestamp until all contacts

in the frame go to an UP state. The custom timestamp value must also be provided for the first element in the contacts array. The time stamp values after the first element are ignored. The custom timestamp value must increment in every injection frame.
When PerformanceCount is specified, the time stamp will be converted to the current time in .1 millisecond resolution upon actual injection. If a custom PerformanceCount resulted in the same .1 millisecond window from the previous injection, ERROR_NOT_READY is returned and injection will not occur. While injection will not be invalidated immediately by the error, the next successful injection must have a PerformanceCount value that is at least 0.1 millisecond from the previously successful injection. This is also true if Time is used.
If both Time and PerformanceCount are specified in InjectTouchInput, ERROR_INVALID_PARAMETER is returned.
InjectTouchInput cannot switch between Time and PerformanceCount once injection has started.
If neither Time and PerformanceCount are specified, InjectTouchInput allocates the timestamp based on the timing of the call. If InjectTouchInput calls are repeatedly less than 0.1 millisecond apart, ERROR_NOT_READY might be returned. The error will not invalidate the input immediately, but the injection application needs to retry the same frame again for injection to succeed.
(Read only property)

196.44.27 Constants

196.44.28 kFlagCanceled = & h8000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates that the pointer is departing in an abnormal manner, such as when the system receives invalid input for the pointer or when a device with active pointers departs abruptly. If the application receiving the input is in a position to do so, it should treat the interaction as not completed and reverse any effects of the concerned pointer.

196.44.29 kFlagCaptureChanged = & h200000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates that this pointer was captured by (associated with) another element and the original element has lost capture.

196.44.30 kFlagConfidence = & h4000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.

Notes: Confidence is a suggestion from the source device about whether the pointer represents an intended or accidental interaction, which is especially relevant for touch pointers where an accidental interaction (such as with the palm of the hand) can trigger input. The presence of this flag indicates that the source device has high confidence that this input is part of an intended interaction.

196.44.31 kFlagDown = & h10000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates that this pointer transitioned to a down state; that is, it made contact with the digitizer surface.

196.44.32 kFlagFifthButton = & h100

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Analogous to a second extended mouse (XButton2) button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the second extended mouse (XBUTTON2) button is down.

196.44.33 kFlagFirstButton = & h10

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Indicates a primary action, analogous to a left mouse button down.
A touch pointer has this flag set when it is in contact with the digitizer surface.
A pen pointer has this flag set when it is in contact with the digitizer surface with no buttons pressed.
A mouse pointer has this flag set when the left mouse button is down.

196.44.34 kFlagFourthButton = & h80

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Analogous to a first extended mouse (XButton1) button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the first extended mouse (XBUTTON1) button is down.

196.44.35 kFlagHasTransform = & h400000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates that this pointer has an associated transform.

196.44.36 kFlagHWheel = & h100000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates input associated with a pointer h-wheel. For mouse pointers, this is equivalent to the action of the mouse horizontal scroll wheel.

196.44.37 kFlagInContact = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Indicates that this pointer is in contact with the digitizer surface.
When this flag is not set, it indicates a hovering pointer.

196.44.38 kFlagInRange = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Indicates that this pointer continues to exist. When this flag is not set, it indicates the pointer has left detection range.

This flag is typically not set only when a hovering pointer leaves detection range (kFlagUpdate is set) or when a pointer in contact with a window surface leaves detection range (kFlagUp is set).

196.44.39 kFlagNew = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates the arrival of a new pointer.

196.44.40 kFlagNone = 0

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Default

196.44.41 kFlagPrimary = & h2000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Indicates that this pointer has been designated as the primary pointer. A primary pointer is a single pointer that can perform actions beyond those available to non-primary pointers. For example, when a primary pointer makes contact with a window,Äôs surface, it may provide the window an opportunity to activate by sending it a PointerActivate event.
The primary pointer is identified from all current user interactions on the system (mouse, touch, pen, and so on). As such, the primary pointer might not be associated with your app. The first contact in a multi-touch interaction is set as the primary pointer. Once a primary pointer is identified, all contacts must be lifted before a new contact can be identified as a primary pointer. For apps that don't process pointer input, only the primary pointer's events are promoted to mouse events.

196.44.42 kFlagSecondButton = & h20

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Indicates a secondary action, analogous to a right mouse button down.

A touch pointer does not use this flag.
A pen pointer has this flag set when it is in contact with the digitizer surface with the pen barrel button pressed.
A mouse pointer has this flag set when the right mouse button is down.

196.44.43 kFlagThirdButton = & h40

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes:

Analogous to a mouse wheel button down.
A touch pointer does not use this flag.
A pen pointer does not use this flag.
A mouse pointer has this flag set when the mouse wheel button is down.

196.44.44 kFlagUp = & h40000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates that this pointer transitioned to an up state; that is, contact with the digitizer surface ended.

196.44.45 kFlagUpdate = & h20000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates that this is a simple update that does not include pointer state changes.

196.44.46 kFlagWheel = & h80000

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the flag constants.
Notes: Indicates input associated with a pointer wheel. For mouse pointers, this is equivalent to the action of the mouse scroll wheel.

196.44.47 kPointerChangeFifthButtonDown = 9

MBS Win Plugin, Plugin Version: 16.2.

Function: The fifth button transitioned to a pressed state.

196.44.48 kPointerChangeFifthButtonUp = 10

MBS Win Plugin, Plugin Version: 16.2.

Function: The fifth button transitioned to a released state.

196.44.49 kPointerChangeFirstButtonDown = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: The first button transitioned to a pressed state.

196.44.50 kPointerChangeFirstButtonUp = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: The first button transitioned to a released state.

196.44.51 kPointerChangeFourthButtonDown = 7

MBS Win Plugin, Plugin Version: 16.2.

Function: The fourth button transitioned to a pressed state.

196.44.52 kPointerChangeFourthButtonUp = 8

MBS Win Plugin, Plugin Version: 16.2.

Function: The fourth button transitioned to a released state.

196.44.53 kPointerChangeNone = 0

MBS Win Plugin, Plugin Version: 16.2.

Function: No change in button state.

196.44.54 kPointerChangeSecondButtonDown = 3

MBS Win Plugin, Plugin Version: 16.2.

Function: The second button transitioned to a pressed state.

196.44.55 kPointerChangeSecondButtonUp = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: The second button transitioned to a released state.

196.44.56 kPointerChangeThirdButtonDown = 5

MBS Win Plugin, Plugin Version: 16.2.

Function: The third button transitioned to a pressed state.

196.44.57 kPointerChangeThirdButtonUp = 6

MBS Win Plugin, Plugin Version: 16.2.

Function: The third button transitioned to a released state.

196.44.58 kTypeMouse = 4

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the pointer types.
Notes: Mouse pointer type.

196.44.59 kTypePen = 3

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the pointer types.
Notes: Pen pointer type.

196.44.60 kTypePointer = 1

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the pointer types.
Notes:

Generic pointer type.
This type never appears in pointer messages or pointer data. Some data query functions allow the caller to restrict the query to specific pointer type. The kTypePointer type can be used in these functions to specify that the query is to include pointers of all types

196.44.61 kTypeTouch = 2

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the pointer types.
Notes: Touch pointer type.

196.44.62 kTypeTouchpad = 5

MBS Win Plugin, Plugin Version: 16.2.

Function: One of the pointer types.
Notes: Touchpad pointer type (Windows 8.1 and later).

196.45 control WinPreviewControlMBS

196.45.1 control WinPreviewControlMBS

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The preview control for Windows.
Notes:

Used to show PDF documents on Windows using the built-in preview handler on Windows 10 and newer.
Can also be used to use other built-in preview handlers on Windows by setting classID.

Since the control is handled by Windows, the key and mouse events are not expected to work.

Available on Windows 10 and newer.
Use QLPreviewViewControlMBS or PDFViewControlMBS for macOS to show previews and QLPreview-ControllerMBS or PDFViewIOSControlMBS for iOS.

- 21.5, page 10: News

196.45.6 Methods

196.45.7 LoadData(data as MemoryBlock)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes:

Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.
See also:

- 196.45.8 LoadData(data as string) 27910

196.45.8 LoadData(data as string)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given data.
Notes:

Lasterror is set.
If loading from data is not supported for preview, we use a temporary file instead.
See also:

- 196.45.7 LoadData(data as MemoryBlock) 27910

196.45.9 LoadFile(file as folderitem)

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: Loads the given file.
Notes:

Lasterror is set.
If the preview handler does not support reading file, the plugin reads the file and passes as data.

If the file path is invalid, the preview will show a file not found error message.

196.45.10 Properties

196.45.11 classID as String

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The class ID for the previewer to use.
Notes:

If empty, uses PDF viewer.
Available preview classes in a typical Windows 10 installation:

Class ID	Description
{ 13D3C4B8-B179-4ebb-BF62-F704173E7448 }	Windows Contact Preview Handler
{ 1531d583-8375-4d3f-b5fb-d23bbd169f22 }	Windows TXT Previewer
{ 53BEDF0B-4E5B-4183-8DC9-B844344FA104 }	Microsoft Windows MAPI Preview Handler
{ 8a7cae0e-5951-49cb-bf20-ab3fa1e44b01 }	Windows Font previewer
{ 92dbad9f-5025-49b0-9078-2d78f935e341 }	Microsoft Windows Mail Mime Preview Handler
{ a42c2ccb-67d3-46fa-abe6-7d2f3488c7a3 }	Windows RTF Previewer
{ b9815375-5d7f-4ce2-9245-c9d4da436930 }	Microsoft Windows Mail Mime Preview Handler
{ BFD468D2-D0A0-4bdc-878C-E69C2F5B435D }	Microsoft Windows Mail Html Preview Handler
{ E64164EB-1AE0-4C50-BAEF-A413C2B3A4BC }	Microsoft 3MF Shell Thumbnail and Preview Handler
{ f8b8412b-dea3-4130-b36c-5e8be73106ac }	Microsoft Windows Mail Html Preview Handler
{ 3A84F9C2-6164-485C-A7D9-4B27F8AC009E }	Microsoft PDF Previewer
{ DC6EFB56-9CFA-464D-8880-44885D7DC193 }	Adobe PDF Preview Handler for Vista

(Read and Write property)

196.45.12 Lasterror as Integer

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The last error code.
Notes: (Read and Write property)

196.45.13 LasterrorString as String

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop only.

Function: The error message for the error number in the lasterror property.
Notes: (Read only property)

196.45.14 Events

196.45.15 Close

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The close event.
In Xojo version 2021r3 and newer this event is named Closing.

196.45.16 Closing

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The close event.
In older Xojo versions, this event is named Close.

196.45.17 Configure

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function: The event called while initializing, where you can apply properties just before plugin reads them.
Notes: e.g. set classID here in code.

196.45.18 ConstructContextualMenu(base as MenuItem, x as Integer, y as Integer) as Boolean

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function: This event is called when it is appropriate to display a contextual menu for the control.

196.45.19 ContextualMenuAction(hitItem as MenuItem) as Boolean

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function: Called when a menuitem is choosen.
Notes: This allows the control to react on its relevant menu items. Please return true if you handled it or false to give others a chance.

196.45.20 EnableMenuItems

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The enable menu items event.
In Xojo version 2021r3 and newer this event is named MenuBarSelected.

196.45.21 FocusLost

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The lost focus event.
In older Xojo versions, this event is named LostFocus.

196.45.22 FocusReceived

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The got focus event.
In older Xojo versions, this event is named GotFocus.

196.45.23 GotFocus

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The got focus event.
In Xojo version 2021r3 and newer this event is named FocusReceived.

196.45.24 LostFocus

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The lost focus event.
In Xojo version 2021r3 and newer this event is named FocusLost.

196.45.25 MenuBarSelected

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The enable menu items event.
In older Xojo versions, this event is named EnableMenuItems.

196.45.26 Open

MBS Win Plugin, Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The open event.
In Xojo version 2021r3 and newer this event is named Opening.

196.45.27 Opening

Plugin Version: 23.3, Platform: Windows, Targets: .

Function:

The open event.
In older Xojo versions, this event is named Open.

196.46 class WinThreadPoolMBS

196.46.1 class WinThreadPoolMBS

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class to control Windows Thread Pool.
Example:

```
static pool as WinThreadPoolMBS // global or window property

pool = New WinThreadPoolMBS
pool.ThreadMaximum = 4
```

Notes:

You can have an instance of this class to create and define a thread pool.
If you never initialize a pool with this class, the default pool is used.

196.46.4 Methods

196.46.5 Constructor

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

196.46.6 Destructor

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

196.46.7 Properties

196.46.8 Handle as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle of the thread pool.
Notes: (Read and Write property)

196.46.9 LastError as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code.
Notes: (Read and Write property)

196.46.10 StackCommit as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The stack commit size.
Notes:

Default is 4 KB for the default stack grow size.
The rate the stack grows.
Should be in page size multiplies, e.g. 4096.

Sets the stack reserve and commit sizes for new threads in the specified thread pool. Stack reserve and commit sizes for existing threads are not changed.
(Read and Write property)

196.46.11 StackReserve as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The stack reservie size.
Example:

```
static pool as WinThreadPoolMBS // property or global

// increase stack size from default
pool = New WinThreadPoolMBS
pool.StackReserve = 2048*1024
```

Notes:

Default is 1 MB for the default stack size.
The rate the stack grows.
Should be in page size multiplies, e.g. 4096.

Sets the stack reserve and commit sizes for new threads in the specified thread pool. Stack reserve and commit sizes for existing threads are not changed.
(Read and Write property)

196.46.12 ThreadMaximum as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The upper limit for thread count.
Example:

```
static pool as WinThreadPoolMBS // property or global

pool = New WinThreadPoolMBS
pool.StackReserve = 2048*1024
pool.ThreadMaximum = 4
```

Notes:

Default for Windows is 500, but it may be much lower in practice as it's relative to the number of CPU cores and jobs.
(Read and Write property)

196.46.13 ThreadMinimum as Integer

MBS Win Plugin, Plugin Version: 21.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The lower limit for thread count.
Notes:

Default 0 to allow having no thread.
(Read and Write property)

196.47 class WMIObjectMBS

196.47.1 class WMIObjectMBS

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a WMI object.

196.47.4 Methods

196.47.5 GetNames as string()

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the names of all properties in this object.

196.47.6 GetProperty(Name as string) as Variant

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a variant.
Notes:

Objects, booleans, strings and numbers are supported directly. Also string arrays in version 13.1.
Other values are casted to string first.

196.47.7 GetPropertyBoolean(Name as string) as Boolean

MBS Win Plugin, Plugin Version: 13.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as an integer.
Notes: Value must be of a numeric type.

196.47.8 GetPropertyDouble(Name as string) as Double

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as a double.
Notes: Value must be of a numeric type.

196.47.9 GetPropertyInt64(Name as string) as Int64

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as an integer value.

196.47.10 GetPropertyInteger(Name as string) as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as an integer.
Example:

```
dim w as WindowsWMIMBS // your WMI object

MsgBox str(w.GetPropertyInteger("MaxClockSpeed")) // uint32
```

Notes: Value must be of a numeric type.

196.47.11 GetPropertyObject(Name as string) as WMIObjectMBS

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a value as an object.
Notes: Value must be of an IUnknown type.

196.47.12 GetPropertyString(Name as string) as string

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a string.
Example:

```
dim w as WindowsWMIMBS
MsgBox w.GetPropertyString("Name") // string
```

196.47.13 GetPropertyStringArray(Name as string) as string()

MBS Win Plugin, Plugin Version: 13.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a property as a string array.
Example:

```
dim w as WindowsWMIMBS
MsgBox join(w.GetPropertyStringArray("Name"), ", ")
```

196.47.14 GetPropertyType(Name as string) as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the type of a property.
Notes: You can send in the value you get here and the plugin can be changed to handle this type, too. Currently only numbers and strings are handled.

196.47.15 GetPropertyTypeString(Name as string) as string

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the type of a property as a string.
Notes: For example type 8 is returned as "string".

196.47.16 Properties

196.47.17 Handle as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Internal object reference.
Notes: (Read and Write property)

196.47.18 Lasterror as Integer

MBS Win Plugin, Plugin Version: 12.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code reported from one of the functions.
Notes:

-1 is the value used by the plugin if the function is not available.
(Read and Write property)

196.47.19 LasterrorMessage as String

MBS Win Plugin, Plugin Version: 13.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: The error message for the last error.
Notes:

This may help to debug the errors.
(Read only property)

Chapter 197

Windows Console

197.1 class ConsoleStateMBS

197.1.1 class ConsoleStateMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for handling a console window state.

197.1.2 Properties

197.1.3 BackColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The colorcode of the background.
Notes:

Color codes can be build up from red, blue, green and highlight.
red=1, blue=2, green=4 and highlight=8.
(Read and Write property)

197.1.4 CursorX as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The horizontal cursor position in characters.
Notes: (Read and Write property)

197.1.5 CursorY as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vertical cursor position in characters.
Notes: (Read and Write property)

197.1.6 Height as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the window in characters.
Notes: (Read and Write property)

197.1.7 MaxHeight as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The maximum height of the window in characters.
Notes: (Read and Write property)

197.1.8 MaxWidth as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The maximum width of the window in characters.
Notes: (Read and Write property)

197.1.9 TextColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The colorcode of the text.
Notes:

Color codes can be build up from red, blue, green and highlight.
red=1, blue=2, green=4 and highlight=8.
(Read and Write property)

197.1.10 Width as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the window in characters.
Notes: (Read and Write property)

197.1.11 WindowHeight as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the console window.
Notes: (Read and Write property)

197.1.12 WindowLeft as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left position of the console window.
Notes: (Read and Write property)

197.1.13 WindowTop as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top position of the console window.
Notes: (Read and Write property)

197.1.14 WindowWidth as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the console window.
Notes: (Read and Write property)

197.2 class WindowsConsoleMBS

197.2.1 class WindowsConsoleMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for handling a console window in Windows.

197.2.2 Methods

197.2.3 Close

MBS Win Plugin, Plugin Version: 4.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

197.2.4 FlushConsole

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The FlushConsole function flushes the console input buffer.
Notes: All input records currently in the input buffer are discarded.

197.2.5 ReadConsole(maxcount as Integer) as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reads maximum of maxcount characters from the input stream.

197.2.6 SetCursorPosition(x as Integer,y as Integer)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the cursor position inside the console window.

197.2.7 SetWindowPosition(absolute as boolean, left as Integer,top as Integer, right as Integer, bottom as Integer)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the window position and size.
Notes: If absolute=false, the coordinates are relative to the current one.

197.2.8 State as ConsoleStateMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current state of the console window.

197.2.9 WriteConsole(message as string) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes the message to the console.
Notes: Returns true if successfull.

197.2.10 Properties

197.2.11 AutoScrollAtEOL as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Automatical scrolling at end of line?
Notes:

When writing with WriteConsole or echoing with ReadFile, the cursor moves to the beginning of the next row when it reaches the end of the current row. This causes the rows displayed in the console window to scroll up automatically when the cursor advances beyond the last row in the window. It also causes the contents of the screen buffer to scroll up (discarding the top row of the screen buffer) when the cursor advances beyond the last row in the screen buffer. If this mode is disabled, the last character in the row is overwritten with any subsequent characters.
(Read and Write property)

197.2.12 BackColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text background color used.
Notes: (Read and Write property)

197.2.13 CursorSize as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The size of the cursor in percent (from 0 to 100).
Notes: (Read and Write property)

197.2.14 CursorVisible as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Is the cursor visible?
Notes: (Read and Write property)

197.2.15 EchoInput as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Echo the input on the screen?
Notes:

Characters read by the ReadFile function are written to the active screen buffer as they are read. This mode can be used only if the WaitForReturn mode is also enabled.
(Read and Write property)

197.2.16 GotConsole as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: whether the console was created inside the constructor.
Notes: (Read only property)

197.2.17 InputCodepage as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Codepage of the input stream.
Notes: (Read and Write property)

197.2.18 OutputCodepage as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Codepage of the output stream.
Notes: (Read and Write property)

197.2.19 ProcessInput as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Process input before reading?
Notes:

Ctrl+c is processed by the system and is not placed in the input buffer. If the input buffer is being read by ReadConsole, other control keys are processed by the system and are not returned in the ReadConsole buffer. If the WaitForReturn mode is also enabled, backspace, carriage return, and linefeed characters are handled by the system.
(Read and Write property)

197.2.20 ProcessOutput as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Process output before reading?
Notes:

Characters written by the WriteConsole function or echoed by the ReadFile or ReadConsole function are parsed for ASCII control sequences, and the correct action is performed. Backspace, tab, bell, carriage return, and linefeed characters are processed.
(Read and Write property)

197.2.21 TextColor as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text color used.
Notes: (Read and Write property)

197.2.22 Title as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The title bar of the console window.
Notes: (Read and Write property)

197.2.23 WaitForReturn as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Wait for return key on reading?
Notes:

The ReadConsole function returns only when a carriage return character is read. If this mode is disabled, the functions return when one or more characters are available.
(Read and Write property)

197.2.24 Events

197.2.25 ConsoleClosed

MBS Win Plugin, Platform: Windows, Targets: .

Function: Console was closed.

197.2.26 ConsoleOpened

MBS Win Plugin, Platform: Windows, Targets: .

Function: Console was opened.

197.2.27 ControlBreak as boolean

MBS Win Plugin, Platform: Windows, Targets: .

Function: Control-Break was pressed.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

197.2.28 ControlC as boolean

MBS Win Plugin, Platform: Windows, Targets: .

Function: Control-C was pressed.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

197.2.29 Logoff as boolean

MBS Win Plugin, Platform: Windows, Targets: .

Function: The user is logging off.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

197.2.30 Shutdown as boolean

MBS Win Plugin, Platform: Windows, Targets: .

Function: The user is shutting down the computer.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

197.2.31 UserClose as boolean

MBS Win Plugin, Platform: Windows, Targets: .

Function: The user pressed the close button.
Notes:

Return true if you handled it yourself.
Return false for the default handler.

197.2.32 Constants

197.2.33 Black = 0

MBS Win Plugin.

Function: The color code for Black.
Notes: Read only property with value 0.

197.2.34 Blue = 1

MBS Win Plugin.

Function: The color code for Blue.
Notes: Read only property with value 2.

197.2.35 Green = 2

MBS Win Plugin.

Function: The color code for Green.
Notes: Read only property with value 4.

197.2.36 Highlight = 8

MBS Win Plugin.

Function: The color code for Highlight.
Notes: Read only property with value 8.

197.2.37 Red = 4

MBS Win Plugin.

Function: The color code for Red.
Notes: Read only property with value 1.

Chapter 198

Windows ICM

198.1 class WindowsICMColorMBS

198.1.1 class WindowsICMColorMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a color value.
Notes:

A variable of type color may be accessed as any of the supported color space colors by accessing the appropriate member of the union.

198.1.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.1.3 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.1.4 Properties

198.1.5 a as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The a color value of a Lab color.
Notes: (Read and Write property)

198.1.6 b as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The b color value of a Lab color.
Notes: (Read and Write property)

198.1.7 black as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The black color value of a CMYK color.
Notes: (Read and Write property)

198.1.8 blue as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The blue value.
Notes:

Range from 0 to 255.
(Read and Write property)

198.1.9 ch1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The first channel color value of a three channel color.
Notes: (Read and Write property)

198.1.10 ch2 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The second channel color value of a three channel color.
Notes: (Read and Write property)

198.1.11 ch3 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The third channel color value of a three channel color.
Notes: (Read and Write property)

198.1.12 cyan as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The cyan color value of a CMYK color.
Notes: (Read and Write property)

198.1.13 gray as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The gray color value.
Notes:

For grayscale color space.
(Read and Write property)

198.1.14 green as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The green value.
Notes:

Range from 0 to 255.
(Read and Write property)

198.1.15 Index as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The index value for an indexed color space.
Notes: (Read and Write property)

198.1.16 L as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The L color value of a Lab color.
Notes: (Read and Write property)

198.1.17 magenta as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The magenta color value of a CMYK color.
Notes: (Read and Write property)

198.1.18 red as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The red value.
Notes:

Range from 0 to 255.
(Read and Write property)

198.1.19 XYZ_X as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of a XYZ color.
Notes: (Read and Write property)

198.1.20 XYZ_Y as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of a XYZ color.
Notes: (Read and Write property)

198.1.21 XYZ_Z as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of a XYZ color.
Notes: (Read and Write property)

198.1.22 yellow as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The yellow color value of a CMYK color.
Notes: (Read and Write property)

198.1.23 Yxy_x as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The x value of a Yxy color.
Notes: (Read and Write property)

198.1.24 Yxy_y as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The y value of a Yxy color.
Notes:

Yxy_YY is the first Y and Yxy_Y the second one in a Yxy color.
(Read and Write property)

198.1.25 Yxy_YY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The y value of a Yxy color.
Notes:

Yxy_YY is the first Y and Yxy_Y the second one in a Yxy color.
(Read and Write property)

198.1.26 Channel(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The channel value of a colorspaces with 3 to 8 channels.
Notes:

Index from 0 to 7.
(Read and Write computed property)

198.1.27 Constants

198.1.28 COLOR_3_CHANNEL = 6

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in the GENERIC3CHANNEL color space.

198.1.29 COLOR_5_CHANNEL = 8

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in a five channel color space.

198.1.30 COLOR_6_CHANNEL = 9

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in a six channel color space.

198.1.31 COLOR_7_CHANNEL = 10

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in a seven channel color space.

198.1.32 COLOR_8_CHANNEL = 11

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in an eight channel color space.

198.1.33 COLOR_CMYK = 7

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in the CMYKCOLOR color space.

198.1.34 COLOR_GRAY = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in the GRAYCOLOR color space.

198.1.35 COLOR_Lab = 5

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in the LabCOLOR color space.

198.1.36 COLOR_NAMED = 12

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in a named color space.

198.1.37 COLOR_RGB = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in the RGBCOLOR color space.

198.1.38 COLOR_XYZ = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in the XYZCOLOR color space.

198.1.39 COLOR_Yxy = 4

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color type constants.
Notes: The COLOR is in the YxyCOLOR color space.

198.1.40 MAX_COLOR_CHANNELS = 8

MBS Win Plugin, Plugin Version: 11.1.

Function: The maximum number of supported color channels.

198.2 class WindowsICMEnumMBS

198.2.1 class WindowsICMEnumMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The WindowsICMEnumMBS class contains information that defines the profile enumeration constraints.
Example:

```
dim c as new WindowsICMEnumMBS // no options set

dim a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
MsgBox s
next
```

Notes:

198.2.3 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.2.4 Properties

198.2.5 Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile that can be any of the following values.
Notes:

(Read and Write property)

Constant	Meaning
ATTRIB_TRANSPARENCY	Turns transparency on. If this flag is not used, the attribute is reflective by default.
ATTRIB_MATTE	Turns matte display on. If this flag is not used, the attribute is glossy by default.

198.2.6 Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile that can be any of the following values.
Notes:

Constant	Meaning
ATTRIB_TRANSPARENCY	Turns transparency on. If this flag is not used, the attribute is reflective by default.
ATTRIB_MATTE	Turns matte display on. If this flag is not used, the attribute is glossy by default.

(Read and Write property)

198.2.7 Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the profile class.
Notes:

For a description of profile classes, see Using Device Profiles with WCS.
http://msdn.microsoft.com/en-us/library/dd372213(v=VS.85).aspx

A profile class may have any of the following values.

Profile Class	Signature
Input Device Profile	CLASS_SCANNER
Display Device Profile	CLASS_MONITOR
Output Device Profile	CLASS_PRINTER
Device Link Profile	CLASS_LINK
Color Space Conversion Profile	CLASS_COLORSPACE
Abstract Profile	CLASS_ABSTRACT
Named Color Profile	CLASS_NAMED
Color Appearance Model Profile	CLASS_CAMP
Color Gamut Map Model Profile	CLASS_GMMP

(Read and Write property)

198.2.8 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the CMM that is used in the profile.
Notes:

Identification numbers are registered with the ICC.
(Read and Write property)

198.2.9 ConnectionSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile connection space (PCS) is defined.
Notes:

Can be any of the following values: SPACE_XYZ or SPACE_Lab

When the Classs member is set to CLASS_LINK, the PCS is taken from the DataColorSpace member.
(Read and Write property)

198.2.10 Creator as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Signature of the software that created the profile.
Notes:

Signatures are registered with the ICC.
(Read and Write property)

198.2.11 DataColorSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile data is defined.
Notes:

Can be any value from the SPACE_* Constants.
(Read and Write property)

198.2.12 DeviceClass as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the device class.
Notes:

A device class may have one of the following values.

Profile Class	Signature
Input Device Profile	CLASS_SCANNER
Display Device Profile	CLASS_MONITOR
Output Device Profile	CLASS_PRINTER

(Read and Write property)

198.2.13 DeviceName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: User friendly name of the device.
Notes: (Read and Write property)

198.2.14 DitheringMode as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the style of dithering that will be used when an image is displayed.
Notes: (Read and Write property)

198.2.15 Fields as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates which fields in this class are being used.
Notes:

Can be set to any combination of the following constant values:

ET_DEVICENAME
ET_MEDIATYPE
ET_DITHERMODE
ET_RESOLUTION
ET_CMMTYPE
ET_CLASS
ET_DATACOLORSPACE
ET_CONNECTIONSPACE
ET_SIGNATURE
ET_PLATFORM
ET_PROFILEFLAGS
ET_MANUFACTURER
ET_MODEL
ET_ATTRIBUTES
ET_RENDERINGINTENT
ET_CREATOR
ET_DEVICECLASS
(Read and Write property)

198.2.16 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the device profile manufacturer.
Notes:

All manufacturer identification numbers are registered with the ICC.
(Read and Write property)

198.2.17 MediaType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates which type of media is associated with the profile, such as a printer or screen.
Notes: (Read and Write property)

198.2.18 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device manufacturer's device model number.
Notes:

All model identification numbers are registered with the ICC.
(Read and Write property)

198.2.19 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The primary platform for which the profile was created.
Notes:

The member can be set to any of the following values.

Platform	Value
Apple Computer, Inc.	'APPL'
Microsoft Corp.	'MSFT'
Silicon Graphics, Inc.	'SGI'
Sun Microsystems, Inc.	'SUNW'
Taligent	'TGNT'

(Read and Write property)

198.2.20 ProfileFlags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Bit flags containing hints that the CMM uses to interpret the profile data and can be set to one of the following values.
Notes:

Constant	Meaning
FLAG_EMBEDDEDPROFILE	The profile is embedded in a bitmap file.
FLAG_DEPENDENTONDATA	The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

(Read and Write property)

198.2.21 RenderingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The profile rendering intent.
Notes:

The member can be set to one of the following values:

INTENT_PERCEPTUALINTENT_SATURATIONINTENT_RELATIVE_COLORIMETRICINTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=VS.85).aspx
(Read and Write property)

198.2.22 ResolutionX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The horizontal resolution in pixels of the device on which the image will be displayed.
Notes: (Read and Write property)

198.2.23 ResolutionY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The vertical resolution in pixels of the device on which the image will be displayed.
Notes: (Read and Write property)

198.2.24 Signature as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reserved for internal use.
Notes: (Read and Write property)

198.2.25 Constants

198.2.26 ATTRIB_MATTE = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the attribute constants.

Notes: Turns matte display on. If this flag is not used, the attribute is glossy by default.

198.2.27 ATTRIB_TRANSPARENCY = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the attribute constants.
Notes: Turns transparency on. If this flag is not used, the attribute is reflective by default.

198.2.28 CLASS_ABSTRACT = & h61627374

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.29 CLASS_CAMP = & h6C616D70

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.30 CLASS_COLORSPACE = & h73706163

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.31 CLASS_GMMP = & h676D6D70

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.32 CLASS_LINK = & h6C696E6B

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.33 CLASS_MONITOR = & h6D6E7472

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.34 CLASS_NAMED = & h6E6D636C

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.35 CLASS_PRINTER = & h70727472

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.36 CLASS_SCANNER = & h73636E72

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.

198.2.37 ET_ATTRIBUTES = & h02000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.38 ET_CLASS = & h00020

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.39 ET_CMMTYPE = & h00010

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.40 ET_CONNECTIONSPACE = & h00080

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.41 ET_CREATOR = & h08000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.42 ET_DATACOLORSPACE = & h00040

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.43 ET_DEVICECLASS = & h10000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.44 ET_DEVICENAME = & h00001

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.45 ET_DITHERMODE = & h00004

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.46 ET_MANUFACTURER = & h00800

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.47 ET_MEDIATYPE = & h00002

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.48 ET_MODEL = & h01000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.49 ET_PLATFORM = & h00200

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.50 ET_PROFILEFLAGS = & h00400

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.51 ET_RENDERINGINTENT = & h04000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.52 ET_RESOLUTION = & h00008

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.53 ET_SIGNATURE = & h00100

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the constants to specify which property in this class is used.

198.2.54 FLAG_DEPENDENTONDATA = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile flag constants.
Notes: The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

198.2.55 FLAG_EMBEDDEDPROFILE = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile flag constants.
Notes: The profile is embedded in a bitmap file.

198.2.56 FLAG_ENABLE_CHROMATIC_ADAPTATION = & h02000000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile flag constants.

198.2.57 SigMacintosh = & h4150504C

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the platform signatures.
Notes: APPL = Apple Computer, Inc.

198.2.58 SigMicrosoft = & h4D534654

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the platform signatures.
Notes: MSFT = Microsoft Corp.

198.2.59 SigSGI = & h53474920

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the platform signatures.
Notes: SGI = Silicon Graphics, Inc.

198.2.60 SigSolaris = & h53554E57

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the platform signatures.
Notes: SUNW = Sun Microsystems, Inc.

198.2.61 SigTaligent = & h54474E54

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the platform signatures.
Notes: TGNT = Taligent

198.2.62 SPACE_Lab = & h4C616220

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Lab

198.2.63 SPACE_XYZ = & h58595A20

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: XYZ

198.3 class WindowsICMLogColorSpaceMBS

198.3.1 class WindowsICMLogColorSpaceMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class contains information that defines a logical color space.
Notes:

If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of this structure are ignored, and WCS uses the sRGB color space. The Endpoints, GammaRed, GammaGreen, and GammaBlue members are used to describe the logical color space. The Endpoints member is a CIEXYZTRIPLE that contains the x, y, and z values of the color space's RGB endpoint.

The required DWORD bit format for the GammaRed, GammaGreen, and GammaBlue is an 8.8 fixed point interger left-shifted by 8 bits. The plugin takes care about that detail.

Whenever the Filename member contains a file name and the CSType member is set to LCS_CALIBRATED_RGB, WCS ignores the other members of this class. It uses the color space in the file as the color space to which this LOGCOLORSPACE structure refers.

The relation between tri-stimulus values X,Y,Z and chromaticity values x,y,z is as follows:

x = X/(X+Y+Z)
y = Y/(X+Y+Z)
z = Z/(X+Y+Z)

If the CSType member is set to LCS_sRGB or LCS_WINDOWS_COLOR_SPACE, the other members of this structure are ignored, and ICM uses the sRGB color space. Appliations should still initialize the rest of the structure since CreateProfileFromLogColorSpace ignores CSType member and uses Endpoints, GammaRed, GammaGreen, GammaBlue members to create a profile, which may not be initialized in case of LCS_sRGB or LCS_WINDOWS_COLOR_SPACE color spaces.

198.3.4 Properties

198.3.5 CSType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Color space type.
Notes:

The member can be one of the following values.

Value	Meaning
LCS_CALIBRATED_RGB	Color values are calibrated RGB values. The values are translated using the endpoints specified by the lcsEndpoints member before being passed to the device.
LCS_sRGB	Color values are values are sRGB values.
LCS_WINDOWS_COLOR_SPACE	Color values are Windows default color space color values.

(Read and Write property)

198.3.6 EndpointsBX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of the Blue Endpoint.
Notes: (Read and Write property)

198.3.7 EndpointsBY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of the Blue Endpoint.
Notes: (Read and Write property)

198.3.8 EndpointsBZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of the Blue Endpoint.
Notes: (Read and Write property)

198.3.9 EndpointsGX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of the Green Endpoint.
Notes: (Read and Write property)

198.3.10 EndpointsGY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of the Green Endpoint.
Notes: (Read and Write property)

198.3.11 EndpointsGZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of the Green Endpoint.
Notes: (Read and Write property)

198.3.12 EndpointsRX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The X value of the Red Endpoint.
Notes: (Read and Write property)

198.3.13 EndpointsRY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Y value of the Red Endpoint.
Notes: (Read and Write property)

198.3.14 EndpointsRZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Z value of the Red Endpoint.
Notes: (Read and Write property)

198.3.15 Filename as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string that names a color profile file.
Notes:

This member is typically set to "", but may be used to set the color space to be exactly as specified by the color profile. This is useful for devices that input color values for a specific printer, or when using an installable image color matcher. If a color profile is specified, all other members of this class should be set to reasonable values, even if the values are not completely accurate.
(Read and Write property)

198.3.16 GammaBlue as Double

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scale of the blue coordinate.
Notes: (Read and Write property)

198.3.17 GammaGreen as Double

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scale of the green coordinate.
Notes: (Read and Write property)

198.3.18 GammaRed as Double

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scale of the red coordinate.
Notes: (Read and Write property)

198.3.19 Intent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The gamut mapping method.
Notes:

This member can be one of the following values.

Value	Value	Intent	ICC Name	Meaning
LCS_GM_BUSINESS	1	Graphic	Saturation	Maintain saturation. Used for business charts and other situations in which undithered colors are required.
LCS_GM_GRAPHICS	2	Proof	Relative Colorimetric	Maintain colorimetric match. Used for graphic designs and named colors.
LCS_GM_IMAGES	4	Picture	Perceptual	Maintain contrast. Used for photographs and natural images.
LCS_GM_ABS_COLORIMETRIC	8	Match	Absolute Colorimetric	Maintain the white point. Match the colors to their nearest color in the destination gamut.

(Read and Write property)

198.3.20 Constants

198.3.21 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain the white point. Match the colors to their nearest color in the destination gamut.

198.3.22 INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain contrast. Used for photographs and natural images.

198.3.23 INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain colorimetric match. Used for graphic designs and named colors.

198.3.24 INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain saturation. Used for business charts and other situations in which undithered colors are required.

198.3.25 LCS_CALIBRATED_RGB = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space type constants.
Notes: Color values are calibrated RGB values. The values are translated using the endpoints specified by the Endpoints member before being passed to the device.

198.3.26 LCS_sRGB = & h73524742

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space type constants.
Notes: Color values are values are sRGB values.

198.3.27 LCS_WINDOWS_COLOR_SPACE = & h57696E20

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space type constants.
Notes: Color values are Windows default color space color values.

198.4 module WindowsICMModuleMBS

198.4.1 module WindowsICMModuleMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The main module for Windows Image Color Matching functions.

198.4.2 Blog Entries

198.4.3 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.4.4 Methods

198.4.5 AssociateColorProfileWithDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The AssociateColorProfileWithDevice function associates a specified color profile with a specified device.
Notes:

ProfileName: The file name of the profile to associate.
DeviceName: The name of the device to associate.

Returns true on success and false on failure.

The AssociateColorProfileWithDevice function will fail if the profile has not been installed on the computer using the InstallColorProfile function.

Note that under Windows (Windows 95 or later), the PostScript device driver for printers assumes a CMYK color model. Therefore, all PostScript printers must use a CMYK color profile. Windows 2000 does not have this limitation.

If the specified device is a monitor, this function updates the default profile.

Several profiles are typically associated with printers, based on paper and ink types. There is no default. The GDI selects the best one from the associated profiles when your application creates a device context (DC).

Scanners also have no default profile. However, it is atypical to associate more than one profile with a scanner.

AssociateColorProfileWithDevice always adds the specified profile to the current user's per-user profile association list for the specified device. Before adding the profile to the list, AssociateColorProfileWithDevice determines whether the user has previously expressed the desire to use a per-user profile association list for the device. If so, then AssociateColorProfileWithDevice simply adds the specified profile to the existing per-user profile association list for the device. If not, then AssociateColorProfileWithDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It then appends the specified profile to the per-user list. From that point on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

198.4.6 DisassociateColorProfileFromDevice(ProfileName as string, DeviceName as string) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The DisassociateColorProfileFromDevice function disassociates a specified color profile with a specified device on a specified computer.
Notes:

Returns true on success and false on failure.

ProfileName: The file name of the profile to disassociate.
DeviceName: The name of the device to disassociate.

If more than one profile is associated with a device, WCS uses the last one associated as the default. That is, if your application sequentially associates three profiles with a device, WCS will use the last one associated as the default. If your application then calls the DisassociateColorProfileFromDevice function to disassociate the third profile (which is the default in this example), the WCS will use the second profile as the default.

If your application disassociates all profiles from a device, WCS uses the sRGB profile as the default.

DisassociateColorProfileFromDevice always removes the specified profile from the current user's per-user profile association list for the specified device. Before removing the profile from the list, DisassociateColorProfileFromDevice determines whether the user has previously expressed the desire to use a per-user profile association list for the device. If so, then DisassociateColorProfileFromDevice simply removes the specified profile from the existing per-user profile association list for the device. If not, then DisassociateColorProfileFromDevice creates a new per-user profile association list for the device by copying the system-wide association list for that device. It then removes the specified profile from the per-user list. From that point

on, the current user will be using a per-user profile association list for the specified device, as if SetUsePerUserProfiles had been called for Device with the usePerUserProfiles parameter set to TRUE.

198.4.7 EnumColorProfiles(criterias as WindowsICMEnumMBS) as string()

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The EnumColorProfiles function enumerates all the profiles satisfying the given enumeration criteria.
Example:

```
dim c as new WindowsICMEnumMBS // no options set

dim a(-1) as string = WindowsICMModuleMBS.EnumColorProfiles(c)

for each s as string in a
MsgBox s
next
```

Notes:

On success the function returns an array of profile names.

Several profiles are typically associated with printers, based on the paper and ink types. There is a default profile for each device. For International Color Consortium (ICC) profiles, GDI selects the best one from the ICC-associated profiles when your application creates a device context (DC).

Do not attempt to use EnumColorProfiles to determine the default profile for a device. Instead, create a device context for the device and then invoke the GetICMProfile function. On Windows Vista and Windows 7, the WcsGetDefaultColorProfile function can also be used to determine a device's default color profile.

If the Fields member of WindowsICMEnumMBS that is pointed to by the criterias parameter is set to ET_DEVICENAME, this function will enumerate all of the color profiles associated with all types of devices attached to the user's computer, regardless of the device class. If the Fields member is set to ET_DEVICENAME or ET_DEVICECLASS and a device class is specified in the DeviceClass member, this function will only enumerate the profiles associated with the specified device class. If the Fields member is set only to ET_DEVICECLASS, the EnumColorProfiles function will enumerate all profiles that can be associated with that type of device.

Whenever EnumColorProfiles is examining the profiles associated with a specific device, the results depend on whether the user has chosen to use the system-wide list of profiles associated with that device, or his or her own ("per-user") list. Calling SetUsePerUserProfiles with its usePerUserProfiles parameter set to TRUE causes future calls to EnumColorProfiles to look at only the current user's per-user list of profile associa-

tions for the specified device. Calling WcsSetUsePerUserProfiles with its usePerUserProfiles parameter set to FALSE causes future calls to EnumColorProfiles to look at the system-wide list of profile associations for the specified device. If SetUsePerUserProfiles has never been called for the current user, EnumColorProfiles examines the system-wide list.

This function will provide the information for converting WCS-specific DMP information to the legacy EnumType record in enable consistent profile enumeration. The defaults will be the same as ICC if this information is not present.

Per-user/LUA support

The enumeration is specific to current user. Both system wide and current user device associations are considered. For default profile configuration, current user settings override system wide ones.

198.4.8 GetColorDirectory as folderitem

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorDirectory function retrieves the path of the Windows COLOR directory on a specified machine.
Example:

```
dim f as FolderItem = WindowsICMModuleMBS.GetColorDirectory

if f=nil then
MsgBox "No path?"
else
MsgBox f.NativePath
end if
```

Notes: On success returns folderitem for color directory. Returns nil on any error.

198.4.9 GetStandardColorSpaceProfile(ProfileID as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetStandardColorSpaceProfile function retrieves the color profile registered for the specified standard color space.
Example:

```
MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_WINDOWS_COLOR_S
```

Notes:

ProfileID: Specifies the ID value of the standard color space for which to retrieve the profile. The only valid values for this parameter are LCS_sRGB and LCS_WINDOWS_COLOR_SPACE.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return an error if such profiles are used.

Overview of Windows Vista Specific Functionality

This will support WCS DMPs in addition to ICC profiles. It will not support WCS CAMP or GMMP profiles and will return an error if such profiles are used with this API.

Per-user/LUA support

This will retrieve the color profile registered for the given standard color space for current user. If there is no such setting for the current user, it retrieves the system wide setting.

This uses WcsGetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context.

198.4.10 InstallColorProfile(file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The InstallColorProfile function installs a given profile for use on a specified machine.
Notes:

The profile is also copied to the COLOR directory.
Returns true on success and false on failure.

198.4.11 RegisterCMM(cmmID as Integer, file as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: RegisterCMM associates a specified identification value with the specified color management module dynamic link library (CMM DLL).
Notes:

When this ID appears in a color profile, Windows can then locate the corresponding CMM so as to create a transform.

cmmID: Specifies the ID signature of the CMM registered with the International Color Consortium (ICC).

file: Points to the CMM DLL.

Returns true on success and false on failure.

198.4.12 SelectCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: SelectCMM allows an application to select the preferred color management module (CMM) to use.
Notes:

cmmID: Specifies the signature of the desired CMM as registered with the International Color Consortium (ICC).

Windows 2000 only: Setting this parameter to 0 causes the WCS system to select the default CMM.

Returns true on success and false on failure.

198.4.13 SetStandardColorSpaceProfile(ProfileID as Integer, ProfileName as folderitem) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetStandardColorSpaceProfile function registers a specified profile for a given standard color space.
Notes:

The profile can be queried using GetStandardColorSpaceProfile.

ProfileID: Specifies the ID value of the standard color space that the given profile represents.
Profilename: path to the profile file.

Returns true on success and false on failure.

The profile must already be installed on the system before it can be registered for a standard color space.

This function supports Windows Color System (WCS) device model profiles (DMPs) in addition to International Color Consortium (ICC) profiles. It does not support WCS CAMP or GMMP profiles and will return an error if such profiles are used.

Per-user/LUA support

This will register a specified profile for a given standard color space only for current user.

This uses SetDefaultColorProfile with WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER.

This is executable in LUA context if the profile is already installed, fails otherwise with access denied since install is system-wide and requires administrator privileges.

198.4.14 UninstallColorProfile(ProfileName as string, DeleteFile as boolean = true) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: UninstallColorProfile removes a specified color profile from a specified computer. Associated files are optionally deleted from the system.
Notes:

ProfileName: Points to the file name of the profile to uninstall.

DeleteFile: If set to true, the function deletes the profile from the COLOR directory. If set to false, this function has no effect.

Returns true on success and false on failure.

198.4.15 UnregisterCMM(cmmID as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The UnregisterCMM function dissociates a specified ID value from a given color management module dynamic-link library (CMM DLL).
Notes:

cmmID: Specifies the ID value identifying the CMM whose registration is to be removed. This is the signature of the CMM registered with the International Color Consortium (ICC).

Returns true on success and false on failure.

198.4.16 Constants

198.4.17 CMM_DESCRIPTION = 5

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: A text string that describes the color management module.

198.4.18 CMM_DLL_VERSION = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: Version number of the CMM DLL.

198.4.19 CMM_DRIVER_VERSION = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.

198.4.20 CMM_IDENT = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: The CMM identification signature registered with the International Color Consortium (ICC).

198.4.21 CMM_LOGOICON = 6

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: The logo icon for this CMM.

198.4.22 CMM_VERSION = 4

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: Version of Windows supported.

198.4.23 CMM_WIN_VERSION = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: Backward compatibility with Windows 95.

198.4.24 LCS_sRGB = & h73524742

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile IDs for GetStandardColorSpaceProfile.
Example:

MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_sRGB)

198.4.25 LCS_WINDOWS_COLOR_SPACE = & h57696E20

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile IDs for GetStandardColorSpaceProfile.
Example:

MsgBox WindowsICMModuleMBS.GetStandardColorSpaceProfile(WindowsICMModuleMBS.LCS_WINDOWS_COLOR_S

198.5 class WindowsICMNamedProfileInfoMBS

198.5.1 class WindowsICMNamedProfileInfoMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class is used to store information about a named color profile.

198.5.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.5.3 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.5.4 Properties

198.5.5 Count as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Total number of named colors in the profile.
Notes: (Read and Write property)

198.5.6 CountDevCoordinates as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Total number of device coordinates for each named color.
Notes: (Read and Write property)

198.5.7 Flags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Flags for this information record.
Notes:

Not currently used by the default CMM.
(Read and Write property)

198.5.8 Prefix as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string containing the prefix for each color name.
Notes: (Read and Write property)

198.5.9 Suffix as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string containing the suffix for each color name.
Notes: (Read and Write property)

198.6 class WindowsICMProfileHeaderMBS

198.6.1 class WindowsICMProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class contains information that describes the contents of a device profile file.
Notes: This header occurs at the beginning of a device profile file.

198.6.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.6.3 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.6.4 Properties

198.6.5 Attributes0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile.
Notes: (Read and Write property)

198.6.6 Attributes1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Attributes of profile.
Notes: (Read and Write property)

198.6.7 Classs as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Indicates the profile class.
Example:

```
// some profile file
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")

// open profile read only
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PRO-
FILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXIST-
ING)

// get headers
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

// show color space name
Select case h.Classs
case WindowsICMProfileHeaderMBS.CLASS_MONITOR
msgbox "Monitor"
case WindowsICMProfileHeaderMBS.CLASS_PRINTER
msgbox "Printer"
case WindowsICMProfileHeaderMBS.CLASS_SCANNER
msgbox "Scanner"
case WindowsICMProfileHeaderMBS.CLASS_LINK
msgbox "Link"
case WindowsICMProfileHeaderMBS.CLASS_ABSTRACT
msgbox "Abstract"
case WindowsICMProfileHeaderMBS.CLASS_COLORSPACE
msgbox "Colorspace"
case WindowsICMProfileHeaderMBS.CLASS_NAMED
msgbox "Named"
case WindowsICMProfileHeaderMBS.CLASS_CAMP
msgbox "Camp"
case WindowsICMProfileHeaderMBS.CLASS_GMMP
msgbox "GNMP"
else
msgbox "Unknown: "+hex(h.Classs)
end Select
```

Notes:

For a description of profile classes, see Using Device Profiles with WCS:
http://msdn.microsoft.com/en-us/library/dd372213(v=VS.85).aspx

A profile class may have any of the values from the CLASS_* constants.

Class is written with three s here as Class is a reserved word in Xojo.
(Read and Write property)

198.6.8 CMMType as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the CMM that is used in the profile.
Notes:

Identification numbers are registered with the ICC.
(Read and Write property)

198.6.9 ConnectionSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile connection space (PCS) is defined.
Notes:

The member can be any of the following values: SPACE_XYZ or SPACE_Lab.
(Read and Write property)

198.6.10 Creator as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Signature of the software that created the profile.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

MsgBox hex(h.Creator)
```

Notes:

Signatures are registered with the ICC.
(Read and Write property)

198.6.11 DataColorSpace as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A signature value that indicates the color space in which the profile data is defined.
Example:

```
function Name() as string
dim w as WindowsICMProfileMBS // your profile
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

if h=nil then Return "?"

Select case h.DataColorSpace
case WindowsICMProfileHeaderMBS.SPACE_XYZ
Return "XYZ"
case WindowsICMProfileHeaderMBS.SPACE_Lab
Return "Lab"
case WindowsICMProfileHeaderMBS.SPACE_Luv
Return "Luv"
case WindowsICMProfileHeaderMBS.SPACE_YCbCr
Return "YCbCr"
case WindowsICMProfileHeaderMBS.SPACE_Yxy
Return "Yxy"
case WindowsICMProfileHeaderMBS.SPACE_RGB
Return "RGB"
case WindowsICMProfileHeaderMBS.SPACE_GRAY
Return "GRAY"
case WindowsICMProfileHeaderMBS.SPACE_HSV
Return "HSV"
case WindowsICMProfileHeaderMBS.SPACE_HLS
Return "HLS"
case WindowsICMProfileHeaderMBS.SPACE_CMYK
Return "CMYK"
case WindowsICMProfileHeaderMBS.SPACE_CMY
Return "CMY"
case WindowsICMProfileHeaderMBS.SPACE_2_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_3_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_4_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_5_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_6_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_7_CHANNEL
Return "2 Channel"
case WindowsICMProfileHeaderMBS.SPACE_8_CHANNEL
```

```
Return "2 Channel"
else
Return "Unknown: "+hex(h.DataColorSpace)
end Select
end function
```

Notes:

The member can be any of value from the SPACE_* Constants.
(Read and Write property)

198.6.12 DateTime0 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data and time that the profile was created.
Notes: (Read and Write property)

198.6.13 DateTime1 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data and time that the profile was created.
Notes: (Read and Write property)

198.6.14 DateTime2 as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The data and time that the profile was created.
Notes: (Read and Write property)

198.6.15 IlluminantX as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: X value of the Profile illuminant.
Notes: (Read and Write property)

198.6.16 IlluminantY as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Y value of the Profile illuminant.
Notes: (Read and Write property)

198.6.17 IlluminantZ as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Z value of the Profile illuminant.
Notes: (Read and Write property)

198.6.18 Manufacturer as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The identification number of the device profile manufacturer.
Notes:

All manufacturer identification numbers are registered with the ICC.
(Read and Write property)

198.6.19 Model as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The device manufacturer's device model number.
Notes:

All model identification numbers are registered with the ICC.
(Read and Write property)

198.6.20 Platform as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The primary platform for which the profile was created.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PRO-
```

FILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

```
dim h as WindowsICMProfileHeaderMBS = w.ColorProfileHeader

MsgBox DecodingFromHexMBS(hex(h.Platform)) // shows platform, e.g. "APPL"
```

Notes:

The primary platform can be set to any of the following values.

Platform	Value
Apple Computer, Inc.	'APPL'
Microsoft Corp.	'MSFT'
Silicon Graphics, Inc.	'SGI'
Sun Microsystems, Inc.	'SUNW'
Taligent	'TGNT'

(Read and Write property)

198.6.21 ProfileFlags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Bit flags containing hints that the CMM uses to interpret the profile data.
Notes:

The member can be set to the following values.

Constant	Meaning
FLAG_EMBEDDEDPROFILE	The profile is embedded in a bitmap file.
FLAG_DEPENDENTONDATA	The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

(Read and Write property)

198.6.22 RenderingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The profile rendering intent.
Notes:

The member can be set to one of the following values:

INTENT_PERCEPTUALINTENT_SATURATIONINTENT_RELATIVE_COLORIMETRICINTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=VS.85).aspx
(Read and Write property)

198.6.23 Signature as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Reserved for internal use.
Notes: (Read and Write property)

198.6.24 Version as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The version number of the profile.
Notes:

The version number is determined by the ICC. The current major version number is & h02. The current minor version number is & h10. The major and minor version numbers are in binary coded decimal (BCD). They must be stored in the following format.

Byte Number	Contents
0	Major version number in BCD.
1	Minor version number in the most significant nibble of this byte. Bug fix version number in the least significant nibble.
2	Reserved. Must be set to 0.
3	Reserved. Must be set to 0.

(Read and Write property)

198.6.25 Constants

198.6.26 ATTRIB_MATTE = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the attribute constants.
Notes: Turns matte display on. If this flag is not used, the attribute is glossy by default.

198.6.27 ATTRIB_TRANSPARENCY = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the attribute constants.
Notes: Turns transparency on. If this flag is not used, the attribute is reflective by default.

198.6.28 CLASS_ABSTRACT = & h61627374

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Abstract Profile

198.6.29 CLASS_CAMP = & h6C616D70

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Color Appearance Model Profile

198.6.30 CLASS_COLORSPACE = & h73706163

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Color Space Conversion Profile

198.6.31 CLASS_GMMP = & h676D6D70

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Color Gamut Map Model Profile

198.6.32 CLASS_LINK = & h6C696E6B

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Device Link Profile

198.6.33 CLASS_MONITOR = & h6D6E7472

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Display Device Profile

198.6.34 CLASS_NAMED = & h6E6D636C

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Named Color Profile

198.6.35 CLASS_PRINTER = & h70727472

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Output Device Profile

198.6.36 CLASS_SCANNER = & h73636E72

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile class constants.
Notes: Input Device Profile

198.6.37 FLAG_DEPENDENTONDATA = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile flags.
Notes: The profile can't be used independently of the embedded color data. Used for profiles that are embedded in bitmap files.

198.6.38 FLAG_EMBEDDEDPROFILE = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile flags.
Notes: The profile is embedded in a bitmap file.

198.6.39 FLAG_ENABLE_CHROMATIC_ADAPTATION = & h02000000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile flags.

198.6.40 SPACE_2_CHANNEL = & h32434C52

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Generic 2 channel

198.6.41 SPACE_3_CHANNEL = & h33434C52

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Generic 3 channel

198.6.42 SPACE_4_CHANNEL = & h34434C52

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Generic 4 channel

198.6.43 SPACE_5_CHANNEL = & h35434C52

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Generic 5 channel

198.6.44 SPACE_6_CHANNEL = & h36434C52

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Generic 6 channel

198.6.45 SPACE_7_CHANNEL = & h37434C52

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Generic 7 channel

198.6.46 SPACE_8_CHANNEL = & h38434C52

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Generic 8 channel

198.6.47 SPACE_CMY = & h434D5920

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: CMY

198.6.48 SPACE_CMYK = & h434D594B

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: CMYK

198.6.49 SPACE_GRAY = & h47524159

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Gray scale

198.6.50 SPACE_HLS = & h484C5320

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: HLS

198.6.51 SPACE_HSV = & h48535620

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: HSV

198.6.52 SPACE_Lab = & h4C616220

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Lab

198.6.53 SPACE_Luv = & h4C757620

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Luv

198.6.54 SPACE_RGB = & h52474220

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: RGB

198.6.55 SPACE_XYZ = & h58595A20

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: XYZ

198.6.56 SPACE_YCbCr = & h59436272

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: YCbCr

198.6.57 SPACE_Yxy = & h59787920

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the color space constants.
Notes: Yxy

198.7 class WindowsICMProfileMBS

198.7.1 class WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a color profile.

198.7.2 Blog Entries

198.7.4 Methods

198.7.5 ConvertColorNameToIndex(name as string) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CMConvertColorNameToIndex function converts color names in a named color space to index numbers in a color profile.
Notes:

name: The name of the color.

Returns the color index.

This function is required in the default CMM. It is optional for all other CMMs.

198.7.6 ConvertIndexToColorName(index as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ConvertIndexToColorName transforms indices in a color space to an array of names in a named color space.
Notes: This function is required in the default CMM. It is optional for all other CMMs.

198.7.7 CountColorProfileElements as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetCountColorProfileElements function retrieves the number of tagged elements in a given color profile.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox "CountColorProfileElements: "+str(w.CountColorProfileElements)
```

Notes:

Returns number of tagged elements in the profile or 0 on any error.
This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP.

198.7.8 CreateIccProfile(options as Integer = 0) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 14.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts a WCS profile into an International Color Consortium (ICC) profile.
Notes:

Options: A flag value that specifies the profile conversion options.By default, the original WCS profiles used for the conversion are embedded in the output ICC profile in a Microsoft private tag, ProfilesTag (with signature "MS000". This produces an ICC profile that is compatible with ICC software, yet retains the original WCS profile data available to code designed to parse it.The possible values of this parameter are as follows. Any bits not defined in this list are reserved and should be set to zero:

WCS_DEFAULT	Specifies that the new ICC profile contains the original WCS profile in a private ProfilesTag.
WCS_ICCONLY	Specifies that the new ICC profile does not contain either the ProfilesTag or the original WCS profile.

Returns new profile object.

http://msdn.microsoft.com/en-us/library/windows/desktop/dd372239(v=vs.85).aspx

198.7.9 GetColorProfileElement(tag as Integer) as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorProfileElement function copies data from a specified tagged profile element of a specified color profile into a buffer.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("sRGB Profile.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox w.GetColorProfileElement(& h64657363) // that's the code for desc, the description
```

Notes:

tag: Identifies the tagged element from which to copy.

This function will fail if Profile is not a valid International Color Consortium (ICC) profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust XML parsing libraries.

198.7.10 GetColorProfileElementTag(index as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorProfileElementTag function retrieves the tag name specified by dwIndex in the tag table of a given International Color Consortium (ICC) color profile, where Index is a one-based index into that table.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXIST-
```

```
ING)
dim list(-1) as string
dim c as Integer = w.CountColorProfileElements-1

for i as Integer = 0 to c
list.Append DecodingFromHexMBS(hex(w.GetColorProfileElementTag(i)))
next

MsgBox "Tags: "+Join(list, ", ")
```

Notes:

Index: Specifies the one-based index of the tag to retrieve.

This function will fail if Profile is not a valid ICC profile.

GetColorProfileElementTag can be used to enumerate all tags in a profile after getting the number of tags in the profile using GetCountColorProfileElements.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with, and hard coded to, ICC tag types and there exist many robust XML parsing libraries.

198.7.11 GetNamedProfileInfo as WindowsICMNamedProfileInfoMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetNamedProfileInfo function retrieves information about the International Color Consortium (ICC) named color profile that is specified in the first parameter.
Notes:

This function will fail if hProfile is not a valid ICC profile.
This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because named profiles are explicit ICC profile types.
Returns nil on any error.

198.7.12 GetProfileData as string

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Given valid color profile, the GetProfileData function will return the contents of the profile.
Notes:

If the object is a Windows Color System (WCS) handle, then the DMP is returned and the CAMP and GMMP associated with the HPROFILE are ignored.

Returns the data or an empty string on any error.
See GetColorProfileFromHandle in MSDN documentation.

198.7.13 IsColorProfileTagPresent(tag as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IsColorProfileTagPresent function reports whether a specified International Color Consortium (ICC) tag is present in the specified color profile.
Notes:

tag: Specifies the ICC tag to check.

Returns true if the tag is valid and false if not.

This function will fail if Profile is not a valid ICC profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust XML parsing libraries.

198.7.14 IsValid as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The IsValid function reports whether the given profile is a valid ICC profile that can be used for color management.
Example:

```
dim file as FolderItem = SpecialFolder.Desktop.Child("test.icc")
dim w as WindowsICMProfileMBS = WindowsICMProfileMBS.OpenProfileFile(file, WindowsICMProfileMBS.PROFILE_READ, WindowsICMProfileMBS.FILE_SHARE_READ, WindowsICMProfileMBS.OPEN_EXISTING)

MsgBox "Valid: "+str(w.IsValid)
```

Notes:

Returns true if the profile is valid.

Only the Windows default CMM is required to export this function; it is optional for all other CMMs.

If a CMM does not support this function, Windows uses the default CMM to validate the profile.

198.7.15 OpenProfileData(data as string, DesiredAccess as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The OpenColorProfile function opens or create a color profile.
Notes:

file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

198.7.16 OpenProfileFile(file as folderitem, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The OpenColorProfile function opens or create a color profile.
Notes:

file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

Value	Meaning
FILE_SHARE_READ	Other open operations can be performed on the profile for read access.
FILE_SHARE_WRITE	Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.

Value	Meaning
CREATE_NEW	Creates a new profile. Fails if the profile already exists.
CREATE_ALWAYS	Creates a new profile. Overwrites the profile if it exists.
OPEN_EXISTING	Opens the profile. Fails if it does not exist
OPEN_ALWAYS	Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.
TRUNCATE_EXISTING	Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILEs. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn't exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

198.7.17 OpenProfilePath(path as string, DesiredAccess as Integer, ShareMode as Integer, CreationMode as Integer) as WindowsICMProfileMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The OpenColorProfile function opens or create a color profile.
Notes:

file: The file where to load profile from.
DesiredAccess: Specifies how to access the given profile. This parameter must take one the following constant values.

Value	Meaning
PROFILE_READ	Opens the profile for read access.
PROFILE_READWRITE	Opens the profile for both read and write access. Has no effect for WCS XML profiles.

ShareMode: Specifies how the profile should be shared, if the profile is contained in a file. A value of zero prevents the profile from being shared at all. The parameter can contain one or both of the following constants (combined by addition or logical OR).

Value	Meaning
FILE_SHARE_READ	Other open operations can be performed on the profile for read access.
FILE_SHARE_WRITE	Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

CreationMode: Specifies which actions to take on the profile while opening it, if it is contained in a file. This parameter must take one of the following constant values.

Value	Meaning
CREATE_NEW	Creates a new profile. Fails if the profile already exists.
CREATE_ALWAYS	Creates a new profile. Overwrites the profile if it exists.
OPEN_EXISTING	Opens the profile. Fails if it does not exist
OPEN_ALWAYS	Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.
TRUNCATE_EXISTING	Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

Returns the profile on success and nil on error.

For ICC and WCS profiles, a CAMP and GMMP are provided by the function based on the current default CAMP and GMMP in the registry.

When OpenColorProfile encounters an ICC profile with an embedded WCS profile, and if the dwType member within the Profile structure does not take the value DONT_USE_EMBEDDED_WCS_PROFILES, it should extract and use the WCS profile(s) contained in this WcsProfilesTag. The HPROFILE returned would be a WCS HPROFILE.

CreationMode flags CREATE_NEW, CREATE_ALWAYS, and TRUNCATE_EXISTING, will always return blank ICC HPROFILEs. If other CreationMode flags are present, InternalOpenColorProfile is called (using the flags as provided by the API) to determine whether the profile is ICC or WCS XML.

Within the ICC code path, an ICC Profile is returned using the requested sharing, access and creation flags as specified in the tables above.

Within the WCS path, the CreationMode flag OPEN_ALWAYS will fail if the profile doesn't exist, since WCS profiles cannot be created or edited within the WCS architecture (they must be edited outside of it, using MSXML6). For the same reason, dwShareMode flag FILE_SHARE_WRITE, and dwDesiredAccess

flag PROFILE_READWRITE are ignored within the WCS path.

When the function opens the ICC profile, it will look for a WcsProfilesTag and, if there is one, it will extract and use the original WCS profiles contained therein. (See WcsCreateIccProfile.)

An profile with WCS profile information is derived from a DMP by acquiring the default CAMP and default GMMP from the registry. An HPROFILE is a composition of a DMP, CAMP and GMMP.

198.7.18 SetColorProfileHeader(header as WindowsICMProfileHeaderMBS) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The SetColorProfileHeader function sets the header data in a specified ICC color profile.
Notes:

Header: the profile header data to write to the specified profile.

Returns true on success.

This function will fail if Profile is not a valid ICC profile.

If the color profile was not opened with read/write permission, SetColorProfileHeader fails.

SetColorProfileHeader overwrites the current header in the ICC profile.

This function does not support Windows Color System (WCS) profiles CAMP, DMP, and GMMP; because profile elements are implicitly associated with and hard coded to ICC tag types and there exist many robust XML parsing libraries.

198.7.19 Properties

198.7.20 ColorProfileHeader as WindowsICMProfileHeaderMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetColorProfileHeader function retrieves or derives ICC header structure from either ICC color profile or WCS XML profile.
Notes:

Drivers and applications should assume returning TRUE only indicates that a properly structured header

is returned. Each tag will still need to be validated independently using either legacy ICM2 APIs or XML schema APIs.

To determine whether the header is derived from an ICC or DMP profile handle, check the header signature (header bytes 36-39). If the signature is "acsp" (big endian) then an ICC profile was used. If the signature is "cdmp" (big-endian) then a DMP was used.

The distinguishing features that identify a header as having been "synthesized" for a WCS DMP are:

WindowsICMProfileHeaderMBS.Signature = 'pmdc' (little endian = big endian 'cdmp')
WindowsICMProfileHeaderMBS.CMMType = '1scw' (little endian = big endian 'wcs1').
(Read only property)

198.7.21 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal reference to the object.
Notes:

Value is a HPROFILE.
(Read and Write property)

198.7.22 Constants

198.7.23 CREATE_ALWAYS = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the creation mode constants.
Notes: Creates a new profile. Overwrites the profile if it exists.

198.7.24 CREATE_NEW = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the creation mode constants.
Notes: Creates a new profile. Fails if the profile already exists.

198.7.25 FILE_SHARE_READ = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile sharing flags.
Notes: Other open operations can be performed on the profile for read access.

198.7.26 FILE_SHARE_WRITE = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile sharing flags.
Notes: Other open operations can be performed on the profile for write access. Has no effect for WCS XML profiles.

198.7.27 OPEN_ALWAYS = 4

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the creation mode constants.
Notes: Opens the profile if it exists. For ICC profiles, if the profile does not exist, creates the profile. For WCS XML profiles, if the profile does not exist, returns an error.

198.7.28 OPEN_EXISTING = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the creation mode constants.
Notes: Opens the profile. Fails if it does not exist

198.7.29 PROFILE_READ = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile access flags.
Notes: Opens the profile for read access.

198.7.30 PROFILE_READWRITE = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the profile access flags.
Notes: Opens the profile for both read and write access. Has no effect for WCS XML profiles.

198.7.31 TRUNCATE_EXISTING = 5

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the creation mode constants.
Notes: Opens the profile, and truncates it to zero bytes, returning a blank ICC profile. Fails if the profile doesn't exist.

198.7.32 WCS_DEFAULT = 0

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the flags for the CreateICCProfile.
Notes: Specifies that the new ICC profile contains the original WCS profile in a private WcsProfilesTag.

198.7.33 WCS_ICCONLY = & h00010000

MBS Win Plugin, Plugin Version: 14.1.

Function: One of the flags for the CreateICCProfile.
Notes: Specifies that the new ICC profile does not contain either the WcsProfilesTag or the original WCS profile.

198.8 class WindowsICMSetupMBS

198.8.1 class WindowsICMSetupMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: This class is made to query color matching setup information from the user.
Notes: This class contains information that the Setup function uses to initialize the ColorManagement dialog box. After the user closes the dialog box, Setup returns information about the user's selection in this class.

198.8.2 Blog Entries

- MBS Xojo Plugins, version 21.6pr3
- MBS Real Studio Plugins, version 11.1pr11

198.8.3 Blog Entries

- MBS Xojo Plugins, version 21.6pr3
- MBS Real Studio Plugins, version 11.1pr11

198.8.4 Methods

198.8.5 Setup as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Setup function creates a Color Management dialog box that lets the user choose whether to enable color management, and if so, provides control over the color profiles used and over the rendering intent.
Notes: Returns true if the user clicked OK and false on any error or when dialog was cancelled.

198.8.6 Properties

198.8.7 DisplayName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string naming the monitor to be used for color management.
Notes:

If this is not the name of a valid monitor, the first enumerated monitor is used.
(Read and Write property)

198.8.8 Flags as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A set of bit flags used to initialize the dialog box.
Notes:

If set to 0 on entry, all controls assume their default states.

When the dialog box returns, these flags are set to indicate the user's input.

See CMS_* flag constants.
(Read and Write property)

198.8.9 MonitorProfile as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string in which to place the name of the user-selected monitor profile.
Notes:

If the CMS_SETMONITORPROFILE flag is used, this flag can also be used to select a profile other than the monitor default when the dialog is first displayed.
(Read and Write property)

198.8.10 Parent as Variant

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop only.

Function: The parent window.
Notes:

Can reference a Window or DesktopWindow object.
(Read and Write property)

198.8.11 PrinterName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string naming the printer on which the image is to be rendered.
Notes:

If this is not a valid printer name, the default printer is used and named in the dialog.
(Read and Write property)

198.8.12 PrinterProfile as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string in which to place the name of the user-selected printer profile.
Notes:

If the CMS_SETPRINTERPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed.
(Read and Write property)

198.8.13 ProofingIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of color management desired for the proofed image.
Notes:

Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=vs.85).aspx
(Read and Write property)

198.8.14 RenderIntent as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The type of color management desired.
Notes:

Valid values are:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

For more information, see Rendering Intents.
http://msdn.microsoft.com/en-us/library/dd372183(v=vs.85).aspx
(Read and Write property)

198.8.15 SourceName as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: An application-specified string which describes the source profile of the item for which color management is to be performed.
Notes:

If this is "", the Image Source control displays the name of the Windows default color profile.
(Read and Write property)

198.8.16 TargetProfile as String

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A string in which to place the name of the user-selected target profile for proofing.
Notes:

If the CMS_SETTARGETPROFILE flag is used, this flag can also be used to select a profile other than the printer default when the dialog is first displayed.
(Read and Write property)

198.8.17 Events

198.8.18 Apply

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: .

Function: This event is invoked when the Apply button of the Color Management dialog box is selected.

198.8.19 Idle

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: .

Function: This event is called regularly if the CMS_USEHOOK flag is used.

198.8.20 Constants

198.8.21 CMS_DISABLEICM = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag indicates that the "Enable Color Management" check box is cleared, disabling all other controls. If set on exit, it means that the user does not wish color management performed.

198.8.22 CMS_DISABLEINTENT = 1024

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.

198.8.23 CMS_DISABLERENDERINTENT = 2048

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.

198.8.24 CMS_ENABLEPROOFING = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag indicates that the Proofing controls are to be enabled, and the Proofing check box is checked. If set on exit, it means that the user wishes to perform color management for a different target device than the selected printer.

198.8.25 CMS_SETMONITORPROFILE = 16

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag indicates that the color management profile named in the MonitorProfile member is to be the initial selection in the monitor profile control. If the specified profile is not associated with the monitor, this flag is ignored, and the default profile for the monitor is used.

198.8.26 CMS_SETPRINTERPROFILE = 32

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag indicates that the color management profile named in the PrinterProfile member is to be the initial selection in the printer profile control. If the specified profile is not associated with the printer, this flag is ignored, and the default profile for the printer is used.

198.8.27 CMS_SETPROOFINTENT = 5

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: Ignored unless CMS_ENABLEPROOFING is also set. If set on entry, and CMS_ENABLEPROOFING is also set, this flag indicates that the ProofingIntent member is to be used to initialize the Target Rendering Intent control. Otherwise, the control defaults to Picture rendering. This flag is set on exit if proofing is enabled.

198.8.28 CMS_SETRENDERINTENT = 4

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag indicates that the RenderIntent member contains the value to use to initialize the Rendering Intent control. Otherwise, the control defaults to Picture rendering. This flag is set on exit if WCS is enabled.

198.8.29 CMS_SETTARGETPROFILE = 64

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag indicates that the color profile named in the TargetProfile member is to be the initial selection in the target profile control. If the specified profile is not installed, this flag is ignored, and the default profile for the printer is used. If the printer has no default profile, then the first profile in alphabetical order will be displayed.

198.8.30 CMS_USEAPPLYCALLBACK = 256

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag indicates that the SetupColorMatching function should call the Apply event.

198.8.31 CMS_USEDESCRIPTION = 512

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: If set on entry, this flag instructs the Setup function to retrieve the profile description contained in the profile description tags (See ICC Profile Format Specification v3.4). It will insert them into the Monitor Profile, Printer Profile, Emulated Device Profile edit boxes in the Color Management common dialog box.

198.8.32 CMS_USEHOOK = 128

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flag constants.
Notes: The idle event is called regularly if this flag is set.

198.8.33 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain the white point. Match the colors to their nearest color in the destination gamut.

198.8.34 INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain contrast. Used for photographs and natural images.

198.8.35 INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain colorimetric match. Used for graphic designs and named colors.

198.8.36 INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain saturation. Used for business charts and other situations in which undithered colors are required.

198.9 class WindowsICMTransformMBS

198.9.1 class WindowsICMTransformMBS

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a color transformation.

198.9.2 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.9.3 Blog Entries

- MBS Real Studio Plugins, version 11.1pr11

198.9.4 Methods

198.9.5 CheckColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, Results() as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CheckColors function determines whether the colors in an array lie within the output gamut of a specified transform.
Notes:

InputColors: an array of colors.
ctInput: Specifies the input color type.
Results: An array of nColors bytes that receives the results of the test.

If this function succeeds, the return value is TRUE.

If this function fails, the return value is FALSE. For extended error information, call GetLastError.

Remarks

If the input color type is not compatible with the color transform, CheckColors fails.

The function places results of the tests in the array pointed to by paResult. Each byte in the array corresponds to a COLOR element in the array pointed to by paInputColors and has an unsigned value between

0 and 255. The value 0 denotes that the color is in gamut, while a nonzero value denotes that it is out of gamut. For any integer n such that 0 <n <255, a result value of n+1 indicates that the corresponding color is at least as far out of gamut as would be indicated by a result value of n.

The out-of-gamut information in the gamut tags created in WCS use the perceptual color distance in CIECAM02, which is the mean square root in CIECAM02 Jab space. The distance in the legacy ICC profile gamut tags is the mean square root in CIELAB space. We recommend that you use the CIECAM02 space when it is available because it provides more perceptually accurate distance metrics.

198.9.6 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer)

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateColorTransform function creates a color transform that applications can use to perform color management.
Notes:

LogColorSpace: The input colorspace.

DestProfile: The profile of the destination device. The function determines whether the profile contains International Color Consortium (ICC) or Windows Color System (WCS) profile information.

TargetProfile: The profile of the target device. The function determines whether the profile contains ICC or WCS profile information.

Flags: Specifies flags to used control creation of the transform. See Remarks.

On success the handle property is not zero.

If the target profile is nil, the transform goes from the source logical color space to the destination profile. If the target profile is given, the transform goes from the source logical color space to the target profile and then to the destination profile. This allows previewing output meant for the target device on the destination device.

The values in Flags are intended as hints only. The color management module must determine the best way to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

PRESERVEBLACK	If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.
SEQUENTIAL_TRANSFORM	If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.

Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

WCS_ALWAYS	If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types of transforms, except for FAST_TRANSLATE, which only works in a pure ICC-to-ICC transform.

The CreateColorTransform function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

The B2Ax tags are required for any profile that is the target of a transform.

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS_ALWAYS set:

Non-RGB ColorSpace profiles
NamedColor profiles
n-channel profiles (where n >8)
DeviceLink profiles
Abstract profiles
See also:

- 198.9.7 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer) 28009

198.9.7 Constructor(Profiles() as WindowsICMProfileMBS, Intents() as Integer, Flags as Integer, indexPreferredCMM as Integer)

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The CreateMultiProfileTransform function accepts an array of profiles or a single device link

profile and creates a color transform that applications can use to perform color mapping.
Notes:

Profiles: An array of profiles to be used. The function determines whether the HPROFILEs contain International Color Consortium (ICC) or Windows Color System (WCS) profile information and processes them appropriately. When valid WCS profiles are returned by OpenColorProfile, these profiles contain the combination of DMP, CAMP, and GMMP profiles.
Intent: An array of intents to use. Each intent is one of the following values:

INTENT_PERCEPTUAL
INTENT_SATURATION
INTENT_RELATIVE_COLORIMETRIC
INTENT_ABSOLUTE_COLORIMETRIC

GMMPs are a generalization of intents. There are two possible sources of intents: the "destination" profile and the intent list parameter to CreateMultiProfileTransform. The term "destination" is not used since all but two of the profiles in the profile list parameter will serve as first destination and then source.

For more information, see Rendering Intents.

nIntents
Specifies the number of elements in the intents array: can either be 1 or the same value as nProfiles. For profile arrays that contain any WCS profiles, the first rendering intent is ignored and only nProfiles -1 elements are used for these profile arrays. The maximum number of nIntents is 10.

Flags: Specifies flags used to control creation of the transform.

indexPreferredCMM: Specifies the one-based index of the color profile that indicates what color management module (CMM) to use. The application developer may allow Windows to choose the CMM by setting this parameter to INDEX_DONT_CARE. See Using Color Management Modules (CMM) Third party CMMs are only available for ICC workflows. Profile arrays containing WCS profiles will ignore this flag. It is also ignored when only ICC profiles are used and when the WCS_ALWAYS flag is used.

On success the handle property is not zero.

If a device link profile is being used, the function will fail if Profiles contains more than one value.

The array of intents specifies how profiles should be combined. The nth intent is used for combining the nth profile in the array. If only one intent is specified, it is used for the first profile, and all other profiles are combined using Match intent.

The values in Flags are intended as hints only. The color management module must determine the best way

to use them.

Windows Vista: Three new flags have been added that can be used with dwFlags:

PRESERVEBLACK	If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.
SEQUENTIAL_TRANSFORM	If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.

Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

WCS_ALWAYS	If this bit is set, even all-ICC transforms will use the WCS code path.

For details, see CMM Transform Creation Flags. All of the flags mentioned there are supported for all types of transforms, except for FAST_TRANSLATE and USE_RELATIVE_COLORIMETRIC, which only work in a pure ICC-to-ICC transform.

The CreateMultiProfileTransform function is used outside of a device context. Colors may shift when transforming from a color profile to the same color profile. This is due to precision errors. Therefore, a color transform should not be performed under these circumstances.

We recommend that there be only one GMMP between a source and destination DMP. Gamut boundary descriptions (GBDs) are created from the DMP/CAMP combinations. The subsequent GMMPs use the GDBs prior to them in the processing chain until there exists a DMP/CAMP GBD next in the sequence to be used. For example, assume a sequence DMP1, CAMP1, GMMP1, GMMP2, GMMP3, DMP2, CAMP2, GMMP4, GMMP5, CAMP3, DMP3. Then GMMP1, GMMP2 use GBD1 as their source and destination. Then GMMP3 uses GBD1 as source and GBD2 as destination. Then GMMP4 uses GBD2 as source and destination. Finally GMMP5 uses GBD2 as source and GBD3 as destination. This assumes no GMMP is identical to one next to it.

For WCS profiles, we recommend that the rendering intents be set to DWORD_MAX in order to use the GMMP within the WCS profile handle. This is because the array of rendering intents takes precedence over the rendering intents or gamut mapping models specified or contained in the profiles specified by the PROFILEs. The array of rendering intents references the default GMMP for those rendering intents. Ideally, only one gamut mapping is performed between a source and destination device by setting one or the other GMMP to NULL when creating the HPROFILE with WCS profile information. Any legacy application that uses a WCS DMP will invoke a sequence of GMMPs. GDBs are chosen based on DMPs and CAMPs. For intermediate GMMP gamut boundaries, the source and destination GBDs are used.

In summary, if ubound(Intents)=0, then the first GMM is set based on the GMMP that is set as default* for the padwIntent value, unless that value is DWORD_MAX, in which case the embedded GMM information from the second profile is used (The embedded GMM information is either a GMMP or, in the case of an ICC profile, the baseline GMM corresponding to** the intent from the profile header). The remainder of the GMMs are set based on the GMMP that is set as default* for RelativeColorimetric.

If ubound(Intents) = ubound(Profiles) - 1, then each GMM is set based on the GMMP that is set as default* for the value in the padwIntent array at the corresponding index, except where padwIntent values are DWORD_MAX. For values in the padwIntent array that are DWORD_MAX, the GMMs at corresponding positions are set based on the embedded GMM information from the second of the two profiles whose gamuts are mapped by the GMM. (Again, the embedded GMM information is either a GMMP or, in the case of an ICC profile, the baseline GMM corresponding to** the intent from the profile header).

If ubound(Intents) = ubound(Profiles), then first intent is ignored and funtion behaves as it does in the case when ubound(Intents) = ubound(Profiles) - 1.

Any other combination of padwIntents and nIntents will return an error.

- ”set as default” means that the default GMMP is queried using WcsGetDefaultColorProfile with its profileManagementScope parameter set to WCS_PROFILE_MANAGEMENT_SCOPE_CURRENT_USER. This may return either current-user or system-wide defaults as described in the documentation for WcsGetDefaultColorProfile.

- ”GMM corresponding to” does not mean ”GMM from the GMMP set as default for”. Instead it means ”a constant association between ICC profile intents and baseline GMM algorithms.”

WCS transform support for ICC ColorSpace profiles is limited to RGB colorspace profiles. The following ICC profile types cannot be used in a CITE-processed transform, either a mixed WCS/ICC transform or an all-ICC transform with WCS_ALWAYS set:

- Non-RGB ColorSpace profiles
- NamedColor profiles
- n-channel profiles (where n >8)
- DeviceLink profiles
- Abstract profiles

See also:

- 198.9.6 Constructor(LogColorSpace as WindowsICMLogColorSpaceMBS, DestProfile as WindowsICMProfileMBS, TargetProfile as WindowsICMProfileMBS, Flags as Integer) 28008

198.9.8 GetCMMInfo(what as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The GetCMMInfo function retrieves various information about the color management module (CMM) that created the specified color transform.
Notes:

what: Specifies the information to be retrieved. This parameter can take one of the following constant values.

Value	Meaning
CMM_WIN_VERSION	Retrieves the version of Windows targeted by the color management module (CMM).
CMM_DLL_VERSION	Retrieves the version number of the CMM.
CMM_IDENT	Retrieves the CMM signature registered with the International Color Consortium (ICC).

If this function succeeds, the return value is the information specified in What.
If this function fails, the return value is zero.

198.9.9 TranslateBitmapBits(SrcBits as memoryblock, InputType as Integer, Width as Integer, Height as Integer, InputRowBytes as Integer, DestBits as memoryblock, DestType as Integer, DestRowBytes as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.
Notes:

SrcBits: Pointer to the bitmap to translate.
InputType: Specifies the format of the input bitmap. Use one of the BM_* constants.
Width: Specifies the number of pixels per scan line in the input bitmap.
Height: Specifies the number of scan lines in the input bitmap.
InputRowBytes: Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the input bitmap; if set to zero, the function assumes that scan lines are padded so as to be DWORD-aligned.
DestBits: Pointer to the buffer in which to place the translated bitmap.
DestType: Specifies the format of the output bitmap. Use one of the BM_* constants.
DestRowBytes: Specifies the number of bytes from the beginning of one scan line to the beginning of the next in the output bitmap; if set to zero, the function assumes that scan lines should be padded to be DWORD-aligned.

If this function succeeds, the return value is TRUE.

If this function fails, the return value is FALSE.

Remarks

If the input and output formats are not compatible with the color transform, this function fails.

When either of the floating point BMFORMATs, BM_32b_scARGB or BM_32b_scRGB are used, the color data being translated should not contain NaN or infinity. NaN and infinity are not considered to represent legitimate color component values, and the result of translating pixels containing NaN or infinity is meaningless in color terms. NaN or infinity values in the color data being processed will be handled silently, and an error will not be returned.

198.9.10 TranslateColors(InputColors() as WindowsICMColorMBS, ctInput as Integer, OutputColors() as WindowsICMColorMBS, ctOutput as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TranslateColors function translates an array of colors from the source color space to the destination color space as defined by a color transform.
Notes:

InputColors: The input color.
ctInput: Specifies the input color type.
OutputColors: The output color.
ctOutput: Specifies the output color type.

Returns true on success and false on failure.

198.9.11 TranslatePictures(InputPicture as picture, OutputPicture as picture) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The TranslateBitmapBits function translates the colors of a bitmap having a defined format so as to produce another bitmap in a requested format.
Notes:

InputPicture: input picture
OutputPicture: output picture

If this function succeeds, the return value is TRUE.

If this function fails, the return value is FALSE.

Make sure the pictures have the same size.

If the input and output formats are not compatible with the color transform, this function fails.

198.9.12 Properties

198.9.13 Handle as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal handle for the transformation.
Notes: (Read and Write property)

198.9.14 Events

198.9.15 Progress(Maximum as Integer, Current as Integer) as boolean

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: .

Function: The progress event for long operations.

198.9.16 Constants

198.9.17 BEST_MODE = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes: Transform will be used for the display of the highest-quality image possible on the target device.

198.9.18 BM_10b_G3CH = & h0404

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

198.9.19 BM_10b_Lab = & h0403

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

198.9.20 BM_10b_RGB = 9

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

198.9.21 BM_10b_XYZ = & h0401

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

198.9.22 BM_10b_Yxy = & h0402

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 10 bits are used for each color channel. The 2 most significant bits are ignored.

198.9.23 BM_16b_G3CH = & h0504

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

198.9.24 BM_16b_GRAY = & h0505

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. All other bits are ignored.

198.9.25 BM_16b_Lab = & h0503

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

198.9.26 BM_16b_RGB = 10

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

198.9.27 BM_16b_XYZ = & h0501

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

198.9.28 BM_16b_Yxy = & h0502

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 16 bits are used for the gray-scale value. Each of the three color channels uses 16 bits.

198.9.29 BM_32b_scARGB = & h0602

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 128 bits per pixel. 32 bits are used for each color channel, as defined by the IEEE 32-bit floating point standard.

198.9.30 BM_32b_scRGB = & h0601

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 96 bits per pixel. 32 bits are used for each color channel, as defined by the IEEE 32-bit floating point standard.

198.9.31 BM_565RGB = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 16 bits per pixel. 5 bits are used for red, 6 for green, and 5 for blue.

198.9.32 BM_5CHANNEL = & h0205

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 40 bits per pixel. 8 bits apiece are used for each channel.

198.9.33 BM_6CHANNEL = & h0206

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 48 bits per pixel. 8 bits apiece are used for each channel.

198.9.34 BM_7CHANNEL = & h0207

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 56 bits per pixel. 8 bits apiece are used for each channel.

198.9.35 BM_8CHANNEL = & h0208

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. 8 bits apiece are used for each channel.

198.9.36 BM_BGRTRIPLETS = 4

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

198.9.37 BM_CMYKQUADS = & h0020

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel.

198.9.38 BM_G3CHTRIPLETS = & h0204

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel values, the total size is 24 bits per pixel. For single channel gray scale, the total size is 8 bits per pixel.

198.9.39 BM_GRAY = & h0209

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. Only the 8 bit gray-scale value is used.

198.9.40 BM_KYMCQUADS = & h0305

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel.

198.9.41 BM_LabTRIPLETS = & h0203

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel, L, a, and b values, the total size is 24 bits per pixel. For single channel gray scale, the total size is 8 bits per pixel.

198.9.42 BM_NAMED_INDEX = & h0405

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. Named color indices. Index numbering begins at one.

198.9.43 BM_R10G10B10A2 = & h0701

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: Only in Windows Vista.

198.9.44 BM_R10G10B10A2_XR = & h0702

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: Only in Windows Vista.

198.9.45 BM_R16G16B16A16_FLOAT = & h0703

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: Only in Windows Vista.

198.9.46 BM_RGBTRIPLETS = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

198.9.47 BM_S2DOT13FIXED_scARGB = & h0604

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 64 bits per pixel. Color data is stored as one 16-bit word per channel, with a fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for the sign, 2 bits for the integer portion, and 13 bits for the fractional portion.

198.9.48 BM_S2DOT13FIXED_scRGB = & h0603

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 48 bits per pixel. Color data is stored as one 16-bit word per channel, with a fixed range of -4 to +4, inclusive. A signed format is used, with 1 bit for the sign, 2 bits for the integer portion, and 13 bits for the fractional portion.

198.9.49 BM_x555G3CH = & h0104

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 16 bits per pixel. G3CH color space. 5 bits per channel. The most significant bit is ignored.

198.9.50 BM_x555Lab = & h0103

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 16 bits per pixel. Lab color space. 5 bits per channel. The most significant bit is ignored.

198.9.51 BM_x555RGB = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 16 bits per pixel. RGB color space. 5 bits per channel. The most significant bit is ignored.

198.9.52 BM_x555XYZ = & h0101

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 16 bits per pixel. Yxy color space. 5 bits per channel. The most significant bit is ignored.

198.9.53 BM_x555Yxy = & h0102

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 16 bits per pixel. Yxy color space. 5 bits per channel. The most significant bit is ignored.

198.9.54 BM_xBGRQUADS = & h0010

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel. The most significant byte is ignored.

198.9.55 BM_xG3CHQUADS = & h0304

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel. The most significant byte is ignored.

198.9.56 BM_xRGBQUADS = & h0008

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 32 bits per pixel. 8 bits are used for each color channel. The most significant byte is ignored.

198.9.57 BM_XYZTRIPLETS = & h0201

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel colors, such as red, green, and blue, the total size is 24 bits per pixel. For single channel colors, such as gray, the total size is 8 bits per pixel.

198.9.58 BM_YxyTRIPLETS = & h0202

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the bitmap format constants.
Notes: 24 bits per pixel maximum. For three channel, Y, x, and y values, the total size is 24 bits per pixel. For single channel gray scale, the total size is 8 bits per pixel.

198.9.59 CMM_DESCRIPTION = 5

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: A text string that describes the color management module.

198.9.60 CMM_DLL_VERSION = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the values for the GetCMMInfo function.
Notes: Retrieves the version number of the CMM.

198.9.61 CMM_DRIVER_VERSION = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.

198.9.62 CMM_FROM_PROFILE = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.

198.9.63 CMM_IDENT = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the values for the GetCMMInfo function.
Notes: Retrieves the CMM signature registered with the International Color Consortium (ICC).

198.9.64 CMM_LOGOICON = 6

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: The logo icon for this CMM.

198.9.65 CMM_VERSION = 4

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.
Notes: Version of Windows supported.

198.9.66 CMM_WINDOWS_DEFAULT = & h57696E20

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the info selectors for GetInfo.

198.9.67 CMM_WIN_VERSION = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the values for the GetCMMInfo function.
Notes: Retrieves the version of Windows targeted by the color management module (CMM).

198.9.68 ENABLE_GAMUT_CHECKING = & h10000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes: Use this transform for gamut checking.

198.9.69 FAST_TRANSLATE = & h40000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes: Look up color only. Do not interpolate the color.

198.9.70 INDEX_DONT_CARE = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: A special value for index in constructor.
Notes: The application developer may allow Windows to choose the CMM by setting the indexPreferredCMM parameter to INDEX_DONT_CARE for the constructor.

198.9.71 INTENT_ABSOLUTE_COLORIMETRIC = 3

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain the white point. Match the colors to their nearest color in the destination gamut.

198.9.72 INTENT_PERCEPTUAL = 0

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain contrast. Used for photographs and natural images.

198.9.73 INTENT_RELATIVE_COLORIMETRIC = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain colorimetric match. Used for graphic designs and named colors.

198.9.74 INTENT_SATURATION = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the rendering intent constants.
Notes: Maintain saturation. Used for business charts and other situations in which undithered colors are required.

198.9.75 NORMAL_MODE = 2

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes: Transform will be used for normal image display. Average image quality.

198.9.76 PRESERVEBLACK = & h100000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes: If this bit is set, the transform engine inserts the appropriate black generation GMMP as the last GMMP in the transform sequence. This flag only works in a pure WCS transform.

198.9.77 PROOF_MODE = 1

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes: Transform will be used to preview the image. Low image quality.

198.9.78 SEQUENTIAL_TRANSFORM = & h80800000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes:

If this bit is set, each step in the WCS processing pipeline is performed for every pixel in the image and no optimized color transform is built. This flag only works in a pure WCS transform.
Restrictions: A transform created with the SEQUENTIAL_TRANSFORM flag set may only be used in the thread on which it was created and only for one color translation call at a time. COM must be initialized prior to creating the sequential transform and must remain initialized for the lifetime of the transform object.

198.9.79 USE_RELATIVE_COLORIMETRIC = & h20000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.

198.9.80 WCS_ALWAYS = & h200000

MBS Win Plugin, Plugin Version: 11.1.

Function: One of the flags passed when creating a transformation.
Notes: If this bit is set, even all-ICC transforms will use the WCS code path.

Chapter 199

Windows Location

199.1 class WindowsLocationExceptionMBS

199.1.1 class WindowsLocationExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for errors in the Windows Location API.
Notes: Subclass of the RuntimeException class.

199.1.2 Blog Entries

- News from the MBS Xojo Plugins Version 20.4
- MBS Xojo Plugins, version 20.4pr2

199.1.3 Blog Entries

- News from the MBS Xojo Plugins Version 20.4

199.2 class WindowsLocationManagerMBS

199.2.1 class WindowsLocationManagerMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for accessing Location API on Windows.
Notes:

You may need to StartEvents to later query location or receive events.

see MSDN for details:
https://docs.microsoft.com/en-us/windows/win32/locationapi/windows-location-api-portal

See CLLocationManagerMBS class for macOS.

199.2.4 Methods

199.2.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.

199.2.6 RequestPermissions(win as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Opens a system dialog box to request user permission to enable location devices.
Notes: win: the parent window for the dialog.
See also:

• 199.2.7 RequestPermissions(win as window) 28031

199.2.7 RequestPermissions(win as window)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Opens a system dialog box to request user permission to enable location devices.
Notes: win: the parent window for the dialog.
See also:

• 199.2.6 RequestPermissions(win as DesktopWindow) 28030

199.2.8 StartEvents(RequestedReportInterval as Integer = 0)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts events.
Notes: Should be called once to start events and get LocationChanged or StatusChanged to work.

199.2.9 StopEvents

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stop events.

199.2.10 Properties

199.2.11 DesiredAccuracy as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current requested accuracy setting.
Notes:

See kLocationDesiredAccuracyHigh and kLocationDesiredAccuracyDefault constants.
(Read and Write property)

199.2.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

199.2.13 Report as WindowsLocationMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a location report.
Notes:

When Report is called, it may result in a notification being displayed in the taskbar, and a Location Activity event being logged in Event Viewer, if it is the application's first use of location.
(Read only property)

199.2.14 ReportInterval as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The requested amount of time, in milliseconds, between report events.
Notes:

If this value is set to zero, no minimum interval is specified and your application receives events at the location sensor's default interval.
(Read and Write property)

199.2.15 ReportStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the status for the specified report type.
Notes: (Read only property)

199.2.16 Events

199.2.17 LocationChanged(Report as WindowsLocationMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: .

Function: Called when a new location report is available.
Notes: If the application calls LocationChanged as a result of its first use of location, the call might cause a notification to appear in the taskbar, and cause a Location Activity event to be logged in Event Viewer.

199.2.18 StatusChanged(Status as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: .

Function: Called when a report status changes.
Notes: This event provides report status for new reports. The most recent reports remain available through GetReport, regardless of the status reported by this event.

199.2.19 Constants

199.2.20 kLocationDesiredAccuracyDefault = 0

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the possible desired accuracy types.
Notes: The sensor should use the accuracy for which it can optimize power use and other cost considerations.

199.2.21 kLocationDesiredAccuracyHigh = 1

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the possible desired accuracy types.
Notes: The sensor should deliver the most accurate report possible. This includes using services that might charge money, or consuming higher levels of battery power or connection bandwidth.

199.2.22 kLocationReportStatusAccessDenied = 2

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the location report status value constants.
Notes: No permissions have been granted to access this report type. Call RequestPermissions.

199.2.23 kLocationReportStatusError = 1

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the location report status value constants.
Notes: There was an error when creating the report, or location providers for the requested type are unable to provide any data. Location providers might be currently unavailable, or location providers cannot obtain any data. For example, this state may occur when a GPS sensor is indoors and no satellites are in view.

199.2.24 kLocationReportStatusInitializing = 3

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the location report status value constants.
Notes: The report is being initialized.

199.2.25 kLocationReportStatusNotSupported = 0

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the location report status value constants.
Notes: The requested report type is not supported by the API. No location providers of the requested type are installed.

199.2.26 kLocationReportStatusRunning = 4

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the location report status value constants.
Notes: The report is running. New location data for the requested report type is available.

199.3 class WindowsLocationMBS

199.3.1 class WindowsLocationMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: WindowsLocationMBS represents a location report that contains information in the form of latitude and longitude.
Notes:

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

199.3.2 Blog Entries

- News from the MBS Xojo Plugins Version 20.4
- MBS Xojo Plugins, version 20.4pr2

199.3.3 Blog Entries

- News from the MBS Xojo Plugins Version 20.4
- MBS Xojo Plugins, version 20.4pr2

199.3.4 Methods

199.3.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

199.3.6 Properties

199.3.7 Altitude as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the altitude, in meters.
Notes:

Altitude is relative to the reference ellipsoid.

The Altitude property retrieves the altitude relative to the reference ellipsoid that is defined by the latest revision of the World Geodetic System (WGS 84), rather than the altitude relative to sea level.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

199.3.8 AltitudeError as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the altitude error, in meters.
Notes:

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

199.3.9 DateTime as DateTime

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the date and time when the report was generated.
Notes:

Time stamps are provided as Coordinated Universal Time (UTC).
(Read only property)

199.3.10 ErrorRadius as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves a distance from the reported location, in meters.
Notes:

Combined with the location reported as the origin, this radius describes the circle in which the actual location is probably located.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

199.3.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read and Write property)

199.3.12 Latitude as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the latitude, in degrees.
Notes:

The latitude is between -90 and 90, where north is positive.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

199.3.13 Longitude as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the longitude, in degrees.
Notes:

The longitude is between -180 and 180, where East is positive.

Querying the property may raise a WindowsLocationExceptionMBS if this field is not available.
(Read only property)

199.3.14 SensorID as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the ID of the sensor that generated the location report.
Notes:

Provided as formatted UUID.
Maybe all zero if ID is not provided by OS.
(Read only property)

199.3.15 Timestamp as Date

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Retrieves the date and time when the report was generated.
Notes:

Time stamps are provided as Coordinated Universal Time (UTC).
(Read only property)

Chapter 200

Windows Media Foundation

200.1 class MFPMediaItemMBS

200.1.1 class MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: An item to playback.
Notes:

Can be loaded asynchronously before playing, so you can preload the next file while another is playing.
For Windows 7, Windows Server 2008 R2 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

200.1.2 Blog Entries

- News from the MBS Xojo Plugins Version 23.2
- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.2

- MonkeyBread Software Releases the MBS Xojo Plugins in version 23.2
- MBS Xojo Plugins, version 23.2pr1
- MBS Xojo Plugins, version 19.6pr4

200.1.4 Methods

200.1.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

200.1.6 PresentationAttribute(UUID as String) as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the media item for a presentation attribute.
Notes:

see
https://docs.microsoft.com/windows/win32/medfound/presentation-descriptor-attributes

If needed a future MBS Plugin version could include explicit properties for some of those values.

200.1.7 StreamAttribute(index as Integer, UUID as String) as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the media item for a stream attribute.
Notes:

see
https://docs.microsoft.com/windows/win32/medfound/stream-descriptor-attributes

200.1.8 Properties

200.1.9 AudioBitsPerSample as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of bits per audio sample in an audio media type.
Notes:

e.g. 16
(Read only property)

200.1.10 AudioChannels as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of audio channels in an audio media type.
Notes:

e.g. 1
(Read only property)

200.1.11 AudioSamplesPerSecond as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Number of audio samples per second in an audio media type.
Notes:

e.g. 44100
(Read only property)

200.1.12 CanPause as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media item can pause.
Notes:

If this flag is absent, the Pause method will likely fail.
(Read only property)

200.1.13 CanSeek as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media item supports seeking.
Notes:

If this flag is absent, setting the Position property will fail.
(Read only property)

200.1.14 Duration as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the duration of the media item.
Notes: (Read only property)

200.1.15 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

200.1.16 HasAudio as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains an audio stream.
Notes:

Returns the value true if the media item contains at least one audio stream, or false otherwise.
(Read only property)

200.1.17 HasAudioSelected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains an audio stream.
Notes:

Returns the value true if at least one audio stream is selected, or false otherwise.

To select or deselect streams before playback starts, set StreamSelection(index).
(Read only property)

200.1.18 HasSlowSeek as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Seeking can take a long time.
Notes:

For example, the source might download content through HTTP.
(Read only property)

200.1.19 HasVideo as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains a video stream.
Notes:

Returns the value true if the media item contains at least one video stream, or false otherwise.
(Read only property)

200.1.20 HasVideoSelected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains a video stream.
Notes:

Returns the value true if at least one video stream is selected, or false otherwise.

To select or deselect streams before playback starts, set StreamSelection(index).
(Read only property)

200.1.21 IsLive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The media item represents a live data source, such as video camera.
Notes:

If playback is stopped and then restarted, there will be a gap in the content.
(Read only property)

200.1.22 IsProtected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries whether the media item contains protected content.
Notes:

If true then the media item contains protected content. Attempting to play this media item will cause a playback error.
(Read only property)

200.1.23 Metadata as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a dictionary that contains metadata for the source, such as author or title.
Notes: (Read only property)

200.1.24 NumberOfStreams as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of streams (audio, video, and other) in the media item.
Notes: (Read only property)

200.1.25 StartPosition as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The start time for the media item.
Notes:

The adjusted start and stop times are used the next time that SetMediaItem is called with this media item. If the media item is already set on the player, the change does not happen unless you call SetMediaItem again.
(Read and Write property)

200.1.26 StopPosition as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The stop time for the media item.
Notes:

The adjusted start and stop times are used the next time that SetMediaItem is called with this media item. If the media item is already set on the player, the change does not happen unless you call SetMediaItem again.
(Read and Write property)

200.1.27 Tag as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The tag value associated with this plugin object.
Notes:

Can be used freely by you.
(Read and Write property)

200.1.28 URL as String

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the URL that was used to create the media item.
Notes: (Read only property)

200.1.29 VideoFrameRate as Variant

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Frame rate of a video media type, in frames per second.
Notes:

The frame rate is expressed as a ratio. The upper 32 bits of the attribute value contain the numerator and the lower 32 bits contain the denominator. For example, if the frame rate is 30 frames per second (fps), the ratio is 30/1. If the frame rate is 29.97 fps, the ratio is 30,000/1001.

e.g. 2147483648016679, which gives with BitWise.ShiftRight(v, 32) the value 500000 and with BitWise-And(v, & hFFFFFFFF) the value 16679. 500000/16679 gives 29.97.
(Read only property)

200.1.30 StreamSelection(index as Integer) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Selects or deselects a stream.
Notes:

Zero-based index of the stream. To get the number of streams, call NumberOfStreams.

Set to true: The stream is selected. During playback, this stream will play.
Set to false: The stream is not selected. During playback, this stream will not play.
(Read and Write computed property)

200.2 class MFPMediaPlayerExceptionMBS

200.2.1 class MFPMediaPlayerExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for an error with MFPMediaPlayerMBS class.
Notes:

See ErrorCode and Message properties.
Subclass of the RuntimeException class.

200.2.2 Blog Entries

- MBS Xojo Plugins, version 19.6pr4

200.2.3 Blog Entries

200.3 class MFPMediaPlayerMBS

200.3.1 class MFPMediaPlayerMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The Windows Media Foundation Media Player class.
Notes:

An alternative movie and audio player for Xojo.
For Windows 7, Windows Server 2008 R2 or newer.

200.3.8 Methods

200.3.9 ClearMediaItem

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Clears the current media item.
Notes:

This method stops playback and releases the player object's references to the current media item.
This method completes asynchronously. When the operation completes, the MediaItemCleared event is invoked. The event type is

200.3.10 Constructor(URL as String = """, StartPlayback as Boolean = false)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the MFPlay player object for audio only.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Please call this in main thread of application only.
See also:

- 200.3.11 Constructor(URL as String, StartPlayback as Boolean, control as DesktopControl) 28049
- 200.3.12 Constructor(URL as String, StartPlayback as Boolean, control as RectControl) 28049
- 200.3.13 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer) 28050

- 200.3.14 Constructor(URL as String, StartPlayback as Boolean, win as DesktopWindow) 28051
- 200.3.15 Constructor(URL as String, StartPlayback as Boolean, win as Window) 28052

200.3.11 Constructor(URL as String, StartPlayback as Boolean, control as DesktopControl)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Control: A reference to a control where the video will appear. For audio-only playback, this parameter can be nil.

The control specified is used for the first selected video stream in the source.
If control is nil, MFPlay will not display any video.

Please call this in main thread of application only.
See also:

- 200.3.10 Constructor(URL as String = """, StartPlayback as Boolean = false) 28048
- 200.3.12 Constructor(URL as String, StartPlayback as Boolean, control as RectControl) 28049

- 200.3.15 Constructor(URL as String, StartPlayback as Boolean, win as Window) 28052

200.3.12 Constructor(URL as String, StartPlayback as Boolean, control as RectControl)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Control: A reference to a control where the video will appear. For audio-only playback, this parameter can be nil.

The control specified is used for the first selected video stream in the source.
If control is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 200.3.11 Constructor(URL as String, StartPlayback as Boolean, control as DesktopControl) 28049
- 200.3.13 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer) 28050
- 200.3.14 Constructor(URL as String, StartPlayback as Boolean, win as DesktopWindow) 28051
- 200.3.15 Constructor(URL as String, StartPlayback as Boolean, win as Window) 28052

200.3.13 Constructor(URL as String, StartPlayback as Boolean, Handle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Handle: A handle to a window or control where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.
See also:

- 200.3.15 Constructor(URL as String, StartPlayback as Boolean, win as Window) 28052

200.3.14 Constructor(URL as String, StartPlayback as Boolean, win as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Win: A reference to a window where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 200.3.15 Constructor(URL as String, StartPlayback as Boolean, win as Window) 28052

200.3.15 Constructor(URL as String, StartPlayback as Boolean, win as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop only.

Function: Creates a new instance of the MFPlay player object.
Notes:

URL: The string that contains the URL of a media file to open. This parameter can be empty. If the parameter is empty, StartPlayback must be false.
If this parameter is empty, you can open a URL later by calling CreateMediaItemFromURL.

StartPlayback: If true, playback starts automatically. If false, playback does not start until the application calls Play method. If URL is empty, this parameter is ignored.

Win: A reference to a window where the video will appear. For audio-only playback, this parameter can be nil.

The window specified is used for the first selected video stream in the source.

If windows is nil, MFPlay will not display any video.

Please call this in main thread of application only.

- 200.3.14 Constructor(URL as String, StartPlayback as Boolean, win as DesktopWindow) 28051

200.3.16 CreateMediaItemFromURL(URL as String, Sync as Boolean = true, tag as Variant = nil) as MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a media item from a URL.
Notes:

URL: String that contains the URL of a media file.
Sync: If true, the method blocks until it completes. If false, the method does not block and completes asynchronously.

If fSync is true, we return the item on success.

This method does not queue the media item for playback. To queue the item for playback, set MediaItem property.

The CreateMediaItemFromURL method can be called either synchronously or asynchronously:

If Sync is true, the method completes synchronously and returns the new item.
If Sync is false, the method completes asynchronously. When the operation completes, the MediaItemCreated event is invoked. The event call passes the new media item.

If you make multiple asynchronous calls to CreateMediaItemFromURL, they are not guaranteed to complete in the same order. Use the tag to pass data to the event.

Currently, this method raises an error if the URL specifies any of the following protocols: rtsp*, mms*, or mcast.

200.3.17 FrameStep

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Steps forward one video frame.
Notes:

This method completes asynchronously. When the operation completes, the FrameStepped event is raised.

The player object does not support frame stepping during reverse playback (that is, while the playback rate is negative).

200.3.18 GetVideoSourceRect(byref Left as Single, byref Top as Single, byref Right as Single, byref Bottom as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the video source rectangle.
Notes:

This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).
If the source rectangle is { 0, 0, 1, 1 } , the entire image is displayed. This is the default value.

200.3.19 InsertEffect(CLSID as String, isOptional as boolean = false) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Applies an audio or video effect to playback.
Notes:

Please pass class id of a Media Foundation transform (MFT) that implements the effect. MFTs expose the IMFTransform interface.

isOptional specifies whether the effect is optional.

Value	Meaning
True	The effect is optional. If the MFPlay player object cannot add the effect, it ignores the effect and continues playback.
False	If the MFPlay player object cannot add the effect, a playback error occurs.

Returns index of the effect, which you pass for RemoveEffect later if needed.

The effect is applied to any media items set after the method is called. It is not applied to the current media item.

For each media item, the effect is applied to the first selected stream of the matching type (audio or video). If a media item has two selected streams of the same type, the second stream does not receive the effect. The effect is ignored if the media item does not contain a stream that matches the effect type. For example, if you set a video effect and play a file that contains just audio, the video effect is ignored, although no error is raised.

The effect is applied to all subsequent media items, until the application removes the effect. To remove an effect, call RemoveEffect or RemoveAllEffects.

If you set multiple effects of the same type (audio or video), they are applied in the same order in which you call InsertEffect.

Remote Playback Optimizations

Audio and video effects might be incompatible with optimizations that are used for remote playback. The following remarks apply only to audio or video effects that are actually used during playback:
If you mark an audio or video effect as required, by setting fOptional to false, MFPlay disables remote playback optimizations.
Otherwise, if all audio/video effects are marked as optional, MFPlay might drop the effects, in order to enable remote playback optimizations.
In other words, required effects have priority over remote optimizations, but optional effects do not.

Non-audio, non-video effects do not affect remote optimizations. Also, if you insert a required effect but the source does not contain any streams of that type, remote optimizations are not disabled.

200.3.20 Pause

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Pauses playback.
Notes:

While playback is paused, the most recent video frame is displayed, and audio is silent.

This method completes asynchronously. When the operation completes, the application's Paused event is invoked.

200.3.21 Play

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Starts playback.
Notes: This method completes asynchronously. When the operation completes, the Started event is raised.

200.3.22 RemoveAllEffects

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes all effects that were added with the InsertEffect method.
Notes: The change applies to the next media item that is set on the player. The effects are not removed from the current media item.

200.3.23 RemoveEffect(Handle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes an effect that was added with the InsertEffect method.
Notes:

Please pass the number returned by InsertEffect.

The change applies to the next media item that is set on the player. The effect is not removed from the current media item.

200.3.24 SetVideoSourceRect(Left as Single, Top as Single, Right as Single, Bottom as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the video source rectangle.
Notes:

MFPlay clips the video to this rectangle and stretches the rectangle to fill the video window.

This rectangle defines which portion of the video is displayed. It is specified in normalized coordinates, which are defined as follows:
The upper-left corner of the video image is (0, 0).
The lower-right corner of the video image is (1, 1).

To display the entire image, set the source rectangle to { 0, 0, 1, 1 } . This is the default value.

MFPlay stretches the source rectangle to fill the entire video window. By default, MFPlay maintains the source's correct aspect ratio, letterboxing if needed. The letterbox color is controlled by the BorderColor property.

This method fails if no media item is currently set, or if the current media item does not contain video.
To set the video position before playback starts, call this method inside your MediaItemSet event.

200.3.25 Shutdown

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Shuts down the MFPlay player object and releases any resources the object is using.
Notes:

After this method is called, most IMFPMediaPlayer methods raise exception about shutdown. Also, any media items created from this instance of the player object are invalidated and most IMFPMediaItem methods also raise exceptions.

The player object automatically shuts itself down when its reference count reaches zero. You can use the Shutdown method to shut down the player before all of the references have been released.

200.3.26 Stop

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Stops playback.
Notes: This method completes asynchronously. When the operation completes, the Stopped event is raised.

200.3.27 UpdateVideo

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Updates the video frame.
Notes: This method makes sure the video is updated now, not later.

200.3.28 Properties

200.3.29 AspectRatioMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current aspect-ratio correction mode.
Notes:

This mode controls whether the aspect ratio of the video is preserved during playback.
See VideoARMode* constants.
(Read and Write property)

200.3.30 Balance as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current audio balance.
Notes:

The value can be any number in the following range (inclusive).

Value	Meaning
-1.0	The left channel is at full volume; the right channel is silent.
+1.0	The right channel is at full volume; the left channel is silent.

If the value is zero, the left and right channels are at equal volumes. The default value is zero.
(Read and Write property)

200.3.31 BorderColor as Color

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current color of the video border.
Notes:

The border color is used to letterbox the video.
(Read and Write property)

200.3.32 Duration as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the playback duration of the current media item.
Notes:

This method calculates the playback duration, taking into account the start and stop times for the media item. To set the start and stop times, use StartPosition and StopPosition properties on the media item. To get the actual duration of the underlying media file, regardless of start and stop times, use Duration property on the item.

For example, suppose that you load a 30-second audio file and set the start time equal to 2 seconds and stop time equal to 10 seconds. The MFPMediaItemMBS.Duration method will return 30 seconds, but the MFPMediaPlayerMBS.Duration method will return 8 seconds.
(Read only property)

200.3.33 FastestSupportedRateForward as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the fastest supported forward playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

200.3.34 FastestSupportedRateReverse as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the fastest supported reverse playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

200.3.35 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

200.3.36 IdealVideoMaxHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum height of video size that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

200.3.37 IdealVideoMaxWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum width of video sizes that can be displayed without significantly degrading performance or image quality.

Notes: (Read only property)

200.3.38 IdealVideoMinHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum height of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

200.3.39 IdealVideoMinWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the minimum width of video sizes that can be displayed without significantly degrading performance or image quality.
Notes: (Read only property)

200.3.40 Looping as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether to loop video.
Notes:

If set to true, the plugin will call Play automatically when playback ended.
(Read and Write property)

200.3.41 MediaItem as MFPMediaItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Current media item.
Notes:

Setting the MediaItem property is asynchronous. Therefore, while set is pending, get will not return the media item that was just set. Instead, the application should implement MediaItemSet event to know when it is done.
(Read and Write property)

200.3.42 Mute as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the audio is muted.
Notes: (Read and Write property)

200.3.43 NativeVideoAspectRateHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The picture aspect ratio of the video.
Notes: (Read only property)

200.3.44 NativeVideoAspectRateWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The picture aspect ratio of the video.
Notes: (Read only property)

200.3.45 NativeVideoHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height of the video, in pixels.
Notes: (Read only property)

200.3.46 NativeVideoWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width of the video, in pixels.
Notes: (Read only property)

200.3.47 Position as Double

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The playback position.
Notes:

If you call this method while playback is stopped, the new position takes effect after playback resumes.

This method completes asynchronously. When the operation completes, the PositionSet event is raised.
If playback was started before SetPosition is called, playback resumes at the new position. If playback was paused, the video is refreshed to display the current frame at the new position.

If you make two consecutive calls to SetPosition, and the second call is made before the first call has completed, the second call supersedes the first. The status code for the superseded call is set to false in the event data for that call. This behavior prevents excessive latency from repeated calls to SetPosition, as each call may force the media source to perform a relatively lengthy seek operation.
(Read and Write property)

200.3.48 Rate as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current playback rate.
Notes:

The playback rate is expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read and Write property)

200.3.49 SlowestSupportedRateForward as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the slowest supported forward playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

200.3.50 SlowestSupportedRateReverse as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries the slowest supported reverse playback rates.
Notes:

Playback rates are expressed as a ratio of the current rate to the normal rate. For example, 1.0 indicates normal playback speed, 0.5 indicates half speed, and 2.0 indicates twice speed. Positive values indicate forward playback, and negative values indicate reverse playback.
(Read only property)

200.3.51 State as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The current playback state of the MFPlay player object.
Notes:

See State* constants.

This property can be read after the player object has been shut down.

Many of the player methods complete asynchronously. While an asynchronous operation is pending, the current state is not updated until the operation completes. When the operation completes, the application receives an event.
(Read only property)

200.3.52 VideoWindow as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the window where the video is displayed.
Notes:

Returns HWND as integer.
(Read only property)

200.3.53 Volume as Single

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: Desktop, Console & Web.

Function: The audio volume.
Notes:

Volume is expressed as an attenuation level, where 0.0 indicates silence and 1.0 indicates full volume (no attenuation).

If you call this method before playback starts, the setting is applied after playback starts.
This method does not change the master volume level for the player's audio session. Instead, it adjusts the per-channel volume levels for audio stream(s) that belong to the current media item. Other streams in the audio session are not affected.
(Read and Write property)

200.3.54 Events

200.3.55 Ended

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: Playback has ended.
Notes: The player object sends this event when playback reaches the end of the media file.

200.3.56 Error

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: A playback error has occurred.

200.3.57 FrameStepped

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: A frame-step operation has completed.
Notes: This event is sent when the FrameStep method completes.

200.3.58 MediaItemCleared

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: The current media item was cleared.
Notes: This event is sent when the ClearMediaItem method completes.

200.3.59 MediaItemCreated(MediaItem as MFPMediaItemMBS, Tag as variant)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: A new media item was created.
Notes: This event is sent when the CreateMediaItemFromURL method completes.

200.3.60 MediaItemSet

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: A media item is ready for playback.
Notes: This event is sent when the SetMediaItem method completes.

200.3.61 Paused

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: Playback has paused.
Notes: This event is sent when the Pause method completes.

200.3.62 PositionSet

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: The MFPlay player object has seeked to a new playback position.
Notes: This event is sent when the Position setter completes.

200.3.63 RateSet(rate as Single)

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: The playback rate has changed.
Notes: This event is sent when the rate setter completes.

200.3.64 Started

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: Playback has started.
Notes: This event is sent when the Play method completes.

200.3.65 Stopped

MBS WinFrameworks Plugin, Plugin Version: 20.0, Platform: Windows, Targets: .

Function: Playback has stopped.
Notes: This event is sent when the Stop method completes.

200.3.66 Constants

200.3.67 StateEmpty = 0

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the player states.
Notes: Initial state. No media items have been set on the player object.

200.3.68 StatePaused = 3

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the player states.
Notes: Playback is paused.

200.3.69 StatePlaying = 2

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the player states.
Notes: Playback is in progress.

200.3.70 StateShutdown = 4

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the player states.
Notes: The player object was shut down. This state is returned after the application calls Shutdown method.

200.3.71 StateStopped = 1

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the player states.
Notes: Playback is stopped.

200.3.72 VideoARModeMask = 7

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the aspect ratio modes.
Notes: Bitmask to validate flag values. This value is not a valid flag.

200.3.73 VideoARModeNone = 0

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the aspect ratio modes.
Notes: Do not maintain the aspect ratio of the video. Stretch the video to fit the output rectangle.

200.3.74 VideoARModeNonLinearStretch = 4

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the aspect ratio modes.
Notes:

Apply a non-linear horizontal stretch if the aspect ratio of the destination rectangle does not match the aspect ratio of the source rectangle.

The non-linear stretch algorithm preserves the aspect ratio in the middle of the picture and stretches (or shrinks) the image progressively more toward the left and right. This mode is useful when viewing 4:3 content full-screen on a 16:9 display, instead of pillar-boxing. Non-linear vertical stretch is not supported, because the visual results are generally poor.

This mode may cause performance degradation.

If this flag is set, you must also set the VideoARModePreservePixel and VideoARModePreservePicture flags.

200.3.75 VideoARModePreservePicture = 1

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the aspect ratio modes.
Notes: Preserve the aspect ratio of the video by letterboxing or within the output rectangle.

200.3.76 VideoARModePreservePixel = 2

MBS WinFrameworks Plugin, Plugin Version: 20.0.

Function: One of the aspect ratio modes.
Notes:

Correct the aspect ratio if the physical size of the display device does not match the display resolution. For example, if the native resolution of the monitor is 1600 by 1200 (4:3) but the display resolution is 1280 by 1024 (5:4), the monitor will display non-square pixels.

If this flag is set, you must also set the VideoARModePreservePicture flag.

Chapter 201

Windows Mutex

201.1 class WindowsMutexMBS

201.1.1 class WindowsMutexMBS

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for a mutex.
Notes:

As a mutex must have a unique name you can use this class to find out if an application is allready running. Try to create a mutex with an unique name and if it allready exists your application was launched twice.

201.1.2 Blog Entries

- New in the MBS Xojo Plugins Version 20.2
- MBS Xojo Plugins, version 20.2pr2

201.1.4 Methods

201.1.5 close

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.
Notes: There is no need to call this method except you want to free all resources of this object now without waiting for Xojo to do it for you.

201.1.6 Create(name as string)

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new mutex.
Notes:

The name must be unique and should not contain a backslash.
Use only ASCII strings for this.
Lasterror is set.

201.1.7 Lock

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Locks the
Notes:

Blocks until we got the lock.
Lasterror is set.

201.1.8 Open(name as string)

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Trys to open a mutex with the given name.
Notes:

Fails if the mutex does not exist.
Lasterror is set.

201.1.9 TryLock as Boolean

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Tries to lock the mutex.
Notes:

Returns true if we got the lock or false if not.
Lasterror is set.

201.1.10 Unlock

MBS Win Plugin, Plugin Version: 20.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Unlocks the mutex.
Notes: Lasterror is set.

201.1.11 Properties

201.1.12 Handle as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The handle of the Mutex for use with Declares.
Notes: (Read and Write property)

201.1.13 Lasterror as Integer

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The last error code reported.
Notes:

A windows error code.
Or 0 for okay and -1 for "Function not available or parameters wrong."
(Read and Write property)

201.1.14 Name as String

MBS Win Plugin, Plugin Version: 3.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: The name used to create or open the mutex.
Notes: (Read only property)

Chapter 202

Windows OCR

202.1 class WindowsOCREngineMBS

202.1.1 class WindowsOCREngineMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Provides optical character recognition (OCR) functionality.
Notes:

Requires Windows 10 (introduced in 10.0.10240.0)

o use the OCR capabilities of the OcrEngineMBS class in your app, call the RecognizeAsync method. When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object, which contains the recognized text and its size and position. The result is split into lines, and the lines are split into words.

- The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS.
- Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
- Each WindowsOCRWordMBS object specifies the text, size, and position information of the word in the image.

Our plugin class allows you to run the OCR operation either synchronously or asynchronously. The asynchronous operation runs in the background on a separated preemptive thread, so your application GUI is not blocked and this is the preferred way.

Alternatively, you can use the synchronous versions, which block the GUI.

202.1.6 Methods

202.1.7 Available as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether this class is available.
Example:

```
If WindowsOCREngineMBS.Available Then
// okay
Else
```

```
MessageBox "Only for Windows 10 and newer."
End If
```

Notes:

Returns false on Windows 8.x.
Reports true on Windows 10240 or later.

202.1.8 AvailableRecognizerLanguages as WindowsOCRLanguageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns an array of all available OCR languages on the device.
Example:

```
Dim languages() As WindowsOCRLanguageMBS = WindowsOCREngineMBS.AvailableRecognizerLanguages

For Each n As WindowsOCRLanguageMBS In languages
MessageBox n.DisplayName+", "+n.LanguageTag
Next
```

202.1.9 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the OcrEngine class.
Example:

```
Dim Recognizer As New WindowsOCREngine

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: If any language from GlobalizationPreferences.Languages can be resolved to any of the available OCR languages returns new instance of OcrEngine class, otherwise otherwise raises UnsupportedOperationException.
See also:

- 202.1.10 Constructor(Language as WindowsOCRLanguageMBS) 28075

202.1.10 Constructor(Language as WindowsOCRLanguageMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new instance of the OcrEngine class.
Example:

```
Dim Recognizer As New WindowsOCREngine("de-DE")

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes:

If the specified language can be resolved to any of the OCR languages available on the device, returns new instance of OcrEngine class, otherwise raises UnsupportedOperationException.

Raises PlatformNotSupportedException when called on macOS or Linux.
See also:

- 202.1.9 Constructor 28075

202.1.11 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

202.1.12 IsLanguageSupported(Language as WindowsOCRLanguageMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if a specified language can be resolved to any of the available OCR languages.
Notes: True, if the specified language can be resolved to any of the available OCR languages; otherwise, false.

202.1.13 RecognizeAsync(ImageFile as FolderItem)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We will ask Windows to load image from the image file and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 202.1.14 RecognizeAsync(Picture as Picture) 28077

- 202.1.15 RecognizeAsync(PictureData as MemoryBlock) 28077
- 202.1.16 RecognizeAsync(PictureData as String) 28077

202.1.14 RecognizeAsync(Picture as Picture)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We build a bitmap from the picture for Windows and then run OCR.
Calls event RecognizeCompleted later.
See also:

- 202.1.13 RecognizeAsync(ImageFile as FolderItem) 28076
- 202.1.15 RecognizeAsync(PictureData as MemoryBlock) 28077
- 202.1.16 RecognizeAsync(PictureData as String) 28077

202.1.15 RecognizeAsync(PictureData as MemoryBlock)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We will ask Windows to load image from the image data provided and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 202.1.13 RecognizeAsync(ImageFile as FolderItem) 28076
- 202.1.14 RecognizeAsync(Picture as Picture) 28077
- 202.1.16 RecognizeAsync(PictureData as String) 28077

202.1.16 RecognizeAsync(PictureData as String)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We will ask Windows to load image from the image data provided and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
Calls event RecognizeCompleted later.
See also:

- 202.1.13 RecognizeAsync(ImageFile as FolderItem) 28076
- 202.1.14 RecognizeAsync(Picture as Picture) 28077
- 202.1.15 RecognizeAsync(PictureData as MemoryBlock) 28077

202.1.17 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We will ask Windows to load image from the image file and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 202.1.18 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 28078
- 202.1.19 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 28079
- 202.1.20 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 28079

202.1.18 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We build a bitmap from the picture for Windows and then run OCR.
Calls event RecognizeCompleted later.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 202.1.17 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 28078
- 202.1.19 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 28079
- 202.1.20 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 28079

202.1.19 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We will ask Windows to load image from the image data and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 202.1.17 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 28078
- 202.1.18 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 28078
- 202.1.20 RecognizeSync(PictureData as String) as WindowsOCRResultMBS 28079

202.1.20 RecognizeSync(PictureData as String) as WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Scans the specified image for text in the language specified by the RecognizerLanguage property.
Notes:

We will ask Windows to load image from the image data and then run OCR.
Seems to work fine for JPEG and PNG files, but other formats may be supported by Windows, too.
We run loops to wait and yield time to threads while waiting for the job to finish.
On success, true is returned and result is set.
In case of error, the error parameter is set with a text.

Raises NilObjectException or WindowsOCRExceptionMBS in case of an error.
See also:

- 202.1.17 RecognizeSync(ImageFile as FolderItem) as WindowsOCRResultMBS 28078
- 202.1.18 RecognizeSync(Picture as Picture) as WindowsOCRResultMBS 28078
- 202.1.19 RecognizeSync(PictureData as MemoryBlock) as WindowsOCRResultMBS 28079

202.1.21 Properties

202.1.22 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

202.1.23 MaxImageDimension as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the maximum image pixel dimensions supported by the OCR engine.
Example:

```
MessageBox Recognizer.MaxImageDimension.ToString
```

Notes:

The maximum image pixel dimensions supported by the OCR engine.
(Read only property)

202.1.24 RecognizerLanguage as WindowsOCRLanguageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the language being used for text recognition.
Example:

```
Dim Recognizer As New WindowsOCREngine

MessageBox Recognizer.RecognizerLanguage.DisplayName
```

Notes: (Read only property)

202.1.25 Events

202.1.26 RecognizeCompleted(ErrorMessage as String, ErrorCode as Integer, Result as WindowsOCRResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: .

Function: The event called when the recognize process completes.
Notes:

ErrorMessage: The error we report on what went wrong.
ErrorCode: The Windows error code, zero if successful.
Result: The result of the OCR that was initiated by the OcrEngine object.

202.1.27 Stopped(Error as Integer)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: .

Function: Called by the engine in case it had to stop.
Notes: Provides Windows error code for the reason.

202.2 class WindowsOCRExceptionMBS

202.2.1 class WindowsOCRExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The class for an exception in the OCR classes.
Notes: Subclass of the RuntimeException class.

202.3.6 Methods

202.3.7 Constructor(languageTag as String)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Language object.
Notes: Pass a BCP-47 language tag.

202.3.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

202.3.9 Properties

202.3.10 CurrentInputMethodLanguageTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the BCP-47 language tag for the currently enabled keyboard layout or Input Method Editor (IME).
Notes:

This property returns a value for the currently active input method on the thread with keyboard input focus. Calling this on a background thread may not return the expected results.
(Read only property)

202.3.11 DisplayName as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a localized string that is suitable for display to the user for identifying the language.
Notes: (Read only property)

202.3.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

202.3.13 LanguageTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the normalized BCP-47 language tag for this language.
Notes:

e.g. de-DE for Germany
(Read only property)

202.3.14 NativeName as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the name of the language in the language itself.
Notes: (Read only property)

202.3.15 Script as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the four-letter ISO 15924 script code of the language.
Notes: (Read only property)

202.4 class WindowsOCRLineMBS

202.4.1 class WindowsOCRLineMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single line of text recognized by the OCR engine and returned as part of the WindowsOCRResultMBS.
Notes:

When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

202.4.6 Methods

202.4.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

202.4.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

202.4.9 Words as WindowsOCRWordMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of WindowsOCRWordMBS objects that represents the words detected in the current line of text by the RecognizeAsync method.

202.4.10 Properties

202.4.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

202.4.12 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the text of the recognized line.
Notes: (Read only property)

202.5 class WindowsOCRResultMBS

202.5.1 class WindowsOCRResultMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Contains the results of Optical Character Recognition (OCR).
Notes:

When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

202.5.6 Methods

202.5.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

202.5.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

202.5.9 Lines as WindowsOCRLineMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the collection of WindowsOCRLineMBS objects that represents the lines of text detected in the image by the RecognizeAsync method.
Notes: When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.

202.5.10 Properties

202.5.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

202.5.12 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the recognized text.
Notes: (Read only property)

202.5.13 TextAngle as Double

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the clockwise rotation of the recognized text, in degrees, around the center of the image.
Notes:

The clockwise rotation of the recognized text, in degrees, around the center of the image. If the angle of the text can't be detected, the value of this property is null. If the image contains text at different angles, only part of the text will be recognized correctly.

Use the TextAngle property to overlay recognition results correctly on the original image. If the value of the TextAngle property is not null or 0 (zero), then to overlay the recognized text correctly on the original image, you either have to rotate the original image by the detected angle in a counter-clockwise direction, or rotate the recognized text by the detected angle in a clockwise direction.
(Read only property)

202.6 class WindowsOCRWordMBS

202.6.1 class WindowsOCRWordMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single word in a line of text recognized by the OCR engine and returned as part of the WindowsOCRLineMBS.
Notes:

When you call the RecognizeAsync method of the OcrEngine class, the method returns an WindowsOCRResultMBS object. The WindowsOCRResultMBS contains a collection of WindowsOCRLineMBS objects, which you access through the Lines property of the WindowsOCRResultMBS. Each WindowsOCRLineMBS object contains a collection of WindowsOCRWordMBS objects, which you access through the Words property of each WindowsOCRLineMBS.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

202.6.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

202.6.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

202.6.9 Properties

202.6.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

202.6.11 Height as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the size in pixels of the recognized word.
Notes: (Read only property)

202.6.12 Text as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the text of the recognized word.
Notes: (Read only property)

202.6.13 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the size in pixels of the recognized word.
Notes: (Read only property)

202.6.14 X as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the position in pixels of the recognized word from the top left corner of image when the value of TextAngle property is 0 (zero).
Notes: (Read only property)

202.6.15 Y as Single

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the position in pixels of the recognized word from the top left corner of image when the value of TextAngle property is 0 (zero).
Notes: (Read only property)

Chapter 203

Windows PDF

203.1 class WindowsPDFDocumentMBS

203.1.1 class WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a Portable Document Format (PDF) document.
Notes: Methods of this class return an STG_E_READFAULT error if there is a problem in reading the Portable Document Format (PDF) document.

203.1.6 Methods

203.1.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 203.1.8 Constructor(other as WindowsPDFDocumentMBS) 28096

203.1.8 Constructor(other as WindowsPDFDocumentMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 203.1.7 Constructor 28096

203.1.9 ConvertImage(ImageData as String) as String

MBS WinFrameworks Plugin, Plugin Version: 23.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Converts a picture to PNG.
Example:

```
// read in a HEIC image
dim f as FolderItem = SpecialFolder.Desktop.Child("IMG_4609.HEIC")
```

```
dim b as BinaryStream = BinaryStream.Open(f)
dim s as string = b.Read(b.Length)

// convert to PNG
dim p as string = WindowsPDFDocumentMBS.ConvertImage(s)

// and write out as PNG file
dim o as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim c as BinaryStream = BinaryStream.Create(o, true)
c.Write p
c.close

o.Launch
```

Notes:

This is a little utility function to use Windows' built-in image encoders and decoders to convert various image formats like HEIF/HEIC to a PNG image.
Returns new image as string with bytes of PNG image.

203.1.10 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

203.1.11 LoadFromData(data as MemoryBlock, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in Memoryblock synchronously.
Notes:

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.
See also:

- 203.1.12 LoadFromData(data as String, Password as String = "") as WindowsPDFDocumentMBS 28098

203.1.12 LoadFromData(data as String, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in string synchronously.
Notes:

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.
See also:

- 203.1.11 LoadFromData(data as MemoryBlock, Password as String = "") as WindowsPDFDocumentMBS 28097

203.1.13 LoadFromDataAsync(data as MemoryBlock, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in MemoryBlock asynchronously.
Notes:

Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.
See also:

- 203.1.14 LoadFromDataAsync(data as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "") 28098

203.1.14 LoadFromDataAsync(data as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from data in string asynchronously.
Notes:

Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.
See also:

- 203.1.13 LoadFromDataAsync(data as MemoryBlock, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "") 28098

203.1.15 LoadFromFile(File as FolderItem, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from folderitem synchronously.
Notes:

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.

203.1.16 LoadFromFileAsync(File as FolderItem, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from folderitem asynchronously.
Notes:

Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.

203.1.17 LoadFromPath(Path as String, Password as String = "") as WindowsPDFDocumentMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from path synchronously.
Notes:

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method raises an exception reporting an ERROR_WRONG_PASSWORD (1323) error if the wrong password is specified.

203.1.18 LoadFromPathAsync(Path as String, Handler as WindowsPDFDocumentLoadedMBS, Password as String = "")

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads a PDF document from path asynchronously.
Notes:

Calls the given delegate later.

Password: The password to open the Portable Document Format (PDF) document, if it requires one.

If the Portable Document Format (PDF) document does not require a password, this method ignores it.

This method reports an ERROR_WRONG_PASSWORD (1323) error via delegate if the wrong password is specified.

203.1.19 Page(Index as Integer) as WindowsPDFPageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets a page from a Portable Document Format (PDF) document.
Notes: The location of the Portable Document Format (PDF) page relative to its parent document. Starts at zero.

203.1.20 Properties

203.1.21 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

203.1.22 IsPasswordProtected as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets whether the Portable Document Format (PDF) document is password-protected.
Notes:

True if the Portable Document Format (PDF) document is password-protected; otherwise, false.
(Read only property)

203.1.23 PageCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of pages in the Portable Document Format (PDF) document.
Notes: (Read only property)

203.1.24 Delegates

203.1.25 WindowsPDFDocumentLoadedMBS(ErrorMessage as String, ErrorCode as Integer, document as WindowsPDFDocumentMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The delegate called when loading finished.

203.2 class WindowsPDFExceptionMBS

203.2.1 class WindowsPDFExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop only.

Function: The class for exceptions in PDF engine.
Notes: Subclass of the RuntimeException class.

203.3 class WindowsPDFPageDimensionsMBS

203.3.1 class WindowsPDFPageDimensionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents the dimensions of a single page in a Portable Document Format (PDF) document.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

203.3.6 Methods

203.3.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.

203.3.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

203.3.9 Properties

203.3.10 ArtBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries art box.
Notes:

Gets the size of a rectangle that contains the Portable Document Format (PDF) page's contents, including any meaningful surrounding white space, as intended by the Portable Document Format (PDF) page's creator.
(Read only property)

203.3.11 BleedBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries bleed box.
Notes:

Gets the size of a rectangle that specifies the clipped region of a Portable Document Format (PDF) page's contents when it is displayed.
(Read only property)

203.3.12 CropBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries crop box.
Notes:

Gets the size of a rectangle that specifies the cropped region of a Portable Document Format (PDF) page's contents when it is displayed.
(Read only property)

203.3.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

203.3.14 MediaBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries media box.
Notes:

Gets the size of a rectangle that defines the boundaries of the area that the Portable Document Format (PDF) page will be displayed or printed to.
(Read only property)

203.3.15 TrimBox as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Queries trim box.
Notes:

Gets the size of a rectangle that specifies the intended dimensions of the Portable Document Format (PDF) page after it has been trimmed.
(Read only property)

203.4 class WindowsPDFPageMBS

203.4.1 class WindowsPDFPageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents a single page in a Portable Document Format (PDF) document.

203.4.6 Methods

203.4.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The private constructor.
See also:

- 203.4.8 Constructor(other as WindowsPDFPageMBS) 28108

203.4.8 Constructor(other as WindowsPDFPageMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The copy constructor.
See also:

- 203.4.7 Constructor 28107

203.4.9 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

203.4.10 RenderToStream(Options as WindowsPDFPageRenderOptionsMBS = nil) as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Outputs a stream of data, which represents a Portable Document Format (PDF) page's contents as image.
Notes: Takes a set of display settings, applies them to the output of a Portable Document Format (PDF) page's contents, and creates a stream with the customized, rendered output as an synchronous action. This asynchronous action can be used to create a customized display image of the Portable Document Format (PDF) page.

203.4.11 Properties

203.4.12 Dimensions as WindowsPDFPageDimensionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the group of dimension properties for a single page in a Portable Document Format (PDF) document.
Notes: (Read only property)

203.4.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

203.4.14 Index as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the relative position of the Portable Document Format (PDF) page within its parent Portable Document Format (PDF) document.
Notes:

Return the position of the Portable Document Format (PDF) page relative to its parent Portable Document Format (PDF) document.

The first page of a Portable Document Format (PDF) document is index 0 (zero).
(Read only property)

203.4.15 PreferredZoom as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Portable Document Format (PDF) page's preferred magnification factor.
Notes: (Read only property)

203.4.16 Rotation as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the constant that the Portable Document Format (PDF) page will be rotated when it's displayed or printed.
Notes:

See RotationRotate* constants.
Degrees are expressed relative to a clockwise rotation. Degrees are expressed in multiples of 90.
(Read only property)

203.4.17 RotationAngle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the number of degrees that the Portable Document Format (PDF) page will be rotated

when it's displayed or printed.
Notes:

Returns angle from 0 to 360¬∞.
(Read only property)

203.4.18 Size as WindowsPDFSizeMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets the Portable Document Format (PDF) page's size based on its related CropBox, MediaBox, and Rotation property values.
Notes: (Read only property)

203.4.19 Constants

203.4.20 RotationNormal = 0

MBS WinFrameworks Plugin, Plugin Version: 23.2.

Function: One of the constants for rotation.
Notes: No rotation.

203.4.21 RotationRotate180 = 2

MBS WinFrameworks Plugin, Plugin Version: 23.2.

Function: One of the constants for rotation.
Notes: A 180-degree rotation.

203.4.22 RotationRotate270 = 3

MBS WinFrameworks Plugin, Plugin Version: 23.2.

Function: One of the constants for rotation.
Notes: A 270-degree rotation.

203.4.23 RotationRotate90 = 1

MBS WinFrameworks Plugin, Plugin Version: 23.2.

Function: One of the constants for rotation.
Notes: A 90-degree rotation.

203.5 class WindowsPDFPageRenderOptionsMBS

203.5.1 class WindowsPDFPageRenderOptionsMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Represents display settings for a single page of a Portable Document Format (PDF) document, such as the page's background color and its encoding type.

203.5.2 Blog Entries

203.5.6 Methods

203.5.7 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The constructor.
Notes: Creates and initializes a new instance of display settings for a single page of a Portable Document Format (PDF) document.

203.5.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The destructor.

203.5.9 setBitmapEncoderBMP

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to BMP.

203.5.10 setBitmapEncoderJPEG

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to JPEG.

203.5.11 setBitmapEncoderPNG

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to PNG.

203.5.12 setBitmapEncoderTIFF

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets encoding type to TIFF.

203.5.13 Properties

203.5.14 BackgroundColor as Color

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the Portable Document Format (PDF) page's background color.
Notes:

The default background color is White.
(Read and Write property)

203.5.15 BitmapEncoderId as String

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the Portable Document Format (PDF) page's encoding type to be used while the page is being converted to a bitmap.
Notes: (Read and Write property)

203.5.16 DestinationHeight as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the final size of the rendering of the Portable Document Format (PDF) page in device-independent pixels (DIPs).
Notes:

The value for DestinationHeight is the final size of the rendered page. If DestinationHeight is not specified, the page's aspect ratio is maintained relative to the destination width.
(Read and Write property)

203.5.17 DestinationWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets the final size of the rendering of the Portable Document Format (PDF) page in device-independent pixels (DIPs).
Notes:

The value for DestinationWidth is the final size of the rendered page. If DestinationWidth is not specified, the page's aspect ratio is maintained relative to the destination height.
(Read and Write property)

203.5.18 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The internal object reference.
Notes: (Read only property)

203.5.19 IsIgnoringHighContrast as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets whether the Portable Document Format (PDF) page uses the system's high contrast display setting.
Notes: (Read and Write property)

203.5.20 SourceRect as WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gets or sets a portion of the Portable Document Format (PDF) page to be displayed.
Notes: (Read and Write property)

203.6 class WindowsPDFRectMBS

203.6.1 class WindowsPDFRectMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a rectangle.

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Height of rectangle.
Notes: (Read and Write property)

203.6.8 Width as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: Width of rectangle.
Notes: (Read and Write property)

203.6.9 X as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The x origin position.
Notes: (Read and Write property)

203.6.10 Y as Single

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The y origin position.
Notes: (Read and Write property)

203.7 class WindowsPDFSizeMBS

203.7.1 class WindowsPDFSizeMBS

MBS WinFrameworks Plugin, Plugin Version: 23.2, Platform: Windows, Targets: Desktop, Console & Web.

Function: The class for a size.

204.1.4 Methods

204.1.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

204.1.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.1.7 ShowModal(Window as DesktopWindow, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes:

The function returns when the user selects a device using the modal dialog box.

Window: The parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.

- 204.1.8 ShowModal(Window as Window, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 28123

- 204.1.9 ShowModal(WindowHandle as Integer, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 28123

204.1.8 ShowModal(Window as Window, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes:

The function returns when the user selects a device using the modal dialog box.

Window: The parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.
See also:

- 204.1.9 ShowModal(WindowHandle as Integer, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean 28123

204.1.9 ShowModal(WindowHandle as Integer, DeviceFlags as Integer, byref deviceID as String, byref DeviceType as Integer) as boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Displays a device selection dialog box.
Notes:

The function returns when the user selects a device using the modal dialog box.

WindowHandle: Handle to a parent window.
DeviceFlags: Integer value containing a combination of device flags that indicate which type of devices to display. The device flags may be a combination of any of the DeviceFlags constants.

DeviceId: A string containing the ID of the selected device.
DeviceType: The type of the selected device.

Returns true if default button was clicked and a device selected.

204.1.10 Properties

204.1.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.1.12 SubmitButtonText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text displayed in the dialog box that prompts the user to select a device.
Notes: (Read and Write property)

204.1.13 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of the device selection dialog box.
Notes: (Read and Write property)

204.1.14 Constants

204.1.15 DeviceFlagAllDevices = & hFFFF

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show all devices.

204.1.16 DeviceFlagCPLMode = & h10000

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show CPL devices.

204.1.17 DeviceFlagDVDevices = 64

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show digital video camera devices.

204.1.18 DeviceFlagFSDevices = 32

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show removable storage devices, such as CD drives or card readers.

204.1.19 DeviceFlagShowOffline = & h20000

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show devices that are offline. Not supported by all device types.

204.1.20 DeviceFlagSTIDevcies = 8

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show devices of type Still Image Architecture (STI).

204.1.21 DeviceFlagTWAINDevices = 16

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show TWAIN devices.

204.1.22 DeviceFlagWIACameras = 2

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show cameras of type Windows Image Acquisition (WIA).

204.1.23 DeviceFlagWIAScanners = 4

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show scanners of type Windows Image Acquisition (WIA).

204.1.24 DeviceFlagWPDDevices = 1

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device selection flags.
Notes: Show devices of type Windows Portable Devices (WPD).

204.1.25 DeviceTypeDV = 6

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device type constants.
Notes: DV device.

204.1.26 DeviceTypeFS = 5

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device type constants.
Notes: Specifies that the selected device is a removable drive in the file system.

204.1.27 DeviceTypeSTI = 3

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device type constants.
Notes: Specifies that the type of the selected device is Still Image Architecture (STI).

204.1.28 DeviceTypeTWAIN = 4

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device type constants.
Notes: TWAIN device

204.1.29 DeviceTypeUnknown = 0

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device type constants.
Notes: pecifies that the type of the selected device is unknown.

204.1.30 DeviceTypeWIA = 2

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device type constants.
Notes: Specifies that the type of the selected device is Windows Image Acquisition (WIA).

204.1.31 DeviceTypeWPD = 1

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the device type constants.
Notes: Specifies that the type of the selected device is Windows Portable Devices (WPD).

204.2 class WinPhotoAcquireItemMBS

204.2.1 class WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireItemMBS interface provides methods for working with items as they are acquired from a device.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

204.2.2 Blog Entries

- Windows Photos Acquire

204.2.4 Methods

204.2.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

204.2.6 Data as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Reads the data from the file and returns it.

204.2.7 Delete

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Delete method deletes an item.

204.2.8 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.2.9 PropertyKeyCameraSequenceNumber as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The camera sequence number.

204.2.10 PropertyKeyDuplicateDetectionID as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The duplicate detection ID.

204.2.11 PropertyKeyFinalFilename as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The final file name.

204.2.12 PropertyKeyGroupTag as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The group tag.

204.2.13 PropertyKeyIntermediateFile as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The intermediate path name.

204.2.14 PropertyKeyOriginalFilename as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The original path name.

204.2.15 PropertyKeyRelativePathname as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The relative path name.

204.2.16 PropertyKeySkipImport as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: Whether to skip import.

204.2.17 PropertyKeyTransferResult as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: One of the property keys.
Notes: The transfer result.

204.2.18 SubItem(Index as Integer) as WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves a subitem of an item, given the index of the subitem.
Notes: Index: Integer containing the index of the item. Range from 0 to SubItemCount-1.

204.2.19 Thumbnail(width as Integer, Height as Integer) as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the thumbnail provided for an item.
Notes: Width and height specify the size of the thumbnail.

204.2.20 Properties

204.2.21 CanDelete as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The CanDelete method indicates whether an item may be deleted.
Notes:

Indicates that the item can be deleted.
(Read only property)

204.2.22 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.2.23 ItemName as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the file name for an item.
Notes:

The file name consists of the display name and the extension, even if the Hide extensions for known file types setting is checked in the Windows Folder Options dialog box.
(Read only property)

204.2.24 SubItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the number of subitems contained in an item.
Notes: (Read only property)

204.2.25 PropertyValue(key as string) as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Get or set a property for an item.
Notes:

key: Specifies a key for the property to set.

The value is converted to/from variant.
(Read and Write computed property)

204.3 class WinPhotoAcquireMBS

204.3.1 class WinPhotoAcquireMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: This class provides methods for acquiring photos from a device.

204.3.4 Methods

204.3.5 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as DesktopWindow, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes:

PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
Window: The parent window.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can

be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.
See also:

- 204.3.6 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS) 28134

204.3.6 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes:

PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
Window: The parent window.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.

204.3.7 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindowHandle as Integer, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Acquire method acquires photos from a device.
Notes:

PhotoAcquireSource: Pointer to an WinPhotoAcquireSourceMBS object representing the device from which to acquire photos. Initialize this object by calling CreatePhotoSource.
ShowProgress: Flag that, when set to true, indicates that a progress dialog will be shown.
WindowHandle: The parent window handle.
ApplicationName: string containing the application name.
PhotoAcquireProgresCallback: Pointer to an optional WinPhotoAcquireProgressCallBackMBS object. Can be nil.

To initialize the PhotoAcquireSource parameter passed to Acquire, CreatePhotoSource should be called prior to calling Acquire.
PhotoAcquireProgresCallback provides callback methods that allow you to apply further filtering or control as items are acquired.
To verify that there are items in the device before acquisition, or to selectively acquire items from the device, call InitializeItemList to enumerate the items before calling Acquire.

- 204.3.6 Acquire(PhotoAcquireSource as WinPhotoAcquireSourceMBS, ShowProgress as Boolean, ParentWindow as Window, ApplicationName as String, PhotoAcquireProgresCallback as WinPhotoAcquireProgressCallBackMBS) 28134

204.3.8 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

204.3.9 CreatePhotoSource(Device as String) as WinPhotoAcquireSourceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: CreatePhotoSource method initializes an WinPhotoAcquireSourceMBS object to pass to Acquire method.
Notes:

Device: The device name/ID.

Returns the initialized photo source to acquire photos from.

204.3.10 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.3.11 Results as String()

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the paths of all files successfully transferred during the most recent call to Acquire.
Notes: If the file transfer is aborted before any files are transferred, the result is nil.

204.3.12 Properties

204.3.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.4 class WinPhotoAcquireOptionsDialogMBS

204.4.1 class WinPhotoAcquireOptionsDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The standard dialog to show for options.
Notes: The WinPhotoAcquireOptionsDialogMBS interface is used to display an options dialog box in which the user can select photo acquisition settings such as file name formats, as well as whether or not to rotate images, to prompt for a tag name, or to erase photos from the camera after importing.

204.4.4 Methods

204.4.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Please call Initialize.

204.4.6 Create(Window as DesktopWindow) as Integer

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes:

This method is for advanced users, which can position the new window via declares.

Window: The parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 204.4.7 Create(Window as Window) as Integer 28138
- 204.4.8 Create(WindowHandle as Integer) as Integer 28138

204.4.7 Create(Window as Window) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes:

This method is for advanced users, which can position the new window via declares.

Window: The parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 204.4.6 Create(Window as DesktopWindow) as Integer 28137
- 204.4.8 Create(WindowHandle as Integer) as Integer 28138

204.4.8 Create(WindowHandle as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Create method creates and displays a modeless instance of the photo options dialog box, hosted within a parent window.
Notes:

This method is for advanced users, which can position the new window via declares.

WindowHandle: Handle to the parent window.

Returns the handle for the created dialog box.

The Initialize method should be called prior to the Create method.
The parent window provides OK and Cancel buttons to the new dialog box instance.
See also:

- 204.4.6 Create(Window as DesktopWindow) as Integer 28137
- 204.4.7 Create(Window as Window) as Integer 28138

204.4.9 Destroy

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The Destroy method closes and destroys the modeless dialog box created with the Create method.
Notes: If you destroy the parent window, the child window will automatically be destroyed.

204.4.10 Initialize(RegistryRoot as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Initializes the options dialog box and reads any saved options from the registry.
Notes:

Initialize must be called prior to calling Create or DoModal. Failure to do so will cause Create or DoModal to fail.
If Initialize is called while the options dialog box is already displayed, an error will be returned.

RegistryRoot: (optional) String containing the registry root of a custom location to read the acquisition settings from. If this parameter is set to "", the default location will be used.

204.4.11 SaveData

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The SaveData method saves acquisition settings from the options dialog box to the registry so that a subsequent instance of the dialog can be initialized with the same settings.

204.4.12 ShowModal(Window as Window) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DoModal method creates and displays the options dialog box as a modal dialog box.
Notes:

Window: The dialog's parent window.
Returns the code returned when the window is closed.

The modal dialog displayed by DoModal will have OK and Cancel buttons, whereas the OK and Cancel buttons of the modeless dialog displayed by Create must be provided by the parent window.
See also:

- 204.4.13 ShowModal(WindowHandle as Integer) as Integer 28140

204.4.13 ShowModal(WindowHandle as Integer) as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The DoModal method creates and displays the options dialog box as a modal dialog box.
Notes:

WindowHandle: Handle to the dialog's parent window.
Returns the code returned when the window is closed.

The modal dialog displayed by DoModal will have OK and Cancel buttons, whereas the OK and Cancel buttons of the modeless dialog displayed by Create must be provided by the parent window.
See also:

- 204.4.12 ShowModal(Window as Window) as Integer 28140

204.4.14 Properties

204.4.15 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.5 class WinPhotoAcquireProgressCallBackMBS

204.5.1 class WinPhotoAcquireProgressCallBackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireProgressCallBackMBS interface may be implemented if you wish to do extra processing at various stages in the acquisition process.

204.5.4 Methods

204.5.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

204.5.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.5.7 Properties

204.5.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.5.9 Events

204.5.10 Cancelled(byref Cancelled as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The Cancelled method provides extended functionality when a cancellation occurs during an acquisition session.
Notes:

The application provides the implementation of the Cancelled method.

Cancelled: a flag that, when set to true, indicates that the operation was canceled.

204.5.11 DirectoryCreated(Directory as String)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The DirectoryCreated method provides extended functionality when a destination directory is created during the acquisition process.
Notes:

The application provides the implementation of the DirectoryCreated method.

Directory: containing the directory.

204.5.12 EndDelete(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The EndDelete method provides extended functionality when deletion of files from the image source is complete.
Notes:

The application provides the implementation of the EndDelete method.

Result: Specifies the result of the delete operation.

204.5.13 EndEnumeration(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The EndEnumeration method provides extended functionality when enumeration of files from the image source is complete.
Notes:

The application provides the implementation of the EndEnumeration method.
Result: Specifies the result of the enumeration operation.

204.5.14 EndItemDelete(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The EndItemDelete method provides extended functionality each time a file is deleted from the image source.
Notes:

The application provides the implementation of the EndItemDelete method.

ItemIndex: Integer value containing the item index.
Item: To the deleted WinPhotoAcquireItemMBS object.
Result: Specifies the result of the delete operation.

204.5.15 EndItemTransfer(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS, Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The EndItemTransfer method provides extended functionality each time a file is transferred from the image source.
Notes:

The application provides the implementation of the EndItemTransfer method.

ItemIndex: Integer value containing the item index.
Item: Pointer to a photo acquire item object.
Result: Specifies the result of the transfer operation.

204.5.16 EndSession(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The EndSession method provides extended functionality when an acquisition session is completed.
Notes: The application provides the implementation of the EndSession method.

204.5.17 EndTransfer(Result as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The EndTransfer method provides extended functionality when the transfer of all files is complete.
Notes:

The application provides the implementation of the EndTransfer method.

Result: Specifies the result of the transfer.

204.5.18 ErrorAdvise(Result as Integer, ErrorMessage as String, MessageType as Integer, byref ErrorAdviseResult as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The ErrorAdvise method provides custom error handling for errors that occur during acquisition.
Notes:

The application provides the implementation of the ErrorAdvise method.

Result: Specifies the error that occurred.
ErrorMessage: the error message.
MessageType: What type of message. May be one of the following:

ErrorAdviseResult: an integer value containing the error advise result. The result should be one of the acceptable types indicated by the MessageType parameter, and must be one of the following:

204.5.19 FoundItem(Item as WinPhotoAcquireItemMBS) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The FoundItem method provides extended functionality each time an item is found during enumeration of items from the device.

Value	Description
AdviseMessageTypeSkipRetryCancel	Specifies that the error that occurred requires a Skip, Retry, or Cancel response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultSkip, AdviseResultSkipAll, AdviseResultRetry, or AdviseResultAbort.
AdviseMessageTypeRetryCancel	Specifies that the error that occurred requires a Retry or Cancel response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultRetry or AdviseResultAbort.
AdviseMessageTypeYesNo	Specifies that the error that occurred requires a Yes or No response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultYes or AdviseResultNo.
AdviseMessageTypeOK	Specifies that the error that occurred requires an OK response. The ErrorAdviseResult parameter must be set to AdviseResultOK.

Value	Description
AdviseResultYes	Specifies a Yes response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultNo	Specifies a No response. Valid if MessageType is AdviseMessageTypeYesNo.
AdviseResultOK	Specifies an OK response. Valid if MessageType is AdviseMessageTypeOK.
AdviseResultSkip	Specifies a Skip response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultSkipAll	Specifies a Skip All response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.
AdviseResultRetry	Specifies a Retry response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.
AdviseResultAbort	Specifies a Cancel response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.

Notes:

This method can be used to exclude an item from the list of items to acquire. The application provides the implementation of the FoundItem method.

Return true to exclude the item from the results of the enumeration. This would allow the caller to exclude videos or camera raw files, for instance.

204.5.20 GetDeleteAfterAcquire(byref DeleteAfterAcquire as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The GetDeleteAfterAcquire method returns a value indicating whether photos should be deleted after acquisition.
Notes: DeleteAfterAcquire: When set to true, indicates that photos should be deleted after acquisition.

204.5.21 GetUserInput(UserInput as WinUserInputStringMBS, byref Result as Variant, DefaultValue as Variant)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The GetUserInput method overrides the default functionality that displays a message prompting the user for string input during acquisition.
Notes:

The application provides the implementation of the GetUserInput method.

Result: Variant representing the descriptive input to be obtained.
DefaultValue: Variant representing the default value of the input being requested.

If this method is implemented, the implementation should copy the value of the DefaultValue argument to the Result parameter.

If the progress dialog box is suppressed in Acquire, this method must be implemented in order to assign a default value to the Result parameter. Normally a value is supplied to Result in the course of prompting the user with the default dialog, but when the dialog is suppressed, the application must copy the value of the DefaultValue argument to the Result parameter.

204.5.22 StartDelete(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The StartDelete method provides extended functionality when deletion of items from the device begins.
Notes:

The implementation of StartDelete is provided by the application.

Source: the WinPhotoAcquireSourceMBS that items are being deleted from.

204.5.23 StartEnumeration(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The StartEnumeration method provides extended functionality when the enumeration of items to acquire begins.
Notes:

The application provides the implementation of the StartEnumeration method.

Source: the WinPhotoAcquireSourceMBS object that items are being enumerated from.

204.5.24 StartItemDelete(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The StartItemDelete method provides extended functionality each time the deletion of an individual item from the device begins.
Notes:

The application provides the implementation of the StartItemDelete method.

ItemIndex: Integer value containing the item index in the list of items to delete.
Item: The WinPhotoAcquireItemMBS object that is being deleted.

204.5.25 StartItemTransfer(ItemIndex as Integer, Item as WinPhotoAcquireItemMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The StartItemTransfer method provides extended functionality each time the transfer of an item begins.
Notes:

The application provides the implementation of the StartItemTransfer method.

ItemIndex: Integer value containing the item index in the list of items to transfer.
Item: the WinPhotoAcquireItemMBS object that is to be transferred.

204.5.26 StartTransfer(Source as WinPhotoAcquireSourceMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The StartTransfer method provides additional processing when transfer of items from the device begins.
Notes: The application provides the implementation of the StartTransfer method.

204.5.27 UpdateDeletePercent(Percent as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The UpdateDeletePercent method provides extended functionality when the percentage of items deleted changes.
Notes:

The application provides the implementation of the UpdateDeletePercent method.

Percent: Integer value containing the percentage of items deleted.

204.5.28 UpdateTransferPercent(Overall as Boolean, Percent as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: The UpdateTransferPercent method provides extended functionality when the percentage of items transferred changes.
Notes:

The application provides the implementation of the UpdateTransferPercent method.

Overall: Flag that, when set to TRUE, indicates that the value contained in nPercent is a percentage of the overall transfer progress, rather than a percentage of an individual item's progress.
Percent: Integer value containing the percentage of items transferred.

204.5.29 Constants

204.5.30 AdviseMessageTypeOK = 3

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise message type constants.
Notes: Specifies that the error that occurred requires an OK response. The ErrorAdviseResult parameter must be set to AdviseResultOK.

204.5.31 AdviseMessageTypeRetryCancel = 1

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise message type constants.
Notes: Specifies that the error that occurred requires a Skip, Retry, or Cancel response. The ErrorAdvis-

eResult parameter must be set to one of the following: AdviseResultSkip, AdviseResultSkipAll, AdviseResultRetry, or AdviseResultAbort.

204.5.32 AdviseMessageTypeSkipRetryCancel = 0

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise message type constants.
Notes: Specifies that the error that occurred requires a Retry or Cancel response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultRetry or AdviseResultAbort.

204.5.33 AdviseMessageTypeYesNo = 2

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise message type constants.
Notes: Specifies that the error that occurred requires a Yes or No response. The ErrorAdviseResult parameter must be set to one of the following: AdviseResultYes or AdviseResultNo.

204.5.34 AdviseResultAbort = 6

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise result constants.
Notes: Specifies a Cancel response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.

204.5.35 AdviseResultNo = 1

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise result constants.
Notes: Specifies a No response. Valid if MessageType is AdviseMessageTypeYesNo.

204.5.36 AdviseResultOK = 2

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise result constants.
Notes: Specifies an OK response. Valid if MessageType is AdviseMessageTypeOK.

204.5.37 AdviseResultRetry = 5

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise result constants.
Notes: Specifies a Retry response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel or AdviseMessageTypeRetryCancel.

204.5.38 AdviseResultSkip = 3

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise result constants.
Notes: Specifies a Skip response. Valid if MessageType is AdviseMessageTypeSkipRetryCancel.

204.5.39 AdviseResultSkipAll = 4

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise result constants.
Notes: Specifies a Skip All response. Valid if MessageType is AdviseMessageTypeRetryCancel.

204.5.40 AdviseResultYes = 0

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the advise result constants.
Notes: Specifies a Yes response. Valid if MessageType is AdviseMessageTypeYesNo.

204.6 class WinPhotoAcquireSettingsMBS

204.6.1 class WinPhotoAcquireSettingsMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The WinPhotoAcquireSettingsMBS interface is used to work with image acquisition settings, such as file name format.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

204.6.4 Methods

204.6.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

204.6.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.6.7 InitializeFromRegistry(RegistryKey as String)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Specifies a registry key from which to initialize settings.

204.6.8 Properties

204.6.9 AcquisitionDateTime as DateTime

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The acquisition time explicitly.
Notes:

This property is typically used to force two sessions to show the same acquisition time. If not explicitly set, acquisition time defaults to the current machine time.
(Read and Write property)

204.6.10 AcquisitionTime as Date

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The acquisition time explicitly.
Notes:

This property is typically used to force two sessions to show the same acquisition time. If not explicitly set, acquisition time defaults to the current machine time.
(Read and Write property)

204.6.11 Flags as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The photo acquire flags.
Notes: (Read and Write property)

204.6.12 GroupTag as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The group tag for an acquisition session.
Notes:

The group tag is stored as a keyword in each file's metadata. It is also used in the file name if the $ (GroupTag) token is present in the format string passed to OutputFileNameTemplate.
(Read and Write property)

204.6.13 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.6.14 OutputFilenameTemplate as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Specifies a format string (template) that specifies the format of file names.
Notes:

Format strings contain a mix of path literals and tokens. A format string looks like the following:

$ (MyPicturesFolder)\$ (DateAcquired), $ (EventName)\$ (EventName) $ (SequenceNumber).$ (OriginalExtension)

The token format looks like the following, where OptionalPrefix and OptionSuffix are suppressed if the replacement for the TokenIdentifier yields a zero-length string:

$ ([OptionalPrefix] TokenIdentifier:SubToken [OptionalSuffix] | AlternateString)

The caret ("^") is an escape character, so "^$ " would yield "$ " in the final path.
Parentheses and brackets are not allowed as literals within tokens, but can be used outside of tokens. This means you cannot use " [", "] ", "(", or ")" within the OptionalString sub-token unless they are escaped with a caret ("^").
There are a few different classes of tokens, including the following:
SHGetSpecialFolder variables such as the following. These must be the first token, and can only occur once, at most:

- MyPicturesFolder
- MyDocumentsFolder

Session variables such as the following:

- SequenceNumber (The sequence number is used to avoid filename collisions; if it exists, it must be in the file name portion of the path.)
- DateAcquired
- EventName
- UserName
- MachineName

File and metadata variables such as the following:

- DateTaken
- OriginalFilename
- OriginalExtension
- CameraModel
- Width
- Height

Since these tokens are not intended to be visible to users, they will not be localized. For example, $ (DateTaken) will be the same on all versions of Microsoft Windows, regardless of locale or language settings.
As an example, suppose EventName is "Meghan's Birthday" and the naming pattern is as follows:

$ (MyPicturesFolder)\$ (DateAcquired)$ ([,] EventName)\$ (EventName [ ])$ (SequenceNumber).$ (OriginalExtension)
The resulting files would be named as follows:

C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 001.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 002.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 003.jpg
C:\Documents and Settings\shauniv\My Documents\My Pictures\2003-11-14, Meghan's Birthday\Meghan's Birthday 004.jpg
(Read and Write property)

204.6.15 SequencePaddingWidth as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating how wide sequential fields in filenames will be.
Notes:

If the value passed to SetSequencePaddingWidth is nonzero and the format string specified in SetOutputFileNameTemplate contains a sequential token, this method sets the width allotted for the sequential token. For example, given the template $ (GroupTag)$ (AcquisitionSequence).$ (OriginalExtension), if padding is set to 0, a file name might appear as

"Image1.jpg"

If padding is set to 3, the file name may appear as

"Image 1.jpg"
(Read and Write property)

204.6.16 SequenceZeroPadding as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether zeros or spaces are used to pad sequential file names.
Notes:

Flag that, if set to true, indicates that zeros pad sequential file names.
(Read and Write property)

204.6.17 Constants

204.6.18 kFlagsAbortOnSettingsUpdate = & h00000800

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Abort on settings update.

204.6.19 kFlagsDeleteAfterAcquire = & h00000020

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Delete after acquire.

204.6.20 kFlagsDisableAutoRotate = & h00000002

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable auto rotate.

204.6.21 kFlagsDisableDbIntegration = & h00000010

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable DB integration.

204.6.22 kFlagsDisableDuplicateDetection = & h00000040

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable duplicate detection.

204.6.23 kFlagsDisableGroupTagPrompt = & h00000008

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable group tag prompt.

204.6.24 kFlagsDisableMetadataWrite = & h00000100

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable metadata write.

204.6.25 kFlagsDisablePlugins = & h00000004

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable plugins.

204.6.26 kFlagsDisableSettingsLink = & h00000400

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable settings link.

204.6.27 kFlagsDisableThumbnailProgress = & h00000200

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Disable thumbmail progress.

204.6.28 kFlagsEnableThumbnailCaching = & h00000080

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Enable thumbnail caching. On by default.

204.6.29 kFlagsImportVideoAsMultipleFiles = & h00001000

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Import videos as multiple files.

204.6.30 kFlagsNoGalleryLaunch = & h00000001

MBS WinFrameworks Plugin, Plugin Version: 22.1.

Function: One of the flag constants.
Notes: Suppresses the explorer window launched after acquisition.

204.7 class WinPhotoAcquireSourceMBS

204.7.1 class WinPhotoAcquireSourceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: This class is used for acquisition of items from a device.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

204.7.2 Blog Entries

- MBS Xojo Plugins, version 22.1pr2

204.7.4 Methods

204.7.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

204.7.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.7.7 InitializeItemList(ForceEnumeration as Boolean, PhotoAcquireProgress as WinPhotoAcquireProgressCallBackMBS, byref ItemCount as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The InitializeItemList method enumerates transferable items on the device and passes each item to the optional progress callback, if it is supplied.
Notes:

ForceEnumeration: Flag that, if set to true, indicates that enumeration will be repeated even if the item list has already been initialized. If set to false, this flag indicates that repeated calls to InitializeItemList after the item list has already been initialized will not enumerate items again.
PhotoAcquireProgress: Optional. Pointer to an WinPhotoAcquireProgressCallBackMBS object for events.
ItemCount: Returns the number of items found.

If Acquire is called without first calling InitializeItemList, initialization of the item list is done implicitly. The first time the item list is initialized,Äîeither implicitly through Acquire or explicitly by calling InitializeItemList,Äîeach item is enumerated. During enumeration, if an WinPhotoAcquireProgressCallBackMBS object is passed to InitializeItemList, its implementation of StartEnumeration, FoundItem, and EndEnumeration may be used to apply further filtering or control to the list of items to be transferred.

204.7.8 Item(Index as Integer) as WinPhotoAcquireItemMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the WinPhotoAcquireItemMBS object at the given index in the list of items.
Notes: Index: The index from 0 to ItemCount-1.

204.7.9 Properties

204.7.10 DeviceId as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the identifier (ID) of the device.
Notes: (Read only property)

204.7.11 FriendlyName as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the name of the device, formatted for display.
Notes: (Read only property)

204.7.12 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.7.13 ItemCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Retrieves the number of items found by the InitializeItemList method.
Notes: (Read only property)

204.7.14 PhotoAcquireSettings as WinPhotoAcquireSettingsMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Obtains an IPhotoAcquireSettings object for working with acquisition settings.
Notes: (Read only property)

204.8 class WinPhotoExceptionMBS

204.8.1 class WinPhotoExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The class for exceptions in the Windows Photo classes.
Notes: Subclass of the RuntimeException class.

204.9.4 Methods

204.9.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

204.9.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.9.7 Properties

204.9.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.9.9 Events

204.9.10 DoAction(WindowHandle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: .

Function: Run the action for the progress action.

204.10 class WinPhotoProgressDialogMBS

204.10.1 class WinPhotoProgressDialogMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Provides the progress dialog box that may be displayed when enumerating or importing images.
Notes: The dialog box is modal and runs in its own thread.

204.10.4 Methods

204.10.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The constructor.

204.10.6 Create(ParentWindow as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.
Notes:

ParentWindow: The parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 204.10.7 Create(ParentWindow as Window) 28166
- 204.10.8 Create(ParentWindowHandle as Integer) 28166

204.10.7 Create(ParentWindow as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.
Notes:

ParentWindow: The parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 204.10.6 Create(ParentWindow as DesktopWindow) 28165
- 204.10.8 Create(ParentWindowHandle as Integer) 28166

204.10.8 Create(ParentWindowHandle as Integer)

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Creates and displays a progress dialog box that can be shown during image enumeration and acquisition.
Notes:

ParentWindowHandle: Handle of the parent window.

The dialog box that is created is modal, and runs in its own thread.
To close the dialog, call Destroy.
See also:

- 204.10.6 Create(ParentWindow as DesktopWindow) 28165
- 204.10.7 Create(ParentWindow as Window) 28166

204.10.9 Destroy

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Closes and disposes of the progress dialog box shown during image enumeration and acquisition.
Notes: Calling Destroy is the only way to close the progress dialog box. If Destroy is not called, the dialog

box will remain open. The dialog box is not automatically closed when the operation in progress completes.

204.10.10 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.10.11 IsCheckboxChecked(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The check box in the progress dialog box (typically indicating whether to delete files after transfer) is selected.
Notes: Index: Integer value containing the check box identifier (ID).

204.10.12 Properties

204.10.13 ActionLinkCallback as WinPhotoProgressActionCallbackMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The callback object to receive action callback.
Notes: (Read and Write property)

204.10.14 ActionLinkText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The link text for the action item.
Notes: (Read and Write property)

204.10.15 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The caption of the progress dialog box.
Notes:

The caption text is displayed above the progress indicator bar in the dialog box.
(Read and Write property)

204.10.16 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.10.17 IsCancelled as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The IsCancelled method indicates whether the operation has been canceled via the progress dialog box.
Notes:

Returns true to indicate the action has been canceled.
(Read only property)

204.10.18 PercentComplete as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating the completed portion of the current operation.
Notes:

Integer value indicating the percentage of the operation that has completed. This value may be between 0 and 100 only.

If you pass ProgressIndeterminate to PercentComplete, the progress bar will not progress from left to right (from 0 to 100%), but will instead animate to indicate that an operation with an indeterminate end is taking place.
(Read and Write property)

204.10.19 Picture as Picture

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The thumbnail image displayed in the progress dialog box.
Notes:

A bitmap thumbnail (up to 128 x 128 pixels, although it will be scaled to fit if it is too large).
(Read and Write property)

204.10.20 ProgressText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the progress bar in the progress dialog box.
Notes: (Read and Write property)

204.10.21 ShowsActionLink as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether to show an action link.
Notes: (Read and Write property)

204.10.22 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of the progress dialog box.
Notes: (Read and Write property)

204.10.23 WindowHandle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The window handle for the dialog.
Notes: (Read only property)

204.10.24 CheckboxCheck(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether the checkbox is checked.
Notes: (Read and Write computed property)

204.10.25 CheckboxText(Index as Integer = 0) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the check box in the progress dialog box indicating whether to delete images after transfer.
Notes:

Index: Integer containing the check box identifier (ID).
(Read and Write computed property)

204.10.26 CheckboxTooltip(Index as Integer = 0) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The tooltip text for the check box in the progress dialog box.
Notes:

Index: Integer containing the check box identifier (ID).
(Read and Write computed property)

204.10.27 CheckboxVisible(Index as Integer = 0) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: Whether the checkbox is visible.
Notes: (Read and Write computed property)

204.10.28 Constants

204.10.29 ProgressDialogCheckboxIDDefault = 0

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: The ID of the default checkbox.

204.10.30 ProgressIndeterminate = -1

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: The progress value for indeterminate.

204.11 class WinUserInputStringMBS

204.11.1 class WinUserInputStringMBS

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The object created when asking the user for a string,Äîfor example, when obtaining the name of a tag.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

204.11.2 Blog Entries

- MBS Xojo Plugins, version 20.3pr6

204.11.3 Blog Entries

- MBS Xojo Plugins, version 20.3pr6

204.11.4 Methods

204.11.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

204.11.6 Destructor

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The destructor.

204.11.7 MRUEntry(Index as Integer) as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The entry at the given index in the most recently used list.
Notes: Index from 0 to MRUCount-1.

204.11.8 Properties

204.11.9 Default as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The default string used to initialize an edit control (or equivalent).
Notes: (Read only property)

204.11.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

204.11.11 MaxLength as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The maximum string length the user interface (UI) should allow.
Notes:

The maximum string length in characters.
(Read only property)

204.11.12 MRUCount as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The number of items in the list of most recently used items.
Notes: (Read only property)

204.11.13 Prompt as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The title of a prompt if the prompt is a modal dialog box.
Notes: (Read only property)

204.11.14 StringId as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The unlocalized canonical name for the requested string.
Notes:

For example, when requesting a tag name, the canonical name might be "TagName".
(Read only property)

204.11.15 StringType as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: A value indicating the type of string to obtain from the user.
Notes:

A value indicating the type of string to obtain from the user.

See UserInputDefault and UserInputPathElement constants.
(Read only property)

204.11.16 SubmitButtonText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The text for the submit button.
Notes: (Read only property)

204.11.17 TooltipText as String

MBS WinFrameworks Plugin, Plugin Version: 20.3, Platform: Windows, Targets: Desktop only.

Function: The tooltip text displayed for a control.
Notes: (Read only property)

204.11.18 Constants

204.11.19 UserInputDefault = 0

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the constants for string types.
Notes: Specifies that any string is allowed.

204.11.20 UserInputPathElement = 1

MBS WinFrameworks Plugin, Plugin Version: 20.3.

Function: One of the constants for string types.
Notes: Specifies that the string will not accept characters that are illegal in file or directory names (such as * or /).

Chapter 205

Windows Registry

205.1 class RegistryFileTypeMBS

205.1.1 class RegistryFileTypeMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: An easy way to register an document icon for Windows.
Notes:

You set up the properties of this class and than you call create.
I suggest that you do it like QuickTime or Winzip. Ask the user on first run if he want's your application to register its file types.
And also provide two buttons in the Preferencesdialog to register or unregister the types.

This class works on Windows 7 only if you run the app as administrator.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

205.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr5

- Plugin notes

205.1.3 Blog Entries

- MBS Real Studio Plugins, version 12.5pr5
- Plugin notes

205.1.4 Methods

205.1.5 Create as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates this file type.
Example:

```
dim r as RegistryFileTypeMBS
' set properties for r
dim errorcode as Integer
errorcode=r.create
```

Notes:

Returns:

-1 - Run on Mac OS
0 - OK
1 - Failed to create main extension key.
2 - Failed to create the description key for file type.
3 - Failed to create the key for the icon.
4 - Failed to create the key for the open description.
5 - Required parameters not provided.

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

205.1.6 Remove as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes this file type.
Example:

```
dim r as RegistryFileTypeMBS
dim errorcode as Integer

errorcode=r.remove
```

Notes:

Returns:

-1 - Run on Mac OS or parameters bad.
0 - OK
x - A Windows error code like 5 for permissions denied.

Note: The return values changed in MBS Plugin 3.2 to now return Windows error codes!

This function may fail to run if permissions are denied.
Or it may only affect the shadow registry used by Windows to protect itself from having unauthorized apps editing the real registry.

205.1.7 Properties

205.1.8 AppFile as FolderItem

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The application to launch to open the file.
Example:

```
dim r as new RegistryFileTypeMBS
r.Appfile=app.applicationfilembs // it is my file ;-)
```

Notes: (Read and Write property)

205.1.9 Description as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description for this file type.
Example:

```
dim r as new RegistryFileTypeMBS
r.description="Monkeybread File"
```

Notes:

The text to show in the explorer in column view.
(Read and Write property)

205.1.10 Extension as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The extension for this file type.
Example:

```
dim r as new RegistryFileTypeMBS

r.extension=".MBS"
```

Notes:

The extension should start with a dot follow by 3 uppercase letters and it should be unique. But as there are more file types than combinations of 3 letters this may be difficult...
(Read and Write property)

205.1.11 FileType as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A internal unique signature for this file type.
Example:

```
dim r as new RegistryFileTypeMBS

r.FileType="MBSFile"
```

Notes:

May contain any character except chr(0) and should be ANSI encoded.
(Read and Write property)

205.1.12 Iconfile as FolderItem

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The file with the icon.
Example:

```
dim r as new RegistryFileTypeMBS

r.iconfile=app.applicationfileMBS // it is my file ;-)
```

Notes:

You can get the icon out of your application (ID 0 is the default icon).
But you can also use DLL files like "Shell32.dll" for some nice icons.
Last but not least you can use an ICO file which Iconographer can create for you from your Mac Icons.
(Read and Write property)

205.1.13 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the Icon to use.
Example:

```
dim r as new RegistryFileTypeMBS

r.iconid=3
```

Notes:

Your icon file may contain more than one icon. Here you can specify which one to use. First is ID 0.
(Read and Write property)

205.1.14 OpenDescription as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The text to show in the context menu for Open.
Example:

```
dim r as new RegistryFileTypeMBS

r.OpenDescription="Open MBS file"
```

Notes:

If you don't provide an OpenDescription you'll get "Open".
Here you can describe the default action.
e.g. Stuffit Expander could say "Expand file".
(Read and Write property)

205.2 class RegistryKeyMBS

205.2.1 class RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to a Windows Registry Key.

205.2.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 17.4
- MBS Xojo Plugins, version 17.4pr6

205.2.4 Methods

205.2.5 CopyTree(keyname as string, Dest as RegistryKeyMBS) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Copies the specified registry key, along with its values and subkeys, to the specified destination key.
Notes: Returns true on success and false on failure.

205.2.6 CreateKey(name as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a new subkey.
Notes:

If the key is allready present it is just opened.
Returns a registry key or nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

205.2.7 Delete(keyname as string) as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the specified subkey key.
Notes:

Windows 95: The Delete function deletes a subkey and all its descendants.
Windows NT: The Delete function deletes the specified subkey. The subkey to be deleted must not have subkeys.

With plugin version 3.2 the NT behavior is worked around to match the Windows 95 behavior. So all sub keys are deleted!

205.2.8 DeleteTree(keyname as string) as boolean

MBS Win Plugin, Plugin Version: 17.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes the subkeys and values of the specified key recursively.
Example:

```
dim t as RegistryKeyMBS = RegistryMBS.CurrentUser

// create some keys
dim n as RegistryKeyMBS = t.CreateKey("Hello")
dim w as RegistryKeyMBS = n.CreateKey("World")

w.Value("Test").asString = "Hello"

break // see in regedit

// delete it
if t.DeleteTree("Hello") then
MsgBox "deleted. ok"
else
MsgBox "delete failed"
end if
```

Notes: Returns true on success and false on failure.

205.2.9 Flush

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Writes all the attributes of the specified open key into the RegistryMBS.

205.2.10 Item(index as Integer) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the key at the specified index.
Notes:

May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 205.2.11 Item(name as string) as RegistryKeyMBS 28183

205.2.11 Item(name as string) as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the key with the specified name.
Notes:

May return nil on any error like missing access rights.
Some keys can't be opened, but ItemName() may return the name of the key.
See also:

- 205.2.10 Item(index as Integer) as RegistryKeyMBS 28183

205.2.12 ItemName(index as Integer) as string

MBS Win Plugin, Plugin Version: 6.3, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the key at the specified index.
Notes: May return "" on any error.

205.2.13 Value(index as Integer) as RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value at the specified index.
See also:

- 205.2.14 Value(name as string) as RegistryValueMBS 28184

205.2.14 Value(name as string) as RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value item with the specified name.
Notes:

The value must not exists. So use this function to make a new key.
Use an empty name (e.g. "") for the default key value.

This method was named ValueItem in plugin version before 10.4.
See also:

- 205.2.13 Value(index as Integer) as RegistryValueMBS 28184

205.2.15 ValueName(index as Integer) as string

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the value with the given index.
Notes: May return "" on any error.

205.2.16 Properties

205.2.17 ItemCount as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the count of subkeys.
Example:

```
dim i,c as Integer
dim key as RegistryKeyMBS // the registry item

c=key.ItemCount-1
for i=0 to c
```

```
// do something
next
```

Notes:

This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)

205.2.18 name as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the Key.
Notes: (Read only property)

205.2.19 ValueCount as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the count of values.
Example:

```
dim i,c as Integer
dim key as RegistryKeyMBS

c=key.ValueCount
for i=1 to c
// do something
next
```

Notes:

This property calls a System function to get the value. So save it in a local variable instead of calling it in a for loop. See the example.
(Read only property)

205.3 class RegistryMBS

205.3.1 class RegistryMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to the Windows Registry.
Notes: Please send me an email if you need some functions which are now not included.

205.3.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr10
- MBS REALbasic Plugins Version 10.4 release notes

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr11

205.3.4 Methods

205.3.5 classesRoot as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the ClassesRoot Tree.

205.3.6 CurrentConfig as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the CurrentConfig Tree.

205.3.7 CurrentUser as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the CurrentUser Tree.

205.3.8 getBinaryValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as Memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you a Memoryblock of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
dim r as new RegistryMBS
msgBox "This OS is: "+r.getBinaryValue(path, "ProductName").cstring(0)
```

Notes:

Returns nil on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

205.3.9 getStringValue(keypath as string,valuename as string, Use64bitRegistry as boolean = false) as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you a String of the value called valuename in the key found at keypath.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
dim r as new RegistryMBS
msgBox "This OS is: "+r.getStringValue(path, "ProductName")
```

Notes:

Returns "" on any error.
Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

205.3.10 Key(keypath as string, Use64bitRegistry as boolean = false) as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the given path of a key.
Example:

```
const path="HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion"
dim r as new RegistryMBS
msgBox r.Key(path).Name
```

Notes:

If you need you can recreate this function in Xojo code to have some error checking. This function here will return nil on any error.

Use64bitRegistry: Pass true to create key in 64 bit view of the Registry instead of 32 bit view.

205.3.11 LocalMachine as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the LocalMachine Tree.

205.3.12 PerformanceData as RegistryKeyMBS

MBS Win Plugin, Plugin Version: 10.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the PerformanceData Tree.

205.3.13 Users as RegistryKeyMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you an RegistryKeyMBS object for the Users Tree.

205.4 class RegistryValueMBS

205.4.1 class RegistryValueMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Gives you access to a value of a RegistryMBS Key.

205.4.2 Blog Entries

- MBS Xojo Plugins, version 18.3pr6
- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr11

205.4.3 Blog Entries

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr11

205.4.4 Methods

205.4.5 Delete as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Deletes this value.
Notes: The RegistryValueMBS object should be destroyed after deleting.

205.4.6 SetBinaryMem(typ as Integer,data as Memoryblock)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value to the content of the memoryblock.
Notes:

Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

205.4.7 SetBinaryStr(typ as Integer,data as String)

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Sets the value to the content of the string.
Notes:

Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

205.4.8 Properties

205.4.9 asBinary as Memoryblock

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a memoryblock.
Notes:

Can also be used to set the value.
(Read and Write property)

205.4.10 asBinaryString as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a string with binary content.
Notes:

This string may include chr(0).
Can also be used to set the value.
(Read and Write property)

205.4.11 asLong32 as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a 32bit integer.
Notes:

Can also be used to set the value.
(Read and Write property)

205.4.12 asLong64 as Int64

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a 64bit integer.
Example:

```
dim v as RegistryValueMBS
v.aslong64=v.aslong64+1 // add one
```

Notes:

Can also be used to set the value.
(Read and Write property)

205.4.13 asString as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the value as a string.
Notes:

Can also be used to set the value.
(Read and Write property)

205.4.14 isBinary as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is binary data.
Notes: (Read only property)

205.4.15 isLong32 as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a 32 bit integer.
Notes: (Read only property)

205.4.16 isLong64 as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a 64 bit Integer.
Notes: (Read only property)

205.4.17 isString as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns true if the value is a string.
Notes: (Read only property)

205.4.18 name as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the name of the Value.
Notes: (Read only property)

205.4.19 size as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the size of this value.
Notes: (Read only property)

205.4.20 type as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Returns the type of the value.
Notes:

Type may be one of this values:

0	No value type
1	Nul terminated string
2	Nul terminated string (with environment variable references)
3	Free form binary
4	32-bit number (LittleEndian)
5	32-bit number (BigEndian)
6	Symbolic Link (unicode)
7	Multiple Unicode strings
8	Resource list in the resource map
9	Resource list in the hardware description
10	Resource requirements list
11	64-bit number

(Read only property)

Chapter 206

Windows Shortcuts

206.1 class WindowsInternetShortcutMBS

206.1.1 class WindowsInternetShortcutMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create internet shortcuts on Windows.
Example:

```
# if targetwin32
dim w as WindowsInternetShortcutMBS

w=new WindowsInternetShortcutMBS

w.URL="http://www.monkeybreadsoftware.de"
w.Command=3
w.Icon=windowsSystemFolder.child("shell32.dll")
w.iconID=41
w.Location=SpecialFolder.Desktop.child("A new link to explorer.lnk")
w.Working=volume(0)

if w.CreateInternetShortCut then
if w.AddInternetShortCutIcon then
msgBox "Shortcut created."
else
msgBox "Failed to add icon."
end if
else
msgBox "Failed to create shortcut."
end if
# endif
```

206.1.2 Methods

206.1.3 CreateInternetShortCut as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a shortcut on the specified location.
Notes: Version 10.1: Now adds the icon, too.

206.1.4 Properties

206.1.5 Command as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code for the showing of the application.
Notes:

Use e.g. 3 for full screen.
(Read and Write property)

206.1.6 Icon as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the icon file.
Notes:

(Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

206.1.7 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the icon inside the icon file.
Notes: (Read and Write property)

206.1.8 Location as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location where the shortcut is created or modified.
Notes:

(Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

206.1.9 url as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The URL where the shortcut will point to.
Notes: (Read and Write property)

206.1.10 WorkingDirectory as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The working directory for the browser.
Notes:

(Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

206.2 class WindowsShortCutMBS

206.2.1 class WindowsShortCutMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create shortcuts on Windows.
Example:

```
dim w as WindowsShortCutMBS

w = new WindowsShortCutMBS

w.Arguments = ""
w.Command = 3
w.Icon = specialfolder.system.child("shell32.dll").NativePath
w.iconID = 41
w.Location = SpecialFolder.Desktop.child("A new link to explorer.lnk").NativePath
w.Target = SpecialFolder.Windows.child("explorer.exe").NativePath
w.WorkingDirectory = volume(0).NativePath

if w.CreateShortCut then
msgBox "Shortcut created."
else
msgBox "Failed to create shortcut."
end if
```

206.2.3 Blog Entries

- MBS Xojo Plugins, version 21.6pr3

206.2.4 Methods

206.2.5 CreateShortCut as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a shortcut on the specified location.
Notes:

Returns true on success and false on any error.
Version 10.1: Now adds the icon, too.

206.2.6 ResolveShortCut(DisableGUI as boolean=false, DisableSearch as boolean=false) as boolean

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Resolves the shortcut.
Notes:

Fills the properties target, description, Argument, WorkingDirectory, Icon and IconID.
Returns false on any error.

Parameters added in plugin version 7.4:

DisableGUI:
Do not display a dialog box if the link cannot be resolved. The time-out duration will be set to the default value of 3,000 milliseconds (3 seconds).

DisableSearch:
Do not execute the search heuristics.

For more details check this page in Microsoft's documentation:
http://msdn.microsoft.com/en-us/library/bb774952(v=vs.85).aspx

206.2.7 Properties

206.2.8 Arguments as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Arguments to the application which is linked to the shortcut.
Notes: (Read and Write property)

206.2.9 Command as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The code for the showing of the application.
Notes:

Constants which may be useful:

```
SW_HIDE                = 0
SW_NORMAL              = 1
SW_SHOWMINIMIZED       = 2
SW_SHOWMAXIMIZED       = 3
SW_MAXIMIZE            = 3
SW_SHOWNOACTIVATE      = 4
SW_SHOW                = 5
SW_MINIMIZE            = 6
SW_SHOWMINNOACTIVE     = 7
SW_SHOWNA              = 8
SW_RESTORE             = 9
SW_SHOWDEFAULT         = 10
SW_FORCEMINIMIZE       = 11
```

(Read and Write property)

206.2.10 Description as String

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The description of the shortcut.
Notes: (Read and Write property)

206.2.11 Icon as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location of the icon file.
Notes:

(Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

206.2.12 IconID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The ID of the icon inside the icon file.
Notes: (Read and Write property)

206.2.13 Location as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The location where the shortcut is created or modified.
Notes:

(Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

206.2.14 ParentWindow as Variant

MBS Win Plugin, Plugin Version: 3.4, Platform: Windows, Targets: Desktop only.

Function: The parent window used when a dialog must be opened.
Notes:

Can reference a Window or DesktopWindow object.
(Read and Write property)

206.2.15 Target as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The target where the shortcut will point to.
Notes:

(Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

206.2.16 WorkingDirectory as String

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The working directory of this shortcut.
Notes:

(Changed from FolderItem to String in plugin version 3.4)
(Read and Write property)

Chapter 207

Windows Store

207.1 class WindowsStoreAppLicenseMBS

207.1.1 class WindowsStoreAppLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides license info for the current app, including licenses for products that are offered by the app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.1.2 Blog Entries

- News from the MBS Xojo Plugins Version 20.4
- Selling Xojo apps on Windows Store

207.1.4 Methods

207.1.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.1.6 Properties

207.1.7 AddOnLicenses as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the collection of licenses for durable add-ons for which the user has entitlements to use.
Notes:

This property does not include licenses for consumable add-ons.

Returns a map of key and value pairs, where each key is the Store ID of an add-on SKU from the Microsoft Store catalog and each value is a StoreLicense object that contains license info for the add-on.

This collection contains durable add-on licenses that are currently valid. When a license is expired or no longer valid, it will no longer be available in this collection.
(Read only property)

207.1.8 ExpirationDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the expiration date and time for the app license.
Notes:

The expiration date and time for the app license, relative to the system clock.

For usage-limited trials, the expiration date is December 31, 9999. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

207.1.9 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete license data in JSON format.
Notes:

Use the ExtendedJsonData property to access the complete data for the StoreAppLicense object as a JSON-formatted string in your code.
(Read only property)

207.1.10 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.1.11 IsActive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the license is valid and provides the current user an entitlement to use the app.
Notes: (Read only property)

207.1.12 IsTrial as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the license is a trial license.
Notes: (Read only property)

207.1.13 IsTrialOwnedByThisUser as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement for the usage-limited trial that is associated with this app license.
Notes:

This property is intended to be used by developers who have configured their app as a usage-limited trial

in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

207.1.14 SkuStoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of the licensed app SKU from the Microsoft Store catalog.
Notes: (Read only property)

207.1.15 TrialTimeRemaining as Double

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the remaining time for the usage-limited trial that is associated with this app license.
Notes:

This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.

Value is in seconds.
(Read only property)

207.1.16 TrialUniqueId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a unique ID that identifies the combination of the current user and the usage-limited trial that is associated with this app license.
Notes:

This property is intended to be used by developers who have configured their app as a usage-limited trial in Partner Center. Usage-limited trials are currently available only to some developer accounts in Xbox managed partner programs.
(Read only property)

207.2 class WindowsStoreContextMBS

207.2.1 class WindowsStoreContextMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The base class for Windows Store APIs.
Example:

```
dim context as New WindowsStoreContextMBS(Window1)
```

Notes:

Provides members you can use to access and manage Microsoft Store-related data for the current app. For example, you can use members of this class to get Microsoft Store listing and license info for the current app, purchase the current app or products that are offered by the app, or download and install package updates for the app.

Requires Windows 10 Anniversary Edition (introduced in 10.0.14393.0)

Uses delegates, so only available for Xojo 2013 or newer.

207.2.4 Methods

207.2.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.
See also:

- 207.2.6 Constructor(Parent as DesktopWindow) 28208
- 207.2.7 Constructor(Parent as Window) 28208

207.2.6 Constructor(Parent as DesktopWindow)

MBS WinFrameworks Plugin, Plugin Version: 22.0, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Initializes store and sets parent window to use for dialogs.
See also:

- 207.2.5 Constructor 28208
- 207.2.7 Constructor(Parent as Window) 28208

207.2.7 Constructor(Parent as Window)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The constructor.
Notes: Initializes store and sets parent window to use for dialogs.
See also:

- 207.2.6 Constructor(Parent as DesktopWindow) 28208

207.2.8 GetAppLicenseAsync(CompletionHandler as GetAppLicenseCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets license info for the current app, including licenses for add-ons for the current app.
Example:

```
dim context as New WindowsStoreContextMBS(Window1)
context.GetAppLicenseAsync AddressOf GetAppLicenseCompleted
```

Notes:

Asynchronous version, which returns quickly and calls the given delegate later when done.

The StoreAppLicense object returned by this method provides access to licenses for add-ons and other info, such as whether the license is active. If this method is called while the device is offline, it returns the cached value of the current licenses on the device.

207.2.9 GetAppLicenseSync as WindowsStoreAppLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets license info for the current app, including licenses for add-ons for the current app.
Notes:

Synchronous version, which waits for the result.

The StoreAppLicense object returned by this method provides access to licenses for add-ons and other info, such as whether the license is active. If this method is called while the device is offline, it returns the cached value of the current licenses on the device.

207.2.10 GetAssociatedStoreProductsAsync(productKinds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store info for the add-ons of the current app for which the user has purchased.
Notes: productKinds: An array of strings that specify the types of add-ons for which you want to retrieve info.

207.2.11 GetStoreProductForCurrentAppAsync(CompletionHandler as GetStoreProductForCurrentAppCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store listing info for the current app and provides access to a method that you can use to purchase the app for the current user.
Example:

```
dim context as New WindowsStoreContextMBS(Window1)
context.GetStoreProductForCurrentAppAsync AddressOf GetStoreProductForCurrentAppCompleted
```

207.2.12 GetStoreProductsAsync(productKinds() as String, storeIds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store listing info for the specified products that are associated with the current app.
Example:

```
// please change ID for the item to find

Dim StoreIds() As String = Array("12345", "67890")
Dim ProductKinds() As String = Array("**Application**", "**Game**", "**Consumable**", "**UnmanagedConsumable**", "**Durable**")

context.GetStoreProductsAsync ProductKinds, StoreIds, AddressOf GetStoreProductsAsyncCompleted
```

Notes:

productKinds: An array of strings that specify the types of products for which you want to retrieve listing info.
storeIds: An array of the Store ID strings for the products for which you want to retrieve listing info.

207.2.13 GetUserCollectionAsync(productKinds() as String, CompletionHandler as GetStoreProductsCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets Microsoft Store info for the add-ons of the current app for which the user has purchased.
Notes: productKinds: An array of strings that specify the types of add-ons for which you want to retrieve info.

207.2.14 RequestPurchaseAsync(CompletionHandler as RequestPurchaseCompletedMBS, StoreID as String, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Example:

```
dim context as New WindowsStoreContextMBS(Window1)

// please change ID for the item to purchase
Const StoreID = "9NCMFFPJRVHC"

context.RequestPurchaseAsync AddressOf RequestPurchaseCompleted, StoreID
```

Notes:

This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

207.2.15 RequestRateAndReviewAppAsync(CompletionHandler as RequestRateAndReviewAppCompletedMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the user to rate and review the app.
Example:

```
dim context as New WindowsStoreContextMBS(Window1)
context.RequestRateAndReviewAppAsync AddressOf RequestRateAndReviewAppCompleted
```

Notes:

This method will display the UI for the user to select a Store rating and add an optional Store review for the product.

The delegate will later be called with the result.

207.2.16 Properties

207.2.17 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.2.18 Parent as Variant

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The parent window for dialogs.
Notes:

Can reference a Window or DesktopWindow object.
(Read and Write property)

207.2.19 Events

207.2.20 OfflineLicensesChanged

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: .

Function: Raised when the status of the app's license changes (for example, the trial period has expired or the user has purchased the full version of the app).
Notes: When this event is raised, you can get the latest app license from the Microsoft Store by calling the GetAppLicenseAsync method. The WindowsStoreAppLicenseMBS object returned by this method also contains the latest add-on licenses for the app in the AddOnLicenses property.

207.2.21 Constants

207.2.22 kAsyncStatusCanceled = 2

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the constants to specify the status of an asynchronous operation.
Notes: The operation was canceled.

207.2.23 kAsyncStatusCompleted = 1

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the constants to specify the status of an asynchronous operation.
Notes: The operation has completed.

207.2.24 kAsyncStatusError = 3

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the constants to specify the status of an asynchronous operation.
Notes: The operation has encountered an error.

207.2.25 kAsyncStatusStarted = 0

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: One of the constants to specify the status of an asynchronous operation.
Notes: The operation has started.

207.2.26 Delegates

207.2.27 GetAppLicenseCompletedMBS(ErrorCode as Integer, appLicense as WindowsStoreAppLicenseMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate called when app license data was retrieved.
Notes: ErrorCode: The Windows error code in case of a failure.

207.2.28 Blog Entries

- MBS Xojo Plugins, version 23.1pr3

207.2.29 GetStoreProductForCurrentAppCompletedMBS(ErrorCode as Integer, result as WindowsStoreProductResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate called when query is done.
Notes: ErrorCode: The Windows error code in case of a failure.

207.2.30 Blog Entries

- MBS Xojo Plugins, version 23.1pr3

207.2.31 GetStoreProductsCompletedMBS(ErrorCode as Integer, result as WindowsStoreProductQueryResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate for receiving results from product query calls.
Notes: ErrorCode: The Windows error code in case of a failure.

207.2.32 Blog Entries

- MBS Xojo Plugins, version 23.1pr3

207.2.33 RequestPurchaseCompletedMBS(ErrorCode as Integer, result as WindowsStorePurchaseResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The purchase completed and you can query the status.
Notes: ErrorCode: The Windows error code in case of a failure.

207.2.34 Blog Entries

- MBS Xojo Plugins, version 23.1pr3

207.2.35 RequestRateAndReviewAppCompletedMBS(ErrorCode as Integer, result as WindowsStoreRateAndReviewResultMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The delegate used for RequestRateAndReviewAppAsync method.
Notes: ErrorCode: The Windows error code in case of a failure.

207.2.36 Blog Entries

- MBS Xojo Plugins, version 23.1pr3

207.3 class WindowsStoreExceptionMBS

207.3.1 class WindowsStoreExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The exception class to report exceptions with Windows Store.
Notes: Subclass of the RuntimeException class.

207.4.4 Methods

207.4.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.4.6 Properties

207.4.7 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the caption for the image.
Notes: (Read only property)

207.4.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.4.9 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the height of the image, in pixels.
Notes: (Read only property)

207.4.10 ImagePurposeTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the tag for the image.
Notes: (Read only property)

207.4.11 Uri as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URI of the image.
Notes: (Read only property)

207.4.12 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the width of the image, in pixels.
Notes: (Read only property)

207.5 class WindowsStoreLicenseMBS

207.5.1 class WindowsStoreLicenseMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Provides license info for a durable add-on that is associated with the current app.
Notes:

To retrieve StoreLicense objects for the durable add-ons for the current app, use the WindowsStoreAppLicenseMBS.AddOnLicenses property. This property contains only the add-on licenses that are still valid and provide the current user with an entitlement to use the add-on. When an add-on license expires or is longer valid, it will no longer be available in the WindowsStoreAppLicenseMBS.AddOnLicenses collection.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.5.6 Properties

207.5.7 ExpirationDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the expiration date and time for the add-on license.
Notes: (Read only property)

207.5.8 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets complete license data in JSON format.
Notes: (Read only property)

207.5.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.5.10 InAppOfferToken as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of the licensed add-on SKU from the Microsoft Store catalog.
Notes: (Read only property)

207.5.11 IsActive as Boolean

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: This property is reserved for future use, and it is not intended to be used in the current release.
Notes:

Currently, it always returns true.
(Read only property)

207.5.12 SkuStoreId as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets in the product ID for the add-on.
Notes: (Read only property)

207.6 class WindowsStorePriceMBS

207.6.1 class WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Contains pricing info for a product listing in the Microsoft Store.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.6.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.6.6 Properties

207.6.7 CurrencyCode as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the ISO 4217 currency code for the market of the current user.
Notes: (Read only property)

207.6.8 FormattedBasePrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the base price for the product with the appropriate formatting for the market of the current user.
Notes: (Read only property)

207.6.9 FormattedPrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the purchase price for the product with the appropriate formatting for the market of the current user.
Notes: (Read only property)

207.6.10 FormattedRecurrencePrice as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the recurring price for the product with the appropriate formatting for the market of the current user, if recurring billing is enabled for this product.
Notes: (Read only property)

207.6.11 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.6.12 IsOnSale as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the product is on sale.
Notes: (Read only property)

207.6.13 SaleEndDate as Int64

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the end date for the sale period for the product, if the product is on sale.
Notes: (Read only property)

207.7 class WindowsStoreProductMBS

207.7.1 class WindowsStoreProductMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Represents a product that is available in the Microsoft Store.
Notes:

Products in the Store are organized in a hierarcy of product, SKU, and availability objects. Products are represented by StoreProduct objects. The SKUs for each product are represented by StoreSku objects, and the availabilities for each SKU are represented by StoreAvailability objects. For more information, see In-app purchases and trials.
To retrieve a StoreProduct object for the current app, use the GetStoreProductForCurrentAppAsync method.
To retrieve StoreProduct objects for products that can be purchased from within the current app, use these methods.

- GetAssociatedStoreProductsAsync
- GetAssociatedStoreProductsWithPagingAsync
- GetStoreProductsAsync
- GetUserCollectionAsync
- GetUserCollectionWithPagingAsync

This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.7.4 Methods

207.7.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.7.6 GetIsAnySkuInstalledAsync(CompletionHandler as GetIsAnySkuInstalledAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Indicates whether any SKU of this product is installed on the current device.
Notes:

This method is intended to be used for products that have downloadable content (DLC).

Starts an asynchronous operation that, on successful completion, returns true if a SKU of this product is installed on the current device; otherwise, false.

207.7.7 Images as WindowsStoreImageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the images from the Windows Store listing for the product.
Notes: Returns a collection of WindowsStoreImageMBS objects that represent the images from the Windows Store listing for the product.

207.7.8 Keywords as String()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the keywords that are associated with the product in Partner Center.
Notes: This property only applies to StoreProduct objects that represent add-ons. These strings correspond to the value of the Keywords field in the properties page for the add-on in Partner Center.

207.7.9 RequestPurchaseAsync(CompletionHandler as WindowsStoreContextMBS.RequestPurchaseCompletedMBS, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Notes:

This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

207.7.10 SKUs as WindowsStoreSKUMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the list of available SKUs for the product.

207.7.11 Videos as WindowsStoreVideoMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the videos from the Windows Store listing for the product.
Notes: Returns a collection of WindowsStoreVideoMBS objects that represent the videos from the Windows Store listing for the product.

207.7.12 Properties

207.7.13 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product description from the Microsoft Store listing.
Notes: (Read only property)

207.7.14 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete data for the product from the Store in JSON format.
Notes:

Use the ExtendedJsonData property to access the complete data for the StoreProduct object as a JSON-formatted string in your code.
(Read only property)

207.7.15 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.7.16 HasDigitalDownload as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the product has optional downloadable content (DLC).
Notes: (Read only property)

207.7.17 InAppOfferToken as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the product ID for this product, if the current StoreProduct represents an add-on.
Notes:

Returns the product ID for this product, if the current StoreProduct represents an add-on.
(Read only property)

207.7.18 IsInUserCollection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement to use the default SKU of the product.

Notes: (Read only property)

207.7.19 Language as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the language for the data in the Microsoft Store listing for the product.
Notes: (Read only property)

207.7.20 LinkURI as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the URI to the Microsoft Store listing for the product.
Notes:

An example URI is https://www.microsoft.com/store/apps/<Store ID for the product>. If there is no listing page for the product, this link resolves to the Microsoft Store home page.
(Read only property)

207.7.21 Price as WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the price for the default SKU and availability for the product.
Notes: (Read only property)

207.7.22 ProductKind as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the type of the product.
Notes:

These values are currently supported: Application, Game, Consumable, UnmanagedConsumable, and Durable.

see
https://docs.microsoft.com/en-us/uwp/api/windows.services.store.storeproduct.productkind?view=winrt-19041#Windows_Services_Store_StoreProduct_ProductKind
(Read only property)

207.7.23 StoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID for this product.
Notes:

For an app, this property corresponds to the Store ID that is available on the App identity page for the app in Partner Center.
(Read only property)

207.7.24 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product title from the Microsoft Store listing.
Notes: (Read only property)

207.7.25 Delegates

207.7.26 GetIsAnySkuInstalledAsyncCompletedMBS(ErrorCode as Integer, Installed as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The delegate triggered by GetIsAnySkuInstalledAsync when completed.

207.8 class WindowsStoreProductQueryResultMBS

207.8.1 class WindowsStoreProductQueryResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to retrieve details about products that can be purchased from within the current app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.8.2 Methods

207.8.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.8.4 Properties

207.8.5 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the collection of products returned by the request.
Notes:

A dictionary of key and value pairs, where each key is a Store ID for the add-on and the value is a StoreProduct object that represents the add-on.
(Read only property)

207.8.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.8.7 Products as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

207.9 class WindowsStoreProductResultMBS

207.9.1 class WindowsStoreProductResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to retrieve details about the current app.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.9.4 Methods

207.9.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.9.6 Properties

207.9.7 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

207.9.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.9.9 Product as WindowsStoreProductMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets info about the current app.
Notes: (Read only property)

207.10 class WindowsStorePurchasePropertiesMBS

207.10.1 class WindowsStorePurchasePropertiesMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Contains additional details that you can pass to a purchase request for a product, including the product name to display to the user during the purchase.
Notes: The RequestPurchaseAsync methods of the WindowsStoreContextMBS, WindowsStoreProductMBS, WindowsStoreSkuMBS, and WindowsStoreAvailabilityMBS classes have overloads that accept an argument of this type.

207.10.4 Methods

207.10.5 Constructor(Name as String = "")

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Initializes a new instance of the StorePurchaseProperties class.
Notes: Optionally pass name.

207.10.6 Properties

207.10.7 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets or sets a JSON-formatted string that contains extended data to pass with the purchase request to the Microsoft Store.
Notes:

Use the ExtendedJsonData property to access the complete data for the StorePurchaseProperties object as a JSON-formatted string in your code. For more information about the structure of the data, see Data schemas for Store products.
If you want to associate the purchase request with a custom campaign, you can add a field named DevOfferId to the JSON string that is returned by this property and then assign the updated string to this property. You can then retrieve this value later by accessing the DeveloperOfferId property of a StoreCollectionData object. Here is an example JSON string that includes a DevOfferId field: " { \"DevOfferId\": \"your campaign ID\" } ".
(Read and Write property)

207.10.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.10.9 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets or sets the product name that is displayed to the user during the purchase.
Notes:

The specified name appears in the title bar of the purchase UI.
(Read and Write property)

207.11 class WindowsStorePurchaseResultMBS

207.11.1 class WindowsStorePurchaseResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to purchase an app or product that is offered by the app.
Notes:

The RequestPurchaseAsync methods of the StoreContext, StoreProduct, StoreSku, or StoreAvailability classes return an object of this type.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.11.4 Methods

207.11.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.11.6 Properties

207.11.7 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the purchase request, if the operation encountered an error.
Notes: (Read only property)

207.11.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.11.9 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the status of the purchase request.
Notes: (Read only property)

207.11.10 Constants

207.11.11 kStatusAlreadyPurchased = 1

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Defines values that represent the status of a request to purchase an app or add-on.
Notes: The current user has already purchased the specified app or add-on.

207.11.12 kStatusNetworkError = 3

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Defines values that represent the status of a request to purchase an app or add-on.
Notes: The purchase request did not succeed because of a network connectivity error.

207.11.13 kStatusNotPurchased = 2

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Defines values that represent the status of a request to purchase an app or add-on.
Notes: The purchase request did not succeed.

207.11.14 kStatusServerError = 4

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Defines values that represent the status of a request to purchase an app or add-on.
Notes: The purchase request did not succeed because of a server error returned by the Microsoft Store.

207.11.15 kStatusSucceeded = 0

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Defines values that represent the status of a request to purchase an app or add-on.
Notes: The purchase request succeeded.

207.12 class WindowsStoreRateAndReviewResultMBS

207.12.1 class WindowsStoreRateAndReviewResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides response data for a request to rate and review the product.
Notes:

Requires Windows 10, version 1809 (introduced in 10.0.17763.0)
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.12.2 Blog Entries

- Selling Xojo apps on Windows Store

207.12.3 Blog Entries

- Selling Xojo apps on Windows Store

207.12.4 Methods

207.12.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.12.6 Properties

207.12.7 ExtendedError as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the error code for the request, if the operation encountered an error.
Notes: (Read only property)

207.12.8 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the complete result data for a rate and review request in JSON format.
Notes:

This includes information to determine if a user aborted the dialog and error details if the call was not successful.

Use the ExtendedJsonData property to access the complete data for the StoreRateAndReviewResult object as a JSON-formatted string in your code.
JSON Schema:
{ "type": "object", "properties": { "status": { "enum": ["success", "aborted"] } , "data": { "type": "object", "properties": { "updated": { "type": "boolean" } } , "required": ["updated"] } , "errorDetails": { "type": "string" } } , "required": ["status", "errorDetails"] }
(Read only property)

207.12.9 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.12.10 Status as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the status for the rate and review request for the product.
Notes: (Read only property)

207.12.11 WasUpdated as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the request to rate and review had a successful updated.
Notes: (Read only property)

207.12.12 Constants

207.12.13 kStatusCanceledByUser = 1

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Constants for the result status for the rate and review request for the product.
Notes: The request was canceled by the user.

207.12.14 kStatusError = 3

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Constants for the result status for the rate and review request for the product.
Notes: The request encountered an error.

207.12.15 kStatusNetworkError = 2

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Constants for the result status for the rate and review request for the product.
Notes: The request encountered a network error.

207.12.16 kStatusSucceeded = 0

MBS WinFrameworks Plugin, Plugin Version: 20.4.

Function: Constants for the result status for the rate and review request for the product.
Notes: The request was successful.

207.13 class WindowsStoreSKUMBS

207.13.1 class WindowsStoreSKUMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Provides info for a stock keeping unit (SKU) of a product in the Microsoft Store.
Notes:

A SKU is a code that uniquely identifies a particular version of a product or service. It is a very common term used in the field of inventory management. Products in the Store are organized in a hierarcy of product, SKU, and availability objects. Products are represented by StoreProduct objects. The SKUs for each product are represented by StoreSku objects, and the availabilities for each SKU are represented by StoreAvailability objects. For more information, see In-app purchases and trials.
To access the SKUs for a product, use the Skus property of the StoreProduct for the product in which you are interested.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.13.4 Methods

207.13.5 BundledSKUs as String()

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the list of Store IDs for the apps or add-ons that are bundled with this product SKU.

207.13.6 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.13.7 GetIsInstalledAsync(CompletionHandler as GetIsInstalledAsyncCompletedMBS)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Indicates whether this product SKU is installed on the current device.
Notes: Starts an asynchronous operation that, on successful completion, returns true if this product SKU is installed on the current device; otherwise, false.

207.13.8 Images as WindowsStoreImageMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the images from the Microsoft Store listing for the product SKU.
Notes: Returns a collection of WindowsStoreImageMBS objects that represent the images from the Microsoft Store listing for the product SKU.

207.13.9 RequestPurchaseAsync(CompletionHandler as WindowsStoreContextMBS.RequestPurchaseCompletedMBS, PurchaseProperties as WindowsStorePurchasePropertiesMBS = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Requests the purchase for the specified app or add-on and displays the UI that is used to complete the transaction via the Microsoft Store.
Notes:

This method provides the option to specify additional details for a specific offer within a large catalog of products that are represented by a single listing in the Microsoft Store, including the product name to display to the user during the purchase.

StoreID: The Store ID of the app or the add-on that you want to purchase for the current user.
PurchaseProperties: The optional purchase properties with display name or additional JSON.

207.13.10 Videos as WindowsStoreVideoMBS()

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the videos from the Microsoft Store listing for the product SKU.
Notes: Returns a collection of WindowsStoreVideoMBS objects that represent the videos from the Microsoft Store listing for the product SKU.

207.13.11 Properties

207.13.12 CustomDeveloperData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the custom developer data string (also called a tag) that contains custom information about the add-on that this product SKU represents.
Notes:

The custom developer data provides a way for developers to associate custom contextual information with an add-on. For more information about setting this value for an add-on, see Enter add-on properties.
(Read only property)

207.13.13 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product SKU description from the Microsoft Store listing.
Notes: (Read only property)

207.13.14 ExtendedJsonData as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets complete data for the current product SKU from the Store in JSON format.
Notes:

Use the ExtendedJsonData property to access the complete data for the StoreSku object as a JSON-formatted string in your code.
(Read only property)

207.13.15 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.13.16 IsInUserCollection as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current user has an entitlement to use the current product SKU.
Notes: (Read only property)

207.13.17 IsSubscription as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current product SKU is a subscription with recurring billing.
Notes:

For more information about the subscription, see the WindowsStoreSubscriptionInfoMBS class and SubscriptionInfo property.
(Read only property)

207.13.18 IsTrial as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets a value that indicates whether the current product SKU is a trial SKU.
Notes: (Read only property)

207.13.19 Language as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the language for the data in the Microsoft Store listing for the product SKU.
Notes: (Read only property)

207.13.20 Price as WindowsStorePriceMBS

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the price of the default availability for this product SKU.
Notes: (Read only property)

207.13.21 StoreId as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the Store ID of this product SKU.
Notes:

The Store ID returned by this property has the format <product Store ID>/<SKU Store ID>, where:

- <product Store ID>is a 12-character alpha-numeric string, such as 9NBLGGH69M0B. This Store ID is available in Partner Center, and it is returned by the StoreId property of the related StoreProduct object.
- <SKU Store ID>is a 4-character alpha-numeric string that identifies the SKU. An example complete Store ID returned by this property is 9NBLGGH69M0B/000N.

(Read only property)

207.13.22 Title as String

MBS WinFrameworks Plugin, Plugin Version: 20.4, Platform: Windows, Targets: Desktop only.

Function: Gets the product SKU title from the Microsoft Store listing.
Notes: (Read only property)

207.13.23 Delegates

207.13.24 GetIsInstalledAsyncCompletedMBS(ErrorCode as Integer, Installed as Boolean)

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The delegate triggered by GetIsInstalledAsync when finished.

207.14 class WindowsStoreVideoMBS

207.14.1 class WindowsStoreVideoMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Represents a video that is associated with a product listing in the Microsoft Store.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

207.14.2 Blog Entries

- New in MBS Xojo Plugins in version 23.1
- MBS Xojo Plugins, version 23.1pr3

207.14.4 Methods

207.14.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

207.14.6 Properties

207.14.7 Caption as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the caption for the video.
Notes: (Read only property)

207.14.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read only property)

207.14.9 Height as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the height of the video, in pixels.
Notes: (Read only property)

207.14.10 PreviewImage as WindowsStoreImageMBS

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the preview image that is displayed for the video.
Notes: (Read only property)

207.14.11 Uri as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the URI of the video.
Notes: (Read only property)

207.14.12 VideoPurposeTag as String

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the tag for the video.
Notes: (Read only property)

207.14.13 Width as Integer

MBS WinFrameworks Plugin, Plugin Version: 23.1, Platform: Windows, Targets: Desktop only.

Function: Gets the width of the video, in pixels.
Notes: (Read only property)

Chapter 208

Windows System Tray

208.1 Globals

208.1.1 HIconFromFileMBS(IconFile as FolderItem, IconID as Integer) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Windows Icon Handle for an icon loaded fromt he given icon file.
Notes:

What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.
Returns 0 on failure.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.
This function is useful for declares where you have to pass a HICON parameter.

208.1.2 Blog Entries

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr2

208.1.3 HIconFromPicturesMBS(Icon as picture, Mask as picture) as Integer

MBS Win Plugin, Plugin Version: 11.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: Creates a Windows Icon Handle with the given pictures.
Notes:

What image depths are used and supported depends on the Windows version.
Returns 0 on failure.
This function is useful for declares where you have to pass a HICON parameter.

208.1.4 Blog Entries

- MBS Plugins 11.1 Release notes
- MBS REALbasic Plugins, version 11.1pr2

208.2 class WindowsSystemTrayMBS

208.2.1 class WindowsSystemTrayMBS

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class to create an item in the system tray.

208.2.2 Blog Entries

- MBS Real Studio Plugins, version 11.3pr10
- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr8

- MBS REALbasic Plugins Version 10.4 release notes
- MBS REALbasic Plugins, version 10.4pr8

208.2.4 Methods

208.2.5 Add as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Adds the item to the system tray.
Example:

```
dim e as WindowsSystemTrayMBS // your system tray object

if e.add then
list.addrow "Added icon."
else
list.addrow "Failed to add icon."
end if
```

Notes:

Returns true if successfull.
You can change the Icon& Mask or the Tooltip string.

208.2.6 Available as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the system tray functions are available.
Notes:

Returns true on Windows 95 and newer.
Returns false on Mac OS and Linux.

208.2.7 Modify as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Modifies the item to the system tray.
Notes:

Returns true if successfull.
You can change the Icon& Mask or the Tooltip string.

208.2.8 Remove as boolean

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: Removes the item from the system tray.
Notes: Returns true if successfull.

208.2.9 SetFocus as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: This method resets focus back to the system try area.
Notes: May be useful to call as cleanup after some context menu was shown.

208.2.10 SetIconFile(IconFile as FolderItem, IconID as Integer) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads an icon from the given file.
Example:

```
dim wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconFile(file,1)
```

Notes:

Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.
IconID = 0 points to the first icon in the file.

The icon file can be .ico, .exe, .dll or similar files with windows icon resource.

208.2.11 SetIconPicture(Icon as picture, Mask as picture) as boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Loads the icon from the given picture with mask.
Example:

```
dim myicon as picture // your picture
dim mymask as picture // the mask for the picture
dim wst as WindowsSystemTrayMBS // your system tray

call wst.SetIconPicture(myicon, mymask)
```

Notes:

Returns true on success and false on failure.
What image depths are used and supported depends on the Windows version.

Type is 0 for a small icon and 1 for a big icon.

208.2.12 Properties

208.2.13 BalloonMode as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon mode.
Example:

```
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes:

0 is Error, 1 is Info and 2 is warning.
(Read and Write property)

208.2.14 BalloonText as string

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon text to show.
Example:

```
dim wst as WindowsSystemTrayMBS // your system tray object

wst.BalloonTitle="Warning"
wst.BalloonText="You have not clicked on me the last 10 minutes."
call wst.modify
```

Notes:

If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

208.2.15 BalloonTimeout as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The balloon timeout in milliseconds.
Example:

```
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
s.BalloonTimeout = 30000
```

Notes:

A value between 10000 and 30000.
Note that Timeout is valid only in Windows 2000 and Windows XP.
(Read and Write property)
See also:

- 208.2.24 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer) 28258

208.2.16 BalloonTitle as string

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The title of the balloon tooltip.
Example:

```
dim s as WindowsSystemTrayMBS

s.BalloonText = "The text for the balloon."
s.BalloonTitle = "The title for the balloon"
s.BalloonMode = 0 // Error mode
```

Notes:

If BalloonTitle or BalloonText are not empty the balloon is shown when you call modify.
(Read and Write property)

208.2.17 IconHandle as Integer

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: The icon handle currently used for the tray object.
Notes:

zero if no handle is there.
(Read and Write property)

208.2.18 ID as Integer

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: If you have more than one icon in the system tray, use this ID to see which one is referred to inside an event.
Notes: (Read and Write property)

208.2.19 Tooltip as string

MBS Win Plugin, Platform: Windows, Targets: Desktop, Console & Web.

Function: The help string for the tooltip.
Example:

```
dim e as WindowsSystemTrayMBS // global

e=new WindowsSystemTrayMBS
e.ID=12345678
e.Tooltip="some text"
e.BalloonText="some text"
e.BalloonTitle="some text"
e.BalloonMode=0
```

Notes:

Limited to 63 characters.
(Read and Write property)

208.2.20 UsingNewEvents as Boolean

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: Desktop, Console & Web.

Function: Whether the new events are enabled.
Notes:

The plugin tries to enable new events if possible. That will only work on Windows 2000 or newer.

New events are:
BalloonTimeout
PopupOpen
ContextMenu
BalloonHide
KeySelected
BalloonUserClick
BalloonShow
Selected
(Read only property)

208.2.21 Events

208.2.22 BalloonHide(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: The balloon has been hidden.

208.2.23 BalloonShow(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: The balloon was shown.
Notes: You will get one balloon event when it disappears: BalloonHide, BalloonUserClick or BalloonTimeout.

208.2.24 BalloonTimeout(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: The balloon was removed because of a timeout.
See also:

- 208.2.15 BalloonTimeout as Integer 28256

208.2.25 BalloonUserClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: The user clicked on the balloon to make it away.

208.2.26 ContextMenu(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: You should show a context menu.

208.2.27 KeySelected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: The system tray item was selected by the keyboard.

208.2.28 MouseLeftButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the left mouse button is pressed for a double click on the system tray icon.

208.2.29 MouseLeftButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the left mouse button is pressed on the system tray icon.

208.2.30 MouseLeftButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the left mouse button is released on the system tray icon.

208.2.31 MouseMiddleButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the middle mouse button is pressed for a double click on the system tray icon.

208.2.32 MouseMiddleButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the middle mouse button is pressed on the system tray icon.

208.2.33 MouseMiddleButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the middle mouse button is released on the system tray icon.

208.2.34 MouseMove(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the mouse is moved over the system tray icon.

208.2.35 MouseRightButtonDoubleClick(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the right mouse button is pressed for a double click on the system tray icon.

208.2.36 MouseRightButtonDown(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the right mouse button is pressed on the system tray icon.

208.2.37 MouseRightButtonUp(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: Called if the right mouse button is pressed on the system tray icon.

208.2.38 PopupOpen(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: You should show a popup menu on the mouse position.

208.2.39 Selected(id as Integer, MouseX as Integer, MouseY as Integer)

MBS Win Plugin, Plugin Version: 7.4, Platform: Windows, Targets: .

Function: The system tray item was selected.

Chapter 209

Windows Taskbar State

209.1 class WindowsTaskbarStateMBS

209.1.1 class WindowsTaskbarStateMBS

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: A class for information about the settings for the Windows taskbar.

209.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.2pr6

209.1.3 Blog Entries

- MBS Real Studio Plugins, version 12.2pr6

209.1.4 Properties

209.1.5 AlwaysOnTop as Boolean

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if the taskbar should be always on the top.
Notes:

Value is false on any error.
Settable in plugin version 12.2 and newer.

(Read and Write property)

209.1.6 AutoHide as Boolean

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: True if the taskbar automatically hides itself.
Notes:

Value is false on any error.
Settable in plugin version 12.2 and newer.
(Read and Write property)

209.1.7 Bottom as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The bottom value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

209.1.8 Height as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The height value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

209.1.9 Left as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The left value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

209.1.10 Right as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The right value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

209.1.11 Top as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The top value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

209.1.12 Width as Integer

MBS Win Plugin, Plugin Version: 3.1, Platform: Windows, Targets: Desktop, Console & Web.

Function: The width value of the taskbar dimensions.
Notes:

Value is 0 on any error.
(Read and Write property)

Chapter 210

WindowsML

210.1 class WindowsMLExceptionMBS

210.1.1 class WindowsMLExceptionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The exception class for Windows runtime exceptions in WindowsML Plugin part.
Notes:

All exceptions should have the HRESULT as errorNumber and the message set.
Subclass of the RuntimeException class.

210.2 class WinLearningModelBindingMBS

210.2.1 class WinLearningModelBindingMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Used to bind values to named input and output features.

210.2.2 Blog Entries

- News from the MBS Xojo Plugins Version 20.5
- Playing with Machine Learning on Windows

210.2.3 Blog Entries

- News from the MBS Xojo Plugins Version 20.5
- Playing with Machine Learning on Windows

210.2.4 Methods

210.2.5 BindWithDouble(name as string, shape() as Integer, values() as Double = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 64-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.6 BindWithFloat(name as string, shape() as Integer, values() as Single = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 32-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.7 BindWithFloat16(name as string, shape() as Integer, values() as Single = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 16-bit floating point values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.8 BindWithImage(name as string, file as folderItem)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given image file.
Notes: Maybe used with features needing image or tensor data.
See also:

- 210.2.9 BindWithImage(name as string, Path as String) 28269

210.2.9 BindWithImage(name as string, Path as String)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given image file.
Notes: Maybe used with features needing image or tensor data.
See also:

- 210.2.8 BindWithImage(name as string, file as folderItem) 28269

210.2.10 BindWithInt16(name as string, shape() as Integer, values() as Int16 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 16-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.11 BindWithInt32(name as string, shape() as Integer, values() as Int32 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 32-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.12 BindWithInt64(name as string, shape() as Integer, values() as Int64 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 64-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.13 BindWithInt8(name as string, shape() as Integer, values() as Int8 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 8-bit signed integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescrip-

torMBS class.
If values is empty, we bind without passing values.

210.2.14 BindWithUInt16(name as string, shape() as Integer, values() as UInt16 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 16-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.15 BindWithUInt32(name as string, shape() as Integer, values() as UInt32 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 32-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.16 BindWithUInt64(name as string, shape() as Integer, values() as UInt64 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 64-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.17 BindWithUInt8(name as string, shape() as Integer, values() as UInt8 = nil)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Binds a input feature with a given tensor array.
Notes:

This is for 8-bit unsigned integer values.
Shape defines the array dimensions as given in Shape property in WinLearningModelTensorFeatureDescriptorMBS class.
If values is empty, we bind without passing values.

210.2.18 Clear

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Remove all bindings.

210.2.19 Constructor(Session as WinLearningModelSessionMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Creates a WinLearningModelBindingMBS from the specified WinLearningModelSessionMBS.

210.2.20 HasKey(key as string) as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Determines whether the map view contains the specified key.
Notes: Returns true if the map view contains the specified key; otherwise, false.

210.2.21 SetDefaults

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Fills all tensor arrays with empty arrays.

210.2.22 Properties

210.2.23 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

210.2.24 Session as WinLearningModelSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The related session.
Notes: (Read only property)

210.3 class WinLearningModelEvaluationResultMBS

210.3.1 class WinLearningModelEvaluationResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Get the results of the evaluation.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

210.3.2 Blog Entries

- Playing with Machine Learning on Windows

210.3.3 Blog Entries

- Playing with Machine Learning on Windows

210.3.4 Methods

210.3.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

210.3.6 GetTensorBoolean(name as string) as Boolean()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor boolean array.

210.3.7 GetTensorDouble(name as string) as Double()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor double array.

210.3.8 GetTensorFloat(name as string) as Single()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor float array.

210.3.9 GetTensorFloat16(name as string) as Single()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16-bit float array.

210.3.10 GetTensorInt16(name as string) as Int16()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16 bit signed integer array.

210.3.11 GetTensorInt32(name as string) as Int32()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 32 bit signed integer array.

210.3.12 GetTensorInt64(name as string) as Int64()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 64 bit signed integer array.

210.3.13 GetTensorInt8(name as string) as Int8()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 8 bit signed integer array.

210.3.14 GetTensorUInt16(name as string) as UInt16()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 16 bit unsigned integer array.

210.3.15 GetTensorUInt32(name as string) as UInt32()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 32 bit unsigned integer array.

210.3.16 GetTensorUInt64(name as string) as UInt64()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 64 bit unsigned integer array.

210.3.17 GetTensorUInt8(name as string) as UInt8()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Queries result feature as tensor 8 bit unsigned integer array.

210.3.18 OutputNames as String()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Gets the output feature names of the model.

210.3.19 Properties

210.3.20 CorrelationId as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The optional string that was passed to Evaluate function.
Notes: (Read only property)

210.3.21 ErrorStatus as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: If the evaluation failed, returns an error code for what caused the failure.
Notes: (Read only property)

210.3.22 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

210.3.23 Succeeded as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: True if the evaluation completed successfully; otherwise, false.
Notes: (Read only property)

210.4 class WinLearningModelFeatureDescriptorMBS

210.4.1 class WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Describes the common properties that all features have.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

210.4.2 Methods

210.4.3 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

210.4.4 Properties

210.4.5 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A description of what this feature is used for in the model.
Notes: (Read only property)

210.4.6 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

210.4.7 Kind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The kind of feature; use this to know which derived class to use.
Notes:

Or use IsA operator in Xojo to determinate which subclass the plugin used.
(Read only property)

210.4.8 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name you use to bind values to this feature.
Notes: (Read only property)

210.4.9 Required as Boolean

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: If true, you must bind a value to this feature before calling Evaluate.
Notes: (Read only property)

210.4.10 Constants

210.4.11 KindImage = 3

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the input and output feature kinds for a machine learning model constants.
Notes: The feature is an image, so use WinLearningModelImageFeatureDescriptorMBS class.

210.4.12 KindMap = 2

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the input and output feature kinds for a machine learning model constants.
Notes: The feature is a map, so use WinLearningModelMapFeatureDescriptorMBS class.

210.4.13 KindSequence = 1

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the input and output feature kinds for a machine learning model constants.
Notes: The feature is a sequence, so use WinLearningModelSequenceFeatureDescriptorMBS class.

210.4.14 KindTensor = 0

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the input and output feature kinds for a machine learning model constants.
Notes: The feature is a tensor, so use WinLearningModelTensorFeatureDescriptorMBS class.

210.4.15 TensorKindBoolean = 9

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is Boolean.

210.4.16 TensorKindComplex128 = 15

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: Invalid type.

210.4.17 TensorKindComplex64 = 14

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: Invalid type.

210.4.18 TensorKindDouble = 11

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 64-bit floating point.

210.4.19 TensorKindFloat = 1

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 32-bit floating point.

210.4.20 TensorKindFloat16 = 10

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 16-bit floating point.

210.4.21 TensorKindInt16 = 5

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 16-bit signed integer.

210.4.22 TensorKindInt32 = 6

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 32-bit signed integer.

210.4.23 TensorKindInt64 = 7

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 64-bit signed integer.

210.4.24 TensorKindInt8 = 3

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 8-bit signed integer.

210.4.25 TensorKindString = 8

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is String.

210.4.26 TensorKindUInt16 = 4

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 16-bit unsigned integer.

210.4.27 TensorKindUInt32 = 12

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 32-bit unsigned integer.

210.4.28 TensorKindUInt64 = 13

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 64-bit unsigned integer.

210.4.29 TensorKindUInt8 = 2

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: The tensor type is 8-bit unsigned integer.

210.4.30 TensorKindUndefined = 0

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the tensor kind constants.
Notes: Invalid type.

210.5 class WinLearningModelImageFeatureDescriptorMBS

210.5.1 class WinLearningModelImageFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Describes the properties of the image the model is expecting.
Notes:

Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

210.5.2 Properties

210.5.3 BitmapAlphaMode as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the expected alpha mode of the image.
Notes: (Read only property)

210.5.4 BitmapPixelFormat as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Specifies the expected pixel format (channel ordering, bit depth, and data type).
Notes: (Read only property)

210.5.5 Height as UInt32

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The expected image height.
Notes: (Read only property)

210.5.6 Width as UInt32

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The expected image width.
Notes: (Read only property)

210.5.7 Constants

210.5.8 BitmapAlphaModeIgnore = 2

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the alpha modes of pixel data constants.
Notes: The alpha value is ignored.

210.5.9 BitmapAlphaModePremultiplied = 0

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the alpha modes of pixel data constants.
Notes: The alpha value has been premultiplied. Each color is first scaled by the alpha value.

210.5.10 BitmapAlphaModeStraight = 1

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the alpha modes of pixel data constants.
Notes: The alpha value has not been premultiplied. The alpha channel indicates the transparency of the color.

210.5.11 BitmapPixelFormatBgra8 = 87

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is B8G8R8A8 unsigned integer.

210.5.12 BitmapPixelFormatGray16 = 57

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is 16 bpp grayscale.

210.5.13 BitmapPixelFormatGray8 = 62

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is 8 bpp grayscale.

210.5.14 BitmapPixelFormatNv12 = 103

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is NV12.

210.5.15 BitmapPixelFormatP010 = 104

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is P010.

210.5.16 BitmapPixelFormatRgba16 = 12

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is R16B16G16A16 unsigned integer.

210.5.17 BitmapPixelFormatRgba8 = 30

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is R8G8B8A8 unsigned integer.

210.5.18 BitmapPixelFormatUnknown = 0

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is unknown.

210.5.19 BitmapPixelFormatYuy2 = 107

MBS WinFrameworks Plugin, Plugin Version: 20.5.

Function: One of the constants for bitmap pixel formats.
Notes: The pixel format is YUY2.

210.6 class WinLearningModelMapFeatureDescriptorMBS

210.6.1 class WinLearningModelMapFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The descriptor for a map, which is a collection of (key, value) pairs.
Notes:

Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

210.6.2 Properties

210.6.3 KeyKind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Map keys can be tensor kinds.
Notes: (Read only property)

210.6.4 ValueDescriptor as WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Map values can be feature kinds.
Notes: (Read only property)

210.7 class WinLearningModelMBS

210.7.1 class WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Represents a trained machine learning model.
Example:

```
dim ModelFile as FolderItem =SpecialFolder.Desktop.Child("SqueezeNet.onnx")

if not ModelFile.Exists then
MsgBox "Please download model first!"
quit
end if

dim model as WinLearningModelMBS = WinLearningModelMBS.LoadFromFile(ModelFile)

if model = nil then
msgbox "Failed to load model!"
// Check path and you need Windows 10
quit
end if
```

Notes:

This is the main object you use to interact with Windows ML. You use it to load, bind, and evaluate trained ONNX models:

- Load the model using one of the Load method.
- Enumerate the InputFeatures and OutputFeatures and bind to your model.
- Create a LearningModelSessionMBS and evalaute.

Requires Windows 10.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

210.7.2 Blog Entries

210.7.3 Blog Entries

- News from the MBS Xojo Plugins Version 20.5
- MBS Xojo Plugins, version 20.5pr1
- Playing with Machine Learning on Windows

210.7.4 Methods

210.7.5 Constructor

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The private constructor.

210.7.6 InputFeatures as WinLearningModelFeatureDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A list of the model's input features.
Example:

```
dim model as WinLearningModelMBS // your model

dim inputFeatures() as WinLearningModelFeatureDescriptorMBS = model.InputFeatures
for each feature as WinLearningModelFeatureDescriptorMBS in inputFeatures

list.AddRow feature.Name

next
```

210.7.7 LoadFromFile(File as FolderItem) as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Loads a model for Windows Machine Learning.
Example:

```
dim ModelFile as FolderItem =SpecialFolder.Desktop.Child("SqueezeNet.onnx")

if not ModelFile.Exists then
MsgBox "Please download model first!"
quit
```

```
end if

dim model as WinLearningModelMBS = WinLearningModelMBS.LoadFromFile(ModelFile)

if model = nil then
msgbox "Failed to load model!"
// Check path and you need Windows 10
quit
end if
```

Notes:

Please use an onnx file as you find them on various websites, e.g. start here:
https://docs.microsoft.com/en-us/windows/ai/windows-ml/get-onnx-model

Will rasie an exception about unregistered class if called on older Windows versions before 10.

210.7.8 LoadFromFilePath(Path as String) as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Loads a model for Windows Machine Learning.
Notes:

Please use an onnx file as you find them on various websites, e.g. start here:
https://docs.microsoft.com/en-us/windows/ai/windows-ml/get-onnx-model

Will rasie an exception about unregistered class if called on older Windows versions before 10.

210.7.9 OutputFeatures as WinLearningModelFeatureDescriptorMBS()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A list of the model's output features.
Example:

```
dim model as WinLearningModelMBS // your model

dim OutputFeatures() as WinLearningModelFeatureDescriptorMBS = model.OutputFeatures
for each feature as WinLearningModelFeatureDescriptorMBS in OutputFeatures

list.AddRow feature.Name
```

next

210.7.10 Properties

210.7.11 Author as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name of the model author.
Notes: (Read only property)

210.7.12 Description as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A description of the model.
Notes: (Read only property)

210.7.13 Domain as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The domain of the model.
Notes: (Read only property)

210.7.14 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

210.7.15 Metadata as Dictionary

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The metadata from the ONNX model.
Notes: (Read only property)

210.7.16 Name as String

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The name of the model.
Notes: (Read only property)

210.7.17 Version as Int64

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The version of the model.
Notes: (Read only property)

210.8 class WinLearningModelSequenceFeatureDescriptorMBS

210.8.1 class WinLearningModelSequenceFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: A descriptor for a sequence with an array of elements.
Notes:

Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

210.8.2 Properties

210.8.3 ElementDescriptor as WinLearningModelFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The feature descriptor for this sequence element.
Notes: (Read only property)

210.9 class WinLearningModelSessionMBS

210.9.1 class WinLearningModelSessionMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Used to evaluate machine learning models.

210.9.2 Blog Entries

- Playing with Machine Learning on Windows

210.9.3 Blog Entries

- Playing with Machine Learning on Windows

210.9.4 Methods

210.9.5 Constructor(model as WinLearningModelMBS)

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Creates a session using the default device.
Notes: model: The trained machine learning model for this session.

210.9.6 Evaluate(bindings as WinLearningModelBindingMBS, correlationId as string = "") as WinLearningModelEvaluationResultMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Evaluate the machine learning model using the feature values bound in bindings.
Notes:

bindings: Holder for associations between model inputs and variable instances.
correlationId: Optional user-supplied string to connect the output results.

MBS Plugins don't support all possible input/output combinations, so if you need something more, please let us know.

210.9.7 Properties

210.9.8 Handle as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The internal object reference.
Notes: (Read and Write property)

210.9.9 Model as WinLearningModelMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The trained machine learning model for this session.
Notes: (Read only property)

210.10 class WinLearningModelTensorFeatureDescriptorMBS

210.10.1 class WinLearningModelTensorFeatureDescriptorMBS

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: Tensors are multi-dimensional arrays of values.
Notes:

The layout of tensors is row-major, with tightly packed contiguous data representing each dimension. The total size of a tensor is the product of the size of each dimension.
Subclass of the WinLearningModelFeatureDescriptorMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

210.10.2 Methods

210.10.3 Shape as Integer()

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The count and size of each dimension.

210.10.4 Properties

210.10.5 TensorKind as Integer

MBS WinFrameworks Plugin, Plugin Version: 20.5, Platform: Windows, Targets: Desktop only.

Function: The data type of the tensor.
Notes: (Read only property)

Chapter 211

WiringPi

211.1 module WiringPiMBS

211.1.1 module WiringPiMBS

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Deprecated: This item is deprecated and should no longer be used. **Function:** The module to work with wiring pi library.
Notes: Deprecated as underlaying C library is deprecated.

211.1.2 Blog Entries

- Cleanup Xojo Plugins
- MBS Xojo Plugins, version 19.2pr1
- MBS Xojo / Real Studio Plugins, version 15.3pr2

211.1.3 Blog Entries

- Cleanup Xojo Plugins
- MBS Xojo Plugins, version 19.2pr1
- MBS Xojo / Real Studio Plugins, version 15.3pr2

211.1.4 Methods

211.1.5 analogRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the value read on the supplied analog input pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard, quick2Wire analog board, etc.

211.1.6 analogWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This writes the given value to the supplied analog pin.
Notes: You will need to register additional analog modules to enable this function for devices such as the Gertboard.

211.1.7 delay(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This causes program execution to pause for at least howLong milliseconds.
Notes: Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer or approximately 49 days.

211.1.8 delayMicroseconds(HowLong as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This causes program execution to pause for at least howLong microseconds.
Notes:

Due to the multi-tasking nature of Linux it could be longer. Note that the maximum delay is an unsigned 32-bit integer microseconds or approximately 71 minutes.

Delays under 100 microseconds are timed using a hard-coded loop continually polling the system time, Delays over 100 microseconds are done using the system nanosleep() function ,Äì You may need to consider the implications of very short delays on the overall performance of the system, especially if using threads.

211.1.9 digitalRead(pin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This function returns the value read at the given pin.
Notes: It will be kHIGH or kLOW (1 or 0) depending on the logic level at the pin.

211.1.10 digitalWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes the value kHIGH or kLOW (1 or 0) to the given pin which must have been previously set as an output.
Notes: WiringPi treats any non-zero number as kHIGH, however 0 is the only representation of kLOW.

211.1.11 digitalWriteByte(value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This writes the 8-bit byte supplied to the first 8 GPIO pins.
Notes: It,Äôs the fastest way to set all 8 bits at once to a particular value, although it still takes two write operations to the Pi,Äôs GPIO hardware.

211.1.12 gpioClockSet(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sets the clock.

211.1.13 I2CRead(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes:

Some devices present data when you read them without having to do any register transactions.
If the return value is negative then an error has happened and you should consult errno.

211.1.14 I2CReadReg16(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes:

Some devices present data when you read them without having to do any register transactions.
Read a 16-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

211.1.15 I2CReadReg8(fd as Integer, reg as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device read.
Notes:

Some devices present data when you read them without having to do any register transactions.
Read an 8-bit value from the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

211.1.16 I2CSetup(devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This initialises the I2C system with your given device identifier.
Notes:

The ID is the I2C number of the device and you can use the i2cdetect program to find this out. I2CSetup() will work out which revision Raspberry Pi you have and open the appropriate device in /dev.

The return value is the standard Linux filehandle, or -1 if any error ,Äì in which case, you can consult errno as usual.

E.g. the popular MCP23017 GPIO expander is usually device Id 0x20, so this is the number you would pass into wiringPiI2CSetup().

211.1.17 I2CSetupInterface(device as string, devId as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This initialises the I2C system with your given device identifier and name.

211.1.18 I2CWrite(fd as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes:

Some devices accept data this way without needing to access any internal registers.
If the return value is negative then an error has happened and you should consult errno.

211.1.19 I2CWriteReg16(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes:

Some devices accept data this way without needing to access any internal registers.
Write a 16-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

211.1.20 I2CWriteReg8(fd as Integer, reg as Integer, Data as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Simple device write.
Notes:

Some devices accept data this way without needing to access any internal registers.
Write a 8-bit data value into the device register indicated.

If the return value is negative then an error has happened and you should consult errno.

211.1.21 LoadLibrary(File as FolderItem) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes:

Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 211.1.22 LoadLibrary(Path as string) as boolean 28304

211.1.22 LoadLibrary(Path as string) as boolean

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Loads the library.
Notes:

Returns true on success or false on failure.
LoadError is set in case of failure.
See also:

- 211.1.21 LoadLibrary(File as FolderItem) as boolean 28304

211.1.23 micros as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns a number representing the number of microseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after approximately 71 minutes.

211.1.24 millis as UInt32

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns a number representing the number of milliseconds since your program called one of the wiringPiSetup functions.
Notes: It returns an unsigned 32-bit number which wraps after 49 days.

211.1.25 physPinToGpio(physPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the BCM_GPIO pin number of the supplied physical pin on the P1 connector.

211.1.26 piBoardId(byref model as Integer, byref Rev as Integer, byref Mem as Integer, byref Maker as Integer, byref OverVolted as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries board identifiers.
Notes:

Mem is memory in Megabytes.
Maker, Model and Rev are value which match the constants in this module.

211.1.27 piBoardRev as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the board revision of the Raspberry Pi.
Notes: It will be either 1 or 2. Some of the BCM_GPIO pins changed number and function when moving from board revision 1 to 2, so if you are using BCM_GPIO pin numbers, then you need to be aware of the differences.

211.1.28 piHiPri(pri as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This attempts to shift your program (or thread in a multi-threaded program) to a higher priority and enables a real-time scheduling.
Notes:

The priority parameter should be from 0 (the default) to 99 (the maximum). This won,Äôt make your program go any faster, but it will give it a bigger slice of time when other programs are running. The priority parameter works relative to others ,Äì so you can make one program priority 1 and another priority 2 and it will have the same effect as setting one to 10 and the other to 90 (as long as no other programs are running with elevated priorities)

The return value is 0 for success and -1 for error. If an error is returned, the program should then consult the errno global variable, as per the usual conventions.

Note: Only programs running as root can change their priority. If called from a non-root program then nothing happens.

211.1.29 piLock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Locks a synchronization lock.
Notes:

These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a ,Äúkey,Äù. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread ,Äì otherwise it,Äôs possible that the thread could wake-up halfway during your data copy and change the data ,Äì so the data you end up copying is incomplete, or invalid.

211.1.30 piMakerNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps maker numbers to names.

211.1.31 piModelNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps model numbers to names.

211.1.32 pinMode(pin as Integer, mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the mode of a pin to either INPUT, OUTPUT, PWM_OUTPUT or GPIO_CLOCK.
Notes:

Note that only wiringPi pin 1 (BCM_GPIO 18) supports PWM output and only wiringPi pin 7 (BCM_GPIO 4) supports CLOCK output modes.

This function has no effect when in Sys mode. If you need to change the pin mode, then you can do it with the gpio program in a script before you start your program.

211.1.33 piRevisionNames(index as Integer) as string

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Maps revision numbers to names.

211.1.34 piUnlock(Key as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Unlocks a synchronization lock.
Notes:

These allow you to synchronise variable updates from your main program to any threads running in your program. keyNum is a number from 0 to 3 and represents a ,Äúkey,Äù. When another process tries to lock the same key, it will be stalled until the first process has unlocked the same key.

You may need to use these functions to ensure that you get valid data when exchanging data between your main program and a thread ,Äì otherwise it,Äôs possible that the thread could wake-up halfway during your data copy and change the data ,Äì so the data you end up copying is incomplete, or invalid.

211.1.35 pullUpDnControl(pin as Integer, pud as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the pull-up or pull-down resistor mode on the given pin, which should be set as an input.
Notes:

Unlike the Arduino, the BCM2835 has both pull-up an down internal resistors. The parameter pud should be; kPUD_OFF, (no pull up/down), kPUD_DOWN (pull to ground) or kPUD_UP (pull to 3.3v) The internal pull up/down resistors have a value of approximately 50KŒ© on the Raspberry Pi.

This function has no effect on the Raspberry Pi,Äôs GPIO pins when in Sys mode. If you need to activate a pull-up/pull-down, then you can do it with the gpio program in a script before you start your program.

211.1.36 pwmSetClock(divisor as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the divisor for the PWM clock.

211.1.37 pwmSetMode(mode as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The PWM generator can run in 2 modes ,Äì ,Äúbalanced,Äù and ,Äúmark:space,Äù.
Notes: The mark:space mode is traditional, however the default mode in the Pi is ,Äúbalanced,Äù. You can switch modes by supplying the parameter: kPWM_MODE_BAL or kPWM_MODE_MS.

211.1.38 pwmSetRange(range as UInt32)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the range register in the PWM generator.
Notes: The default is 1024.

211.1.39 pwmToneWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes a tone.

211.1.40 pwmWrite(pin as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Writes the value to the PWM register for the given pin.
Notes:

The Raspberry Pi has one on-board PWM pin, pin 1 (BMC_GPIO 18, Phys 12) and the range is 0-1024. Other PWM devices may have other PWM ranges.

This function is not able to control the Pi,Äôs on-board PWM when in Sys mode.

211.1.41 Read(fd as Integer, count as UInt64) as Memoryblock

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Read attempts to read count bytes of data from the object referenced by the descriptor fildes into a buffer.
Notes:

Returns the memoryblock on success (if we got more than zero bytes).
Errno is set in case of error.

211.1.42 serialClose(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Closes the device identified by the file descriptor given.

211.1.43 serialDataAvail(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the number of characters available for reading, or -1 for any error condition, in which case errno will be set appropriately.

211.1.44 serialFlush(fd as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This discards all data received, or waiting to be send down the given device.

211.1.45 serialGetchar(fd as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the next character available on the serial device.
Notes: This call will block for up to 10 seconds if no data is available (when it will return -1)

211.1.46 serialOpen(device as String, Baud as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This opens and initialises the serial device and sets the baud rate.
Notes: It sets the port into ‚Äúraw‚Äù mode (character at a time and no translations), and sets the read timeout to 10 seconds. The return value is the file descriptor or -1 for any error, in which case errno will be set as appropriate.

211.1.47 serialPutchar(fd as Integer, c as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the single byte to the serial device identified by the given file descriptor.

211.1.48 serialPutData(fd as Integer, data as Memoryblock)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with any encoding.

211.1.49 serialPuts(fd as Integer, text as string)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Sends the nul-terminated string to the serial device identified by the given file descriptor.
Notes: This sends text with UTF-8 encoding.

211.1.50 setPadDrive(group as Integer, value as Integer)

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This sets the ‚Äústrength‚Äù of the pad drivers for a particular group of pins.
Notes: There are 3 groups of pins and the drive strength is from 0 to 7. Do not use this unless you know what you are doing.

211.1.51 SPIDataRW(channel as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This performs a simultaneous write/read transaction over the selected SPI bus.
Notes:

Data that was in your buffer is overwritten by data returned from the SPI bus.

That,Äôs all there is in the helper library. It is possible to do simple read and writes over the SPI bus using the standard read() and write() system calls though ,Äì write() may be better to use for sending data to chains of shift registers, or those LED strings where you send RGB triplets of data. Devices such as A/D and D/A converters usually need to perform a concurrent write/read transaction to work.

211.1.52 SPIGetFd(channel as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Queries the file descriptor for a channel.

211.1.53 SPISetup(channel as Integer, speed as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes:

The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

211.1.54 SPISetupMode(channel as Integer, speed as Integer, mode as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This is the way to initialise a channel (The Pi has 2 channels; 0 and 1).
Notes:

The speed parameter is an integer in the range 500,000 through 32,000,000 and represents the SPI clock speed in Hz.

The returned value is the Linux file-descriptor for the device, or -1 on error. If an error has happened, you may use the standard errno global variable to see why.

211.1.55 wiringPiSetup as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes:

This initialises wiringPi and assumes that the calling program is going to be using the wiringPi pin numbering scheme. This is a simplified numbering scheme which provides a mapping from virtual pin numbers 0 through 16 to the real underlying Broadcom GPIO pin numbers. See the pins page for a table which maps the wiringPi pin number to the Broadcom GPIO pin number to the physical location on the edge connector.

This function needs to be called with root privileges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

211.1.56 wiringPiSetupGpio as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes:

This is identical to wiringPiSetup, however it allows the calling programs to use the Broadcom GPIO pin numbers directly with no re-mapping.

As above, this function needs to be called with root privileges, and note that some pins are different from revision 1 to revision 2 boards.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

211.1.57 wiringPiSetupPhys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes:

Identical to wiringPiSetup, however it allows the calling programs to use the physical pin numbers on the P1 connector only.

As above, this function needs to be called with root priviliges.

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

211.1.58 wiringPiSetupSys as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Initializes the library.
Notes:

This initialises wiringPi but uses the /sys/class/gpio interface rather than accessing the hardware directly. This can be called as a non-root user provided the GPIO pins have been exported before-hand using the gpio program. Pin numbering in this mode is the native Broadcom GPIO numbers ,Äì the same as wiringPiSetupGpio() above, so be aware of the differences between Rev 1 and Rev 2 boards.

Note: In this mode you can only use the pins which have been exported via the /sys/class/gpio interface before you run your program. You can do this in a separate shell-script, or by using the system() function from inside your program to call the gpio program.

Also note that some functions have no effect when using this mode as they,Äôre not currently possible to action unless called with root privileges. (although you can use system() to call gpio to set/change modes if needed)

One of the setup functions must be called at the start of your program or your program will fail to work correctly. You may experience symptoms from it simply not working to segfaults and timing issues.

211.1.59 wpiPinToGpio(wpiPin as Integer) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: This returns the BCM_GPIO pin number of the supplied wiringPi pin.
Notes: It takes the board revision into account.

211.1.60 Write(fd as Integer, data as Memoryblock) as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Write to a file descriptor.
Notes:

Write attempts to write bytes to the object referenced by the descriptor fildes from the memoryblock pointed to by data.
Upon successful completion the number of bytes which were written is returned. Otherwise, a -1 is returned and the global variable errno is set to indicate the error.

211.1.61 Properties

211.1.62 ErrNo as Integer

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: The last error code from the underlaying linux functions.
Notes:

must be called directly after a function to have the result from that function.
Calling any other function including writing a debug log, may cause this value to be reset.
(Read only property)

211.1.63 LoadError as String

MBS Linux Plugin, Plugin Version: 15.3, Platform: Linux, Targets: Desktop, Console & Web.

Function: Returns the last load error.
Notes: (Read only property)

211.1.64 Constants

211.1.65 kGPIO_CLOCK = 3

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pin mode constants.
Notes: GPIO Clock

211.1.66 kHIGH = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: The constant for high value.

211.1.67 kINPUT = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pin mode constants.
Notes: Input

211.1.68 kINT_EDGE_BOTH = 3

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the interrupt level constants.
Notes: Both

211.1.69 kINT_EDGE_FALLING = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the interrupt level constants.
Notes: Failing

211.1.70 kINT_EDGE_RISING = 2

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the interrupt level constants.
Notes: Rising

211.1.71 kINT_EDGE_SETUP = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the interrupt level constants.
Notes: Setup

211.1.72 kLOW = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: The constant for low value.

211.1.73 kOUTPUT = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pin mode constants.
Notes: Output

211.1.74 kPI_MAKER_EGOMAN = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the maker values.
Notes: Egoman

211.1.75 kPI_MAKER_MBEST = 4

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the maker values.
Notes: MBest

211.1.76 kPI_MAKER_QISDA = 3

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the maker values.
Notes: QISDA

211.1.77 kPI_MAKER_SONY = 2

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the maker values.
Notes: Sony

211.1.78 kPI_MAKER_UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the maker values.
Notes: Unknown

211.1.79 kPI_MODEL_2 = 6

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the model constants.
Notes: Model 2

211.1.80 kPI_MODEL_A = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the model constants.
Notes: Model A

211.1.81 kPI_MODEL_AP = 5

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the model constants.
Notes: Model AP

211.1.82 kPI_MODEL_B = 2

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the model constants.
Notes: Model B

211.1.83 kPI_MODEL_BP = 3

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the model constants.
Notes: Model BP

211.1.84 kPI_MODEL_CM = 4

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the model constants.
Notes: Model CM

211.1.85 kPI_MODEL_UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the model constants.
Notes: unknown

211.1.86 kPI_VERSION_1 = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the version constants.
Notes: Version 1

211.1.87 kPI_VERSION_1_1 = 2

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the version constants.
Notes: Version 1.1

211.1.88 kPI_VERSION_1_2 = 3

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the version constants.
Notes: Version 1.2

211.1.89 kPI_VERSION_2 = 4

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the version constants.
Notes: Version 2

211.1.90 kPI_VERSION_UNKNOWN = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the version constants.
Notes: Unknown version

211.1.91 kPUD_DOWN = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pull up/down constants.
Notes: pull to ground

211.1.92 kPUD_OFF = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pull up/down constants.
Notes: no pull up/down

211.1.93 kPUD_UP = 2

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pull up/down constants.
Notes: pull to 3.3v

211.1.94 kPWM_MODE_BAL = 1

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the PWM generator modes.
Notes: Balanced

211.1.95 kPWM_MODE_MS = 0

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the PWM generator modes.
Notes: Mark:Space

211.1.96 kPWM_OUTPUT = 2

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pin mode constants.
Notes: PWM Output

211.1.97 kPWM_TONE_OUTPUT = 6

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pin mode constants.
Notes: Tone Output

211.1.98 kSOFT_PWM_OUTPUT = 4

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pin mode constants.
Notes: PWM Output

211.1.99 kSOFT_TONE_OUTPUT = 5

MBS Linux Plugin, Plugin Version: 15.3.

Function: One of the pin mode constants.
Notes: Tone Output

Chapter 212

Wordfile

212.1 class WordFileMBS

212.1.1 class WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Word file editing.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes:

This is a class for reading word files and replacing text to customize document files.
Works for xml and docx files. Does not support old doc file format.

Please report document files where plugin corrupted file or failed to replace text.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

212.1.8 Methods

212.1.9 addMediaFile(name as string, content as string)

MBS Tools Plugin, Plugin Version: 19.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a media file image.
Notes:

You can use this function to add a new image.
You need to add the reference in XML yourself to let the image appear somewhere in the document.

212.1.10 Append(other as WordFileMBS, AddPageBreak as boolean = false) as Boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends one word file text to other.
Notes:

This function takes document part from other word file and copies it,Äôs xml nodes to the current document.
Please only copy from one document to other if they both are made from same template, so internal IDs for styles match.

Returns true on success or false on failure.

Added AddPageBreak parameter in version 19.2. If true, we add a page break between the old and new parts.

212.1.11 AppendTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicates a table row containing a placeholder.
Notes:

If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on the end of the table.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

212.1.12 Constructor

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The private constructor.

212.1.13 Contains(findText as string) as boolean

MBS Tools Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if some text exists in the document.
Notes: This is like HasTag function, but doesn't require markers around the text in the document.

212.1.14 DuplicateTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Duplicates a table row containing a placeholder.
Notes:

If you have tables in your template word file and you like to duplicate it, this function can do that and add the new row on just after the row to copy.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

212.1.15 FieldNames as String()

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries field names in the file.
Notes: This looks for form fields in a word file.

212.1.16 GetFieldText(fieldName as string, byref text as String) as boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries field value.
Notes:

The plugin looks for the field with given name and queries it's text.
Returns true if field was found.

212.1.17 HasTag(tag as string) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a tag exists.
Notes:

The place holder in the document must start with ¬´ and end with ¬ª characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the ¬´ and ¬ª markers (or whatever is configured) within the same font style.

212.1.18 MediaFiles as String()

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Lists the media files in the word document.
Example:

```
// read a word file:
Dim file As New FolderItem("c:\tmp\test.docx", folderitem.PathModes.Native)
Dim wordStream As BinaryStream = BinaryStream.Open(file)
Dim wordData As String = wordStream.Read(wordStream.Length)
wordStream.close
Dim word As WordFileMBS = WordFileMBS.OpenData(wordData)

// now show list of files in message box
Dim MediaFiles() As String = word.MediaFiles
MessageBox Join(MediaFiles, EndOfLine)
```

Notes: e.g. image1.png

212.1.19 OpenData(Data as MemoryBlock) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens data as document.
Notes:

You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 212.1.20 OpenData(Data as String) as WordFileMBS 28326

212.1.20 OpenData(Data as String) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens data as document.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
```

```
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes:

You can pass here XML or Docx file content.
Returns nil in case of an error.
See also:

- 212.1.19 OpenData(Data as MemoryBlock) as WordFileMBS 28326

212.1.21 OpenXML(XML as String) as WordFileMBS

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens XML file from text string.
Notes: Returns nil in case of error.

212.1.22 Parts as String()

MBS Tools Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries names of the parts of the document.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

MsgBox w.XML("footer1")
```

Notes:

This may tell you how many headers/footers we found in a docx file.
e.g. "footer1", "header1", "document".

212.1.23 RemoveTableRow(tag as string) as Integer

MBS Tools Plugin, Plugin Version: 17.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a table row containing a placeholder.
Notes:

If you have tables in your template word file and you only fill some rows, you can remove superfluous rows using this function.

Returns Values

0	success
1	Tag not found.
2	Tag found, but not in a table.
3	Missing main document part.

212.1.24 ReplaceTag(tag as string, text as string = """, All as boolean = false) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces a placeholder with text.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes:

The place holder in the document must start with ¬´ and end with ¬ª characters. The place holder you pass here, should not have those quotes.
Returns true on success or false on failure.
If you need to replace multi line text like addresses, please use several placeholders, at least one per line.

Version 17.0 and newer can handle multi line text better for normal paragraphs with Chr(13). It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the marker, it will not be recognized. So please keep all text between and including the ¬´ and ¬ª markers (or whatever is configured) within the same font style.

212.1.25 SetFieldText(fieldName as string, text as String) as boolean

MBS Tools Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets field value.
Notes:

The plugin looks for the field with given name and sets it's text.
Returns true if field was found.

212.1.26 SetMarkers(openMarker as String, closeMarker as String) as boolean

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the markers to look for before/after a tag.
Notes:

Default are ¬´ and ¬ª.
Should be different and not empty.
Returns true on success or false on failure.

212.1.27 Substitute(findText as string, replaceText as string = """, All as boolean = false) as boolean

MBS Tools Plugin, Plugin Version: 21.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replaces some text in the document with new text.

Notes:

Like ReplaceTag function, but without markers around the tag.

Handles multi line text better for normal paragraphs with Chr(13). It creates for you new paragraphs for each line in the new text.

If you change font or style of the text within the find text, it will not be recognized. So please keep all text within the same font style.

212.1.28 Tags as String()

MBS Tools Plugin, Plugin Version: 22.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries list of tags.
Notes:

Depends on the start/end markers set with OpenMarker/CloseMarker properties.

Can be very useful for debugging to query list of tags found in the document.

212.1.29 WriteFile(path as folderItem) as boolean

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a file to disk.
Example:

```
dim f as FolderItem = GetFolderItem("test.docx")
dim b as BinaryStream = BinaryStream.Open(f)
dim d as string = b.Read(b.Length)
dim w as WordFileMBS = WordFileMBS.OpenData(d)

if w.ReplaceTag("FirstName", "Peter") then
if w.ReplaceTag("LastName", "Miller") then

f = GetFolderItem("output.docx")
if w.WriteFile(f) then
MsgBox "OK"
end if
end if
end if
```

Notes: File extension should be correct, either docx or xml depending on what you loaded.

212.1.30 Properties

212.1.31 Caseless as Boolean

MBS Tools Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to compare tag names case insensitive.
Notes:

Set to true for case insensitive comparison of ASCII characters.
Default is false.
(Read and Write property)

212.1.32 CloseMarker as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The close marker text.
Notes:

Default value is "¬ª".
(Read only property)

212.1.33 OpenMarker as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The open marker text.
Notes:

Default value is "¬´".
(Read only property)

212.1.34 Text as String

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts text of word file.
Notes:

Plugin inserts a few newline characters for detected line ends.

May not give all text. If you miss something, please send us test files.
(Read only property)

212.1.35 XML as String

MBS Tools Plugin, Plugin Version: 15.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XML found in the document.
Notes: (Read and Write property)
See also:

- 212.1.37 XML(part as String) as String 28333

212.1.36 MediaFile(name as string) as String

MBS Tools Plugin, Plugin Version: 16.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries or replaces the content of a media file.
Example:

```
Dim word As WordFileMBS // open word document

// name one
Dim name As String = "image1.jpg"

// or pick from list
'Dim MediaFiles() As String = word.MediaFiles
'Dim name As String = MediaFiles(0) // first one

// load image
Dim ImageFile As FolderItem = SpecialFolder.Desktop.Child("new.jpg")
Dim ImageStream As BinaryStream = BinaryStream.Open(ImageFile)
Dim ImageData As String = ImageStream.Read(ImageStream.Length)

word.MediaFile(name) = ImageData
```

Notes:

You can use this to extract images from word file.
Or to replace a placeholder image with the real image.
For replacement please make sure file type and dimensions match.
Raises KeyNotFoundException if media file with given name is not found.
(Read and Write computed property)

212.1.37 XML(part as String) as String

MBS Tools Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries/Sets XML for a part.
Notes:

See Parts array for possible parts.
(Read and Write computed property)
See also:

- 212.1.35 XML as String 28332

Chapter 213

XL

213.1 class XLAutoFilterMBS

213.1.1 class XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for auto filter.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

213.1.4 Methods

213.1.5 AddSort(columnIndex as Integer, descending as boolean) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the sorted column in AutoFilter by zero-based index and its sort order.
Notes:

Used for multiple level sorting.
Returns false on error and true on success. Get error info with XLBookMBS.errorMessage.

213.1.6 Column(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the AutoFilter column by zero-based index.
Notes: Creates it if it doesn't exist.

213.1.7 ColumnByIndex(colId as Integer) as XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the specified AutoFilter column which have a filter information by index.

213.1.8 Constructor

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

213.1.9 GetRef(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the cell range of AutoFilter with header.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

213.1.10 GetSort(byref columnIndex as Integer, byref descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the zero-based index of sorted column in AutoFilter and its sort order.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

213.1.11 GetSortRange(byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the whole range of data to sort.
Notes: Returns false if error. Get error info with XLBookMBS.errorMessage.

213.1.12 SetRef(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the cell range of AutoFilter with header.

213.1.13 SetSort(columnIndex as Integer, descending as Boolean) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the sorted column in AutoFilter by zero-based index and its sort order.
Notes: Returns false on error and true on success. Get error info with XLBookMBS.errorMessage.

213.1.14 Properties

213.1.15 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent object.
Notes:

Usually the XLFilterColumnMBS object.
(Read only property)

213.1.16 ColumnSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of specified AutoFilter columns which have a filter information.
Notes: (Read only property)

213.1.17 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

213.2 class XLBookMBS

213.2.1 class XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The central class for a workbook.
Example:

```
// create new Excel file, pass true for XLSX format or false for older XLS format
Dim book As New XLBookMBS(True)

// add sheet
Dim sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Dim file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes:

The MBS Xojo XL Plugin is based on LibXL, a powerful library to handle Excel files.

You'll need your own license for LibXL. For more information go here:
https://www.monkeybreadsoftware.de/xojo/plugin-xls.shtml

When you have obtained license file inside your XOJO project place XLBookMBS.SetKeyGlobal call with LibXL license in app.open.

213.2.6 Methods

213.2.7 AddCustomNumFormat(customNumFormat as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new custom number format to the workbook.
Notes: The format string customNumFormat indicates how to format and render the numeric value of a cell. See custom format strings guidelines (in FAQ). Returns the custom format identifier. It's used in XLFormatMBS.NumFormat. Returns 0 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.8 AddFont(initFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new font to the workbook, initial parameters can be copied from other font.
Notes:

Returns nil if error occurs.

The initFont can be from another book.

213.2.9 AddFormat(initFormat as XLFormatMBS = nil) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new format to the workbook, initial parameters can be copied from other format.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes:

Returns nil if error occurs.

The initFormat can be from another book.

213.2.10 AddFormatFromStyle(style as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new format to the workbook from the predefined style.
Notes:

Returns nil if error occurs.
Please note that after loading a file it will be removed.
See kCellStyle* constants.

213.2.11 AddPicture(path as folderitem) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 213.2.12 AddPicture(path as string) as Integer 28342

213.2.12 AddPicture(path as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook.
Notes: Returns a picture identifier. Supports BMP, DIB, PNG, JPG and WMF picture formats. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 213.2.11 AddPicture(path as folderitem) as Integer 28342

213.2.13 AddPictureData(data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a picture to the workbook from memory buffer:
Notes: Returns a picture identifier. Use picture identifier with XLSheetMBS.setPicture(). Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.14 AddRichString as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new rich string to be used in the book.

213.2.15 AddSheet(name as string, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new sheet to this book, returns the sheet.
Example:

```
// create new Excel file, pass true for XLSX format or false for XLS
Dim book As New XLBookMBS(True)

// add sheet
Dim sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Dim file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes:

Use initSheet parameter if you wish to copy an existing sheet.
Must be from the same book to copy sheet.

Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.16 AddStyledText(StyledText as StyledText) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds styled text to the book to later assign to a cell.
Notes: We convert attributes like bold, italic, underline, color, font name and size.

213.2.17 available as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the library is available.
Notes: Returns false on PPC targets.

213.2.18 BookVersion as Integer

MBS XL Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the version number of this book.
Example:

```
dim b as new XLBookMBS
dim v as Integer = b.BookVersion

dim h as Integer = v \256 \256 \256
dim m as Integer = v \256 \256 mod 256
dim l as Integer = v \256 mod 256

MsgBox "libXL "+str(h)+"."+str(m)+"."+str(l)
```

Notes: Version number is encoded as hex number with major version, minor version and bugfix.

213.2.19 Constructor(xml as boolean = false)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new XLBookMBS object.

Notes: xml: If true, creates a book in xlsx format (xml), else one in xls format (binary).

213.2.20 CopyContent(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies all content from one book to other book.
Notes:

The plugin loops through all sheets and creates matching sheets on new book.
Formats and fonts are created on the fly.

This allows you to convert from XLS to XLSX or back.
Please report if something is not copied. Of course plugin can only copy what libXL supports, so stuff like movies or diagrams are not copied.

213.2.21 CustomNumFormat(fmt as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a custom format string for specified custom format identifier fmt.
Notes: See custom format string guidelines (in FAQ). Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.22 DefaultFont(byref fontSize as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a default font name and size for this workbook.
Notes: Returns "" if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.23 DelSheet(index as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes a sheet with specified index.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.24 Font(index as Integer) as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a font with defined index.
Notes: Index must be less than return value of fontCount method.

213.2.25 FontCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of fonts in this book.

213.2.26 Fonts as XLFontMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all defined fonts.

213.2.27 Format(index as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a format with defined index.
Notes: Index must be less than return value of formatCount method.

213.2.28 FormatCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of formats in this book.

213.2.29 Formats as XLFormatMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all defined formats.

213.2.30 InsertSheet(index as Integer, name as string = """, initSheet as XLSheetMBS = nil) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts a new sheet to this book at position index, returns the sheet.
Notes:

Use initSheet parameter if you wish to copy an existing sheet. Must be from the same book to copy sheet.

Returns NULL if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.31 LibVersion as string

MBS XL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of library as string.
Example:

MsgBox XLBookMBS.LibVersion

Notes:

Returns for example "3.8.0".
With plugin version 17.4 or newer, this returns 4 numbers, so you may see another .0 on the end.

213.2.32 LibVersionNumber as Integer

MBS XL Plugin, Plugin Version: 17.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns version of library as number.
Example:

MsgBox str(XLBookMBS.LibVersionNumber)

Notes: Returns for example 3 * 256*256*256 + 8 * 256*256 + 0 * 256 + 0.

213.2.33 Load(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file into memory.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.

- 213.2.34 Load(path as string) as boolean 28348

213.2.34 Load(path as string) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file into memory.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

With the constructor of the XLBookMBS object you decide if you want to load XML format or older binary format. If the format of the book object doesn't match the file, it will fail.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 213.2.33 Load(path as folderitem) as boolean 28347

213.2.35 Load2(path as folderitem) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.

See also:

- 213.2.36 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 28349
- 213.2.37 Load2(path as string) as XLBookMBS 28349
- 213.2.38 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 28350

213.2.36 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
dim e as string
dim b as XLBookMBS = XLBookMBS.Load2(f,e)

if b = nil then
MsgBox e
Return
end if

dim s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 213.2.35 Load2(path as folderitem) as XLBookMBS 28348
- 213.2.37 Load2(path as string) as XLBookMBS 28349
- 213.2.38 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 28350

213.2.37 Load2(path as string) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("XING contacts.xlsx")
dim b as XLBookMBS = XLBookMBS.Load2(f)

if b = nil then
MsgBox e
Return
end if

dim s as XLSheetMBS = b.Sheet(0)
MsgBox s.ReadString(1,1)
```

Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 213.2.35 Load2(path as folderitem) as XLBookMBS 28348
- 213.2.36 Load2(path as folderitem, byref ErrorMessage as String) as XLBookMBS 28349
- 213.2.38 Load2(path as string, byref ErrorMessage as String) as XLBookMBS 28350

213.2.38 Load2(path as string, byref ErrorMessage as String) as XLBookMBS

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a xls-file from file.
Notes:

Autodetects if format is old (binary) or new (xml).
Returns nil if error occurs. On success returns a valid book.
Optionally returns error with ErrorMessage parameter.

Loading a file into the book object clears existing formats, sheets and fonts from previous book. You can recreate the ones you need or search them in the existing formats, fonts or sheets.
See also:

- 213.2.37 Load2(path as string) as XLBookMBS 28349

213.2.39 LoadError as String

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The last error message from LoadLibrary call.
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.dylib")

if XLBookMBS.LoadLibrary(f) then
MsgBox "OK"
else
MsgBox XLBookMBS.LoadError
end if
```

213.2.40 LoadLibrary(File as FolderItem) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the libXL library file.
Example:

```
MsgBox "Version before: "+XLBookMBS.LibVersion

dim f as FolderItem = SpecialFolder.Desktop.Child("libxl.dylib")

if XLBookMBS.LoadLibrary(f) then
MsgBox "Version after: "+XLBookMBS.LibVersion
else
MsgBox XLBookMBS.LoadError
end if
```

Notes:

Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

• 213.2.41 LoadLibrary(Path as string) as boolean 28352

213.2.41 LoadLibrary(Path as string) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the libXL library file.
Notes:

Returns true on success or false on failure.

While the plugin comes with an internal libXL library, you can use this method to load a different version of the library.
See also:

• 213.2.40 LoadLibrary(File as FolderItem) as boolean 28351

213.2.42 LoadMT(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads from file.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

• 213.2.43 LoadMT(path as string) as boolean 28352

213.2.43 LoadMT(path as string) as boolean

213.2.56 LoadRawPartially(data as MemoryBlock, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file from user's memory buffer.
Notes:

data: Data buffer
sheetIndex: loads a file only with specified sheet index, -1 loads all sheets
firstRow: the first row of loaded range, -1 loads all rows until lastRow
lastRow: the last row of loaded range, -1 loads all rows after firstRow.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 213.2.57 LoadRawPartially(data as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean 28358

213.2.57 LoadRawPartially(data as string, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads a file from user's memory buffer.
Notes:

data: Data buffer
sheetIndex: loads a file only with specified sheet index, -1 loads all sheets
firstRow: the first row of loaded range, -1 loads all rows until lastRow
lastRow: the last row of loaded range, -1 loads all rows after firstRow.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 213.2.56 LoadRawPartially(data as MemoryBlock, sheetIndex as Integer, firstRow as Integer, lastRow as Integer) as boolean 28357

213.2.58 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an entire file into memory.
Notes:

Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 213.2.59 LoadUsingTempFile(path as string, TempFile as String) as boolean 28358

213.2.59 LoadUsingTempFile(path as string, TempFile as String) as boolean

MBS XL Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads an entire file into memory.
Notes:

Specify a temporary file for reducing memory consumption.
Returns false if error occurs or true on success. Get error info with errorMessage function.
See also:

- 213.2.58 LoadUsingTempFile(path as folderitem, TempFile as folderitem) as boolean 28358

213.2.60 MoveSheet(SourceIndex as integer, DestIndex as Integer) as boolean

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Takes a sheet with SourceIndex and insert it in front of a sheet with DestIndex.
Notes: Returns false if error occurs and true on success.

213.2.61 PackColor(ColorValue as color) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs red, green and blue components in color type.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

See also:

- 213.2.62 PackColor(red as Integer, green as Integer, blue as Integer) as Integer 28359

213.2.62 PackColor(red as Integer, green as Integer, blue as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs red, green and blue components in color type.
See also:

- 213.2.61 PackColor(ColorValue as color) as Integer 28359

213.2.63 PackDate(d as date) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Packs date and time information into double type.
See also:

- 213.2.64 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double 28360

213.2.64 PackDate(year as Integer, month as Integer, day as Integer, hour as Integer = 0, min as Integer = 0, sec as Integer = 0, msec as Integer = 0) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs date and time information into double type.
See also:

- 213.2.63 PackDate(d as date) as Double 28360

213.2.65 PackDateTime(d as dateTime) as double

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packs date and time information into double type.

213.2.66 Picture(index as Integer, byref data as string) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a picture at position index in memory buffer.
Notes:

Parameters:
index: position in the workbook
data: reference to buffer

Returns type of picture. See PictureType* constants.

213.2.67 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of pictures in this workbook.

213.2.68 Save(path as folderitem) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves current workbook into xls-file.
Example:

```
// create new Excel file, pass true for XLSX format or false for older XLS format
Dim book As New XLBookMBS(True)

// add sheet
Dim sheet As XLSheetMBS = book.addSheet("Test")
Call sheet.WriteString(2, 1, "Hello World", Nil)

// write file and launch
Dim file As FolderItem = SpecialFolder.Desktop.Child("Writing data.xlsx")

If book.Save(file) Then
file.Launch
Else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
End If
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

- 213.2.74 SaveRaw(byref data as MemoryBlock) as boolean 28363

213.2.76 SaveRawMT(byref data as MemoryBlock) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to memoryblock.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 213.2.77 SaveRawMT(byref data as string) as boolean 28364

213.2.77 SaveRawMT(byref data as string) as boolean

MBS XL Plugin, Plugin Version: 17.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Saves document to string.
Notes:

Same as the other method without MT in name, except:

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.

- 213.2.76 SaveRawMT(byref data as MemoryBlock) as boolean 28364

213.2.78 SetDefaultFont(fontName as string, fontSize as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a default font name and size for this workbook.

213.2.79 SetKey(name as string, key as string)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets customer's license key.
Notes:

Call this once for each XLBookMBS object and before you read or write data.

If you have keys for more than one platform, please use # if condition to make sure you pass right key for current platform.

213.2.80 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets customer's license key.
Example:

```
// add this to app.open

# if TargetMacOS then
// Mac license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# elseif TargetLinux then
// Linux license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# elseif TargetWin32 then
// Win license
XLBookMBS.SetKeyGlobal("Your Name", "Your Key")
# else
// missing
# endif
```

Notes:

You can call this before using the other plugin functions to set key on application startup. Simply call it in app.open event.

If you have keys for more than one platform, please use # if condition to make sure you pass right key for current platform.
See also:

- 213.2.81 SetKeyGlobal(name as string, key as string) 28365

213.2.81 SetKeyGlobal(name as string, key as string)

MBS XL Plugin, Plugin Version: 18.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Private method to avoid you call this on an object.
Notes:

Please call shared method in app.open.
Because if you make a new object and set key, it's too late.
See also:

- 213.2.80 SetKeyGlobal(name as string, key as string) 28365

213.2.82 SetLocale(locale as string)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the locale.
Example:

```
dim book as new XLBookMBS(false)
book.SetLocale "en_US.UTF-8"
```

Notes: Sets the locale for this library. It has no effect for unicode projects.

213.2.83 Sheet(index as Integer) as XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the sheet with specified index.
Notes: Returns nil if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.2.84 SheetCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of sheets in this book.

213.2.85 Sheets as XLSheetMBS()

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns array with all sheets.
Example:

```
Function SheetByName(book as XLBookMBS, name as string) As XLSheetMBS
dim sheets() as XLSheetMBS = book.Sheets
for each s as XLSheetMBS in sheets
```

```
if s.Name = name then
Return s
end if
next
End Function
```

213.2.86 SheetType(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 13.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries type of the sheet.

213.2.87 UnpackColor(ColorValue as Integer) as color

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks color type to red, green and blue components.
See also:

- 213.2.88 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer) 28367

213.2.88 UnpackColor(ColorValue as Integer, byref red as Integer, byref green as Integer, byref blue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks color type to red, green and blue components.
See also:

- 213.2.87 UnpackColor(ColorValue as Integer) as color 28367

213.2.89 UnpackDate(Value as Double) as date

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Unpacks date and time information from double type.
Notes: Returns nil if error occurs.
See also:

- 213.2.90 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 28368
- 213.2.91 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 28368
- 213.2.92 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 28369

213.2.90 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 213.2.89 UnpackDate(Value as Double) as date 28367
- 213.2.91 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 28368
- 213.2.92 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 28369

213.2.91 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 213.2.89 UnpackDate(Value as Double) as date 28367
- 213.2.90 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 28368
- 213.2.92 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean 28369

213.2.92 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer, byref msec as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns false if error occurs.
See also:

- 213.2.89 UnpackDate(Value as Double) as date 28367
- 213.2.90 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer) as boolean 28368
- 213.2.91 UnpackDate(Value as Double, byref year as Integer, byref month as Integer, byref day as Integer, byref hour as Integer, byref min as Integer, byref sec as Integer) as boolean 28368

213.2.93 UnpackDateTime(Value as double) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Unpacks date and time information from double type.
Notes: Returns nil if error occurs.

213.2.94 Properties

213.2.95 ActiveSheet as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Active sheet index in this workbook.
Notes: (Read and Write property)

213.2.96 BiffVersion as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns BIFF version of binary file.
Notes:

Used for xls format only.
(Read only property)

213.2.97 CalcMode as integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The calculation mode of workbook.
Notes:

Cal be manual, auto or automatic except for data tables.
See CalcMode* constants.
(Read and Write property)

213.2.98 ErrorMessage as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the last error message.
Notes: (Read only property)

213.2.99 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

213.2.100 IsDate1904 as boolean

MBS XL Plugin, Plugin Version: 13.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether dates are 1904 based.
Notes:

A boolean value that indicates whether the date systems used in the workbook starts in 1904.
True indicates the date system starts in 1904, where January 1, 1904 is the first day in the system.
False indicates the workbook uses the 1900 date system, where January 1, 1900 is the first day in the system.
(Read and Write property)

213.2.101 IsTemplate as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the workbook is template.
Notes:

The template flag: true - workbook is template, false - workbook is not template (default).
This flag must have a value "true" for template files (xlt and xltx).
(Read and Write property)

213.2.102 IsWriteProtected as Boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns whether the workbook is marked as read-only.
Notes: (Read only property)

213.2.103 RefR1C1 as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the R1C1 reference mode is active.
Notes: (Read and Write property)

213.2.104 RgbMode as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the RGB mode is active. Used for xlsx format only.
Notes:

true - RGB mode, false - Index mode (default).
In RGB mode use PackColor() and UnpackColor() methods for getting/setting colors. Used for xlsx format only.
(Read and Write property)

213.2.105 Constants

213.2.106 CalcModeAuto = 1

MBS XL Plugin, Plugin Version: 20.2.

Function: One of the call mode constants.
Notes: automatic calculation

213.2.107 CalcModeAutoNoTable = 2

MBS XL Plugin, Plugin Version: 20.2.

Function: One of the call mode constants.
Notes: automatic except for data tables

213.2.108 CalcModeManual = 0

MBS XL Plugin, Plugin Version: 20.2.

Function: One of the call mode constants.
Notes: manual calculation

213.2.109 kCellstyle20Accent1 = 19

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.110 kCellstyle20Accent2 = 23

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.111 kCellstyle20Accent3 = 27

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.112 kCellstyle20Accent4 = 31

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.113 kCellstyle20Accent5 = 35

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.114 kCellstyle20Accent6 = 39

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.115 kCellstyle40Accent1 = 20

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.116 kCellstyle40Accent2 = 24

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.117 kCellstyle40Accent3 = 28

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.118 kCellstyle40Accent4 = 32

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.119 kCellstyle40Accent5 = 36

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.120 kCellstyle40Accent6 = 40

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.121 kCellstyle60Accent1 = 21

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.122 kCellstyle60Accent2 = 25

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.123 kCellstyle60Accent3 = 29

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.124 kCellstyle60Accent4 = 33

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.125 kCellstyle60Accent5 = 37

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.126 kCellstyle60Accent6 = 41

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.127 kCellstyleAccent1 = 22

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.128 kCellstyleAccent2, = 26

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.129 kCellstyleAccent3 = 30

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.130 kCellstyleAccent4, = 34

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.131 kCellstyleAccent5 = 38

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.132 kCellstyleAccent6, = 42

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.133 kCellstyleBad = 1

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Bad, usually red text on a light red background.

213.2.134 kCellstyleCalc = 4

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.135 kCellstyleCheckcell = 5

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.136 kCellstyleComma = 43

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Comma

213.2.137 kCellstyleComma0 = 44

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Comma [0]

213.2.138 kCellstyleCurrency = 45

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Currency

213.2.139 kCellstyleCurrency0 = 46

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Currency [0]

213.2.140 kCellstyleExplanatory = 6

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.141 kCellstyleGood = 2

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.142 kCellstyleHeading1 = 14

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.143 kCellstyleHeading2 = 15

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.144 kCellstyleHeading3 = 16

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.145 kCellstyleHeading4 = 17

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.146 kCellstyleHyperlink = 9

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.147 kCellstyleInput = 7

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Input field style

213.2.148 kCellstyleLinkedCell = 10

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Linked Cell style.

213.2.149 kCellstyleNeutral = 3

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Bad, usually brown text on a light orange background.

213.2.150 kCellstyleNormal = 0

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Normal.

213.2.151 kCellstyleNote = 11

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Note style

213.2.152 kCellstyleOutput, = 8

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Output field style

213.2.153 kCellstylePercent = 47

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Percent

213.2.154 kCellstyleTitle = 13

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Title style

213.2.155 kCellstyleTotal, = 18

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.
Notes: Total value style

213.2.156 kCellstyleWarning = 12

MBS XL Plugin, Plugin Version: 23.3.

Function: One of the cell stykle constants.

213.2.157 PictureTypeDIB = 4

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: DIB format

213.2.158 PictureTypeEMF = 5

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: EMF format

213.2.159 PictureTypeError = & hFF

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: Error. Check XLBookMBS.ErrorMessage method.

213.2.160 PictureTypeGIF = 2

MBS XL Plugin, Plugin Version: 15.3.

Function: One of the picture format constants.
Notes: GIF format.

213.2.161 PictureTypeJPEG = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: JPEG format

213.2.162 PictureTypePICT = 6

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: Mac PICT format.

213.2.163 PictureTypePNG = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: PNG format

213.2.164 PictureTypeTIFF = 7

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: TIFF format

213.2.165 PictureTypeWMF = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the picture format constants.
Notes: WMF format

213.2.166 SheetTypeChart = 1

MBS XL Plugin, Plugin Version: 13.1.

Function: One of the sheet type constants.
Notes: Sheet is a chart.

213.2.167 SheetTypeSheet = 0

MBS XL Plugin, Plugin Version: 13.1.

Function: One of the sheet type constants.
Notes: This is a normal sheet.

213.2.168 SheetTypeUnknown = 2

MBS XL Plugin, Plugin Version: 13.1.

Function: One of the sheet type constants.
Notes: Type is unknown.

213.3 class XLCopyOptionsMBS

213.3.1 class XLCopyOptionsMBS

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The options for copying.

213.3.6 Methods

213.3.7 Constructor

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor.
Notes: Initializes object and sets all properties to true.

213.3.8 Properties

213.3.9 CopyColHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy column hidden flags.
Notes:

Defaults to true.
(Read and Write property)

213.3.10 CopyComments as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy comments.
Notes:

Defaults to true.
(Read and Write property)

213.3.11 CopyFormat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy formats.
Notes:

Defaults to true.
(Read and Write property)

213.3.12 CopyHorPageBreak as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy horizontal page breaks.
Notes:

Defaults to true.
(Read and Write property)

213.3.13 CopyMerge as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy merge cells.
Notes:

Defaults to true.
(Read and Write property)

213.3.14 CopyNamedRanges as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy named ranges.
Notes:

Defaults to true.
(Read and Write property)

213.3.15 CopyPicture as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy pictures.
Notes:

Defaults to true.
(Read and Write property)

213.3.16 CopyPrintArea as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print area.
Notes:

Defaults to true.
(Read and Write property)

213.3.17 CopyPrintFit as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print fit settings.
Notes:

Defaults to true.
(Read and Write property)

213.3.18 CopyPrintRepeat as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy print repeat settings.
Notes:

Defaults to true.
(Read and Write property)

213.3.19 CopyRowHidden as Boolean

MBS XL Plugin, Plugin Version: 19.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to copy row hidden flags.
Notes:

Defaults to true.
(Read and Write property)

213.4 class XLFilterColumnMBS

213.4.1 class XLFilterColumnMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for filter column.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

213.4.4 Methods

213.4.5 AddFilter(Filter as String)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the filter value.

213.4.6 Clear

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clear the filter criteria.

213.4.7 Constructor

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

213.4.8 Filter(index as Integer) as String

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the filter value by index.

213.4.9 GetCustomFilterEx(byref Op1 as Integer, byref Value1 as String, byref Op2 as Integer, byref Value2 as String, byref andOp as Boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the custom filter criteria:
Notes:

op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;
Value12 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".
Returns false if error. Get error info with XLBookMBS.errorMessage.

213.4.10 GetTop10(byref value as Double, byref top as boolean, byref percent as boolean) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the number of top or bottom items:
Notes:

value - number of items;
top - top items if true otherwise bottom items;
percent - using percent instead of number items.
Returns false if error. Get error info with XLBookMBS.errorMessage.

213.4.11 SetCustomFilter(Op as Integer, Value as String)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the custom filter criteria:
Notes:

op - operator used by the filter comparison in the filter criteria;

Value - value used in the filter criteria;

213.4.12 SetCustomFilterEx(Op1 as Integer, Value1 as String, Op2 as Integer, Value2 as String, andOp as Boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the custom filter criteria:
Notes:

op1 - operator used by the filter comparison in the first filter criteria;
Value1 - value used in the first filter criteria;
op2 - operator used by the filter comparison in the second filter criteria;
Value2 - value used in the second filter criteria;
andOp - flag indicating whether the two criterias have an "and" relationship. True indicates "and", false indicates "or".

213.4.13 SetTop10(value as Double, top as boolean = true, percent as boolean = false)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the number of top or bottom items:
Notes:

value - number of items;
top - top items if true otherwise bottom items;
percent - using percent instead of number items.

213.4.14 Properties

213.4.15 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The owner object.
Notes: (Read only property)

213.4.16 FilterSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of filter values.
Notes: (Read only property)

213.4.17 FilterType as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the filter type of this AutoFilter column.
Notes:

can be constants FilterColor, FilterCustom, FilterDynamic, FilterExt, FilterIcon, FilterNotSet, FilterTop10 or FilterValue.
(Read only property)

213.4.18 Handle as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

213.4.19 Index as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of this AutoFilter column.
Notes: (Read only property)

213.4.20 Constants

213.4.21 FilterColor = 4

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: Specifies the color to filter by.

213.4.22 FilterCustom = 2

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: Custom filter with specified criteria.

213.4.23 FilterDynamic = 3

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: Specifies dynamic filter criteria.

213.4.24 FilterExt = 6

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: Defines flexible storage extensions.

213.4.25 FilterIcon = 5

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: Specifies the icon to filter by.

213.4.26 FilterNotSet = 7

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: No filter.

213.4.27 FilterTop10 = 1

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: The top N (percent or number of items) to filter by.

213.4.28 FilterValue = 0

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the filter types.
Notes: Filter by specified values.

213.4.29 OperatorEqual = 0

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the compare operators.
Notes: Equal

213.4.30 OperatorGreaterThan = 1

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the compare operators.
Notes: Greater than

213.4.31 OperatorGreaterThanOrEqual = 2

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the compare operators.
Notes: Greater than or equal

213.4.32 OperatorLessThan = 3

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the compare operators.
Notes: Less than

213.4.33 OperatorLessThanOrEqual = 4

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the compare operators.
Notes: Less than or equal

213.4.34 OperatorNotEqual = 5

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the compare operators.
Notes: Not equal

213.5 class XLFontMBS

213.5.1 class XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a font definition.
Example:

```
dim book as XLBookMBS // your book
dim textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.name = "Century Gothic"
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

213.5.2 Blog Entries

- LibXL Extras for Xojo
- StyledText for Excel files with LibXL 3.9 in Xojo
- MBS Xojo Plugins, version 18.4pr9

213.5.3 Blog Entries

- LibXL Extras for Xojo
- StyledText for Excel files with LibXL 3.9 in Xojo
- MBS Xojo Plugins, version 18.4pr9

213.5.4 Methods

213.5.5 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

213.5.6 Properties

213.5.7 Bold as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is bold.
Notes: (Read and Write property)

213.5.8 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The owner object.
Notes:

As a font is only valid with the owning book, we keep a back reference here.
(Read only property)

213.5.9 ColorRGB as Color

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font color as color value.
Notes:

While ColorValue may return indexed color, this property converts to a Xojo color value.
(Read and Write property)

213.5.10 ColorValue as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the font.
Example:

```
dim book as XLBookMBS // your book
dim textFont as XLFontMBS = book.addFont()
textFont.size = 8
textFont.ColorValue = XLFontMBS.ColorGray25
```

Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.5.11 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

213.5.12 Italic as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is italic.
Notes:

If italic doesn't show, maybe check whether the chosen font supports italic.
(Read and Write property)

213.5.13 Name as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the font.
Notes:

Default name is "Arial".
(Read and Write property)

213.5.14 Script as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The script style of the font.
Notes: (Read and Write property)

213.5.15 Size as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The size of the font in points.
Notes: (Read and Write property)

213.5.16 StrikeOut as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the font is strikeout.
Notes: (Read and Write property)

213.5.17 Underline as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The underline style of the font.
Notes:

See Underline* constants.
(Read and Write property)

213.5.18 Constants

213.5.19 ColorAqua = 49

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.20 ColorAuto = & h7Fff

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.21 ColorBlack = 8

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.22 ColorBlue = 12

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.23 ColorBlueCl = 39

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.24 ColorBluegray = 54

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.25 ColorBrightgreen = 11

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.26 ColorBrown = 60

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.27 ColorCoralCf = 29

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.28 ColorDarkblue = 18

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.29 ColorDarkblueCl = 32

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.30 ColorDarkgreen = 58

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.31 ColorDarkpurpleCf = 28

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.32 ColorDarkred = 16

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.33 ColorDarkredCl = 37

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.34 ColorDarkteal = 56

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.35 ColorDarkyellow = 19

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.36 ColorDefaultBackground = 65

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.
Notes: Auto

213.5.37 ColorDefaultForeground = 64

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.
Notes: Auto

213.5.38 ColorGold = 51

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.39 ColorGray25 = 22

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.40 ColorGray40 = 55

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.41 ColorGray50 = 23

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.42 ColorGray80 = 63

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.43 ColorGreen = 17

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.44 ColorIceblueCf = 31

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.45 ColorIndigo = 62

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.46 ColorIvoryCf = 26

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.47 ColorLavender = 46

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.48 ColorLightblue = 48

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.49 ColorLightgreen = 42

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.50 ColorLightorange = 52

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.51 ColorLightturquoise = 41

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.52 ColorLightturquoiseCf = 27

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.53 ColorLightyellow = 43

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.54 ColorLime = 50

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.55 ColorNone = & H7F

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the color constants.
Notes: No color.

213.5.56 ColorOceanblueCf = 30

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.57 ColorOlivegreen = 59

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.58 ColorOrange = 53

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.59 ColorPaleblue = 44

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.60 ColorPeriwinkleCf = 24

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.61 ColorPink = 14

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.62 ColorPinkCl = 33

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.63 ColorPlum = 61

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.64 ColorPlumCf = 25

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.65 ColorRed = 10

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.66 ColorRose = 45

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.67 ColorSeagreen = 57

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.68 ColorSkyblue = 40

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.69 ColorTan = 47

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.70 ColorTeal = 21

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.71 ColorTealCl = 38

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.72 ColorTooltip = 81

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.73 ColorTurquoise = 15

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.74 ColorTurquoiseCl = 35

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.75 ColorViolet = 20

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.76 ColorVioletCl = 36

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.77 ColorWhite = 9

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.78 ColorYellow = 13

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.79 ColorYellowCl = 34

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the color constants.

213.5.80 ScriptNormal = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the script style constants.

213.5.81 ScriptSub = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the script style constants.

213.5.82 ScriptSuper = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the script style constants.

213.5.83 UnderlineDouble = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the underline style constants.

213.5.84 UnderlineDoubleacc = & H22

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the underline style constants.

213.5.85 UnderlineNone = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the underline style constants.

213.5.86 UnderlineSingle = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the underline style constants.

213.5.87 UnderlineSingleacc = & H21

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the underline style constants.

213.6 class XLFormatMBS

213.6.1 class XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for a format.
Example:

```
dim book as XLBookMBS // your book
// add font
dim boldFont as XLFontMBS = book.addFont()
boldFont.StrikeOut = true

// add format
dim boldFormat as XLFormatMBS = book.addFormat
boldFormat.font = boldFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", boldFormat)
```

Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

213.6.6 Methods

213.6.7 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

213.6.8 SetBorder(border as Integer = 1)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border style.
Notes: See BorderStyle* constants.

213.6.9 SetBorderColor(ColorValue as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the border color.
Notes: If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.

213.6.10 SetFont(font as XLFontMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the font for the format.
Notes: To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.6.11 SetRotation(rotation as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the text rotation.
Notes:

Must be a value from the following table:

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

213.6.12 Properties

213.6.13 AlignH as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The horizontal alignment.
Notes:

See AlignH* constants.
(Read and Write property)

213.6.14 AlignV as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The vertical alignment.
Notes:

See AlignV* constants.
(Read and Write property)

213.6.15 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object owning this format object.
Notes:

As a format is only valid with the owning book, we keep a back reference here.
(Read only property)

213.6.16 BorderBottom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

213.6.17 BorderBottomColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the bottom border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.6.18 BorderDiagonal as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diagonal border.
Notes:

see BorderDiagonal* constants.
(Read and Write property)

213.6.19 BorderDiagonalColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the diagonal border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.6.20 BorderDiagonalStyle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The diagonal border style.
Notes:

See BorderDiagonal* constants.
(Read and Write property)

213.6.21 BorderLeft as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

213.6.22 BorderLeftColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the left border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.6.23 BorderRight as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

213.6.24 BorderRightColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the right border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.6.25 BorderTop as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top border style.
Notes:

See BorderStyle* constants.
(Read and Write property)

213.6.26 BorderTopColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The color of the top border.
Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.6.27 FillPattern as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The fill pattern.
Notes:

See fill pattern constants.
(Read and Write property)

213.6.28 Font as XLFontMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The font for the format.
Example:

```
// your book
dim book as XLBookMBS

// add font
dim StrikeOutFont as XLFontMBS = book.addFont()
StrikeOutFont.StrikeOut = true

// add format
dim StrikeOutFormat as XLFormatMBS = book.addFormat
StrikeOutFormat.font = StrikeOutFont

// write on a cell in first sheet
sheet = book.Sheet(0)
call sheet.WriteString(1, 1, "Sales Receipt", StrikeOutFormat)
```

Notes:

To create a new font use XLBookMBS.addFont(). Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
(Read and Write property)

213.6.29 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

213.6.30 Hidden as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the hidden protection property is set to true.
Notes: (Read and Write property)

213.6.31 Indent as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The text indentation level.
Notes:

Must be less than or equal to 15.
(Read and Write property)

213.6.32 Locked as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the locked protection property is set to true.
Notes:

Needs to be used together with XLSheetMBS.Protect property and XLSheetMBS.SetProtectEx method to prevent editing in locked cells.
(Read and Write property)

213.6.33 NumFormat as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The number format identifier.
Notes:

The identifier must be a valid built-in number format identifier or the identifier of a custom number format. To create a custom format use XLBookMBS.addCustomNumFormat(). Or use one of the NumFormat* constants.
(Read and Write property)

213.6.34 PatternBackgroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The background color of the fill pattern.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.6.35 PatternForegroundColor as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The foreground color of the fill pattern.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123
```

Call sheet.WriteNumber row, col, value, redBackgroundFormat

Notes:

If book is in RGB mode, you need to use UnpackColor to get red, green and blue color components or color value from the returned number. If book is not in RGB mode, you receive a color number (see XLFontMBS color constants).
If you set value and book is in RGB mode you can use PackColor function to get a numeric value for a color or color components. If the book is not in RGB mode, you can use color constants in XLFontMBS classes.
(Read and Write property)

213.6.36 Rotation as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the text rotation.
Notes:

Must be a value from the following table:

Value	Meaning
0 - 90	Text rotated counterclockwise 0 to 90 degrees
91 - 180	Text rotated clockwise 1 to 90 degrees
255	Vertical text

(Read only property)

213.6.37 ShrinkToFit as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the cell is shrink-to-fit.
Notes: (Read and Write property)

213.6.38 Wrap as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the cell text is wrapped.
Notes: (Read and Write property)

213.6.39 Constants

213.6.40 AlignHCenter = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Center

213.6.41 AlignHDistributed = 7

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Distributed

213.6.42 AlignHFill = 4

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Fill

213.6.43 AlignHGeneral = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Default

213.6.44 AlignHJustify = 5

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Justify

213.6.45 AlignHLeft = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Left

213.6.46 AlignHMerge = 6

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Center over several cells.

213.6.47 AlignHRight = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the horizontal alignment constants.
Notes: Right

213.6.48 AlignVBottom = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the vertical alignment constants.
Notes: Bottom

213.6.49 AlignVCenter = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the vertical alignment constants.
Notes: Center

213.6.50 AlignVDistributed = 4

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the vertical alignment constants.
Notes: Distributed

213.6.51 AlignVJustify = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the vertical alignment constants.
Notes: Justify

213.6.52 AlignVTop = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the vertical alignment constants.
Notes: Top

213.6.53 BorderDiagonalBoth = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the diagonal border style constants.

213.6.54 BorderDiagonalDown = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the diagonal border style constants.

213.6.55 BorderDiagonalNone = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the diagonal border style constants.

213.6.56 BorderDiagonalUp = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the diagonal border style constants.

213.6.57 BorderStyleDashdot = 9

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: dash and dot

213.6.58 BorderStyleDashdotdot = 11

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: dash and dots

213.6.59 BorderStyleDashed = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: dashed

213.6.60 BorderStyleDotted = 4

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: dotted

213.6.61 BorderStyleDouble = 6

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: double

213.6.62 BorderStyleHair = 7

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: hair style

213.6.63 BorderStyleMedium = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: medium

213.6.64 BorderStyleMediumdashdot = 10

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: medium dash and dot

213.6.65 BorderStyleMediumdashdotdot = 12

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: medium dash and dots

213.6.66 BorderStyleMediumdashed = 8

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: medium dashed

213.6.67 BorderStyleNone = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: no border

213.6.68 BorderStyleSlantdashdot = 13

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: dash and dot

213.6.69 BorderStyleThick = 5

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: thick

213.6.70 BorderStyleThin = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the border style constants.
Notes: thin

213.6.71 FillPatternDiagcrosshatch = 9

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.72 FillPatternDiagstripe = 8

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.73 FillPatternGray12P5 = 17

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.74 FillPatternGray25 = 4

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.75 FillPatternGray50 = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.76 FillPatternGray6P25 = 18

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.77 FillPatternGray75 = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.78 FillPatternHorstripe = 5

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.79 FillPatternNone = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.80 FillPatternRevdiagstripe = 7

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.81 FillPatternSolid = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.
Example:

```
// define a format for red fill
Dim redBackgroundFormat As XLFormatMBS = book.AddFormat
Dim c As Color = & cFF0000
// will give back numeric value of color for RGB mode or color index
Dim n As Integer = book.PackColor(c)
// we set forecolor of the pattern to fill background!
redBackgroundFormat.PatternForegroundColor = n
redBackgroundFormat.PatternBackgroundColor = n
redBackgroundFormat.FillPattern = XLFormatMBS.FillPatternSolid

Dim row As Integer = 5 // 6th row
Dim col As Integer = 1 // Column B
Dim value As Double = 123

Call sheet.WriteNumber row, col, value, redBackgroundFormat
```

213.6.82 FillPatternThickdiagcrosshatch = 10

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.83 FillPatternThindiagcrosshatch = 16

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.84 FillPatternThindiagstripe = 14

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.85 FillPatternThinhorcrosshatch = 15

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.86 FillPatternThinhorstripe = 11

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.87 FillPatternThinrevdiagstripe = 13

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.88 FillPatternThinverstripe = 12

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.89 FillPatternVerstripe = 6

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the fill pattern style constants.

213.6.90 NumformatAccount = 41

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: account value: 5,000

213.6.91 NumformatAccountcur = 42

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: account value with currency symbol: $ 5,000

213.6.92 NumformatAccountD2 = 43

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: account value with decimal point: 5,000.00

213.6.93 NumformatAccountD2Cur = 44

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes:

account value with currency symbol and decimal point: $ 5,000.00

213.6.94 NumformatCurrencyD2Negbra = 7

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: monetary value with decimal point, negative in brackets: ($ 1000.00)

213.6.95 NumformatCurrencyD2NegbraRed = 8

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: monetary value with decimal point, negative is red in brackets: ($ 1000.00)

213.6.96 NumformatCurrencyNegbra = 5

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: monetary value, negative in brackets: (1000$)

213.6.97 NumformatCurrencyNegbraRed = 6

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: monetary value, negative is red in brackets: (1000$)

213.6.98 NumformatCustom000P0EPlus0 = 48

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom value: 15.2E+3

213.6.99 NumformatCustomDMon = 16

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom date value: 11-Mar

213.6.100 NumformatCustomDMonYY = 15

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom date value: 11-Mar-09

213.6.101 NumformatCustomH0MMSS = 46

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom time value: 20:30:55

213.6.102 NumformatCustomHMM = 20

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom date value: 8:30

213.6.103 NumformatCustomHMMAM = 18

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom date value: 8:30 AM

213.6.104 NumformatCustomHMMSS = 21

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom date value: 8:30:00

213.6.105 NumformatCustomHMMSSAM = 19

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom date value: 8:30:00 AM

213.6.106 NumformatCustomMDYYYYHMM = 22

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom datetime value: 3/11/2009 8:30

213.6.107 NumformatCustomMMSS = 45

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom time value: 30:55

213.6.108 NumformatCustomMMSS0 = 47

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom time value: 30:55.0

213.6.109 NumformatCustomMonYY = 17

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: custom date value: Mar-09

213.6.110 NumformatDate = 14

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: date value, depends on OS settings: 3/11/2009

213.6.111 NumformatFractionOneDig = 12

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: fraction value, one digit: 10 1/2

213.6.112 NumformatFractionTwoDig = 13

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: fraction value, two digits: 10 23/95

213.6.113 NumformatGeneral = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: general format

213.6.114 NumformatNumber = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: general number: 1000

213.6.115 NumformatNumberD2 = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: number with decimal point: 1000.00

213.6.116 NumformatNumberD2SepNegbra = 39

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: number with thousands separator and decimal point, negative in brackets: (4,000.00)

213.6.117 NumformatNumberD2SepNegbraRed = 40

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: number with thousands separator and decimal point, negative is red in brackets: (4,000.00)

213.6.118 NumformatNumberSep = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: number with thousands separator: 100,000

213.6.119 NumformatNumberSepD2 = 4

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: number with decimal point and thousands separator: 100,000.00

213.6.120 NumformatNumberSepNegbra = 37

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: number with thousands separator, negative in brackets: (4,000)

213.6.121 NumformatNumberSepNegbraRed = 38

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: number with thousands separator, negative is red in brackets: (4,000)

213.6.122 NumformatPercent = 9

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: percent value, multiply the cell value by 100: 75%

213.6.123 NumformatPercentD2 = 10

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: percent value with decimal point, multiply the cell value by 100: 75.00%

213.6.124 NumformatScientificD2 = 11

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: scientific value with E character and decimal point: 10.00E+1

213.6.125 NumformatText = 49

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the number format constants.
Notes: text value

213.7 class XLFormControlMBS

213.7.1 class XLFormControlMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to represent various form controls on an Excel sheet.
Notes:

This allows you to batch pre-fill form fields in an Excel document.
You may need Excel to create the template with the form fields.

New in LibXL 4.0.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

213.7.6 Methods

213.7.7 AddItem(value as String)

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the item to a list box or drop-down form control.

213.7.8 ClearItems

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clears all items from a list box or drop-down form control.

213.7.9 Constructor

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

213.7.10 FromAnchor(byref Col as Integer, byref ColOff as Integer, byref Row as Integer, byref RowOff as Integer) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the top left location of a control within a document.

213.7.11 InsertItem(Index as Integer, value as String)

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the item to the specified position to a list box or drop-down form control.

213.7.12 Item(Index as Integer) as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the item by index from a list box or drop-down form control.
Notes: Index in range from zero to ItemCount-1.

213.7.13 ToAnchor(byref Col as Integer, byref ColOff as Integer, byref Row as Integer, byref RowOff as Integer) as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the bottom right location of a control within a document.

213.7.14 Properties

213.7.15 AltText as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Alternative text for the object.
Notes: (Read only property)

213.7.16 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The book reference.
Notes: (Read only property)

213.7.17 Checked as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether a check box is selected or a radio button is selected.
Notes:

This attribute only applies to check box and radio button form controls.

See CheckType* constants.
(Read and Write property)

213.7.18 DefaultSize as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is at its default size.
Notes: (Read only property)

213.7.19 Disabled as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is allowed to run an attached macro.
Notes: (Read only property)

213.7.20 DropLines as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of lines in the drop-down before scroll bars are added.
Notes:

This attribute only applies to drop-down form controls.
This value must be at least 0 and at most 30000.
(Read and Write property)

213.7.21 Dx as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the width of the scroll bar in pixels.
Notes:

This attribute only applies to list boxes, scroll bars, spin boxes and drop-downs.
(Read and Write property)

213.7.22 FirstButton as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is the first button in a set of radio buttons.
Notes:

This attribute only applies to radio button form controls.
(Read and Write property)

213.7.23 FmlaGroup as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference in a group box is linked to.
Notes:

Only applies to group box form controls.
(Read and Write property)

213.7.24 FmlaLink as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference is linked to.
Notes:

Only applies to check boxes, radio buttons, scroll bars, spin boxes, drop-downs and list boxes.
(Read and Write property)

213.7.25 FmlaRange as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference with range of source data cells.
Notes:

This attribute only applies to list box and drop-down form controls.
(Read and Write property)

213.7.26 FmlaTxbx as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The cell reference with the source data that the form control object's data is linked to.
Notes:

This attribute applies only to label and edit box form controls.
Any cell range can be specified but only the first cell in the range is considered.
(Read and Write property)

213.7.27 Handle as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

213.7.28 Horiz as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether the scroll bar is horizontal.
Notes:

This attribute only applies to scroll bar form controls.
(Read and Write property)

213.7.29 Inc as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The change in the current value of a scroll bar or a spin box form control as a result of on an increment click.
Notes:

It must be at least 0 and at most 30000. This attribute applies only to scroll bar or spin box form controls.
(Read and Write property)

213.7.30 ItemCount as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of items in a list box or drop-down form control.
Notes: (Read only property)

213.7.31 LinkedCell as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The worksheet range linked to the control's value.
Notes: (Read only property)

213.7.32 ListFillRange as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The range of source data cells used to populate the list box.
Notes: (Read only property)

213.7.33 Locked as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is locked when the sheet is protected.
Notes: (Read only property)

213.7.34 Macro as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The custom function associated with the object.
Notes: (Read only property)

213.7.35 Max as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The maximum value generated by the scroll bar or by the spin box.
Notes:

It must be at least 0 and at most 30000. This attribute only applies to scroll bars and spin boxes.
(Read and Write property)

213.7.36 Min as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The minimum value generated by the scroll bar or by the spin box.
Notes:

It must be at least 0 and at most 30000. This attribute only applies to scroll bars and spin box.
(Read and Write property)

213.7.37 MultiSel as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The indices of selected items as a comma-delimited list.
Notes:

The list indices are one-based.
This attribute is valid only if the attribute selType has the value "multi".
This attribute applies only to list box form controls.
(Read and Write property)

213.7.38 Name as String

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name for this embedded control.
Notes: (Read only property)

213.7.39 ObjectType as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the form control object type.
Notes:

See ObjectType constants.
(Read only property)

213.7.40 Print as Boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether the object is printed when the document is printed.
Notes: (Read only property)

213.7.41 Sel as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The index of the selected item.
Notes:

The index is one-based.
If set to a value of 0, no items are selected.
This attribute applies only to list box and drop-down form controls.
(Read and Write property)

213.7.42 Constants

213.7.43 CheckedTypeChecked = 1

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the check states.
Notes: Object is checked or selected.

213.7.44 CheckedTypeMixed = 2

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the check states.
Notes: Mixed selection. Applies only to check boxes.

213.7.45 CheckedTypeUnchecked = 0

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the check states.
Notes: Object is unchecked or unselected.

213.7.46 ObjectTypeButton = 1

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Button control

213.7.47 ObjectTypeCheckbox = 2

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Check-box control

213.7.48 ObjectTypeDialog = 11

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Dialog control

213.7.49 ObjectTypeDrop = 3

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Drop-down (combo box) control

213.7.50 ObjectTypeEditbox = 10

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Edit box control

213.7.51 ObjectTypeGbox = 4

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Group box control

213.7.52 ObjectTypeLabel = 5

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Label control

213.7.53 ObjectTypeList = 6

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: List box control

213.7.54 ObjectTypeRadio = 7

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Radio button control

213.7.55 ObjectTypeScroll = 8

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Scroll bar control

213.7.56 ObjectTypeSpin = 9

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Spin box control

213.7.57 ObjectTypeUnknown = 0

MBS XL Plugin, Plugin Version: 21.5.

Function: One of the object types.
Notes: Unknown control

213.8 class XLRichStringMBS

213.8.1 class XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the rich text.
Notes: This class allows to have more than one font within one cell.

213.8.4 Methods

213.8.5 AddFont(templateFont as XLFontMBS = nil) as XLFontMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a new font to the RichString for using with the addText() method.
Notes: templateFont parameter added for version 20.3.

213.8.6 AddStyledText(StyledText as StyledText)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Adds styled text to the rich string.
Notes: We convert attributes like bold, italic, underline, color, font name and size.

213.8.7 AddText(text as String, font as XLFontMBS = nil)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a piece of text (run) with the specified font to the RichString for mixing different fonts in a single cell.

213.8.8 Constructor(book as XLBookMBS)

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a new rich text to be used in the book.

213.8.9 Text(Index as Integer) as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a piece of text (run) with the specified index from the RichString.
See also:

- 213.8.15 Text as String 28451
- 213.8.10 Text(Index as Integer, byref font as XLFontMBS) as String 28450

213.8.10 Text(Index as Integer, byref font as XLFontMBS) as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a piece of text (run) and font with the specified index from the RichString.
See also:

- 213.8.15 Text as String 28451
- 213.8.9 Text(Index as Integer) as String 28450

213.8.11 Properties

213.8.12 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The reference to the owning book.
Notes: (Read only property)

213.8.13 Handle as Integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

213.8.14 StyledText as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Queries styled text with attributes of the rich string.
Notes:

We convert attributes like bold, italic, underline, color, font name and size.
(Read only property)

213.8.15 Text as String

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries all text from the rich string.
Notes: (Read only property)
See also:

- 213.8.9 Text(Index as Integer) as String 28450
- 213.8.10 Text(Index as Integer, byref font as XLFontMBS) as String 28450

213.8.16 TextCount as Integer

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of text (run) in the RichString.
Notes: (Read only property)

213.9 class XLSheetMBS

213.9.1 class XLSheetMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an Excel worksheet.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

213.9.6 Methods

213.9.7 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range (only for xlsx files).
Notes:

type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;
value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
See also:

- 213.9.8 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0)

213.9.8 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = "", prompt as String = "", errorTitle as string = "", error as string = "", errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range (only for xlsx files).
Notes:

type: the type of data validation.
op: the relational operator of data validation.
rowFirst: the first row of range;
rowLast: the last row of range;
colFirst: the first column of range;
colLast: the last column of range;
value1: the first value for relational operator;
value2: the second value for ValidationOpBetween or ValidationOpNotBetween operator;
allowBlank: a boolean value indicating whether the data validation treats empty or blank entries as valid, 'true' means empty entries are OK and do not violate the validation constraints;
hideDropDown: a boolean value indicating whether to display the dropdown combo box for a list type data validation (ValidationTypeList);
showInputMessage: a boolean value indicating whether to display the input prompt message;
showErrorMessage: a boolean value indicating whether to display the error alert message when an invalid value has been entered, according to the criteria specified;
promptTitle: title bar text of input prompt;
prompt: message text of input prompt;
errorTitle: title bar text of error alert;
error: message text of error alert;
errorStyle: the style of error alert used for this data validation:
See also:

- 213.9.7 AddDataValidation(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as String, value2 as String) 28454

213.9.9 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).

Notes: See parameters in the addDataValidation() method.
See also:

- 213.9.10 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0) 28456

213.9.10 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double, allowBlank as Boolean, hideDropDown as Boolean = false, showInputMessage as Boolean = true, showErrorMessage as Boolean = true, promptTitle as String = """, prompt as String = """, errorTitle as string = """, error as string = """, errorStyle as integer = 0)

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a data validation for the specified range with double or date values for the relational operator (only for xlsx files).
Notes: See parameters in the addDataValidation() method.
See also:

- 213.9.9 AddDataValidationDouble(type as Integer, op as integer, rowFirst as integer, colFirst as integer, rowLast as integer, colLast as integer, value1 as Double, value2 as Double) 28455

213.9.11 AddHyperlink(hyperlink as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the new hyperlink.

213.9.12 AddIgnoredError(rowFirst as Integer, colFirst as Integer, rowLast as Integer, colLast as Integer, iError as Integer) as Boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds the ignored error for specified range.
Notes:

It allows to hide green triangles on left sides of cells. For example, if a cell is formatted as text but contains a numeric value, this is considered to be a potential error because the number won't be treated as a number,

for example, in calculations. It is possible to combine a few IgnoredError values with operator | .

Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

213.9.13 AddrToRowCol(addr as string, byref row as Integer, byref col as Integer, byref rowRelative as boolean, byref colRelative as boolean)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts a cell reference to row and column.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

dim row, col as Integer
dim rowRelative, colRelative as boolean

sheet.AddrToRowCol("F7", row, col, rowRelative, colRelative)
MsgBox str(row)+" "+str(col) // shows 6 5
```

213.9.14 AddSelectionRange(sqref as string)

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Adds a range to the selection.

213.9.15 ApplyFilter

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Applies the AutoFilter to the sheet.

213.9.16 CellType(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns cell's type.
Notes: See CellType constants.

213.9.17 Clear(rowFirst as Integer = 0, rowLast as Integer = 1048575, colFirst as Integer = 0, colLast as Integer = 16383) as Boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears cells in specified area.

213.9.18 ClearPrintArea

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears the print area.

213.9.19 ClearPrintRepeats

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Clears repeated rows and columns on each page.

213.9.20 ColWidth(col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column width.

213.9.21 ColWidthPx(col as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column width in pixels.

213.9.22 Constructor

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The private constructor.

213.9.23 CopyCell(rowSrc as Integer, colSrc as Integer, rowDst as Integer, colDst as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies cell with format from (rowSrc, colSrc) to (rowDst, colDst).
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.24 CopyCellValue(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer, SourceColumn as Integer, DestColumn as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 21.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a cell from one sheet to another.
Notes:

Source and destination sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

If source and dest sheet are the same, does same as CopyCell function.

213.9.25 CopyColumn(dest as XLSheetMBS, SourceColumn as Integer, DestColumn as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a column from one sheet to another.
Notes:

Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

213.9.26 CopyRow(dest as XLSheetMBS, SourceRow as Integer, DestRow as Integer, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a row from one sheet to another.
Notes:

Sheets can be in different books.
This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.

213.9.27 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies a sheet to the other book.
Notes:

This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.
See also:

- 213.9.28 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil) 28460

213.9.28 CopySheet(dest as XLSheetMBS, Options as XLCopyOptionsMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Copies the sheet content to the other sheet.
Notes:

This copies most properties and all cells.
If something is missing, please let us know.

If options is nil, we copy everything.
See also:

- 213.9.27 CopySheet(dest as XLBookMBS, Options as XLCopyOptionsMBS = nil) 28460

213.9.29 DelHyperlink(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes hyperlink by index.
Notes: Index: The index from 0 to HyperlinkSize.

213.9.30 DelMerge(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes merged cells.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.31 DelMergeByIndex(index as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes merged cells by index.
Notes: Index: From 0 to MergeSize-1.

213.9.32 DelNamedRange(name as string, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes the named range by name.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.errorMessage().
scopeId - index of sheet for local named range or ScopeWorkbook for global named range.

213.9.33 FormControl(index as integer) as XLFormControlMBS

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a form control with the specified index.
Notes:

The index must be less than the return value of the FormControlCount property.
This allows you to batch pre-fill form fields in an Excel document.
You may need Excel to create the template with the form fields.

213.9.34 GetActiveCell(byref row as integer, byref col as integer) as boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets an active cell of the sheet.
Notes: Returns true if an active cell is found otherwise returns false.

213.9.35 GetHorPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row with horizontal page break at position index.

213.9.36 GetMerge(row as Integer, col as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets merged cells for cell at row, col.
Notes:

Result is written in rowFirst, rowLast, colFirst, colLast.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.37 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by name.
Notes: Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.ErrorMessage property.
See also:

- 213.9.38 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean

213.9.38 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer, ScopeID as Integer, byref Hidden as Integer) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by name.
Notes:

scopeId - index of sheet for local named range or SCOPE_WORKBOOK for global named range.
hidden - true if named range is hidden and false if isn't.
Returns false if specified named range isn't found or error occurs. Get error info with XLBookMBS.errorMessage.
See also:

- 213.9.37 GetNamedRange(name as string, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as boolean 28462

213.9.39 GetPicture(index as Integer, byref rowTop as Integer, byref colLeft as Integer, byref rowBottom as Integer, byref colRight as Integer, byref width as Integer, byref height as Integer, byref offsetX as Integer, byref offsetY as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a workbook picture index at position index in worksheet.
Notes:

Output parameters:
(rowTop, colLeft) - top left position of picture;
(rowBottom, colRight) - bottom right position of picture;
width - width of picture in pixels;
height - height of picture in pixels;
offset_x - horizontal offset of picture in pixels;
offset_y - vertical offset of picture in pixels.

Use XLBookMBS.getPicture() for extracting binary data of picture by workbook picture index.
Returns -1 if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.40 GetPrintArea(byref rowFirst as Integer, byref colFirst as Integer, byref rowLast as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the print area.

Notes: Returns false if print area isn't found.

213.9.41 GetPrintFit(byref wPages as Integer, byref hPages as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns whether fit to page option is enabled.
Notes:

Output parameters:
wPages - number of pages the sheet width is fit to;
hPages - number of pages the sheet height is fit to.

213.9.42 GetPrintRepeatCols(byref colFirst as Integer, byref colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets repeated columns on each page from colFirst to colLast.
Notes: Returns false if repeated columns aren't found.

213.9.43 GetPrintRepeatRows(byref rowFirst as Integer, byref rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets repeated rows on each page from rowFirst to rowLast.
Notes: Returns false if repeated rows aren't found.

213.9.44 GetTabRgbColor(byref red as Integer, byref green as Integer, byref blue as Integer) as Boolean

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the sheet's tab RGB color.
Notes: Returns true if the values have been returned.

213.9.45 GetTopLeftView(byref row as Integer, byref col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Extracts the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
dim col, row as Integer
sheet.GetTopLeftView(row, col)

MsgBox str(Row)+", "+str(col) // shows 2, 3
```

213.9.46 GetVerPageBreak(index as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns column with vertical page break at position index.

213.9.47 GroupCols(colFirst as Integer, colLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Groups columns from colFirst to colLast.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.48 GroupRows(rowFirst as Integer, rowLast as Integer, collapsed as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Groups rows from rowFirst to rowLast.

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.49 Hyperlink(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as String

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the hyperlink and its coordianates by index.

213.9.50 HyperlinkIndex(row as integer, col as integer) as Integer

MBS XL Plugin, Plugin Version: 23.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if the cell contains a hyperlink.
Notes: Returns an index of hyperlink if exists, -1 if there is no hyperlink in this cell.

213.9.51 InsertCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts columns from colFirst to colLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

213.9.52 InsertColAndKeepRanges(colFirst as integer, colLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts columns from colFirst to colLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

213.9.53 InsertRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts rows from rowFirst to rowLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

213.9.54 InsertRowAndKeepRanges(rowFirst as integer, rowLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Inserts rows from rowFirst to rowLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

213.9.55 IsAutoFilter as boolean

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this sheet has an auto filter.
Notes: Returns true if there is an auto filter, otherwise false.

213.9.56 IsDate(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that cell contains a date or time value.

213.9.57 IsFormula(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that cell contains a formula.

213.9.58 IsRichString(row as integer, col as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks that the cell contains a rich string with multiple fonts.
Notes: If return value is true read it with the readRichString() method.

213.9.59 Merge(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref colFirst as Integer, byref colLast as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the merged cells by index.

213.9.60 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by index.
See also:

- 213.9.61 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string 28468

213.9.61 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref scopeId as Integer, byref Hidden as Boolean) as string

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the named range coordianates by index.
Notes:

scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
hidden - true if named range is hidden and false if isn't.
See also:

- 213.9.60 NamedRange(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer) as string 28468

213.9.62 ReadBlank(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads format from blank cell.
Notes:

Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.63 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 28469

213.9.63 ReadBlank(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads format from blank cell.
Notes:

Returns false if specified cell isn't blank or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.62 ReadBlank(row as Integer, col as Integer) as boolean 28468

213.9.64 ReadBoolean(row as Integer, col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a boolean value and its format from cell.
Notes:

If nil format is returned then an error occured. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.65 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean 28469

213.9.65 ReadBoolean(row as Integer, col as Integer, byref format as XLFormatMBS) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a boolean value and its format from cell.
Notes:

If nil format is returned then an error occured. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.64 ReadBoolean(row as Integer, col as Integer) as boolean 28469

213.9.66 ReadComment(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a comment from specified cell.
Notes:

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.67 ReadDate(row as Integer, col as Integer) as date

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a date/time and its format from cell.
Notes:

Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.68 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date 28470

213.9.68 ReadDate(row as Integer, col as Integer, byref format as XLFormatMBS) as date

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads a date/time and its format from cell.
Notes:

Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.67 ReadDate(row as Integer, col as Integer) as date 28470

213.9.69 ReadDateTime(row as integer, col as integer) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a date/time and its format from cell.
Notes:

Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.70 ReadDateTime(row as integer, col as integer, byref format as XLFormatMBS) as dateTime 28471

213.9.70 ReadDateTime(row as integer, col as integer, byref format as XLFormatMBS) as dateTime

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a date/time and its format from cell.
Notes:

Internally uses XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.69 ReadDateTime(row as integer, col as integer) as dateTime 28471

213.9.71 ReadError(row as Integer, col as Integer) as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads error from cell.
Notes:

See ErrorType* constants.
Col and Row are zero based.

Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.72 ReadFormula(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a formula string and its format from cell.
Notes:

Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.73 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string 28472

213.9.73 ReadFormula(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a formula string and its format from cell.
Notes:

Returns nil if specified cell doesn't contain formula or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.72 ReadFormula(row as Integer, col as Integer) as string 28472

213.9.74 ReadNumber(row as Integer, col as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a number or date/time and its format from cell.
Notes:

Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.75 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double 28473

213.9.75 ReadNumber(row as Integer, col as Integer, byref format as XLFormatMBS) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a number or date/time and its format from cell.
Notes:

Use XLBookMBS.dateUnpack() for extract date/time parts from double.
If format is returned as nil, then error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.74 ReadNumber(row as Integer, col as Integer) as Double 28472

213.9.76 ReadRichString(row as integer, col as integer) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a rich string with multiple fonts and its format from the cell.
Notes:

It's possible to check if the specified cell contains a rich string with the isRichString() method.
Returns nil if the specified cell doesn't contain a string or error occurs.
Get error info with XLBookMBS.ErrorMessage property.
See also:

- 213.9.77 ReadRichString(row as integer, col as integer, byref format as XLFormatMBS) as XLRichStringMBS 28473

213.9.77 ReadRichString(row as integer, col as integer, byref format as XLFormatMBS) as XLRichStringMBS

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a rich string with multiple fonts and its format from the cell.
Notes:

It's possible to check if the specified cell contains a rich string with the isRichString() method.
Returns nil if the specified cell doesn't contain a string or error occurs.
Get error info with XLBookMBS.ErrorMessage property.
See also:

- 213.9.76 ReadRichString(row as integer, col as integer) as XLRichStringMBS 28473

213.9.78 ReadString(row as Integer, col as Integer) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a string and its format from cell.
Notes:

Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.79 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string 28474

213.9.79 ReadString(row as Integer, col as Integer, byref format as XLFormatMBS) as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a string and its format from cell.
Notes:

Returns "" if specified cell doesn't contain string or error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
See also:

- 213.9.78 ReadString(row as Integer, col as Integer) as string 28474

213.9.80 ReadStyledText(row as integer, col as integer) as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads rich string of a cell and converts to StyledText.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
See also:

- 213.9.81 ReadStyledText(row as integer, col as integer, byref format as XLFormatMBS) as StyledText 28475

213.9.81 ReadStyledText(row as integer, col as integer, byref format as XLFormatMBS) as StyledText

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Reads rich string from a cell and returns as StyledText.
Notes: We convert attributes like bold, italic, underline, color, font name and size.
See also:

- 213.9.80 ReadStyledText(row as integer, col as integer) as StyledText 28474

213.9.82 ReadValue(row as integer, col as integer) as Variant

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a value value from a cell.
Notes:

Depending on content we return number, boolean, text or date.
Returns nil for empty, error or blank cells.
See also:

- 213.9.83 ReadValue(row as integer, col as integer, byref format as XLFormatMBS) as Variant 28475

213.9.83 ReadValue(row as integer, col as integer, byref format as XLFormatMBS) as Variant

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Reads a value value from a cell.
Notes:

Depending on content we return number, boolean, text or date.
Returns nil for empty, error or blank cells.
See also:

- 213.9.82 ReadValue(row as integer, col as integer) as Variant 28475

213.9.84 RemoveCol(colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes columns from colFirst to colLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

213.9.85 RemoveColAndKeepRanges(colFirst as integer, colLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes columns from colFirst to colLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

213.9.86 RemoveComment(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a comment from the cell (only for xls format).

213.9.87 RemoveDataValidations

MBS XL Plugin, Plugin Version: 17.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all data validations for the sheet (only for xlsx files).

213.9.88 RemoveFilter

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes the AutoFilter from the sheet.

213.9.89 RemovePicture(row as integer, col as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a picture in the specified position.
Notes: Returns false if an error occurs.

213.9.90 RemovePictureByIndex(index as integer) as Boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes a picture by specified index. Returns false if an error occurs.

213.9.91 RemoveRow(rowFirst as Integer, rowLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes rows from rowFirst to rowLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Updates existing named ranges.

213.9.92 RemoveRowAndKeepRanges(rowFirst as integer, rowLast as integer) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes rows from rowFirst to rowLast.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Doesn't update existing named ranges.

213.9.93 RemoveSelection

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Removes all selection.

213.9.94 RowColToAddr(row as Integer, col as Integer, rowRelative as boolean = true, colRelative as boolean = true) as string

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Converts row and column to a cell reference.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)
```

```
// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

MsgBox sheet.RowColToAddr(5,5) // shows F6
MsgBox sheet.RowColToAddr(5,5,false,false) // shows $ F$ 6
```

213.9.95 RowHeight(row as Integer) as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row height.

213.9.96 RowHeightPx(row as integer) as Integer

MBS XL Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns row height in pixels.

213.9.97 SelectionRange as string

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a range of the selection.

213.9.98 SetActiveCell(row as integer, col as integer)

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an active cell of the sheet.

213.9.99 SetAutoFitArea(rowFirst as Integer = 0, colFirst as Integer = 0, rowLast as Integer = -1, colLast as Integer = -1)

MBS XL Plugin, Plugin Version: 15.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the borders for autofit column widths feature.
Notes: The method setCol with -1 width value will affect only to the specified limited area.

213.9.100 SetCol(colFirst as Integer, colLast as Integer, width as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets column width and format for all columns from colFirst to colLast.
Notes:

If format is nil then format is ignored. Columns may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Column width measured as the number of characters of the maximum digit width of the numbers 0, 1, 2, ..., 9 as rendered in the normal style's font. Value -1 is used for autofit column widths. If format equals 0 then format is ignored. Columns may be hidden.

213.9.101 SetColPx(colFirst as integer, colLast as integer, width as integer, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets column width in pixels and format for all columns from colFirst to colLast.
Notes:

Value -1 is used for autofit column widths.
If format equals nil then format is ignored. Columns may be hidden.
Returns false if error occurs. Get an error info with the errorMessage function in XLBookMBS class.

213.9.102 SetFooter(footer as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the footer text for the sheet when printed.
Notes:

The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. See setHeader for details. Margin is specified in inches.

213.9.103 SetHeader(header as string, margin as Double) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the header text of the sheet when printed.
Notes:

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("& "). Margin is specified in inches.

213.9.104 SetHorPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets/removes a horizontal page break.
Example:

```
// new document
dim x as new XLBookMBS

// add a sheet
dim s as XLSheetMBS = x.AddSheet
```

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

```
// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.105 SetMerge(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets merged cells for range: rowFirst - rowLast, colFirst - colLast.

Example:

```
// create new xls file
Dim book As New XLBookMBS(True)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

// create a format with border
Dim borderFormat As XLFormatMBS = book.AddFormat
borderFormat.SetBorder 2
borderFormat.SetBorderColor & hFF0000

// now fill a cell and merge a few more cells.
Dim r1 As Boolean = sheet.WriteString(2, 2, "Hello World", borderFormat)
Dim r2 As Boolean = sheet.SetMerge(2, 4, 2, 4)

// write file
Dim file As FolderItem = SpecialFolder.Desktop.Child("Generate.xlsx")

if book.Save(file) then
file.Launch
else
MsgBox "Failed to create file."+EndOfLine+EndOfLine+book.ErrorMessage
end if
```

Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.106 SetNamedRange(name as string, rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer, scopeId as Integer = -2) as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the named range.
Notes:

scopeId - index of sheet for local named range or ScopeWorkbook for global named range.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

213.9.107 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a picture with pictureId identifier at position row and col with scale factor.
Notes: Use XLBookMBS.addPicture() for getting picture identifier.
See also:

- 213.9.108 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0) 28483

213.9.108 SetPicture(row as Integer, col as Integer, PictureID as Integer, width as Integer, height as Integer, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets a picture with pictureId identifier at position row and col with custom size.
Notes:

Use XLBookMBS.addPicture() for getting a picture identifier.

Width and height can be -1 for default size of picture.
See also:

- 213.9.107 SetPicture(row as Integer, col as Integer, PictureID as Integer, scale as Double = 1.0, OffsetX as Integer = 0, OffsetY as Integer = 0, pos as Integer = 0) 28483

213.9.109 SetPrintArea(rowFirst as Integer, rowLast as Integer, colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the print area.

213.9.110 SetPrintFit(wPages as Integer, hPages as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Fits sheet width and sheet height to wPages and hPages respectively.

213.9.111 SetPrintRepeatCols(colFirst as Integer, colLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets repeated columns on each page from colFirst to colLast.

213.9.112 SetPrintRepeatRows(rowFirst as Integer, rowLast as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets repeated rows on each page from rowFirst to rowLast.

213.9.113 SetProtectEx(protect as boolean = true, password as string = "", enhancedProtection as Integer = -1)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Protects/unprotects the sheet with password and enchanced parameters below.
Notes: It is possible to combine a few EnhancedProtection values with operator BitwiseOr.

213.9.114 SetRow(row as Integer, height as Double, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets row height and format.
Notes:

If format is nil then format is ignored. Row may be hidden. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

Height is in points. If you want to convert from pixels to points you can use this calculation: points = pixels * 72 / 96. So for a height of 72 pixel, you pass 54 points.

213.9.115 SetRowPx(row as integer, height as integer, format as XLFormatMBS = nil, hidden as boolean = false) as boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets row height in pixels.
Notes: If format equals nil then format is ignored. Row may be hidden. Returns false if error occurs. Get

an error info with the errorMessage function in XLBookMBS class.

213.9.116 SetTabColor(colorValue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color for the sheet's tab.

213.9.117 SetTabRgbColor(red as Integer, green as Integer, blue as Integer)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the color for the sheet's tab.

213.9.118 SetTopLeftView(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 12.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the first visible row and the leftmost visible column of the sheet.
Example:

```
// create new xls file
dim book as new XLBookMBS(false)

// create sheet
dim sheet as XLSheetMBS = book.AddSheet("Sheet1")

// set top left view
sheet.SetTopLeftView(2,3)

// read values
dim col, row as Integer
sheet.GetTopLeftView(row, col)

MsgBox str(Row)+", "+str(col) // shows 2, 3
```

213.9.119 SetVerPageBreak(row as Integer, pageBreak as boolean = true) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets/removes a vertical page break.
Notes: Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.120 Split(row as Integer, col as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Splits a sheet at position (row, col).
Notes: Splits a sheet at position (row, col) or specifies the position of frozen pane. This function allows to freeze a header at top position or freeze some columns on the right.

213.9.121 SplitInfo(byref row as Integer, byref col as Integer) as Boolean

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the split information (position of frozen pane) in the sheet.
Notes:

row: vertical position of the split;
col: horizontal position of the split.
Returns true on success.

213.9.122 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the table parameters by index.
Notes:

headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.
Returns a string representing the name of the table.
See also:

- 213.9.123 Table(name as string, byref rowFirst as integer, byref rowLast as integer, byref ColFirst as integer, byref ColLast as integer, byref headerRowCount as integer, byref totalsRowCount as integer) as Boolean

213.9.123 Table(name as string, byref rowFirst as integer, byref rowLast as integer, byref ColFirst as integer, byref ColLast as integer, byref headerRowCount as integer, byref totalsRowCount as integer) as Boolean

MBS XL Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Gets the table parameters by name.
Notes:

headerRowCount - the number of header rows showing at the top of the table. 0 means that the header row is not shown.
totalsRowCount - the number of totals rows that shall be shown at the bottom of the table. 0 means that the totals row is not shown.

Returns true if the table is found.
See also:

- 213.9.122 Table(index as Integer, byref rowFirst as Integer, byref rowLast as Integer, byref ColFirst as Integer, byref ColLast as Integer, byref headerRowCount as Integer, byref totalsRowCount as Integer) as string 28486

213.9.124 WriteBlank(row as Integer, col as Integer, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes blank cell with specified format.
Notes:

Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.125 WriteBoolean(row as Integer, col as Integer, value as boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a bool value into cell with specified format.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim format as XLFormatMBS // optional format

Dim Success as Boolean = Sheet.WriteBoolean(2, 5, true, format)
```

Notes:

If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.126 WriteComment(row as Integer, col as Integer, value as string, author as string, width as Integer, height as Integer)

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a comment to the cell.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim format as XLFormatMBS // optional format

Dim Success as Boolean = Sheet.WriteComment(2, 5, "Sales Worldwide", "Peter", 30, 10)
```

Notes:

row and col: cell's position
value: comment string
author: author string
width: width of text box in pixels
height: height of text box in pixels

Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.127 WriteDate(row as Integer, col as Integer, value as date, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a date/time into cell with specified format.
Notes:

If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.128 WriteDateTime(row as integer, col as integer, value as dateTime, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a date/time into cell with specified format.
Notes:

If format is nil then format is ignored. Internally uses XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.129 WriteError(row as Integer, col as Integer, Error as Integer, format as XLFormatMBS = nil)

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes error into the cell with specified format.
Notes: If format equals nil then format is ignored.

213.9.130 WriteFormula(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula into cell with specified format.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim format as XLFormatMBS // optional format

Dim Success as Boolean = Sheet.WriteFormula(2, 5, "SUM(E16:E38)", format)
```

Notes:

If format is nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.
As LibXL does not calculate the result of the formula, it will not encode the result in the Excel file. It does

only store the formula, so an app opening the file will have to do the calculation. But QuickLook on Mac OS X does not calculate, so results do not show there.
Examples for formulas are: "TODAY()", "IF(C1>0;ABS(C1*D1);"""")", "SUM(E16:E38)" or "E39+E39*E40".

213.9.131 WriteFormulaBool(row as Integer, col as Integer, Expression as string, value as Boolean, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated bool value into cell with specified format.
Notes:

If format equals nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

213.9.132 WriteFormulaNum(row as Integer, col as Integer, Expression as string, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated double value into cell with specified format.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim format as XLFormatMBS // optional format

Dim Success as Boolean = Sheet.WriteFormulaNum(2, 5, "SUM(E16:E38)", 123.45, format)
```

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

213.9.133 WriteFormulaString(row as Integer, col as Integer, Expression as string, value as String, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a formula expression with precalculated string value into cell with specified format.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim DollarFormat as XLFormatMBS // the format to use
```

```
Dim Success as Boolean = Sheet.WriteFormulaNum(2, 5, "SUM(E16:E38)", "$ 123.45"", DollarFormat)
```

Notes: If format equals nil then format is ignored. Returns false if error occurs. Get error info with XLBookMBS.errorMessage.

213.9.134 WriteNumber(row as Integer, col as Integer, value as Double, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a number or date/time into cell with specified format.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim format as XLFormatMBS // optional format

Dim Success as Boolean = Sheet.WriteNumber(2, 5, 123.45, format)
```

Notes:

If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.135 WriteRichString(row as integer, col as integer, RichString as XLRichStringMBS, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a rich string with multiple fonts into the cell with the specified format.
Notes:

Add a new rich string with the addRichString() method. If format equals nil then format is ignored.
Returns false if an error occurs. Get error info with XLBookMBS.ErrorMessage property.

213.9.136 WriteString(row as Integer, col as Integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a string into cell with specified format.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim format as XLFormatMBS // optional format

Dim Success as Boolean = Sheet.WriteString(2, 5, "Hello World", format)
```

Notes:

If format is nil then format is ignored.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.137 WriteStringAsNumber(row as integer, col as integer, value as string, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Writes a number into cell with specified format and passes it as text.
Example:

```
Dim Sheet as XLSheetMBS // your current sheet
Dim format as XLFormatMBS // optional format

Dim Success as Boolean = Sheet.WriteStringAsNumber(2, 5, "123.45", format)
```

Notes:

Please pass number as text here to avoid running into rounding errors with floating point numbers.

If format is nil then format is ignored. Use XLBookMBS.datePack() for packing date/time parts to double.
Returns false if error occurs. Get error info with XLBookMBS.ErrorMessage property.
Col and Row are zero based.
Please remember that Excel files have limits like 65536 rows and 256 columns.

213.9.138 WriteStyledText(row as integer, col as integer, StyledText as StyledText, format as XLFormatMBS = nil) as boolean

MBS XL Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: Desktop, Console & Web.

Function: Writes a styled text to a cell.
Notes:

Same as building a rich string based in the StyledText and assigning it to the cell.

We convert attributes like bold, italic, underline, color, font name and size.

213.9.139 Properties

213.9.140 AutoFilter as XLAutoFilterMBS

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the AutoFilter.
Notes:

Creates it if it doesn't exist.
Only for xml based files.
(Read only property)

213.9.141 Book as XLBookMBS

MBS XL Plugin, Plugin Version: 15.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: The parent book.
Notes:

As a sheet is only valid with the owning book, we keep a back reference here.
(Read only property)

213.9.142 DefaultRowHeight as Double

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The default row height measured in point size.
Notes: (Read and Write property)

213.9.143 DisplayGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the gridlines are displayed.
Notes:

True if gridlines are displayed and false if aren't.
(Assigning a value to this property calls setDisplayGridlines internally)

(Read and Write property)

213.9.144 FirstCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first column in the sheet that contains a used cell.
Notes: (Read only property)

213.9.145 FirstFilledCol as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first column in the sheet that contains a filled cell.
Notes: (Read only property)

213.9.146 FirstFilledRow as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first row in the sheet that contains a filled cell.
Notes: (Read only property)

213.9.147 FirstRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the first row in the sheet that contains a used cell.
Notes: (Read only property)

213.9.148 Footer as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The footer text of the sheet when printed.
Notes:

The footer text appears at the bottom of every page when printed. The length of the text must be less than or equal to 255. The footer text can contain special commands, for example a placeholder for the page

number, current date or text formatting attributes. Margin is specified in inches.

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

(Read only property)

213.9.149 FooterMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The footer margin in inches.
Notes: (Read only property)

213.9.150 FormControlCount as Integer

MBS XL Plugin, Plugin Version: 21.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of form controls in this worksheet.
Notes: (Read only property)

213.9.151 GetHorPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of horizontal page breaks in the sheet.
Example:

```
// new document
dim x as new XLBookMBS

// add a sheet
dim s as XLSheetMBS = x.AddSheet

// write a cell
call s.WriteString(5,5, "Hello")

// now put a page break there
if s.SetHorPageBreak(5, true) then
// and now we have one at row 5
MsgBox str(s.GetHorPageBreakCount)+" "+str(s.GetHorPageBreak(0))
end if
```

Notes: (Read only property)

213.9.152 GetVerPageBreakCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of vertical page breaks in the sheet.
Notes: (Read only property)

213.9.153 GroupSummaryBelow as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether grouping rows summary is below.
Notes:

True if summary is below and false if isn't.
(Read and Write property)

213.9.154 GroupSummaryRight as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether grouping columns summary is right.
Notes:

Returns true if summary is right and false if isn't.
(Read and Write property)

213.9.155 Handle as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The internal object reference.
Notes: (Read and Write property)

213.9.156 HCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the sheet is centered horizontally when printed.
Notes: (Read and Write property)

213.9.157 Header as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The header text of the sheet when printed.
Notes:

The text appears at the top of every page when printed. The length of the text must be less than or equal to 255. The header text can contain special commands, for example a placeholder for the page number, current date or text formatting attributes. Special commands are represented by single letter with a leading ampersand ("& "). Margin is specified in inches.

(Read only property)

213.9.158 HeaderMargin as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Code	Description
& L	specifies the beginning of the left section
& P	specifies the current page number
& N	specifies the total number of pages
& \d { 1,3 }	specifies the text font size, where font size is measured in points, for example: & 9 or & 36
& S	specifies whether the strikethrough text style is on or off
& X	specifies whether the superscript text style is on or off
& Y	specifies whether the subscript text style is on or off
& C	specifies the beginning of the center section
& D	specifies a date
& T	specifies a time
& G	specifies a picture
& U	specifies whether the single underline text style is on or off
& E	specifies whether the double underline text style is on or off
& R	specifies the beginning of the right section
& Z	specifies a workbook file path
& F	specifies a workbook file name
& A	specifies a sheet name
& "fontname"	specifies the text font, for example: & "Comic Sans MS"
& B	specifies whether the bold text style is on or off
& I	specifies whether the italic text style is on or off
& &	specifies an ampersand character (&)

Function: The header margin in inches.
Notes: (Read only property)

213.9.159 Hidden as Integer

MBS XL Plugin, Plugin Version: 12.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: Specifies the visible state of this sheet.
Notes:

See constants: SheetStateHidden, SheetStateVeryHidden, SheetStateVisible.
(Read and Write property)

213.9.160 HyperlinkSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of hyperlinks in the sheet.
Notes: (Read only property)

213.9.161 Landscape as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether to use landscape or portrait mode for printing.
Notes:

true - pages are printed using landscape mode, false - pages are printed using portrait mode.
(Read and Write property)

213.9.162 LastCol as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the column after the last column in the sheet that contains a used cell.
Example:

```
dim book as XLBookMBS // your book instance

// get first sheet
dim sheet as XLSheetMBS = book.Sheet(0)

// show index of last column
dim LastCol as Integer = sheet.LastCol

MsgBox "LastCol: " + str(LastCol)
```

Notes: (Read only property)

213.9.163 LastFilledCol as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the column after the last column in the sheet that contains a filled cell.
Notes: (Read only property)

213.9.164 LastFilledRow as Integer

MBS XL Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the row after the last row in the sheet that contains a filled cell.
Notes: (Read only property)

213.9.165 LastRow as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the zero-based index of the row after the last row in the sheet that contains a used cell.
Example:

```
dim book as XLBookMBS // your book instance

// get first sheet
dim sheet as XLSheetMBS = book.Sheet(0)

// show index of last row
dim LastRow as Integer = sheet.LastRow

MsgBox "LastRow: " + str(LastRow)
```

Notes: (Read only property)

213.9.166 MarginBottom as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The bottom margin of the sheet in inches.
Notes: (Read and Write property)

213.9.167 MarginLeft as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The left margin of the sheet in inches.
Notes: (Read and Write property)

213.9.168 MarginRight as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The right margin of the sheet in inches.
Notes: (Read and Write property)

213.9.169 MarginTop as Double

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The top margin of the sheet in inches.
Notes: (Read and Write property)

213.9.170 MergeSize as Integer

MBS XL Plugin, Plugin Version: 14.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of merged cells in this worksheet.
Notes: (Read only property)

213.9.171 Name as string

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The name of the sheet.
Notes: (Read and Write property)

213.9.172 NamedRangeCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of named ranges in the sheet.
Notes: (Read only property)

213.9.173 Paper as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The paper size.
Notes:

See Paper* constants.
(Read and Write property)

213.9.174 PictureCount as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns a number of pictures in this worksheet.
Notes: (Read only property)

213.9.175 PrintGridlines as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the gridlines are printed.
Notes:

True if gridlines are printed and false if aren't.
(Read and Write property)

213.9.176 PrintRowCol as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the row and column headers are printed.
Notes: (Read and Write property)

213.9.177 PrintZoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scaling factor for printing as a percentage.
Notes: (Read and Write property)

213.9.178 Protect as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether sheet is protected.
Notes: (Read and Write property)

213.9.179 RightToLeft as boolean

MBS XL Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the text is displayed in right-to-left mode.
Notes:

true - the text is displayed in right-to-left mode,
false - the text is displayed in left-to-right mode.
(Read and Write property)

213.9.180 TabColor as Integer

MBS XL Plugin, Plugin Version: 23.1, Platforms: macOS, Linux, Windows, Targets: All.

Function: The sheet's tab color.
Notes:

For use with documents using indexed colors.
(Read and Write property)

213.9.181 TableSize as Integer

MBS XL Plugin, Plugin Version: 16.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the number of tables in the sheet.
Notes: (Read only property)

213.9.182 VCenter as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether the sheet is centered vertically when printed.
Notes: (Read and Write property)

213.9.183 Zoom as Integer

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The zoom level of the current view.
Notes:

100 is a usual view.
(Read and Write property)

213.9.184 CellFormat(row as Integer, col as Integer) as XLFormatMBS

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: The cell's format.
Notes: (Read and Write computed property)

213.9.185 ColHidden(col as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether column is hidden.
Notes: (Read and Write computed property)

213.9.186 RowHidden(row as Integer) as boolean

MBS XL Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether row is hidden.
Notes: (Read and Write computed property)

213.9.187 Constants

213.9.188 CellTypeBlank = 4

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the cell type constants.
Notes: blank

213.9.189 CellTypeBoolean = 3

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the cell type constants.
Notes: boolean value

213.9.190 CellTypeEmpty = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the cell type constants.
Notes: empty

213.9.191 CellTypeError = 5

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the cell type constants.
Notes: error

213.9.192 CellTypeNumber = 1

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the cell type constants.
Notes: number value

213.9.193 CellTypeStrictDate = 6

MBS XL Plugin, Plugin Version: 20.2.

Function: One of the cell type constants.
Notes: strict date

213.9.194 CellTypeString = 2

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the cell type constants.
Notes: string value

213.9.195 ErrorTypeDiv0 = 7

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the error type constants.
Notes: DIV/0!

213.9.196 ErrorTypeNA = & h2A

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the error type constants.
Notes: N/A

213.9.197 ErrorTypeName = & h1D

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the error type constants.
Notes: NAME?

213.9.198 ErrorTypeNoError = & hFF

MBS XL Plugin, Plugin Version: 14.3.

Function: One of the error type constants.
Notes: No Error.

213.9.199 ErrorTypeNull = 0

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the error type constants.
Notes: NULL!

213.9.200 ErrorTypeNum = & h24

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the error type constants.
Notes: NUM!

213.9.201 ErrorTypeRef = & h17

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the error type constants.
Notes: REF!

213.9.202 ErrorTypeValue = & h0F

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the error type constants.
Notes: VALUE!

213.9.203 IgnoreErrorDataValidation = 128

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when a cell's value in a Table does not comply with the Data Validation rules specified.

213.9.204 IgnoreErrorEmptyCellref = 2

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when formulas refer to empty cells.

213.9.205 IgnoreErrorEvalError = 1

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when cells contain formulas that result in an error.

213.9.206 IgnoreErrorInconsistFormula = 16

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when a formula in a region of your worksheet differs from other formulas in the same region.

213.9.207 IgnoreErrorInconsistRange = 8

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when formulas omit certain cells in a region.

213.9.208 IgnoreErrorNoError = 0

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: No error.

213.9.209 IgnoreErrorNumberStoredAsText = 4

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when numbers are formatted as text or are preceded by an apostrophe.

213.9.210 IgnoreErrorTwodigTextyear = 32

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when formulas contain text formatted cells with years represented as 2 digits.

213.9.211 IgnoreErrorUnlockFormula = 64

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the ignore error constants.
Notes: Ignore errors when unlocked cells contain formulas.

213.9.212 Paper10X11 = 45

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the paper format constants.

213.9.213 Paper10X14 = 16

MBS XL Plugin, Plugin Version: 11.3.

Function: One of the paper format constants.
Notes: 10 x 14 in

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Nothing is allowed except cell selections.

213.9.330 ProtectAutofilter = 4096

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Autofilters are allowed when the sheet is protected.

213.9.331 ProtectDefault = -1

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Default protection.

213.9.332 ProtectDeleteColumns = 256

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Deleting columns is allowed when the sheet is protected.

213.9.333 ProtectDeleteRows = 512

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Deleting rows is allowed when the sheet is protected.

213.9.334 ProtectFormatCells = 4

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Formatting cells is allowed when the sheet is protected.

213.9.335 ProtectFormatColumns = 8

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Formatting columns is allowed when the sheet is protected.

213.9.336 ProtectFormatRows = 16

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Formatting rows is allowed when the sheet is protected.

213.9.337 ProtectInsertColumns = 32

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Inserting columns is allowed when the sheet is protected.

213.9.338 ProtectInsertHyperlinks = 128

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Inserting hyperlinks is allowed when the sheet is protected.

213.9.339 ProtectInsertRows = 64

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Inserting rows is allowed when the sheet is protected.

213.9.340 ProtectObjects = 1

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Objects are locked when the sheet is protected.

213.9.341 ProtectPivottables = 8192

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Pivot tables are allowed when the sheet is protected.

213.9.342 ProtectScenarios = 2

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Scenarios are locked when the sheet is protected.

213.9.343 ProtectSelLockedCells = 1024

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Selection of locked cells is locked when the sheet is protected.

213.9.344 ProtectSelUnlockedCells = 16384

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Selection of unlocked cells is locked when the sheet is protected.

213.9.345 ProtectSort = 2048

MBS XL Plugin, Plugin Version: 16.5.

Function: One of the protection levels.
Notes: Sorting is allowed when the sheet is protected.

213.9.346 ScopeUndefined = -2

MBS XL Plugin, Plugin Version: 14.0.

Function: One of the scope constants.
Notes: Undefined scope

213.9.347 ScopeWorkbook = -1

MBS XL Plugin, Plugin Version: 14.0.

Function: One of the scope constants.
Notes: Workbook scope.

213.9.348 SheetStateHidden = 1

MBS XL Plugin, Plugin Version: 12.1.

Function: One of the constants for the visible state of a sheet.
Notes: Sheet is hidden, but can be shown via the user interface.

213.9.349 SheetStateVeryHidden = 2

MBS XL Plugin, Plugin Version: 12.1.

Function: One of the constants for the visible state of a sheet.
Notes: Sheet is hidden and cannot be shown in the user interface.

213.9.350 SheetStateVisible = 0

MBS XL Plugin, Plugin Version: 12.1.

Function: One of the constants for the visible state of a sheet.
Notes: Sheet is visible

213.9.351 ValidationErrstyleInformation = 2

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the error styles.
Notes: This data validation error style uses an information icon in the error alert.

213.9.352 ValidationErrstyleStop = 0

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the error styles.
Notes: This data validation error style uses a stop icon in the error alert.

213.9.353 ValidationErrstyleWarning = 1

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the error styles.
Notes: This data validation error style uses a warning icon in the error alert.

213.9.354 ValidationOpBetween = 0

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is between two other values.

213.9.355 ValidationOpEqual = 2

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is equal to a specified value.

213.9.356 ValidationOpGreaterthan = 6

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is greater than a specified value.

213.9.357 ValidationOpGreaterthanorequal = 7

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is greater than or equal to a specified value.

213.9.358 ValidationOpLessthan = 4

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is less than a specified value.

213.9.359 ValidationOpLessthanorequal = 5

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is less than or equal to a specified value.

213.9.360 ValidationOpNotbetween = 1

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is not between two other values.

213.9.361 ValidationOpNotequal = 3

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the validation operations.
Notes: Data validation which checks if a value is not equal to a specified value.

213.9.362 ValidationTypeCustom = 7

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: Data validation which uses a custom formula to check the cell value.

213.9.363 ValidationTypeDate = 4

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: Data validation which checks for date values satisfying the given condition.

213.9.364 ValidationTypeDecimal = 2

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: Data validation which checks for decimal values satisfying the given condition.

213.9.365 ValidationTypeList = 3

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: Data validation which checks for a value matching one of list of values.

213.9.366 ValidationTypeNone = 0

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: No data validation.

213.9.367 ValidationTypeTextLength = 6

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: Data validation which checks for text values, whose length satisfies the given condition.

213.9.368 ValidationTypeTime = 5

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: Data validation which checks for time values satisfying the given condition.

213.9.369 ValidationTypeWhole = 1

MBS XL Plugin, Plugin Version: 17.2.

Function: One of the constants for the types of data validation.
Notes: Data validation which checks for whole number values satisfying the given condition.

Chapter 214

XML

214.1 class XMLAttributeMBS

214.1.1 class XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLAttributeMBS class refers to an attribute of an XML element.
Notes:

Typically the allowable values for the attribute are defined in a documenttype definition.
XMLAttributeMBS objects inherit the XMLNodeMBS interface, but since attributes are not actually child nodes of the elements they are associated with, the DOM does not consider them part of the document tree. Thus, the XMLNodeMBS attributes parentNode, previousSibling, and nextSibling have a null value for XMLAttributeMBS objects. The DOM takes the view that attributes are properties of elements rather than having a separate identity from the elements they are associated with; this should make it more efficient to implement such features as default attributes associated with all elements of a given type. Furthermore, attribute nodes may not be immediate children of a DOMDocumentFragment. However, they can be associated with XMLElementMBS nodes contained within a DOMDocumentFragment. In short, users of the DOM need to be aware that XMLAttributeMBS nodes have some things in common with other objects inheriting the XMLNodeMBS interface, but they also are quite distinct.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.1.6 Methods

214.1.7 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.1.8 Properties

214.1.9 isId as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this attribute is known to be of type ID or not.
Notes:

When it is and its value is unique, the ownerElement of this attribute can be retrieved using getElementById on XMLDocumentMBS.
(Read only property)

214.1.10 Name as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the name of this attribute.
Notes: (Read only property)

214.1.11 OwnerElement as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLElementMBS node this attribute is attached to or nil if this attribute is not in use.
Notes: (Read only property)

214.1.12 SchemaTypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type information associated with this attribute.
Notes:

the XMLTypeInfoMBS associated with this attribute.
(Read only property)

214.1.13 Specified as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is specified.
Notes:

Returns true if the attribute received its value explicitly in the XML document, or if a value was assigned programatically with the setValue function. Returns false if the attribute value came from the default value declared in the document's DTD.
(Read only property)

214.1.14 Value as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the value of the attribute.
Notes:

The value of the attribute is returned as a string. Character and general entity references are replaced with their values.

Assign something to set the value of the attribute. A text node with the unparsed contents of the string will be created.
(Read and Write property)

214.2 class XMLCDATASectionMBS

214.2.1 class XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: CDATA sections are used to escape blocks of text containing characters that would otherwise be regarded as markup.
Notes:

The only delimiter that is recognized in a CDATA section is the "]] >" string that ends the CDATA section. CDATA sections cannot be nested. Their primary purpose is for including material such as XML fragments, without needing to escape all the delimiters.

The data attribute of the XMLTextMBS node holds the text that is contained by the CDATA section. Note that this may contain characters that need to be escaped outside of CDATA sections and that, depending on the character encoding ("charset") chosen for serialization, it may be impossible to write out some characters as part of a CDATA section.

The XMLCDATASectionMBS interface inherits from the XMLCharacterDataMBS interface through the XMLTextMBS interface. Adjacent XMLCDATASectionMBS nodes are not merged by use of the normalize method of the XMLNodeMBS interface. Because no markup is recognized within a XMLCDATASectionMBS, character numeric references cannot be used as an escape mechanism when serializing. Therefore, action needs to be taken when serializing a XMLCDATASectionMBS with a character encoding where some of the contained characters cannot be represented. Failure to do so would not produce well-formed XML.One potential solution in the serialization process is to end the CDATA section before the character, output the character using a character reference or entity reference, and open a new CDATA section for any further characters in the text node. Note, however, that some code conversion libraries at the time of writing do not return an error or exception when a character is missing from the encoding, making the task of ensuring that data is not corrupted on serialization more difficult.
Subclass of the XMLTextMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.2.2 Methods

214.2.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.3 class XMLCharacterDataMBS

214.3.1 class XMLCharacterDataMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for character data.
Notes:

The XMLCharacterDataMBS interface extends XMLNodeMBS with a set of attributes and methods for accessing character data in the DOM. For clarity this set is defined here rather than on each object that uses these attributes and methods. No DOM objects correspond directly to XMLCharacterDataMBS, though XMLTextMBS and others do inherit the interface from it. All offsets in this interface start from 0.

As explained in the DOM spec, text strings in the DOM are represented in UTF-16, i.e. as a sequence of 16-bit units. In the following, the term 16-bit units is used whenever necessary to indicate that indexing on XMLCharacterDataMBS is done in 16-bit units.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.3.2 Methods

214.3.3 appendData(data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Append the string to the end of the character data of the node.
Notes: Upon success, data provides access to the concatenation of data.

214.3.4 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.3.5 deleteData(offset as Integer, count as Integer)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Remove a range of characters from the node.
Notes:

Upon success, data and length reflect the change.

offset: The offset from which to remove characters. Zero based.
count: The number of characters to delete.

If the sum of offset and count exceeds length then all characters from offset to the end of the data are deleted.

214.3.6 insertData(offset as Integer, data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Insert a string at the specified character offset.
Notes: offset: The character offset at which to insert. Zero based.

214.3.7 replaceData(offset as Integer, count as Integer, data as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replace the characters starting at the specified character offset with the specified string.
Notes:

offset: The offset from which to start replacing.
count: The number of characters to replace.

If the sum of offset and count exceeds length, then all characters to the end of the data are replaced (i.e., the effect is the same as a remove method call with the same range, followed by an append method invocation).

214.3.8 substringData(offset as Integer, count as Integer) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Extracts a range of data from the node.
Notes:

offset: Start offset of substring to extract. Zero based.
count: The number of characters to extract.

The specified substring. If the sum of offset and count exceeds the length, then all characters to the end of the data are returned.

214.3.9 Properties

214.3.10 Data as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The data content.
Notes:

Returns the character data of the node that implements this interface.
The DOM implementation may not put arbitrary limits on the amount of data that may be stored in a XMLCharacterDataMBS node. However, implementation limits may mean that the entirety of a node's data may not fit into a single XMLCh* String. In such cases, the user may call substringData to retrieve the data in appropriately sized pieces.

Can be assigned with new data.
(Read and Write property)

214.3.11 Length as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number of characters that are available through data and the substringData method below.
Notes: (Read only property)

214.4 class XMLCommentMBS

214.4.1 class XMLCommentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a comment in a xml document.
Notes:

This interface inherits from CharacterData and represents the content of a comment, i.e., all the characters between the starting '<!–' and ending '–>'.
Subclass of the XMLCharacterDataMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.4.2 Methods

214.4.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.5 class XMLConfigurationMBS

214.5.1 class XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLConfigurationMBS interface represents the configuration of a document and maintains a table of recognized parameters.
Notes:

Using the configuration, it is possible to change Document.normalizeDocument behavior, such as replacing CDATASection nodes with Text nodes or specifying the type of the schema that must be used when the validation of the Document is requested. XMLConfigurationMBS objects are also used in [DOM Level 3 Load and Save] in the XMLParserMBS and XMLSerializerMBS interfaces.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.5.2 Methods

214.5.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.5.4 Properties

214.5.5 ByteOrderMark as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include byte order mark byte in output.
Notes: (Read and Write property)

214.5.6 CanonicalForm as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to .
Notes:

true: Canonicalize the document according to the rules specified in [Canonical XML] . Note that this is limited to what can be represented in the DOM. In particular, there is no way to specify the order of the attributes in the DOM.

false: (default) Do not canonicalize the document.
(Read and Write property)

214.5.7 CDataSections as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep CData sections in the document.
Notes:

true: (default) Keep CDATASection nodes in the document.
false: Transform CDATASection nodes in the document into Text nodes. The new Text node is then combined with any adjacent Text node.
(Read and Write property)

214.5.8 Comments as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep comments.
Notes:

true: (default) Keep Comment nodes in the document.
false: Discard Comment nodes in the Document.
(Read and Write property)

214.5.9 DataTypeNormalization as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Wether to perform data type normalization.
Notes:

true: Exposed normalized values in the tree.
false: (default) Do not perform normalization on the tree.
(Read and Write property)

214.5.10 DiscardDefaultContent as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to discard default content.
Notes:

true: (default) Use whatever information available to the implementation (i.e. XML schema, DTD, the specified flag on Attr nodes, and so on) to decide what attributes and content should be discarded or not. Note that the specified flag on Attr nodes in itself is not always reliable, it is only reliable when it is set to false since the only case where it can be set to false is if the attribute was created by the implementation. The default content won't be removed if an implementation does not have any information available.
false: Keep all attributes and all content.
(Read and Write property)

214.5.11 elementcontentwhitespace as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to keep all white spaces.
Example:

```
Dim parser As New XMLParserMBS

// configure the parser
Dim DOMConfig As XMLConfigurationMBS = p.DOMConfig
DOMConfig.ElementContentWhitespace=False

// prepare XML input
Dim Input As New XMLInputMBS
Input.InputString = kXML2

// and parse
Var xml1 As XMLDocumentMBS = p.parse(Input)

Break
```

Notes:

true: (default) Keep all white spaces in the document.
false: Discard white space in element content while normalizing. The implementation is expected to use the isWhitespaceInElementContent flag on Text nodes to determine if a text node should be written out or not.
(Read and Write property)

214.5.12 Entities as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Keep entities in the document.
Notes:

true: Keep EntityReference and Entity nodes in the document.

false: (default) Remove all EntityReference and Entity nodes from the document, putting the entity expansions directly in their place. Text nodes are into "normal" form. Only EntityReference nodes to non-defined entities are kept in the document.
(Read and Write property)

214.5.13 formatprettyprint as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to pretty print XML.
Notes:

For serializing XML.

Formatting the output by adding whitespace to produce a pretty-printed, indented, human-readable form. The exact form of the transformations is not specified by this specification.
Pretty-printing changes the content of the document and may affect the validity of the document, validating implementations should preserve validity.
(Read and Write property)

214.5.14 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.5.15 ignoreunknowncharacterdenormalizations as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to ignore unknown character normalizations.
Notes:

For serializing XML.

If, while verifying full normalization when [XML 1.1] is supported, a character is encountered for which the normalization properties cannot be determined, then raise a "unknown-character-denormalization" warning (instead of raising an error, if this parameter is not set) and ignore any possible denormalizations caused by these characters.

Set to false to report a fatal error if a character is encountered for which the processor cannot determine the

normalization properties.
(Read and Write property)

214.5.16 InfoSet as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to only keep the information defined in the XML Information Set.
Notes:

true: Only keep in the document the information defined in the XML Information Set [XML Information set] . This forces the following features to false: namespace-declarations, validate-if-schema, entities, datatype-normalization, cdata-sections. This forces the following features to true: whitespace-in-element-content, comments, namespaces. Other features are not changed unless explicitly specified in the description of the features. Note that querying this feature with getFeature returns true only if the individual features specified above are appropriately set.
false: Setting infoset to false has no effect.
(Read and Write property)

214.5.17 namespacedeclarations as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include namespace declaration attributes.
Notes:

true: (default) Include namespace declaration attributes, specified or defaulted from the schema or the DTD, in the document. See also the section Declaring Namespaces in [XML Namespaces] .
false: Discard all namespace declaration attributes. The Namespace prefixes are retained even if this feature is set to false.
(Read and Write property)

214.5.18 NameSpaces as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to do namespace processing.
Notes:

true: (default) Perform the namespace processing as defined in [XML Namespaces] .
false: Do not perform the namespace processing.
(Read and Write property)

214.5.19 normalizecharacters as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to do character normalization.
Notes:

true: Perform the W3C Text Normalization of the characters [CharModel] in the document.
false: (default) Do not perform character normalization.
(Read and Write property)

214.5.20 SpaceFirstLevelElements as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to space first level elements for pretty print.
Notes:

If true, this adds an extra line feed between the elements that are children of the document root.
(Read and Write property)

214.5.21 splitcdatasections as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to split the CData Sections.
Notes:

true: (default) Split CDATA sections containing the CDATA section termination marker ']] >'. When a CDATA section is split a warning is issued.
false: Signal an error if a CDATASection contains an unrepresentable character.
(Read and Write property)

214.5.22 Validate as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to validate against a schema.
Notes:

true: Require the validation against a schema (i.e. XML schema, DTD, any other type or representation of schema) of the document as it is being normalized as defined by [XML 1.0] . If validation errors are found, or no schema was found, the error handler is notified. Note also that normalized values will not be exposed to the schema in used unless the feature datatype-normalization is true.
Note: validate-if-schema and validate are mutually exclusive, setting one of them to true will set the other

one to false.
false: (default) Only XML 1.0 non-validating processing must be done. Note that validation might still happen if validate-if-schema is true.
(Read and Write property)

214.5.23 validateifschema as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to validate only if a declaration for the document element can be found.
Notes:

true: Enable validation only if a declaration for the document element can be found (independently of where it is found, i.e. XML schema, DTD, or any other type or representation of schema). If validation errors are found, the error handler is notified. Note also that normalized values will not be exposed to the schema in used unless the feature datatype-normalization is true.
Note: validate-if-schema and validate are mutually exclusive, setting one of them to true will set the other one to false.
false: (default) No validation should be performed if the document has a schema. Note that validation must still happen if validate is true.
(Read and Write property)

214.5.24 xmldeclaration as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to include declaration.
Notes:

For serializing XML.

If a XMLDocumentMBS, XMLElementMBS, or XMLEntityMBS node is serialized, the XML declaration, or text declaration, should be included. The version (xmlVersion if the document is a Level 3 document and the version is non-null, otherwise use the value "1.0"), and the output encoding (see write methods for details on how to find the output encoding) are specified in the serialized XML declaration.

Do not serialize the XML and text declarations. Report a "xml-declaration-needed" warning if this will cause problems (i.e. the serialized data is of an XML version other than [XML 1.0] , or an encoding would be needed to be able to re-parse the serialized data).
(Read and Write property)

214.6 class XMLDocumentFragmentMBS

214.6.1 class XMLDocumentFragmentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLDocumentFragmentMBS is a "lightweight" or "minimal" XMLDocumentMBS object.
Notes:

It is very common to want to be able to extract a portion of a document's tree or to create a new fragment of a document. Imagine implementing a user command like cut or rearranging a document by moving fragments around. It is desirable to have an object which can hold such fragments and it is quite natural to use a XMLNodeMBS for this purpose. While it is true that a XMLDocumentMBS object could fulfill this role, a XMLDocumentMBS object can potentially be a heavyweight object, depending on the underlying implementation. What is really needed for this is a very lightweight object. XMLDocumentFragmentMBS is such an object.

Furthermore, various operations – such as inserting nodes as children of another XMLNodeMBS – may take XMLDocumentFragmentMBS objects as arguments; this results in all the child nodes of the XMLDocumentFragmentMBS being moved to the child list of this node.
The children of a XMLDocumentFragmentMBS node are zero or more nodes representing the tops of any sub-trees defining the structure of the document. XMLDocumentFragmentMBS nodes do not need to be well-formed XML documents (although they do need to follow the rules imposed upon well-formed XML parsed entities, which can have multiple top nodes). For example, a XMLDocumentFragmentMBS might have only one child and that child node could be a XMLTextMBS node. Such a structure model represents neither an HTML document nor a well-formed XML document.

When a XMLDocumentFragmentMBS is inserted into a XMLDocumentMBS (or indeed any other XMLNodeMBS that may take children) the children of the XMLDocumentFragmentMBS and not the XMLDocumentFragmentMBS itself are inserted into the XMLNodeMBS. This makes the XMLDocumentFragmentMBS very useful when the user wishes to create nodes that are siblings; the XMLDocumentFragmentMBS acts as the parent of these nodes so that the user can use the standard methods from the XMLNodeMBS interface, such as insertBefore() and appendChild().
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.6.2 Methods

214.6.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.7 class XMLDocumentMBS

214.7.1 class XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLDocumentMBS interface represents the entire XML document.
Example:

```
// parse it
dim doc as new XMLDocumentMBS("<test id=123>abc</test>")

// and make a string:
dim s as string = doc.toString

Break // see in debugger
```

Notes:

Conceptually, it is the root of the document tree, and provides the primary access to the document's data.

Since elements, text nodes, comments, processing instructions, etc. cannot exist outside the context of a XMLDocumentMBS, the XMLDocumentMBS interface also contains the factory methods needed to create these objects. The XMLNodeMBS objects created have a ownerDocument attribute which associates them with the XMLDocumentMBS within whose context they were created.

All methods can raise a XMLExceptionMBS object in case of a problem.
Subclass of the XMLNodeMBS class.

214.7.6 Methods

214.7.7 adoptNode(node as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Changes the ownerDocument of a node, its children, as well as the attached attribute nodes if there are any.
Notes:

If the node has a parent it is first removed from its parent child list. This effectively allows moving a subtree from one document to another.
Should not be needed in Xojo apps.

214.7.8 ClearCache

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Frees the node cache for this document.
Notes: You should usually not need to use this method.

214.7.9 Close

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Explicitly close document.
Notes:

This frees memory for all nodes and the XML document now.
You should usually not need to use this method.

214.7.10 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor to create a blank document.
Example:

```
// create blank document
dim doc as new XMLDocumentMBS

dim testNode as XMLElementMBS = doc.createElement("test")

System.DebugLog "doc.append"
```

```
call doc.appendChild testNode

System.DebugLog "testNode.append"
call testNode.appendChild doc.createTextNode("Hello World")

// and make a string:
dim s as string = doc.toString

Break // see in debugger
```

- 214.7.13 Constructor(file as FolderItem) 28557
- 214.7.14 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 28557

214.7.11 Constructor(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience function to parse a document from a memoryblock.
See also:

- 214.7.10 Constructor 28555
- 214.7.12 Constructor(data as String) 28556
- 214.7.13 Constructor(file as FolderItem) 28557
- 214.7.14 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 28557

214.7.12 Constructor(data as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Convenience function to parse a document from a string.
Example:

```
// parse it
dim doc as new XMLDocumentMBS("<test id=123>abc</test>")

// and make a string:
```

```
dim s as string = doc.toString

Break // see in debugger
```

- 214.7.11 Constructor(data as MemoryBlock) 28556
- 214.7.13 Constructor(file as FolderItem) 28557
- 214.7.14 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 28557

214.7.13 Constructor(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Initializes by loading an XML file.
See also:

- 214.7.10 Constructor 28555
- 214.7.11 Constructor(data as MemoryBlock) 28556
- 214.7.12 Constructor(data as String) 28556
- 214.7.14 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) 28557

214.7.14 Constructor(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMDocument object of the specified type with its document element.
Notes:

namespaceURI: The namespace URI of the document element to create.
qualifiedName: The qualified name of the document element to be created.
DocumentType: The type of document to be created or nil. When doctype is not nil, its ownerDocument attribute is set to the document being created.
See also:

- 214.7.10 Constructor 28555
- 214.7.11 Constructor(data as MemoryBlock) 28556

- 214.7.12 Constructor(data as String) 28556
- 214.7.13 Constructor(file as FolderItem) 28557

214.7.15 Create as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a blank document.
See also:

- 214.7.16 Create(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) as XMLDocumentMBS 28558

214.7.16 Create(namespaceURI as String, qualifiedName as string, DocumentType as XMLDocumentTypeMBS = nil) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMDocument object of the specified type with its document element.
Notes:

namespaceURI: The namespace URI of the document element to create.
qualifiedName: The qualified name of the document element to be created.
DocumentType: The type of document to be created or nil. When doctype is not nil, its ownerDocument attribute is set to the document being created.

Returns a new XMLDocumentMBS object.
See also:

- 214.7.15 Create as XMLDocumentMBS 28558

214.7.17 createAttribute(Name as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an XMLAttributeMBS of the given name.
Notes:

Note that the XMLAttributeMBS instance can then be set on an XMLElementMBS using the setAttributeNode method.
To create an attribute with a qualified name and namespace URI, use the createAttributeNS method.

name: The name of the attribute.

Returns a new XMLAttributeMBS object with the nodeName attribute set to name, and localName, prefix, and namespaceURI set to "". The value of the attribute is the empty string.

214.7.18 createAttributeNS(namespaceURI as String, qualifiedName as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an attribute of the given qualified name and namespace URI.
Notes:

namespaceURI: The namespace URI of the attribute to create.
qualifiedName: The qualified name of the attribute to instantiate.

214.7.19 createCDATASection(Data as String) as XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLCDATASectionMBS node whose value is the specified string.

214.7.20 createComment(Text as String) as XMLCommentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a DOMComment node given the specified string.

214.7.21 createDocumentFragment as XMLDocumentFragmentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an empty XMLDocumentFragmentMBS object.

214.7.22 createDocumentType(Name as String, PublicID as String = "", SystemID as String = "") as XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a XMLDocumentTypeMBS node.

214.7.23 createElement(Name as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an element of the type specified.
Example:

```
Dim doc As New XMLDocumentMBS

Dim testNode As XMLElementMBS = doc.createElement("test")
Call doc.appendChild testNode

MessageBox doc.toString
```

Notes:

Note that the instance returned implements the XMLElementMBS interface, so attributes can be specified directly on the returned object.

In addition, if there are known attributes with default values, XMLAttributeMBS nodes representing them are automatically created and attached to the element.

To create an element with a qualified name and namespace URI, use the createElementNS method.
tagName The name of the element type to instantiate. For XML, this is case-sensitive.
A new XMLElementMBS object with the nodeName attribute set to tagName, and localName, prefix, and namespaceURI set to "".

214.7.24 createElementNS(namespaceURI as String, qualifiedName as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an element of the given qualified name and namespace URI.
Notes:

namespaceURI: The namespace URI of the element to create.
qualifiedName: The qualified name of the element type to instantiate.

214.7.25 createEntity(Name as String) as XMLEntityMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new entity.
Notes: name: The name of the entity to instantiate.

214.7.26 createEntityReference(Text as String) as XMLEntityReferenceMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an XMLEntityReferenceMBS object.
Notes:

In addition, if the referenced entity is known, the child list of the XMLEntityReferenceMBS node is made the same as that of the corresponding XMLEntityMBS node.If any descendant of the XMLEntityMBS node has an unbound namespace prefix, the corresponding descendant of the created XMLEntityReferenceMBS node is also unbound; (its namespaceURI is nil). The DOM Level 2 does not support any mechanism to resolve namespace prefixes.

name: The name of the entity to reference.

Returns the new XMLEntityReferenceMBS object.

214.7.27 createNodeIterator(root as XMLNodeMBS = nil, whatToShow as Integer = & hFFFF, entityReferenceExpansion as boolean = false, filter as XMLNodeFilterMBS = nil) as XMLNodeIteratorMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a NodeIterator object.
Notes:

NodeIterators are used to step through a set of nodes, e.g. the set of nodes in a NodeList, the document subtree governed by a particular node, the results of a query, or any other set of nodes. The set of nodes to be iterated is determined by the implementation of the NodeIterator. DOM Level 2 specifies a single NodeIterator implementation for document-order traversal of a document subtree. Instances of these iterators are created by calling createNodeIterator().

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the iterator. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.

root: The root node of the DOM tree
whatToShow: This attribute determines which node types are presented via the iterator.
filter: The filter used to screen nodes .
entityReferenceExpansion: The value of this flag determines whether the children of entity reference nodes

are visible to the iterator. If false, they will be skipped over.

214.7.28 createNotation(Name as String) as XMLNotationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a Notation.
Notes:

name: The name of the notation to instantiate

Returns a XMLNotationMBS that references the newly created XMLNotationMBS node.

214.7.29 createProcessingInstruction(Target as String, Data as string) as XMLCDATASectionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLProcessingInstructionMBS node given the specified name and data strings.
Notes:

target: The target part of the processing instruction.
data: The data for the node.

214.7.30 createTextNode(Text as String) as XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a XMLTextMBS node given the specified string.
Example:

```
Dim doc As New XMLDocumentMBS
Dim element As XMLElementMBS = doc.createElement("test")

Call doc.appendChild element
Call element.appendChild doc.createTextNode("Hello World")

MessageBox doc.toString
```

214.7.31 createTreeWalker(root as XMLNodeMBS = nil, whatToShow as Integer = & hFFFF, entityReferenceExpansion as boolean = false, filter as XMLNodeFilterMBS = nil) as XMLTreeWalkerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a TreeWalker object.
Notes:

TreeWalker objects are used to navigate a document tree or subtree using the view of the document defined by its whatToShow flags and any filters that are defined for the TreeWalker. Any function which performs navigation using a TreeWalker will automatically support any view defined by a TreeWalker.

Omitting nodes from the logical view of a subtree can result in a structure that is substantially different from the same subtree in the complete, unfiltered document. Nodes that are siblings in the TreeWalker view may be children of different, widely separated nodes in the original view. For instance, consider a Filter that skips all nodes except for XMLTextMBS nodes and the root node of a document. In the logical view that results, all text nodes will be siblings and appear as direct children of the root node, no matter how deeply nested the structure of the original document.

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the TreeWalker. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false

root: The root node of the DOM tree
whatToShow: This attribute determines which node types are presented via the tree-walker.
filter: The filter used to screen nodes
entityReferenceExpansion: The value of this flag determines whether the children of entity reference nodes are visible to the tree-walker. If false, they will be skipped over.

214.7.32 ElementsByTagName(TagName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an array of all the XMLElementMBS(s) with a given local name and namespace URI in the order in which they are encountered in a preorder traversal of the XMLDocumentMBS tree.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)

Dim elements() As XMLElementMBS = doc.ElementsByTagName("f")
```

Break

Notes:

TagName: The tag name of the elements to match on. The special value "*" matches all local names.

Returns a new array object containing all the matched XMLElementMBS(s).

214.7.33 ElementsByTagNameNS(namespaceURI as string, localName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns an array of all the XMLElementMBS(s) with a given local name and namespace URI in the order in which they are encountered in a preorder traversal of the XMLDocumentMBS tree.
Notes:

namespaceURI: The namespace URI of the elements to match on. The special value "*" matches all namespaces.
localName: The local name of the elements to match on. The special value "*" matches all local names.

Returns a new array object containing all the matched XMLElementMBS(s).

214.7.34 evaluate(expression as String, contextNode as XMLNodeMBS, type as Integer) as XMLXPathResultMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Evaluates an XPath expression string and returns a result of the specified type if possible.
Notes:

expression: The XPath expression string to be parsed and evaluated.
contextNode: The context is context node for the evaluation of this XPath expression. Must be owned by the same document and must be a XMLDocumentMBS, XMLElementMBS, XMLAttributeMBS, XMLTextMBS, XMLCDATASectionMBS, DOMComment, XMLProcessingInstructionMBS, or XPathNamespace node.
type: If a specific type is specified, then the result will be returned as the corresponding type. This must be one of the codes of the XMLXPathResultMBS clas constants.

Retruns result of the evaluation of the XPath expression as XMLXPathResultMBS class.

Raises exception if the expression is not legal according to the rules of the DOMXPathEvaluator.

Raises exception if the result cannot be converted to return the specified type.

214.7.35 getElementById(elementId as String) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the XMLElementMBS whose ID is given by elementId.
Example:

```
Dim doc As New XMLDocumentMBS("<doc><test id=""1""">abc</test><test id=""2""">def</test></doc>")

// we mark this id attribute to be the id
Dim d1 As XMLElementMBS = doc.DocumentElement.FirstElementChild
Call d1.SetIdAttribute("id", True)

// now search for it
Dim element1 As XMLElementMBS = doc.getElementById("1")
Dim element2 As XMLElementMBS = doc.getElementById("2") // not marked!

Break
```

Notes:

If no such element exists, returns nil.
Behavior is not defined if more than one element has this ID. The DOM implementation must have information that says which attributes are of type ID. Attributes with the name "ID" are not of type ID unless so defined. Implementations that do not know whether attributes are of type ID or not are expected to return nil.

elementId: The unique id value for an element.

Returns the matching element.

214.7.36 importNode(node as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Imports a node from another document by cloning it to the current document.
Notes: You don't need to do this manually as the plugin will do it for you in methods as appendChild, replaceChild and insertBefore.

214.7.37 IterateElementsByTagName(TagName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Example:

```
Dim doc As New XMLDocumentMBS("<doc><test id=""1"">abc</test><test id=""2"">def</test></doc>")

For Each e As XMLElementMBS In doc.IterateElementsByTagName("test")
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

214.7.38 IterateElementsByTagNameNS(namespaceURI as string, localName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Notes: For use with For Each Loops in Xojo.

214.7.39 LoadXml(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads XML from data.
Notes: Replaces current document with the new one.
See also:

- 214.7.40 LoadXml(data as String) 28566
- 214.7.41 LoadXml(file as FolderItem) 28567

214.7.40 LoadXml(data as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml from data.
Notes: Replaces current document with the new one.
See also:

- 214.7.39 LoadXml(data as MemoryBlock) 28566
- 214.7.41 LoadXml(file as FolderItem) 28567

214.7.41 LoadXml(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml file.
Notes:

Replaces current document with the new one.
This may reference other files in same folder.
See also:

- 214.7.39 LoadXml(data as MemoryBlock) 28566
- 214.7.40 LoadXml(data as String) 28566

214.7.42 LoadXmlMT(data as MemoryBlock)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads XML from data.
Notes:

Replaces current document with the new one.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 214.7.43 LoadXmlMT(data as String) 28567
- 214.7.44 LoadXmlMT(file as FolderItem) 28568

214.7.43 LoadXmlMT(data as String)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml from data.
Notes:

Replaces current document with the new one.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 214.7.42 LoadXmlMT(data as MemoryBlock) 28567
- 214.7.44 LoadXmlMT(file as FolderItem) 28568

214.7.44 LoadXmlMT(file as FolderItem)

MBS XML Plugin, Plugin Version: 22.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Loads xml file.
Notes:

Replaces current document with the new one.
This may reference other files in same folder.

The work is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
See also:

- 214.7.42 LoadXmlMT(data as MemoryBlock) 28567
- 214.7.43 LoadXmlMT(data as String) 28567

214.7.45 NodeFromHandle(Handle as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates a node (or subclass) object based on a handle.
Notes: Raises exception if this handle doesn't belong to this document.

214.7.46 normalizeDocument

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Normalizes the document.
Notes:

This method acts as if the document was going through a save and load cycle, putting the document in a "normal" form. The actual result depends on the features being set. See XMLConfigurationMBS for details.

Noticeably this method normalizes XMLTextMBS nodes, makes the document "namespace wellformed", according to the algorithm described below in pseudo code, by adding missing namespace declaration attributes and adding or changing namespace prefixes, updates the replacement tree of XMLEntityReferenceMBS nodes, normalizes attribute values, etc.
Mutation events, when supported, are generated to reflect the changes occurring on the document. Note that this is a partial implementation. Not all the required features are implemented. Currently XMLAttributeMBS and XMLTextMBS nodes are normalized. Features to remove XMLCommentMBS and XMLCDATASectionMBS work.

214.7.47 renameNode(node as XMLNodeMBS, namespaceURI as String, qualifiedName as String) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.5, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Rename an existing node.
Notes:

When possible this simply changes the name of the given node, otherwise this creates a new node with the specified name and replaces the existing node with the new node as described below. This only applies to nodes of type ELEMENT_NODE and ATTRIBUTE_NODE.

When a new node is created, the following operations are performed: the new node is created, any registered event listener is registered on the new node, any user data attached to the old node is removed from that node, the old node is removed from its parent if it has one, the children are moved to the new node, if the renamed node is an XMLElementMBS its attributes are moved to the new node, the new node is inserted at the position the old node used to have in its parent's child nodes list if it has one, the user data that was attached to the old node is attach to the new node, the user data event NODE_RENAMED is fired.

When the node being renamed is an XMLAttributeMBS that is attached to an XMLElementMBS, the node is first removed from the XMLElementMBS attributes map. Then, once renamed, either by modifying the existing node or creating a new one as described above, it is put back.

node: The node to rename.
namespaceURI: The new namespaceURI.
qualifiedName: The new qualified name.

214.7.48 Properties

214.7.49 DocType as XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the document type.
Notes:

The Document Type Declaration (see XMLDocumentTypeMBS) associated with this document. For XML documents without a document type declaration this returns nil.
The DOM Level 2 does not support editing the Document Type Declaration. docType cannot be altered in any way, including through the use of methods inherited from the XMLNodeMBS interface, such as insertNode or removeNode.
(Read only property)

214.7.50 DocumentElement as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a convenience attribute that allows direct access to the child node that is the root element of the document.
Notes: (Read only property)

214.7.51 DocumentURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The location of the document or "" if undefined.
Notes:

Beware that when the XMLDocumentMBS supports the feature "HTML" , the href attribute of the HTML BASE element takes precedence over this attribute.
(Read and Write property)

214.7.52 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The configuration used when normalizeDocument is invoked.
Notes: (Read only property)

214.7.53 InputEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input encoding.
Example:

```
Dim xml As String
```

```
xml = "<?xml version='1.0' encoding='ISO-8859-1'?>" +_
EndOfLine.UNIX +_
"<doc><test>tr√§nen√ºberstr√mt</test></doc>"

// make sure the variable has the encoding declared above!
xml = ConvertEncoding(xml, encodings.ISOLatin1)

Dim doc As New XMLDocumentMBS(xml)

MessageBox doc.InputEncoding
```

Notes:

An attribute specifying the encoding used for this document at the time of the parsing. This is "" when it is not known, such as when the XMLDocumentMBS was created in memory.
(Read only property)

214.7.54 StrictErrorChecking as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether errors checking is enforced or not
Notes:

An attribute specifying whether errors checking is enforced or not. When set to false, the implementation is free to not test every possible error case normally defined on DOM operations, and not raise any XMLExceptionMBS. In case of error, the behavior is undefined. This attribute is true by defaults.
(Read and Write property)

214.7.55 XmlEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the XML declaration, the encoding of this document.
Notes:

This is "" when unspecified or when it is not known, such as when the XMLDocumentMBS was created in memory.
(Read only property)

214.7.56 XmlStandalone as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether this is a standalone document.
Notes:

An attribute specifying, as part of the XML declaration, whether this document is standalone. This is false when unspecified.
(Read and Write property)

214.7.57 XmlVersion as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the XML declaration, the version number of this document.
Notes:

This is "" when unspecified.
(Read and Write property)

214.7.58 Constants

214.7.59 ShowAll = & hFFFF

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show all XMLNodeMBS(s).

214.7.60 ShowAttribute = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLAttributeMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with an attribute node as its root; in this case, it means that the attribute node will appear in the first position of the iteration or traversal. Since attributes are never children of other nodes, they do not appear when traversing over the document tree.

214.7.61 ShowCDataSection = 8

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLCDATASectionMBS nodes.

214.7.62 ShowComment = & h80

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show DOMComment nodes.

214.7.63 ShowDocument = & h100

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLDocumentMBS nodes.

214.7.64 ShowDocumentFragment = & h400

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLDocumentFragmentMBS nodes.

214.7.65 ShowDocumentType = & h200

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLDocumentTypeMBS nodes.

214.7.66 ShowElement = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLElementMBS nodes.

214.7.67 ShowEntity = & h20

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLEntityMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with an XMLEntityMBS node as its root; in this case, it means that the XMLEntityMBS node will appear in the first position of the traversal. Since entities are not part of the document tree, they do not appear when traversing over the document tree.

214.7.68 ShowEntityReference = & h10

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLEntityReferenceMBS nodes.

214.7.69 ShowNotation = & h800

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLNotationMBS nodes. This is meaningful only when creating an XMLNodeIteratorMBS or XMLTreeWalkerMBS with a XMLNotationMBS node as its root; in this case, it means that the XMLNotationMBS node will appear in the first position of the traversal. Since notations are not part of the document tree, they do not appear when traversing over the document tree.

214.7.70 ShowProcessingInstruction = & h40

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLProcessingInstructionMBS nodes.

214.7.71 ShowText = 4

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants for what to show parameter.
Notes: Show XMLTextMBS nodes.

214.8 class XMLDocumentTypeMBS

214.8.1 class XMLDocumentTypeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a document type.
Notes:

Each XMLDocumentMBS has a doctype attribute whose value is either nil or a XMLDocumentTypeMBS object. The XMLDocumentTypeMBS interface in the DOM Core provides an interface to the list of entities that are defined for the document, and little else because the effect of namespaces and the various XML schema efforts on DTD representation are not clearly understood as of this writing.

The DOM Level 2 doesn't support editing XMLDocumentTypeMBS nodes.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.8.2 Methods

214.8.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.8.4 Entities as XMLEntityMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: A array containing the general entities, both external and internal, declared in the DTD. Parameter entities are not contained.
Notes:

Duplicates are discarded. For example in: <!DOCTYPE
ex SYSTEM "ex.dtd" [<!ENTITY foo "foo"><!ENTITY bar
"bar"><!ENTITY bar "bar2"><!ENTITY % baz "baz">
] ><ex/>

the interface provides access to foo and the first declaration of bar but not the second declaration of bar or baz. Every node in this map also implements the XMLEntityMBS interface.

The DOM Level 2 does not support editing entities, therefore entities cannot be altered in any way.

214.8.5 Notations as XMLNotationMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries array of notations.
Notes:

A named node map containing the notations declared in the DTD. Duplicates are discarded. Every node in this map also implements the XMLNotationMBS interface.

The DOM Level 2 does not support editing notations, therefore notations cannot be altered in any way.

214.8.6 Properties

214.8.7 InternalSubset as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal subset as a string, or empty if there is none.
Notes:

This is does not contain the delimiting square brackets.The actual content returned depends on how much information is available to the implementation. This may vary depending on various parameters, including the XML processor used to build the document.
(Read only property)

214.8.8 Name as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of DTD; i.e., the name immediately following the DOCTYPE keyword.
Notes: (Read only property)

214.8.9 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the public identifier of the external subset.
Notes: (Read only property)

214.8.10 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the system identifier of the external subset.
Notes: (Read only property)

214.9 class XMLDOMParserMBS

214.9.1 class XMLDOMParserMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class to customize the parser and run it.
Example:

```
Dim xml As String = "<test id=""123""></test>"
Dim parser As New XMLDOMParserMBS

Parser.ExitOnFirstFatalError = True
parser.DoNamespaces = True
parser.DoSchema = true

// parse it
Dim doc As XMLDocumentMBS = Parser.Parse(xml)
// and make a string:
Dim s As String = doc.toString

Break
```

Notes:

This class wraps XercesDOMParser.

This class implements the Document Object Model (DOM) interface. It should be used by applications which choose to parse and process the XML document using the DOM api's. This implementation also allows the applications to install an error and an entity handler (useful extensions to the DOM specification).

It can be used to instantiate a validating or non-validating parser, by setting a member flag.

214.9.6 Methods

214.9.7 Constructor

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

214.9.8 Parse(data as MemoryBlock) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a XML in MemoryBlock.
Notes: Returns new document on success.
See also:

- 214.9.9 Parse(data as string) as XMLDocumentMBS 28579

214.9.9 Parse(data as string) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a XML string.
Example:

```
Dim xml As String = "<test id=""123""></test>"
Dim parser As New XMLDOMParserMBS

// parse it
Dim doc As XMLDocumentMBS = Parser.Parse(xml)
// and make a string:
```

```
Dim s As String = doc.toString

Break
```

Notes: Returns new document on success.
See also:

- 214.9.8 Parse(data as MemoryBlock) as XMLDocumentMBS 28579

214.9.10 Reset

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reset the parser.
Notes: This method resets the state of the DOM driver and makes it ready for a fresh parse run.

214.9.11 Properties

214.9.12 CreateEntityReferenceNodes as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'include entity references' flag.
Notes:

This method allows the user to specify whether the parser should create entity reference nodes in the DOM tree being produced. When the 'create' flag is true, the parser will create EntityReference nodes in the DOM tree.
The EntityReference nodes and their child nodes will be read-only.
When the 'create' flag is false, no EntityReference nodes will be created.

The replacement text of the entity is included in either case, either as a child of the Entity Reference node or in place at the location of the reference.

The default value is 'true'.
(Read and Write property)

214.9.13 DoNamespaces as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'do namespaces' flag
Notes:

This method allows users to enable or disable the parser's namespace processing. When set to true, parser starts enforcing all the constraints and rules specified by the NameSpace specification.

The parser's default state is: false.
(Read and Write property)

214.9.14 DoSchema as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'do schema' flag.
Notes:

This method allows users to enable or disable the parser's schema processing. When set to false, parser will not process any schema found.

The parser's default state is: false.

Note: If set to true, namespace processing must also be turned on.
(Read and Write property)

214.9.15 ExitOnFirstFatalError as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'exit on first error' flag.
Notes:

This method allows users to set the parser's behaviour when it encounters the first fatal error. If set to true, the parser will exit at the first fatal error. If false, then it will report the error and continue processing.

The default value is 'true' and the parser exits on the first fatal error.
(Read and Write property)

214.9.16 ExternalSchemaLocation as String

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows the user to specify a list of schemas to use.
Notes:

If the targetNamespace of a schema specified using this method matches the targetNamespace of a schema occurring in the instance document in the schemaLocation attribute, or if the targetNamespace matches the namespace attribute of the "import" element, the schema specified by the user using this method will be used (i.e., the schemaLocation attribute in the instance document or on the "import" element will be effectively ignored).

The syntax is the same as for schemaLocation attributes in instance documents: e.g, "http://www.example.com file_name.xsd". The user can specify more than one XML Schema in the list.
(Read and Write property)

214.9.17 GenerateSyntheticAnnotations as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'generate synthetic annotations' flag.
Notes:

A synthetic XSAnnotation is created when a schema component has non-schema attributes but has no child annotations so that the non-schema attributes can be recovered under PSVI.
(Read and Write property)

214.9.18 Handle as Integer

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.9.19 IdentityConstraintChecking as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows users to enable or disable the parser's identity constraint checks.
Notes:

By default, the parser does identity constraint checks.
The default value is true.</p>
(Read and Write property)

214.9.20 IncludeIgnorableWhitespace as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Set the 'include ignorable whitespace' flag
Notes:

This method allows the user to specify whether a validating parser should include ignorable whitespaces as text nodes. It has no effect on non-validating parsers which always include non-markup text.
When set to true (also the default), ignorable whitespaces will be added to the DOM tree as text nodes. The method DOMText.isIgnorableWhitespace() will return true for those text
nodes only.
When set to false, all ignorable whitespace will be discarded and no text node is added to the DOM tree. Note: applications intended to process the "xml:space" attribute should not set this flag to false.
And this flag also overrides any schema datateye whitespace facets, that is, all ignorable whitespace will be discarded even though 'preserve' is set in schema datatype whitespace facets.
(Read and Write property)

214.9.21 Threaded as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether to run Parse threaded.
Notes:

If true, the parsing is performed on a preemptive thread, so this function does not block the application and can yield time to other Xojo threads. Must be called in a Xojo thread to enjoy benefits. If called in main thread will block, but keep other background threads running.
(Read only property)

214.9.22 ValidateAnnotations as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The 'validlate annotations' flag.
Notes:

The value for specifying whether Annotations should be validated or not.
(Read and Write property)

214.9.23 ValidationConstraintFatal as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parser's behaviour when it encounters a validation constraint error.
Notes:

If set to true, and the the parser will treat validation error as fatal and will exit depends on the state of "getExitOnFirstFatalError". If false, then it will report the error and continue processing.

Note: setting this true does not mean the validation error will be printed with the word "Fatal Error". It is still printed as "Error", but the parser will exit if "setExitOnFirstFatalError" is set to true.
The default value is 'false'.
(Read and Write property)

214.9.24 ValidationSchemaFullChecking as Boolean

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method allows the user to turn full Schema constraint checking on/off.
Notes:

Only takes effect if Schema validation is enabled.
If turned off, partial constraint checking is done.

Full schema constraint checking includes those checking that may be time-consuming or memory intensive. Currently, particle unique attribution constraint checking and particle derivation restriction checking are controlled by this option.

The parser's default state is: false.
(Read and Write property)

214.9.25 ValidationScheme as Integer

MBS XML Plugin, Plugin Version: 23.0, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The validation scheme to be used by this parser.
Notes:

The value is one of the ValSchemes enumerated values defined by this class:

ValidateNever	turn off validation
ValidateAlways	turn on validation
ValidateAuto	turn on validation if any internal/external DTD subset have been seen

The parser's default state is: ValidateNever

(Read and Write property)

214.9.26 Constants

214.9.27 ValidateAlways = 1

MBS XML Plugin, Plugin Version: 23.0.

Function: One of the validation setting constants.
Notes: The parser will always report validation errors.

214.9.28 ValidateAuto = 2

MBS XML Plugin, Plugin Version: 23.0.

Function: One of the validation setting constants.
Notes: The parser will report validation errors only if a grammar is specified.

214.9.29 ValidateNever = 0

MBS XML Plugin, Plugin Version: 23.0.

Function: One of the validation setting constants.
Notes: Do not report validation errors.

214.10 class XMLElementMBS

214.10.1 class XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a XML element.
Notes:

By far the vast majority of objects (apart from text) that authors encounter when traversing a document are XMLElementMBS nodes.

Assume the following XML document:

<elementExample id="demo">
<subelement1/>
<subelement2><subsubelement/></subelement2>
</elementExample>

When represented using DOM, the top node is an XMLElementMBS node for "elementExample", which contains two child XMLElementMBS nodes, one for "subelement1" and one for "subelement2". "subelement1" contains no child nodes.

Elements may have attributes associated with them; since the XMLElementMBS interface inherits from XMLNodeMBS, the generic XMLNodeMBS interface method getAttributes may be used to retrieve the set of all attributes for an element. There are methods on the XMLElementMBS interface to retrieve either an XMLAttributeMBS object by name or an attribute value by name. In XML, where an attribute value may contain entity references, an XMLAttributeMBS object should be retrieved to examine the possibly fairly complex sub-tree representing the attribute value. On the other hand, in HTML, where all attributes have simple string values, methods to directly access an attribute value can safely be used as a convenience.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.10.6 Methods

214.10.7 AttributeNode(Name as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an XMLAttributeMBS node by name.
Notes:

name: The name (nodeName) of the attribute to retrieve.

The XMLAttributeMBS node with the specified name (nodeName) or null if there is no such attribute.

214.10.8 AttributeNodeNS(namespaceURI as string, localName as String) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an XMLAttributeMBS node by local name and namespace URI.
Notes:

namespaceURI: The namespace URI of the attribute to retrieve.
localName: The local name of the attribute to retrieve.

The XMLAttributeMBS node with the specified attribute local name and namespace URI or nil if there is no such attribute.

214.10.9 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.10.10 Element(Index as Integer) as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries element with given index.
Notes: Returns nil if index is out of index.

214.10.11 ElementsByTagName(TagName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a DOMNodeList of all descendant elements with a given tag name, in the order in which they would be encountered in a preorder traversal of the XMLElementMBS tree.
Notes:

name: The name of the tag to match on. The special value "*" matches all tags.

A list of matching XMLElementMBS nodes.

214.10.12 ElementsByTagNameNS(namespaceURI as string, localName as String) as XMLElementMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a nodes of all the DOMElements with a given local name and namespace URI in the order in which they would be encountered in a preorder traversal of the XMLDocumentMBS tree, starting from this node.
Notes:

namespaceURI: The namespace URI of the elements to match on. The special value "*" matches all namespaces.
localName: The local name of the elements to match on. The special value "*" matches all local names.

214.10.13 HasAttribute(Name as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether an attribute exists.
Notes:

Returns true when an attribute with a given name is specified on this element or has a default value, false otherwise.

name: The name of the attribute to look for.

Returns true if an attribute with the given name is specified on this element or has a default value, false otherwise.

214.10.14 HasAttributeNS(namespaceURI as string, localName as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Whether an attribute exists.
Notes:

Returns true when an attribute with a given local name and namespace URI is specified on this element or has a default value, false otherwise.

namespaceURI: The namespace URI of the attribute to look for.
localName: The local name of the attribute to look for.
true: if an attribute with the given local name and namespace URI is specified or has a default value on this element, false otherwise.

214.10.15 IterateElements as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements.
Example:

```
Dim doc As New XMLDocumentMBS("<doc><other>abc</other><test>def</test></doc>")

Dim root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateElements
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

214.10.16 IterateElementsByTagName(TagName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Example:

```
Dim doc As New XMLDocumentMBS("<doc><test id=""1"">abc</test><test id=""2"">def</test></doc>")

Dim root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateElementsByTagName("test")
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

214.10.17 IterateElementsByTagNameNS(namespaceURI as string, localName as String) as XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the elements with matching tag name.
Notes: For use with For Each Loops in Xojo.

214.10.18 RemoveAttribute(Name as String)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes an attribute by name.
Example:

```
Dim xml As String = "<test>test</test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

DocumentElement.AttributeValue("a") = "123"

MessageBox DocumentElement.toString

DocumentElement.RemoveAttribute("a")

MessageBox DocumentElement.toString
```

Notes:

If the removed attribute is known to have a default value, an attribute immediately appears containing the default value as well as the corresponding namespace URI, local name, and prefix when applicable.

To remove an attribute by local name and namespace URI, use the removeAttributeNS method.

214.10.19 RemoveAttributeNode(Node as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the specified attribute node.
Notes: If the removed XMLAttributeMBS has a default value it is immediately replaced. The replacing attribute has the same namespace URI and local name, as well as the original prefix, when applicable.

214.10.20 RemoveAttributeNS(namespaceURI as string, localName as string)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes an attribute by local name and namespace URI.
Notes:

If the removed attribute has a default value it is immediately replaced. The replacing attribute has the same namespace URI and local name, as well as the original prefix.

namespaceURI: The namespace URI of the attribute to remove.
localName: The local name of the attribute to remove.

214.10.21 SetAttributeNode(AttributeNode as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a new attribute.
Notes:

If an attribute with that name (nodeName) is already present in the element, it is replaced by the new one.
AttributeNode: The XMLAttributeMBS node to add to the attribute list.
If the AttributeNode attribute replaces an existing attribute, the replaced XMLAttributeMBS node is returned, otherwise null is returned.

If the new attribute is from another document, we clone it first.

214.10.22 SetAttributeNodeNS(AttributeNode as XMLAttributeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds a new attribute.
Notes:

If an attribute with that local name and namespace URI is already present in the element, it is replaced by the new one.

AttributeNode: The XMLAttributeMBS node to add to the attribute list.
If the newAttr attribute replaces an existing attribute with the same local name and namespace URI, the replaced XMLAttributeMBS node is returned, otherwise nil is returned.

If the new attribute is from another document, we clone it first.

214.10.23 SetIdAttribute(name as string, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets ID attribute.
Notes:

If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of XMLAttributeMBS::isId and the behavior of ElementById in XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the SchemaTypeInfo XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the parameter isId to undeclare an attribute for being a user-determined ID attribute. To specify an XMLAttributeMBS by local name and namespace URI, use the setIdAttributeNS method.

name: The name of the XMLAttributeMBS.
isId: Whether the attribute is of type ID.

214.10.24 SetIdAttributeNode(idAttr as XMLAttributeMBS, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the id attribute node.
Notes:

If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of isId of XMLAttributeMBS and the behavior of getElementById of XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the SchemaTypeInfo of XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for

the parameter isId to undeclare an attribute for being a user-determined ID attribute.

idAttr: The XMLAttributeMBS node.
isId: Whether the attribute is of type ID.

If the new attribute is from another document, we clone it first.

214.10.25 SetIdAttributeNS(namespaceURI as string, localName as string, isID as boolean)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets id attribute.
Notes:

If the parameter isId is true, this method declares the specified attribute to be a user-determined ID attribute. This affects the value of isId of XMLAttributeMBS and the behavior of getElementById of XMLDocumentMBS, but does not change any schema that may be in use, in particular this does not affect the getSchemaTypeInfo of XMLAttributeMBS of the specified XMLAttributeMBS node. Use the value false for the parameter isId to undeclare an attribute for being a user-determined ID attribute.

namespaceURI: The namespace URI of the XMLAttributeMBS.
localName: The local name of the XMLAttributeMBS.
isId: Whether the attribute is of type ID.

214.10.26 Properties

214.10.27 ChildElementCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of child nodes that are of type XMLElementMBS.
Notes:

Note: the count is computed every time this function is invoked

The number of XMLElementMBS objects that are direct children of this object (nested elements are not counted), or 0 if there is none.
(Read only property)

214.10.28 FirstElementChild as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The first child of type XMLElementMBS.
Notes:

The XMLElementMBS object that is the first element node among the child nodes of this node, or nil if there is none.
(Read only property)

214.10.29 LastElementChild as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The last child of type XMLElementMBS.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements backwards, skips e.g. text nodes and comments
Dim node As XMLElementMBS = DocumentElement.LastElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousElementSibling
// loop ends when there is no next one
Wend
```

Notes:

The XMLElementMBS object that is the last element node among the child nodes of this node, or nil if there is none.
(Read only property)

214.10.30 NextElementSibling as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The next sibling node of type XMLElementMBS.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements skips e.g. text nodes and comments
Dim node As XMLElementMBS = DocumentElement.FirstElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextElementSibling
// loop ends when there is no next one
Wend
```

Notes:

The XMLElementMBS object that is the next sibling element node in document order, or nil if there is none. (Read only property)

214.10.31 PreviousElementSibling as XMLElementMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The previous sibling node of type XMLElementMBS.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

// looping over elements backwards, skips e.g. text nodes and comments
Dim node As XMLElementMBS = DocumentElement.LastElementChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousElementSibling
// loop ends when there is no next one
Wend
```

Notes:

The XMLElementMBS object that is the previous sibling element node in document order, or nil if there is none.

(Read only property)

214.10.32 SchemaTypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the type information associated with this element.
Notes: (Read only property)

214.10.33 TagName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of the element.
Notes:

For example, in: <elementExample id="demo">... </elementExample>, tagName has the value "elementExample". Note that this is case-preserving in XML, as are all of the operations of the DOM.
(Read only property)

214.10.34 AttributeValue(Name as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an attribute value by name.
Example:

```
Dim doc As New XMLDocumentMBS
Dim node As XMLElementMBS = doc.createElement("Hello")

node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

Dim attrs() As XMLAttributeMBS = node.AttributeNodes
For Each a As XMLAttributeMBS In attrs
MessageBox a.Name+": "+a.Value
Next
```

Notes:

name: The name of the attribute to retrieve.
The XMLAttributeMBS value as a string, or the empty string if that attribute does not have a specified or

default value.

If assigned, adds/sets a new attribute.
If an attribute with that name is already present in the element, its value is changed to be that of the value parameter. This value is a simple string, it is not parsed as it is being set. So any markup (such as syntax to be recognized as an entity reference) is treated as literal text, and needs to be appropriately escaped by the implementation when it is written out. In order to assign an attribute value that contains entity references, the user must create an XMLAttributeMBS node plus any XMLTextMBS and XMLEntityReferenceMBS nodes, build the appropriate subtree, and use setAttributeNode to assign it as the value of an attribute.
(Read and Write computed property)

214.10.35 AttributeValueNS(namespaceURI as string, localName as string) as string

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Retrieves an attribute value by local name and namespace URI.
Notes:

namespaceURI The namespace URI of the attribute to retrieve.
localName The local name of the attribute to retrieve.

Returns the XMLAttributeMBS value as a string, or an "" if that attribute does not have a specified or default value.

Adds a new attribute when assigned.
If an attribute with the same local name and namespace URI is already present on the element, its prefix is changed to be the prefix part of the qualifiedName, and its value is changed to be the value parameter. This value is a simple string, it is not parsed as it is being set. So any markup (such as syntax to be recognized as an entity reference) is treated as literal text, and needs to be appropriately escaped by the implementation when it is written out. In order to assign an attribute value that contains entity references, the user must create an XMLAttributeMBS node plus any XMLTextMBS and XMLEntityReferenceMBS nodes, build the appropriate subtree, and use setAttributeNodeNS or setAttributeNode to assign it as the value of an attribute.

namespaceURI: The namespace URI of the attribute to create or alter.
qualifiedName: The qualified name of the attribute to create or alter.
value: The value to set in string form.
(Read and Write computed property)

214.11 class XMLEntityMBS

214.11.1 class XMLEntityMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents an entity, either parsed or unparsed, in an XML document.
Notes:

Note that this models the entity itself not the entity declaration. XMLEntityMBS declaration modeling has been left for a later Level of the DOM specification.
The nodeName attribute that is inherited from XMLNodeMBS contains the name of the entity.
An XML processor may choose to completely expand entities before the structure model is passed to the DOM; in this case there will be no XMLEntityReferenceMBS nodes in the document tree.
XML does not mandate that a non-validating XML processor read and process entity declarations made in the external subset or declared in external parameter entities. This means that parsed entities declared in the external subset need not be expanded by some classes of applications, and that the replacement value of the entity may not be available. When the replacement value is available, the corresponding XMLEntityMBS node's child list represents the structure of that replacement text. Otherwise, the child list is empty.
The DOM Level 2 does not support editing XMLEntityMBS nodes; if a user wants to make changes to the contents of an XMLEntityMBS, every related XMLEntityReferenceMBS node has to be replaced in the structure model by a clone of the XMLEntityMBS's contents, and then the desired changes must be made to each of those clones instead. XMLEntityMBS nodes and all their descendants are readonly.
An XMLEntityMBS node does not have any parent.If the entity contains an unbound namespace prefix, the namespaceURI of the corresponding node in the XMLEntityMBS node subtree is null. The same is true for XMLEntityReferenceMBS nodes that refer to this entity, when they are created using the createEntityReference method of the XMLDocumentMBS interface. The DOM Level 2 does not support any mechanism to resolve namespace prefixes.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.11.2 Methods

214.11.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.11.4 Properties

214.11.5 InputEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying the encoding used for this entity at the time of parsing, when it is an external parsed entity.
Notes:

This is empty if it an entity from the internal subset or if it is not known.
(Read only property)

214.11.6 NotationName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: For unparsed entities, the name of the notation for the entity.
Notes:

For parsed entities, this is empty.
(Read only property)

214.11.7 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The public identifier associated with the entity, if specified.
Notes:

If the public identifier was not specified, this is empty.
(Read only property)

214.11.8 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier associated with the entity, if specified.
Notes:

If the system identifier was not specified, this is empty.
(Read only property)

214.11.9 XmlEncoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the text declaration, the encoding of this entity, when it is an external parsed entity.

Notes:

This is empty otherwise.
(Read only property)

214.11.10 XmlVersion as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: An attribute specifying, as part of the text declaration, the version number of this entity, when it is an external parsed entity.
Notes:

This is empty otherwise.
(Read only property)

214.12 class XMLEntityReferenceMBS

214.12.1 class XMLEntityReferenceMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an entity reference.
Notes:

XMLEntityReferenceMBS objects may be inserted into the structure model when an entity reference is in the source document, or when the user wishes to insert an entity reference. Note that character references and references to predefined entities are considered to be expanded by the HTML or XML processor so that characters are represented by their Unicode equivalent rather than by an entity reference. Moreover, the XML processor may completely expand references to entities while building the structure model, instead of providing XMLEntityReferenceMBS objects. If it does provide such objects, then for a given XMLEntityReferenceMBS node, it may be that there is no XMLEntityMBS node representing the referenced entity. If such an XMLEntityMBS exists, then the subtree of the XMLEntityReferenceMBS node is in general a copy of the XMLEntityMBS node subtree. However, this may not be true when an entity contains an unbound namespace prefix. In such a case, because the namespace prefix resolution depends on where the entity reference is, the descendants of the XMLEntityReferenceMBS node may be bound to different namespace URIs.
As for XMLEntityMBS nodes, XMLEntityReferenceMBS nodes and all their descendants are readonly.
Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.12.2 Methods

214.12.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.13 class XMLExceptionMBS

214.13.1 class XMLExceptionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for exceptions in the XML world.
Notes: Subclass of the RuntimeException class.

214.14 class XMLInputMBS

214.14.1 class XMLInputMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents a single input source for an XML entity.
Example:

```
Dim xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Dim Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Dim parser As New XMLParserMBS
Dim doc As XMLDocumentMBS = parser.parse(Input)

// inspect document in debugger
MessageBox doc.toString
```

Notes:

This interface allows an application to encapsulate information about an input source in a single object, which may include a public identifier, a system identifier, a byte stream (possibly with a specified encoding), and/or a character stream.

There are two places that the application will deliver this input source to the parser: as the argument to the parse method, or as the return value of the XMLResourceResolverMBS.resolveResource method.

The XMLParserMBS will use the XMLInputMBS object to determine how to read XML input. If there is a character stream available, the parser will read that stream directly; if not, the parser will use a byte stream, if available; if neither a character stream nor a byte stream is available, the parser will attempt to open a URI connection to the resource identified by the system identifier.

A XMLInputMBS object belongs to the application: the parser shall never modify it in any way (it may modify a copy if necessary).

214.14.2 Methods

214.14.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

214.14.4 Properties

214.14.5 BaseURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The base URI to be used for resolving relative URIs to absolute URIs.
Notes:

If the baseURI is itself a relative URI, the behavior is implementation dependent.
(Read and Write property)

214.14.6 Encoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The encoding which will be required for use with the XML text read via a stream opened by this input source.
Example:

```
Dim Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = "<test id=""123""></test>"
```

Notes:

This is usually not set, allowing the encoding to be sensed in the usual XML way. However, in some cases, the encoding in the file is known to be incorrect because of intermediate transcoding, for instance encapsulation within a MIME document.
(Read and Write property)

214.14.7 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.14.8 InputMemory as MemoryBlock

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input memoryblock.
Notes: (Read and Write property)

214.14.9 InputString as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The input string.
Example:

```
Dim Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = "<test id=""123""></test>"
```

Notes: (Read and Write property)

214.14.10 IssueFatalErrorIfNotFound as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Indicates if the parser should issue fatal error if this input source is not found.
Notes:

If set to false, the parser issue warning message instead.
Default: true
(Read and Write property)

214.14.11 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The public identifier for this input source.
Notes:

The public identifier is always optional: if the application writer includes one, it will be provided as part of the location information.
(Read and Write property)

214.14.12 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier for this input source.
Notes:

The system id is always required. The public id may be used to map to another system id, but the system id must always be present as a fall back.
If the system ID is a URL, it must be fully resolved.
(Read and Write property)

214.15 class XMLIterateAttributeNodesMBS

214.15.1 class XMLIterateAttributeNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the iterator over attribute nodes.
Example:

```
Dim doc As New XMLDocumentMBS("<doc id=""123"" value=""test""></doc>")

Dim root As XMLElementMBS = doc.DocumentElement
For Each e As XMLAttributeMBS In root.IterateAttributeNodes
MessageBox e.Name+": "+e.Value
Next
```

Notes:

Used internally for for each loops.

Requires Xojo 2019r2 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Interfaces: Iterator, Iterable

214.15.2 Methods

214.15.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.15.4 Iterator as Iterator

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the iterator.

214.15.5 MoveNext as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next attribute.
Notes: Returns true on success or false when the iterator has no more elements.

214.15.6 Value as Variant

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.

214.16 class XMLIterateChildNodesMBS

214.16.1 class XMLIterateChildNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the iterator over child nodes.
Example:

```
Dim doc As New XMLDocumentMBS("<doc><test>abc</test><test>def</test></doc>")

Dim root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateChildNodes
MessageBox e.toString
Next
```

Notes:

Used internally for for each loops.

Requires Xojo 2019r2 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Interfaces: Iterator, Iterable

214.16.2 Methods

214.16.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.16.4 Iterator as Iterator

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the iterator.

214.16.5 MoveNext as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next child node.
Notes: Returns true on success or false when the iterator has no more elements.

214.16.6 Value as Variant

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.

214.17 class XMLIterateElementsMBS

214.17.1 class XMLIterateElementsMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for the iterator over elements.
Example:

```
Dim doc As New XMLDocumentMBS("<doc><test id=""1"">abc</test><test id=""2"">def</test></doc>")

For Each e As XMLElementMBS In doc.IterateElementsByTagName("test")
MessageBox e.toString
Next
```

Notes:

Used internally for for each loops.

Requires Xojo 2019r2 or newer.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

Interfaces: Iterator, Iterable

214.17.2 Methods

214.17.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.17.4 Iterator as Iterator

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries the iterator.

214.17.5 MoveNext as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to next element.
Notes: Returns true on success or false when the iterator has no more elements.

214.17.6 Value as Variant

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current value.

214.18 class XMLNodeFilterMBS

214.18.1 class XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Filters are objects that know how to "filter out" nodes.
Notes:

If a XMLNodeIteratorMBS or XMLTreeWalkerMBS is given a XMLNodeFilterMBS, it applies the filter before it returns the next node. If the filter says to accept the node, the traversal logic returns it; otherwise, traversal looks for the next node and pretends that the node that was rejected was not there.

The DOM does not provide any filters. XMLNodeFilterMBS is just an class that users can implement to provide their own filters by filling in the event.

XMLNodeFilterMBSs do not need to know how to traverse from node to node, nor do they need to know anything about the data structure that is being traversed. This makes it very easy to write filters, since the only thing they have to know how to do is evaluate a single node. One filter may be used with a number of different kinds of traversals, encouraging code reuse.

214.18.2 Methods

214.18.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

214.18.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

214.18.5 Events

214.18.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: Test whether a specified node is visible in the logical view of a XMLTreeWalkerMBS or XMLNodeIteratorMBS.
Notes:

This event will be called by the implementation of XMLTreeWalkerMBS and XMLNodeIteratorMBS; it is not normally called directly from user code. (Though you could do so if you wanted to use the same filter to guide your own application logic.)
node: The node to check to see if it passes the filter or not.

A constant to determine whether the node is accepted, rejected, or skipped, as defined above.

214.18.7 Constants

214.18.8 FilterAccept = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter return constants.
Notes: Accept the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will return this node.

214.18.9 FilterReject = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter return constants.
Notes: Reject the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For XMLTreeWalkerMBS, the children of this node will also be rejected. XMLNodeIteratorMBSs treat this as a synonym for FilterSkip.

214.18.10 FilterSkip = 3

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter return constants.
Notes: Skip this single node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For both XMLNodeIteratorMBS and XMLTreeWalkerMBS, the children of this node will still be considered.

214.19 class XMLNodeIteratorMBS

214.19.1 class XMLNodeIteratorMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates a list of nodes.
Notes:

XMLNodeIteratorMBSs are used to step through a set of nodes, e.g. the set of nodes in a DOMNodeList, the document subtree governed by a particular XMLNodeMBS, the results of a query, or any other set of nodes. The set of nodes to be iterated is determined by the implementation of the XMLNodeIteratorMBS. DOM Level 2 specifies a single XMLNodeIteratorMBS implementation for document-order traversal of a document subtree. Instances of these XMLNodeIteratorMBSs are created by calling createNodeIterator(). This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.19.4 Methods

214.19.5 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.19.6 nextNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the next node in the set and advances the position of the XMLNodeIteratorMBS in the set.
Notes:

After a XMLNodeIteratorMBS is created, the first call to nextNode() returns the first node in the set.
The next XMLNodeMBS in the set being iterated over, or null if there are no more members in that set. @exception DOMException INVALID_STATE_ERR: Raised if this method is called after the detach method was invoked.

214.19.7 previousNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the previous node in the set and moves the position of the XMLNodeIteratorMBS backwards in the set.
Notes: The previous XMLNodeMBS in the set being iterated over, or null if there are no more members in that set.

214.19.8 Properties

214.19.9 Current as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The current node.
Notes:

Starts with the root node.
(Read only property)

214.19.10 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The owning document.
Notes: (Read only property)

214.19.11 ExpandEntityReferences as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the expandEntityReferences flag.
Notes:

The value of this flag determines whether the children of entity reference nodes are visible to the XMLNodeIteratorMBS. If false, these children and their descendants will be rejected. Note that this rejection takes precedence over whatToShow and the filter. Also note that this is currently the only situation where XMLNodeIteratorMBSs may reject a complete subtree rather than skipping individual nodes.

To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the XMLNodeIteratorMBS. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.
(Read only property)

214.19.12 Filter as XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLNodeFilterMBS used to screen nodes.
Notes: (Read only property)

214.19.13 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.19.14 Root as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root node of the XMLNodeIteratorMBS, as specified when it was created.
Notes: (Read only property)

214.19.15 WhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return which node types are presented via the iterator.
Notes:

This attribute determines which node types are presented via the XMLNodeIteratorMBS. The available set of constants is defined in the XMLNodeFilterMBS interface. Nodes not accepted by whatToShow will be skipped, but their children may still be considered. Note that this skip takes precedence over the filter, if any.

Default is ShowAll.
(Read only property)

214.20 class XMLNodeMBS

214.20.1 class XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLNodeMBS interface is the primary datatype for the entire Document Object Model.
Notes:

It represents a single node in the document tree. While all objects implementing the XMLNodeMBS interface expose methods for dealing with children, not all objects implementing the XMLNodeMBS interface may have children. For example, XMLTextMBS nodes may not have children, and adding children to such nodes results in a XMLExceptionMBS being raised.

The attributes nodeName, nodeValue and attributes are included as a mechanism to get at node information without casting down to the specific derived interface. In cases where there is no obvious mapping of these attributes for a specific nodeType (e.g., nodeValue for an XMLElementMBS or attributes for a XMLCommentMBS), this returns nil. Note that the specialized interfaces may contain additional and more convenient mechanisms to get and set the relevant information.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.20.6 Methods

214.20.7 appendChild(newChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Adds the node newChild to the end of the list of children of this node.
Notes:

If the newChild is already in the tree, it is first removed.
newChild The node to add. If it is a XMLDocumentFragmentMBS object, the entire contents of the document fragment are moved into the child list of this node.

If the new node is from another document, we clone it first.

Returns the newly added node.

214.20.8 AttributeNode(Index as Integer) as XMLAttributeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries attribute node by index.
Notes: Index is zero based up to AttributeCount-1.

214.20.9 AttributeNodes as XMLAttributeMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries an array with all attributes.
Example:

```
Dim doc As New XMLDocumentMBS
Dim node As XMLElementMBS = doc.createElement("Hello")

// add some attributes
node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"
```

```
// now show them all in message dialogs
Dim attrs() As XMLAttributeMBS = node.AttributeNodes
For Each a As XMLAttributeMBS In attrs
MessageBox a.Name+": "+a.Value
Next
```

Notes: Gets a array containing the attributes of this node (if it is an XMLElementMBS) or null otherwise.

214.20.10 Child(Index as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries child node with given index.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim node As XMLElementMBS = doc.DocumentElement

Dim count As Integer = node.ChildCount
Dim node0 As XMLNodeMBS = node.Child(0)
Dim node1 As XMLNodeMBS = node.Child(1)
Dim node2 As XMLNodeMBS = node.Child(2)
Dim node3 As XMLNodeMBS = node.Child(3)
'Dim node4 As XMLNodeMBS = node.Child(4) // out of bounds exception
Break // see debugger
```

Notes: Index is zero based up to ChildCount-1.

214.20.11 ChildNodes as XMLNodeMBS()

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets a DOMNodeList that contains all children of this node.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

Dim children() As XMLNodeMBS = DocumentElement.ChildNodes
For Each node As XMLNodeMBS In children
MessageBox node.toString
Next
```

Notes:

If there are no children, this is a array containing no nodes.

The array is a static snapshot of the content of the node.

214.20.12 Clone(deep as Boolean) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns a duplicate of this node.
Notes:

Pass true for deep parameter to copy all sub objects as well.

This function serves as a generic copy constructor for nodes.

The duplicate node has no parent (parentNode returns nil.).

Cloning an XMLElementMBS copies all attributes and their values, including those generated by the XML processor to represent defaulted attributes, but this method does not copy any text it contains unless it is a deep clone, since the text is contained in a child XMLTextMBS node. Cloning any other type of node simply returns a copy of this node.
deep If true, recursively clone the subtree under the specified node; if false, clone only the node itself (and its attributes, if it is an XMLElementMBS).

214.20.13 compareDocumentPosition(other as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Compares two nodes for their position in the document.
Notes:

Compares the reference node, i.e. the node on which this method is being called, with a node, i.e. the one passed as a parameter, with regard to their position in the document and according to the document order.

other: The node to compare against this node.

Returns how the given node is positioned relatively to this node.

214.20.14 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.20.15 insertBefore(newChild as XMLNodeMBS, refChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Inserts the node newChild before the existing child node refChild.
Notes:

If refChild is nil, insert newChild at the end of the list of children.

If newChild is a XMLDocumentFragmentMBS object, all of its children are inserted, in the same order, before refChild. If the newChild is already in the tree, it is first removed. Note that a XMLNodeMBS that has never been assigned to refer to an actual node is == nil.
newChild The node to insert.

refChild The reference node, i.e., the node before which the new node must be inserted.

If the new node is from another document, we clone it first.

Returns the new node.

214.20.16 isDefaultNamespace(namespaceURI as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method checks if the specified namespaceURI is the default namespace or not.
Notes:

namespaceURI: The namespace URI to look for.
Returns true if the specified namespaceURI is the default namespace, false otherwise.

214.20.17 isEqualNode(other as XMLNodeMBS) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Tests whether two nodes are equal.

Notes:

This method tests for equality of nodes, not sameness (i.e., whether the two nodes are pointers to the same object) which can be tested with XMLNodeMBS::isSameNode. All nodes that are the same will also be equal, though the reverse may not be true.

Two nodes are equal if and only if the following conditions are satisfied: The two nodes are of the same type.The following string attributes are equal: nodeName, localName, namespaceURI, prefix, nodeValue , baseURI. This is: they are both null, or they have the same length and are character for character identical. The attributes node maps are equal. This is: they are both nil, or they have the same length and for each node that exists in one map there is a node that exists in the other map and is equal, although not necessarily at the same index.The childNodes node lists are equal. This is: they are both nil, or they have the same length and contain equal nodes at the same index. This is true for XMLAttributeMBS nodes as for any other type of node. Note that normalization can affect equality; to avoid this, nodes should be normalized before being compared.

For two XMLDocumentTypeMBS nodes to be equal, the following conditions must also be satisfied: The following string attributes are equal: publicId, systemId, internalSubset. The entities node maps are equal. The notations node maps are equal.

On the other hand, the following do not affect equality: the ownerDocument attribute, the specified attribute for XMLAttributeMBS nodes, the isWhitespaceInElementContent attribute for XMLTextMBS nodes, as well as any user data or event listeners registered on the nodes.

other: The node to compare equality with.
If the nodes, and possibly subtrees are equal, true otherwise false.

214.20.18 isSameNode(other as XMLNodeMBS) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this node is the same node as the given one.
Notes:

This method provides a way to determine whether two XMLNodeMBS references returned by the implementation reference the same object. When two XMLNodeMBS references are references to the same object, even if through a proxy, the references may be used completely interchangeably, such that all attributes have the same values and calling the same DOM method on either reference always has exactly the same effect.

other: The node to test against.

Returns true if the nodes are the same, false otherwise.

214.20.19 IterateAttributeNodes as XMLIterateAttributeNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the attributes.
Example:

```
Dim doc As New XMLDocumentMBS("<doc id=""123"" value=""test""></doc>")

Dim root As XMLElementMBS = doc.DocumentElement
For Each e As XMLAttributeMBS In root.IterateAttributeNodes
MessageBox e.Name+": "+e.Value
Next
```

Notes: For use with For Each Loops in Xojo.

214.20.20 IterateChildNodes as XMLIterateChildNodesMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates over the child nodes.
Example:

```
Dim doc As New XMLDocumentMBS("<doc><test>abc</test><test>def</test></doc>")

Dim root As XMLElementMBS = doc.DocumentElement
For Each e As XMLElementMBS In root.IterateChildNodes
MessageBox e.toString
Next
```

Notes: For use with For Each Loops in Xojo.

214.20.21 lookupNamespaceURI(prefix as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Look up the namespace URI associated to the given prefix, starting from this node.
Notes:

The prefix to look for. If this parameter is null, the method will return the default namespace URI if any.
Returns the associated namespace URI or null if none is found.

214.20.22 lookupPrefix(namespaceURI as String) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Look up the prefix associated to the given namespace URI, starting from this node.
Notes:

The default namespace declarations are ignored by this method.

namespaceURI: The namespace URI to look for.

Returns an associated namespace prefix if found, null if none is found. If more than one prefix are associated to the namespace prefix, the returned namespace prefix is implementation dependent.

214.20.23 Normalize

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Normalizes the node tree.
Notes:

Puts all XMLTextMBS nodes in the full depth of the sub-tree underneath this XMLNodeMBS, including attribute nodes, into a "normal" form where only markup (e.g., tags, comments, processing instructions, CDATA sections, and entity references) separates XMLTextMBS nodes, i.e., there are neither adjacent XMLTextMBS nodes nor empty XMLTextMBS nodes. This can be used to ensure that the DOM view of a document is the same as if it were saved and re-loaded, and is useful when operations (such as XPointer lookups) that depend on a particular document tree structure are to be used.

Note: In cases where the document contains CDATASections, the normalize operation alone may not be sufficient, since XPointers do not differentiate between XMLTextMBS nodes and XMLCDATASectionMBS nodes.

214.20.24 removeChild(Node as XMLNodeMBS)

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Removes the child node indicated by oldChild from the list of children.
Notes: Returns the old node.

214.20.25 replaceChild(newChild as XMLNodeMBS, oldChild as XMLNodeMBS) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Replaces the child node oldChild with newChild in the list of children, and returns the oldChild node.
Notes:

If newChild is a XMLDocumentFragmentMBS object, oldChild is replaced by all of the XMLDocumentFragmentMBS children, which are inserted in the same order.

If the newChild is already in the tree, it is first removed.
newChild The new node to put in the child list.
oldChild The node being replaced in the list.

If the new node is from another document, we clone it first.

Returns the old node.

214.20.26 Properties

214.20.27 AttributeCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of attributes.
Example:

```
Dim doc As New XMLDocumentMBS
Dim node As XMLElementMBS = doc.createElement("Hello")

node.AttributeValue("Hello") = "World"
node.AttributeValue("Value") = "123"
node.AttributeValue("Test") = "Value"

MessageBox node.AttributeCount.ToString // shows 3
```

Notes: (Read only property)

214.20.28 BaseURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The absolute base URI of this node or "" if undefined.
Notes:

This value is computed according to. However, when the XMLDocumentMBS supports the feature "HTML" , the base URI is computed using first the value of the href attribute of the HTML BASE element if any, and the value of the documentURI attribute from the XMLDocumentMBS interface otherwise.

When the node is an XMLElementMBS, a XMLDocumentMBS or a a XMLProcessingInstructionMBS, this attribute represents the properties [base URI] defined in . When the node is a XMLNotationMBS, an XMLEntityMBS, or an XMLEntityReferenceMBS, this attribute represents the properties [declaration base URI] .
(Read only property)

214.20.29 ChildCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Queries number of child nodes.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim node As XMLElementMBS = doc.DocumentElement

MessageBox node.ChildCount.ToString+" Children"
```

Notes: (Read only property)

214.20.30 FirstChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the first child of this node.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

Dim node As XmlNodeMBS = DocumentElement.FirstChild
While node <>Nil
```

```
// show each child
MessageBox node.toString

node = node.NextSibling
// loop ends when there is no next one
Wend
```

Notes:

If there is no such node, this returns nil.
(Read only property)

214.20.31 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.20.32 hasAttributes as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this node (if it is an element) has any attributes.
Notes:

Returns true if this node has any attributes, false otherwise.
(Read only property)

214.20.33 hasChildren as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This is a convenience method to allow easy determination of whether a node has any children.
Example:

```
Dim xml As String = "<test>test</test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

MessageBox "HasChildren: "+DocumentElement.hasChildren.ToString // shows true

DocumentElement.removeChild DocumentElement.FirstChild
```

```
MessageBox "HasChildren after removal: "+DocumentElement.hasChildren.ToString // shows false
```

Notes:

Returns true if the node has any children, false if the node has no children.
(Read only property)

214.20.34 LastChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the last child of this node.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

// loop over nodes backwards
Dim node As XmlNodeMBS = DocumentElement.LastChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousSibling
// loop ends when there is no previous one
Wend
```

Notes:

If there is no such node, this returns nil.
(Read only property)

214.20.35 LocalName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the local part of the qualified name of this node.
Notes:

For nodes created with a DOM Level 1 method, such as createElement from the XMLDocumentMBS interface, it is "".
(Read only property)

214.20.36 NamespaceURI as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The namespace URI.
Notes:

Get the namespace URI of this node, or "" if it is unspecified.
This is not a computed value that is the result of a namespace lookup based on an examination of the namespace declarations in scope. It is merely the namespace URI given at creation time.

For nodes of any type other than element and attribute and nodes created with a DOM Level 1 method, such as createElement from the XMLDocumentMBS interface, this is always "".
(Read only property)

214.20.37 NextSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the node immediately following this node.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

Dim node As XmlNodeMBS = DocumentElement.FirstChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.NextSibling
// loop ends when there is no next one
Wend
```

Notes:

If there is no such node, this returns nil.
(Read only property)

214.20.38 NodeName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The name of this node, depending on its type.
Notes:

This property can also be used with name "Name".
(Read only property)

214.20.39 NodeType as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The type of this node.
Example:

```
Dim xml As String = "<test id=""123""></test>"
Dim doc As New XMLDocumentMBS(xml)

MessageBox doc.DocumentElement.NodeType.ToString // shows 1 for element
```

Notes:

See Type* constants.
(Read only property)

214.20.40 NodeValue as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the value of this node, depending on its type.
Notes:

Sets the value of the node.

Any node which can have a nodeValue will also accept requests to set it to a string. The exact response to this varies from node to node – Attribute, for example, stores its values in its children and has to replace them with a new Text holding the replacement value.

For most types of Node, value is null and attempting to set it will throw XMLExceptionMBS. This will also be thrown if the node is read-only.

This property can also be used with name Value.

(Read and Write property)

214.20.41 OwnerDocument as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the XMLDocumentMBS object associated with this node.
Notes:

This is also the XMLDocumentMBS object used to create new nodes.
When this node is a XMLDocumentMBS or a XMLDocumentTypeMBS which is not used with any XMLDocumentMBS yet, this is nil.
(Read only property)

214.20.42 ParentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the parent of this node.
Notes:

All nodes, except XMLDocumentMBS, XMLDocumentFragmentMBS, and XMLAttributeMBS may have a parent. However, if a node has just been created and not yet added to the tree, or if it has been removed from the tree, a null XMLNodeMBS is returned.
(Read only property)

214.20.43 Prefix as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the namespace prefix of this node, or "" if it is unspecified.
Notes:

Can be set.
Note that setting this attribute, when permitted, changes the nodeName attribute, which holds the qualified name, as well as the tagName and name attributes of the XMLElementMBS and XMLAttributeMBS interfaces, when applicable.

Note also that changing the prefix of an attribute, that is known to have a default value, does not make a new attribute with the default value and the original prefix appear, since the namespaceURI and localName do not change.
(Read and Write property)

214.20.44 PreviousSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Gets the node immediately preceding this node.
Example:

```
Dim xml As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"
Dim doc As New XMLDocumentMBS(xml)
Dim DocumentElement As XMLElementMBS = doc.DocumentElement

// loop over nodes backwards
Dim node As XmlNodeMBS = DocumentElement.LastChild
While node <>Nil

// show each child
MessageBox node.toString

node = node.PreviousSibling
// loop ends when there is no previous one
Wend
```

Notes:

If there is no such node, this returns nil.
(Read only property)

214.20.45 ReferenceCount as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The reference count.
Notes:

Helps us to debug memory leaks.
(Read only property)

214.20.46 toString as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Creates an UTF-8 encoded text representation of the XML.
Example:

```
Dim xml As String = "<test id=""123"">Hello</test>"
Dim doc As New XMLDocumentMBS(xml)
```

MessageBox doc.toString

Notes:

Convenience function to use XMLSerializerMBS class internally.
(Read only property)

214.20.47 Constants

214.20.48 DocumentPositionContainedBy = 16

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants returned by compareDocumentPosition function.
Notes: The node is contained by the reference node. A node which is contained is always following, too.

214.20.49 DocumentPositionContains = 8

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants returned by compareDocumentPosition function.
Notes: The node contains the reference node. A node which contains is always preceding, too.

214.20.50 DocumentPositionDisconnected = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants returned by compareDocumentPosition function.
Notes: The two nodes are disconnected. Order between disconnected nodes is always implementation-specific.

214.20.51 DocumentPositionFollowing = 4

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants returned by compareDocumentPosition function.
Notes: The node follows the reference node.

214.20.52 DocumentPositionImplementationSpecific = 32

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants returned by compareDocumentPosition function.
Notes: The determination of preceding versus following is implementation-specific.

214.20.53 DocumentPositionPreceding = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the constants returned by compareDocumentPosition function.
Notes: The second node precedes the reference node.

214.20.54 TypeAttribute = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Attribute Node

214.20.55 TypeCDataSection = 4

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: CDataSection Node

214.20.56 TypeComment = 8

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Comment Node

214.20.57 TypeDocument = 9

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Document Node

214.20.58 TypeDocumentFragment = 11

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Document Fragment

214.20.59 TypeDocumentType = 10

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Document Type Node

214.20.60 TypeElement = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Element Node

214.20.61 TypeEntity = 6

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Entity Node

214.20.62 TypeEntityReferenceNode = 5

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Entity Reference Node

214.20.63 TypeNotation = 12

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Notation Node

214.20.64 TypeProcessingInstruction = 7

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Processing Instruction Node

214.20.65 TypeText = 3

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the node type constants.
Notes: Text Node

214.21 class XMLNotationMBS

214.21.1 class XMLNotationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents a notation declared in the DTD.
Notes:

A notation either declares, by name, the format of an unparsed entity (see section 4.7 of the XML 1.0 specification), or is used for formal declaration of Processing Instruction targets (see section 2.6 of the XML 1.0 specification). The nodeName attribute inherited from XMLNodeMBS is set to the declared name of the notation.
The DOM Level 1 does not support editing XMLNotationMBS nodes; they are therefore readonly.
A XMLNotationMBS node does not have any parent.
Subclass of the XMLNodeMBS class.
This is a subclass of an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.21.2 Properties

214.21.3 PublicId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the public identifier of this notation.
Notes:

If the public identifier was not specified, this is "".
(Read only property)

214.21.4 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get the system identifier of this notation.
Notes:

If the system identifier was not specified, this is "".
(Read only property)

214.22 class XMLOutputMBS

214.22.1 class XMLOutputMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This interface represents an output destination for data.
Example:

```
Dim output As New XMLOutputMBS
output.Encoding = "UTF-8"

// now pass to write method in XMLSerializerMBS class
```

214.22.2 Methods

214.22.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

214.22.4 Properties

214.22.5 Encoding as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The encoding which will be required for use with the XML text read via a stream opened by this input source.
Example:

```
Dim output As New XMLOutputMBS
output.Encoding = "UTF-8"

// now pass to write method in XMLSerializerMBS class
```

Notes:

This is usually not set, allowing the encoding to be sensed in the usual XML way. However, in some cases, the encoding in the file is known to be incorrect because of intermediate transcoding, for instance encapsulation within a MIME document.

Pass the name of the encoding to force, e.g. "UTF-8".

(Read and Write property)

214.22.6 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.22.7 SystemId as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The system identifier for this input source.
Notes:

The system id is always required. The public id may be used to map to another system id, but the system id must always be present as a fall back.

If the system ID is a URL, it must be fully resolved.
(Read and Write property)

214.23 class XMLParserFilterMBS

214.23.1 class XMLParserFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XML parser filter class.
Notes:

The XMLParserFilterMBS class provide applications the ability to examine nodes as they are being created during the parse process.
And it lets the application decide what nodes should be in the output DOM tree or not.

214.23.2 Methods

214.23.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

214.23.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

214.23.5 Events

214.23.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: This eventn will be called by the parser at the completion of the parsing of each node.
Notes:

The node and all of its descendants will exist and be complete. The parent node will also exist, although it may be incomplete, i.e. it may have additional children that have not yet been parsed. Attribute nodes are never passed to this function. From within this method, the new node may be freely modified - children may be added or removed, text nodes modified, etc. The state of the rest of the document outside this node is not defined, and the affect of any attempt to navigate to, or to modify any other part of the document is undefined. For validating parsers, the checks are made on the original document, before any modification by the filter. No validity checks are made on any document modifications made by the filter. If this new node

is rejected, the parser might reuse the new node and any of its descendants.

node: The newly constructed element. At the time this method is called, the element is complete - it has all of its children (and their children, recursively) and attributes, and is attached as a child to its parent.

Return one of the Filter* constants.

214.23.7 getWhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: Tells the XMLParserMBS what types of nodes to show to the acceptNode event.
Notes: If a node is not shown to the filter using this attribute, it is automatically included in the DOM document being built. See XMLDocumentMBS for definition of the constants.

214.23.8 startElement(node as XMLElementMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: The parser will call this method after each XMLElementMBS start tag has been scanned, but before the remainder of the XMLElementMBS is processed.
Notes:

The intent is to allow the element, including any children, to be efficiently skipped. Note that only element nodes are passed to the startElement function. The element node passed to startElement for filtering will include all of the attributes, but none of the children nodes. The XMLElementMBS may not yet be in place in the document being constructed (it may not have a parent node.) A startElement filter function may access or change the attributes for the XMLElementMBS. Changing namespace declarations will have no effect on namespace resolution by the parser.

node: The newly encountered element. At the time this method is called, the element is incomplete - it will have its attributes, but no children.

Return one of the Filter* constants.

214.23.9 Constants

214.23.10 FilterAccept = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter action constants.
Notes: Accept the node.

214.23.11 FilterInterrupt = 4

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter action constants.
Notes: Interrupt the normal processing of the document.

214.23.12 FilterReject = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter action constants.
Notes: Reject the node and its children.

214.23.13 FilterSkip = 3

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter action constants.
Notes: Skip this single node. The children of this node will still be considered.

214.24 class XMLParserMBS

214.24.1 class XMLParserMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLParserMBS class provides an API for parsing XML documents and building the corresponding DOM document tree.
Example:

```
Dim p As New XMLParserMBS
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.xml")

Dim doc As XMLDocumentMBS = p.parseFile(f)

// inspect document in debugger
MessageBox doc.NodeName
```

Notes: Please note that asynchronous mode is not yet supported in MBS Plugin.

214.24.6 Methods

214.24.7 abort

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Abort the loading of the document that is currently being loaded by the XMLParserMBS.
Notes:

If the XMLParserMBS is currently not busy, a call to this method does nothing.
invoking this method will remove the installed filter

214.24.8 Constructor(Asynchronous as Boolean = false, schemaType as string = "")

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Create a new XMLParserMBS.
Notes:

The newly constructed parser may then be configured by means of its XMLConfigurationMBS object, and used to parse documents by means of its parse method.

async: The mode argument is either synchronous or asynchronous, if async is true then the XMLParserMBS that is created will operate in synchronous mode, if async is false then the XMLParserMBS that is created will operate in asynchronous mode.

schemaType: An absolute URI representing the type of the schema language used during the load of a XMLDocumentMBS using the newly created XMLParserMBS. Note that no lexical checking is done on the absolute URI. In order to create a XMLParserMBS for any kind of schema types (i.e. the XMLParserMBS will be free to use any schema found), use the value "".

Note: For W3C XML Schema [XML Schema Part 1] , applications must use the value "http://www.w3.org/2001/XMLSchema
For XML DTD [XML 1.0] , applications must use the value "http://www.w3.org/TR/REC-xml". Other Schema languages are outside the scope of the W3C and therefore should recommend an absolute URI in order to use this method.

214.24.9 parse(inputSource as XMLInputMBS) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML document from a resource identified by a XMLInputMBS.
Example:

```
Dim xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Dim Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText
```

```
Dim parser As New XMLParserMBS
Dim doc As XMLDocumentMBS = parser.parse(Input)

// inspect document in debugger
MessageBox doc.toString
```

Notes:

The parser owns the returned XMLDocumentMBS. It will be deleted when the parser is released.

source: The XMLInputMBS from which the source of the document is to be read.

If the XMLParserMBS is a synchronous XMLParserMBS the newly created and populated XMLDocumentMBS is returned.
If the XMLParserMBS is asynchronous then nil is returned since the document object may not yet be constructed when this method returns.

214.24.10 parseFile(file as FolderItem) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parses a file.
Example:

```
Dim p As New XMLParserMBS
Dim f As FolderItem = SpecialFolder.Desktop.Child("test.xml")

Dim doc As XMLDocumentMBS = p.parseFile(f)

// inspect document in debugger
MessageBox doc.NodeName
```

214.24.11 parseURI(URI as String) as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML document from a location identified by a URI reference [IETF RFC 2396] .
Notes:

If the URI contains a fragment identifier (see section 4.1 in [IETF RFC 2396]), the behavior is not defined by this specification, future versions of this specification may define the behavior.

The parser owns the returned XMLDocumentMBS. It will be deleted when the parser is released.

uri: The location of the XML document to be read (in Unicode)

If the XMLParserMBS is a synchronous XMLParserMBS the newly created and populated XMLDocumentMBS is returned.
If the XMLParserMBS is asynchronous then nil is returned since the document object is not yet parsed when this method returns.

214.24.12 parseWithContext(inputSource as XMLInputMBS, contextNode as XMLNodeMBS, Action as Integer) as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Parse an XML fragment from a resource identified by a XMLInputMBS and insert the content into an existing document at the position specified with the context and action arguments.
Example:

```
Dim xmlText As String = "<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>"

Dim Input As New XMLInputMBS
Input.Encoding = "UTF-8"
Input.InputString = xmlText

Dim parser As New XMLParserMBS

Dim doc As New XMLDocumentMBS("", "MyDocument")

// load new test node into the MyDocument
Dim newNode As XMLNodeMBS = parser.parseWithContext(Input, doc.DocumentElement, parser.Action-
AppendAsChildren)

// inspect document in debugger
MessageBox doc.toString
```

Notes:

When parsing the input stream, the context node (or its parent, depending on where the result will be inserted) is used for resolving unbound namespace prefixes. The context node's ownerDocument node (or the node itself if the node of type document) is used to resolve default attributes and entity references. As the new data is inserted into the document, at least one mutation event is fired per new immediate child or sibling of the context node. If the context node is a XMLDocumentMBS node and the action is ActionReplaceChildren, then the document that is passed as the context node will be changed such that its xmlEncoding, documentURI, xmlVersion, inputEncoding, xmlStandalone, and all other such attributes are set to what they would be set to if the input source was parsed using parse(). This method is always synchronous, even if the XMLParserMBS is asynchronous (when Async() returns true). If an error occurs while parsing, the

caller is notified through the ErrorHandler instance associated with the "error-handler" parameter of the XMLConfigurationMBS. When calling parseWithContext, the values of the following configuration parameters will be ignored and their default values will always be used instead: "validate", "validate-if-schema" "element-content-whitespace". Other parameters will be treated normally, and the parser is expected to call the XMLParserMBSFilter just as if a whole document was parsed.

source: The XMLInputMBS from which the source document is to be read. The source document must be an XML fragment, i.e. anything except a complete XML document (except in the case where the context node of type DOCUMENT_NODE, and the action is ActionReplaceChildren), a DOCTYPE (internal subset), entity declaration(s), notation declaration(s), or XML or text declaration(s).

contextNode: The node that is used as the context for the data that is being parsed. This node must be a XMLDocumentMBS node, a XMLDocumentFragmentMBS node, or a node of a type that is allowed as a child of an XMLElementMBS node, e.g. it cannot be an XMLAttributeMBS node.

action: This parameter describes which action should be taken between the new set of nodes being inserted and the existing children of the context node. The set of possible actions is defined in action constants.

Return the node that is the result of the parse operation. If the result is more than one top-level node, the first one is returned.

214.24.13 resetCachedGrammarPool

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Clear the cached grammar pool.

214.24.14 resetDocumentPool

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Reset the documents vector pool and release all the associated memory back to the system.
Notes:

When parsing a document using a DOM parser, all memory allocated for a DOM tree is associated to the DOM document.

If you do multiple parse using the same DOM parser instance, then multiple DOM documents will be generated and saved in a vector pool. All these documents (and thus all the allocated memory) won't be deleted until the parser instance is destroyed.

If you don't need these DOM documents anymore and don't want to destroy the DOM parser instance at

this moment, then you can call this method to reset the document vector pool and release all the allocated memory back to the system.

It is an error to call this method if you are in the middle of a parse (e.g. in the mid of a progressive parse).

214.24.15 URIText(ID as Integer) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the string corresponding to a URI id from the URI string pool.
Notes:

ID: id of the string in the URI string pool.

Returns the URI string corresponding to the URI id.

214.24.16 Properties

214.24.17 Asynchronous as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return whether the parser is asynchronous.
Notes:

Value is true if the XMLParserMBS is asynchronous and false if it is synchronous.
(Read only property)

214.24.18 Busy as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return whether the parser is busy parsing.
Notes:

Value is true if the XMLParserMBS is currently busy loading a document, otherwise false.
(Read only property)

214.24.19 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Get a pointer to the XMLConfigurationMBS object used when parsing an input source.
Example:

```
Dim parser As New XMLParserMBS

// configure the parser
Dim DOMConfig As XMLConfigurationMBS = p.DOMConfig
DOMConfig.ElementContentWhitespace=False

// prepare XML input
Dim Input As New XMLInputMBS
Input.InputString = kXML2

// and parse
Var xml1 As XMLDocumentMBS = p.parse(Input)

Break
```

Notes:

This XMLConfigurationMBS is specific to the parse operation.
No parameter values from this XMLConfigurationMBS object are passed automatically to the XMLConfigurationMBS object on the XMLDocumentMBS that is created, or used, by the parse operation. The DOM application is responsible for passing any needed parameter values from this XMLConfigurationMBS object to the XMLConfigurationMBS object referenced by the XMLDocumentMBS object.
(Read only property)

214.24.20 Filter as XMLParserFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The parse filter.
Notes:

When the application provides a filter, the parser will call out to the filter at the completion of the construction of each XMLElementMBS node. The filter implementation can choose to remove the element from the document being constructed or to terminate the parse early. The filter is invoked after the operations requested by the XMLConfigurationMBS parameters have been applied. For example, if "validate" is set to true, the validation is done before invoking the filter.

Currently filter can only work in synchronous mode.
(Read and Write property)

214.24.21 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.24.22 SrcOffset as Int64

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the current src offset within the input source.
Notes: (Read only property)

214.24.23 Constants

214.24.24 ActionAppendAsChildren = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the action constants for parseWithContext method.
Notes: Append the result of the parse operation as children of the context node. For this action to work, the context node must be a XMLElementMBS or a XMLDocumentFragmentMBS.

214.24.25 ActionInsertAfter = 4

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the action constants for parseWithContext method.
Notes: Insert the result of the parse operation as the immediately following sibling of the context node. For this action to work the context node's parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.

214.24.26 ActionInsertBefore = 3

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the action constants for parseWithContext method.
Notes: Insert the result of the parse operation as the immediately preceding sibling of the context node. For this action to work the context node's parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.

214.24.27 ActionReplace = 5

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the action constants for parseWithContext method.
Notes: Replace the context node with the result of the parse operation. For this action to work, the context node must have a parent, and the parent must be a XMLElementMBS or a XMLDocumentFragmentMBS.

214.24.28 ActionReplaceChildren = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the action constants for parseWithContext method.
Notes: Replace all the children of the context node with the result of the parse operation. For this action to work, the context node must be a XMLElementMBS, a XMLDocumentMBS, or a XMLDocumentFragmentMBS.

214.25 class XMLProcessingInstructionMBS

214.25.1 class XMLProcessingInstructionMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The DOMProcessingInstruction interface represents a "processing instruction", used in XML as a way to keep processor-specific information in the text of the document.
Notes:

Subclass of the XMLNodeMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.25.2 Methods

214.25.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.25.4 Properties

214.25.5 Data as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The content of this processing instruction.
Notes:

This is from the first non white space character after the target to the character immediately preceding the ?<.

Can be set to put in new instruction.
(Read and Write property)

214.25.6 Target as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The target of this processing instruction.
Notes:

XML defines this as being the first token following the markup that begins the processing instruction. (Read only property)

214.26 class XMLSerializerFilterMBS

214.26.1 class XMLSerializerFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLSerializerMBSFilter provide applications the ability to examine nodes as they are being serialized.
Notes:

XMLSerializerMBSFilter lets the application decide what nodes should be serialized or not.
The XMLDocumentMBS, XMLDocumentTypeMBS, XMLNotationMBS, and XMLEntityMBS nodes are not passed to the filter.

214.26.2 Methods

214.26.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

214.26.4 Destructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The destructor.

214.26.5 Events

214.26.6 acceptNode(node as XMLNodeMBS) as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: Test whether a specified node is visible in the logical view of a XMLTreeWalkerMBS or XMLNodeIteratorMBS.
Notes:

This event will be called by the implementation of XMLTreeWalkerMBS and XMLNodeIteratorMBS; it is not normally called directly from user code. (Though you could do so if you wanted to use the same filter to guide your own application logic.)
node: The node to check to see if it passes the filter or not.

A constant to determine whether the node is accepted, rejected, or skipped, as defined above.

214.26.7 getWhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: .

Function: Tells the XMLSerializerMBS what types of nodes to show to the filter.
Notes:

See XMLNodeFilterMBS for definition of the constants. The constant SHOW_ATTRIBUTE is meaningless here, attribute nodes will never be passed to a XMLSerializerMBSFilter.

The constants of what types of nodes to show.
Default is ShowAll if event is not implemented.

214.26.8 Constants

214.26.9 FilterAccept = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter return constants.
Notes: Accept the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will return this node.

214.26.10 FilterReject = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter return constants.
Notes: Reject the node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For XMLTreeWalkerMBS, the children of this node will also be rejected. XMLNodeIteratorMBSs treat this as a synonym for FilterSkip.

214.26.11 FilterSkip = 3

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the filter return constants.
Notes: Skip this single node. Navigation methods defined for XMLNodeIteratorMBS or XMLTreeWalkerMBS will not return this node. For both XMLNodeIteratorMBS and XMLTreeWalkerMBS, the children

of this node will still be considered.

214.27 class XMLSerializerMBS

214.27.1 class XMLSerializerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: XMLSerializerMBS provides an API for serializing (writing) a DOM document out in an XML document.
Notes:

The XML data is written to an output stream, the type of which depends on the specific language bindings in use. During serialization of XML data, namespace fixup is done when possible.

XMLSerializerMBS accepts any node type for serialization. For nodes of type Document or Entity, well formed XML will be created if possible. The serialized output for these node types is either as a Document or an External Entity, respectively, and is acceptable input for an XML parser. For all other types of nodes the serialized form is not specified, but should be something useful to a human for debugging or diagnostic purposes. Note: rigorously designing an external (source) form for stand-alone node types that don't already have one defined in seems a bit much to take on here.
Within a Document or Entity being serialized, Nodes are processed as follows Documents are written including an XML declaration and a DTD subset, if one exists in the DOM. Writing a document node serializes the entire document. Entity nodes, when written directly by write defined in the XMLSerializerMBS interface, output the entity expansion but no namespace fixup is done. The resulting output will be valid as an external entity. Entity References nodes are serializes as an entity reference of the form "& entityName;") in the output. Child nodes (the expansion) of the entity reference are ignored. CDATA sections containing content characters that can not be represented in the specified output encoding are handled according to the "split-cdata-sections" feature.If the feature is true, CDATA sections are split, and the unrepresentable characters are serialized as numeric character references in ordinary content. The exact position and number of splits is not specified. If the feature is false, unrepresentable characters in a CDATA section are reported as errors. The error is not recoverable - there is no mechanism for supplying alternative characters and continuing with the serialization. All other node types (XMLElementMBS, XMLTextMBS, etc.) are serialized to their corresponding XML source form.

Within the character data of a document (outside of markup), any characters that cannot be represented directly are replaced with character references. Occurrences of '<' and '& ' are replaced by the predefined entities & lt; and & amp. The other predefined entities (& gt, & apos, etc.) are not used; these characters can be included directly. Any character that can not be represented directly in the output character encoding is serialized as a numeric character reference.

Attributes not containing quotes are serialized in quotes. Attributes containing quotes but no apostrophes are serialized in apostrophes (single quotes). Attributes containing both forms of quotes are serialized in quotes, with quotes within the value represented by the predefined entity & quot;. Any character that can not be represented directly in the output character encoding is serialized as a numeric character reference.

Within markup, but outside of attributes, any occurrence of a character that cannot be represented in the

output character encoding is reported as an error. An example would be serializing the element with the encoding="us-ascii".

When requested by setting the normalize-characters feature on XMLSerializerMBS, all data to be serialized, both markup and character data, is W3C Text normalized according to the rules defined in . The W3C Text normalization process affects only the data as it is being written; it does not alter the DOM's view of the document after serialization has completed.

Namespaces are fixed up during serialization, the serialization process will verify that namespace declarations, namespace prefixes and the namespace URIs associated with Elements and Attributes are consistent. If inconsistencies are found, the serialized form of the document will be altered to remove them. The algorithm used for doing the namespace fixup while seralizing a document is a combination of the algorithms used for lookupNamespaceURI and lookupPrefix. previous paragraph to be defined closer here.

Any changes made affect only the namespace prefixes and declarations appearing in the serialized data. The DOM's view of the document is not altered by the serialization operation, and does not reflect any changes made to namespace declarations or prefixes in the serialized output.

While serializing a document the serializer will write out non-specified values (such as attributes whose specified is false) if the output-default-values feature is set to true. If the output-default-values flag is set to false and the use-abstract-schema feature is set to true the abstract schema will be used to determine if a value is specified or not, if use-abstract-schema is not set the specified flag on attribute nodes is used to determine if attribute values should be written out.

Ref to Core spec (1.1.9, XML namespaces, 5th paragraph) entity ref description about warning about unbound entity refs. Entity refs are always serialized as & foo;, also mention this in the load part of this spec.

When serializing a document the XMLSerializerMBS checks to see if the document element in the document is a DOM Level 1 element or a DOM Level 2 (or higher) element (this check is done by looking at the localName of the root element). If the root element is a DOM Level 1 element then the XMLSerializerMBS will issue an error if a DOM Level 2 (or higher) element is found while serializing. Likewise if the document element is a DOM Level 2 (or higher) element and the XMLSerializerMBS sees a DOM Level 1 element an error is issued. Mixing DOM Level 1 elements with DOM Level 2 (or higher) is not supported.

XMLSerializerMBSs have a number of named features that can be queried or set. The name of XMLSerializerMBS features must be valid XML names. Implementation specific features (extensions) should choose an implementation dependent prefix to avoid name collisions.

Here is a list of properties that must be recognized by all implementations.

"normalize-characters"

true: [optional] (default) Perform the W3C Text Normalization of the characters in document as they are written out. Only the characters being written are (potentially) altered. The DOM document itself is unchanged.

false: [required] do not perform character normalization.

"split-cdata-sections"

true: [required] (default) Split CDATA sections containing the CDATA section termination marker ']] >' or characters that can not be represented in the output encoding, and output the characters using numeric character references. If a CDATA section is split a warning is issued.

false: [required] Signal an error if a CDATASection contains an unrepresentable character.

"validation"

true: [optional] Use the abstract schema to validate the document as it is being serialized. If validation errors are found the error handler is notified about the error. Setting this state will also set the feature use-abstract-schema to true.
false: [required] (default) Don't validate the document as it is being serialized.

"expand-entity-references"

true: [optional] Expand EntityReference nodes when serializing.
false: [required] (default) Serialize all EntityReference nodes as XML entity references.

"whitespace-in-element-content"

true: [required] (default) Output all white spaces in the document.
false: [optional] Only output white space that is not within element content. The implementation is expected to use the isWhitespaceInElementContent flag on Text nodes to determine if a text node should be written out or not.

"discard-default-content"

true: [required] (default) Use whatever information available to the implementation (i.e. XML schema, DTD, the specified flag on Attr nodes, and so on) to decide what attributes and content should be serialized or not. Note that the specified flag on Attr nodes in itself is not always reliable, it is only reliable when it is set to false since the only case where it can be set to false is if the attribute was created by a Level 1 implementation.
false: [required] Output all attributes and all content.

"format-canonical"

true: [optional] This formatting writes the document according to the rules specified in . Setting this feature to true will set the feature "format-pretty-print" to false.
false: [required] (default) Don't canonicalize the output.

"format-pretty-print"

true: [optional] Formatting the output by adding whitespace to produce a pretty-printed, indented, human-readable form. The exact form of the transformations is not specified by this specification. Setting this feature to true will set the feature "format-canonical" to false.
false: [required] (default) Don't pretty-print the result.

"byte-order-mark"

false: [optional] (default) Setting this feature to true will output the correct BOM for the specified encoding.
true: [required] Don't generate a BOM.

”space-first-level-elements”

true: [optional] (default) Setting this feature to true will add an extra line feed between the elements that are children of the document root.
false: [required] Don’t add the extra line feed.

214.27.2 Methods

214.27.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The constructor.

214.27.4 writeToBuffer(Node as XMLNodeMBS, output as XMLOutputMBS) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Dim doc As New XMLDocumentMBS(”<test id=””123””><f>1</f><f>2</f><f>3</f><f>4</f></test>”)

// create serializer
Dim serializer As New XMLSerializerMBS

// options
serializer.NewLine = EndOfLine.macOS

Dim output As New XMLOutputMBS
output.Encoding = ”UTF-8”

// and output to string
Dim s As String = serializer.writeToBuffer(doc, output)
```

Notes:

Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
output: The output for the data to be written.

Returns XML if node was successfully serialized and false in case a failure occured and the failure wasn't canceled by the error handler.

We internally create a memory buffer to output to and return you the output.

214.27.5 writeToFile(Node as XMLNodeMBS, File as FolderItem) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Dim doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Dim serializer As New XMLSerializerMBS

Dim file As FolderItem = SpecialFolder.Desktop.Child("test.xml")

// and output to string
Dim r As Boolean = serializer.writeToFile(doc, file)
```

Notes:

Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
uri: The destination for the data to be written.

Returns true if node was successfully serialized and false in case a failure occured and the failure wasn't canceled by the error handler.

214.27.6 writeToString(Node as XMLNodeMBS) as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Serialize the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Dim doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Dim serializer As New XMLSerializerMBS

// options
serializer.NewLine = EndOfLine.macOS

// and output to string
Dim s As String = serializer.writeToString(doc)
```

Notes:

The result of serializing the node is returned as a string. Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The node to be written.

Returns the serialized data, or "" in case a failure occured and the failure wasn't canceled by the error handler. The returned string is always marked as UTF-16.

214.27.7 writeToURI(Node as XMLNodeMBS, URI as String) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Write out the specified node as described above in the description of XMLSerializerMBS.
Example:

```
// parse it
Dim doc As New XMLDocumentMBS("<test id=""123""><f>1</f><f>2</f><f>3</f><f>4</f></test>")

// create serializer
Dim serializer As New XMLSerializerMBS

Dim file As FolderItem = SpecialFolder.Desktop.Child("test.xml")
```

```
// and output to string
Dim r As Boolean = serializer.writeToURI(doc, file.NativePath)
```

Notes:

Writing a Document or Entity node produces a serialized form that is well formed XML. Writing other node types produces a fragment of text in a form that is not fully defined by this document, but that should be useful to a human for debugging or diagnostic purposes.

node: The Document or Entity node to be written. For other node types, something sensible should be written, but the exact serialized form is not specified.
uri: The destination for the data to be written.

Returns true if node was successfully serialized and false in case a failure occured and the failure wasn't canceled by the error handler.

214.27.8 Properties

214.27.9 DOMConfig as XMLConfigurationMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLConfigurationMBS object used by the Serializer when serializing a DOM node.
Notes: (Read only property)

214.27.10 Filter as XMLSerializerFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The filter to decide which elements to output.
Notes:

When the application provides a filter, the serializer will call out to the filter before serializing each Node. Attribute nodes are never passed to the filter. The filter implementation can choose to remove the node from the stream or to terminate the serialization early.

filter: The writer filter to be used.
(Read and Write property)

214.27.11 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.27.12 NewLine as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The end-of-line sequence of characters to be used in the XML being written out.
Notes:

The only permitted values are these: ""
Use a default end-of-line sequence. DOM implementations should choose the default to match the usual convention for text files in the environment being used. Implementations must choose a default sequence that matches one of those allowed by 2.11 "End-of-Line Handling". However, Xerces-C++ always uses LF when this property is set to nil since otherwise automatic translation of LF to CR-LF on Windows for text files would result in such files containing CR-CR-LF. If you need Windows-style end of line sequences in your output, consider writing to a file opened in text mode or explicitly set this property to CR-LF.

The default value for this attribute is "" to use default.
(Read and Write property)

214.28 class XMLTextMBS

214.28.1 class XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for a piece of XML text.
Notes:

The XMLTextMBS interface inherits from XMLCharacterDataMBS and represents the textual content (termed character data in XML) of an XMLElementMBS or XMLAttributeMBS. If there is no markup inside an element's content, the text is contained in a single object implementing the XMLTextMBS interface that is the only child of the element. If there is markup, it is parsed into the information items (elements, comments, etc.) and XMLTextMBS nodes that form the list of children of the element.

When a document is first made available via the DOM, there is only one XMLTextMBS node for each block of text. Users may create adjacent XMLTextMBS nodes that represent the contents of a given element without any intervening markup, but should be aware that there is no way to represent the separations between these nodes in XML or HTML, so they will not (in general) persist between DOM editing sessions. The normalize() method on XMLNodeMBS merges any such adjacent XMLTextMBS objects into a single node for each block of text.
Subclass of the XMLCharacterDataMBS class.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.28.2 Xojo Developer Magazine

- 21.2, pages 68 to 69: XML for Beginners, Using XML with the MBS Plugin by Stefanie Juchmes

214.28.3 Xojo Developer Magazine

- 21.2, pages 68 to 69: XML for Beginners, Using XML with the MBS Plugin by Stefanie Juchmes

214.28.4 Methods

214.28.5 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.28.6 splitText(Offset as Integer) as XMLTextMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Breaks this node into two nodes at the specified offset, keeping both in the tree as siblings.
Notes:

After being split, this node will contain all the content up to the offset point. A new node of the same type, which contains all the content at and after the offset point, is returned. If the original node had a parent node, the new node is inserted as the next sibling of the original node. When the offset is equal to the length of this node, the new node has no data.
offset: The 16-bit unit offset at which to split, starting from 0.

Returns the new node, of the same type as this node.

Raises exception in case of error.

214.28.7 Properties

214.28.8 IsElementContentWhitespace as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns whether this text node contains element content whitespace, often abusively called "ignorable whitespace".
Notes:

The text node is determined to contain whitespace in element content during the load of the document or if validation occurs while using normalizeDocument().
(Read only property)

214.28.9 WholeText as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns all text of DOMText nodes logically-adjacent text nodes to this node, concatenated in document order.
Notes:

When assigned, substitutes the a specified text for the text of the current node and all logically-adjacent text nodes.
(Read and Write property)

214.29 class XMLTreeWalkerMBS

214.29.1 class XMLTreeWalkerMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Allows you to walk over a xml tree.
Notes:

XMLTreeWalkerMBS objects are used to navigate a document tree or subtree using the view of the document defined by their whatToShow flags and filter (if any). Any function which performs navigation using a XMLTreeWalkerMBS will automatically support any view defined by a XMLTreeWalkerMBS.
Omitting nodes from the logical view of a subtree can result in a structure that is substantially different from the same subtree in the complete, unfiltered document. Nodes that are siblings in the XMLTreeWalkerMBS view may be children of different, widely separated nodes in the original view. For instance, consider a XMLNodeFilterMBS that skips all nodes except for XMLTextMBS nodes and the root node of a document. In the logical view that results, all text nodes will be siblings and appear as direct children of the root node, no matter how deeply nested the structure of the original document.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.29.6 Methods

214.29.7 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.29.8 firstChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the first visible child of the current node, and returns the new node.
Notes:

If the current node has no visible children, returns null, and retains the current node.
The new node, or null if the current node has no visible children in the XMLTreeWalkerMBS's logical view.

214.29.9 lastChild as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the last visible child of the current node, and returns the new node.
Notes:

If the current node has no visible children, returns null, and retains the current node.
The new node, or null if the current node has no children in the XMLTreeWalkerMBS's logical view.

214.29.10 nextNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the next visible node in document order relative to the current node, and returns the new node.
Notes:

If the current node has no next node, or if the search for nextNode attempts to step upward from the XMLTreeWalkerMBS's root node, returns null, and retains the current node.
The new node, or null if the current node has no next node in the XMLTreeWalkerMBS's logical view.

214.29.11 nextSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the next sibling of the current node, and returns the new node.
Notes:

If the current node has no visible next sibling, returns null, and retains the current node.
The new node, or null if the current node has no next sibling. in the XMLTreeWalkerMBS's logical view.

214.29.12 ParentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves to and returns the closest visible ancestor node of the current node.
Notes:

If the search for parentNode attempts to step upward from the XMLTreeWalkerMBS's root node, or if it fails to find a visible ancestor node, this method retains the current position and returns null.
The new parent node, or null if the current node has no parent in the XMLTreeWalkerMBS's logical view.

214.29.13 previousNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the previous visible node in document order relative to the current node, and returns the new node.
Notes:

If the current node has no previous node, or if the search for previousNode attempts to step upward from the XMLTreeWalkerMBS's root node, returns null, and retains the current node.
The new node, or null if the current node has no previous node in the XMLTreeWalkerMBS's logical view.

214.29.14 previousSibling as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Moves the XMLTreeWalkerMBS to the previous sibling of the current node, and returns the new node.
Notes:

If the current node has no visible previous sibling, returns null, and retains the current node.
The new node, or null if the current node has no previous sibling. in the XMLTreeWalkerMBS's logical view.

214.29.15 Properties

214.29.16 CurrentNode as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Return the node at which the XMLTreeWalkerMBS is currently positioned.
Notes:

Can be assigned to move:
The node at which the XMLTreeWalkerMBS is currently positioned.
Alterations to the DOM tree may cause the current node to no longer be accepted by the XMLTreeWalkerMBS's associated filter. currentNode may also be explicitly set to any node, whether or not it is within the subtree specified by the root node or would be accepted by the filter and whatToShow flags. Further traversal occurs relative to currentNode even if it is not part of the current view, by applying the filters in the requested direction; if no traversal is possible, currentNode is not changed.
(Read and Write property)

214.29.17 Document as XMLDocumentMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The owning document.
Notes: (Read only property)

214.29.18 ExpandEntityReferences as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The value of this flag determines whether the children of entity reference nodes are visible to the XMLTreeWalkerMBS.
Notes:

If false, these children and their descendants will be rejected. Note that this rejection takes precedence over whatToShow and the filter, if any.
To produce a view of the document that has entity references expanded and does not expose the entity reference node itself, use the whatToShow flags to hide the entity reference node and set expandEntityReferences to true when creating the XMLTreeWalkerMBS. To produce a view of the document that has entity reference nodes but no entity expansion, use the whatToShow flags to show the entity reference node and set expandEntityReferences to false.
(Read only property)

214.29.19 Filter as XMLNodeFilterMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The filter used to screen nodes.
Notes: (Read only property)

214.29.20 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.29.21 Root as XMLNodeMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The root node of the DOMTreeWalker, as specified when it was created.
Notes: (Read only property)

214.29.22 WhatToShow as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This attribute determines which node types are presented via the DOMTreeWalker.
Notes:

The available set of constants is defined in the DOMNodeFilter interface. Nodes not accepted by whatToShow will be skipped, but their children may still be considered. Note that this skip takes precedence over the filter, if any.
Default is ShowAll.
(Read only property)

214.30 class XMLTypeInfoMBS

214.30.1 class XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The XMLTypeInfoMBS interface represent a type used by XMLElementMBS or XMLAttributeMBS nodes, specified in the schemas associated with the document.
Notes:

The type is a pair of a namespace URI and name properties, and depends on the document's schema.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.30.2 Methods

214.30.3 Constructor

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.30.4 isDerivedFrom(typeNamespaceArg as String, typeNameArg as String, derivationMethod as Integer) as Boolean

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: This method returns if there is a derivation between the reference type definition, i.e. the XMLTypeInfoMBS on which the method is being called, and the other type definition, i.e. the one passed as parameters.
Notes:

typeNamespaceArg: The namespace of the other type definition.
typeNameArg: The name of the other type definition.
derivationMethod: The type of derivation and conditions applied between two types, as described in the list of constants provided in this interface.

If the document's schema is a DTD or no schema is associated with the document, this method will always return false.
If the document's schema is an XML Schema, the method will true if the reference type definition is derived from the other type definition according to the derivation parameter. If the value of the parameter is 0 (no bit is set to 1 for the derivationMethod parameter), the method will return true if the other type definition can be reached by recursing any combination of { base type definition } , { item type definition } , or { member type definitions } from the reference type definition.

214.30.5 Properties

214.30.6 Handle as Integer

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The internal object reference.
Notes: (Read only property)

214.30.7 TypeName as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns The name of a type declared for the associated XMLElementMBS or XMLAttributeMBS, or "" if unknown.
Notes: (Read only property)

214.30.8 TypeNamespace as String

MBS XML Plugin, Plugin Version: 22.4, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The namespace of the type declared for the associated XMLElementMBS or XMLAttributeMBS or "" if the XMLElementMBS does not have declaration or if no namespace information is available.
Notes: (Read only property)

214.30.9 Constants

214.30.10 DerivationExtension = 2

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the derivationMethod constants.
Notes: If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the derivation by extension. The reference type definition is derived by extension from the other type definition if the other type definition can be reached recursively following the { base type definition } property from the reference type definition, and at least one of the derivation methods involved is an extension.

214.30.11 DerivationList = 8

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the derivationMethod constants.
Notes: If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the list. The reference type definition is derived by list from the other type definition if there exists two type definitions T1 and T2 such as the reference type definition is derived from T1 by DerivationRestriction or DerivationExtension, T2 is derived from the other type definition by DerivationRestriction, T1 has { variety } list, and T2 is the { item type definition } . Note that T1 could be the same as the reference type definition, and T2 could be the same as the other type definition.

214.30.12 DerivationRestriction = 1

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the derivationMethod constants.
Notes: If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the derivation by restriction if complex types are involved, or a restriction if simple types are involved. The reference type definition is derived by restriction from the other type definition if the other type definition is the same as the reference type definition, or if the other type definition can be reached recursively following the { base type definition } property from the reference type definition, and all the derivation methods involved are restriction.

214.30.13 DerivationUnion = 4

MBS XML Plugin, Plugin Version: 22.4.

Function: One of the derivationMethod constants.
Notes: If the document's schema is an XML Schema [XML Schema Part 1] , this constant represents the union if simple types are involved. The reference type definition is derived by union from the other type definition if there exists two type definitions T1 and T2 such as the reference type definition is derived from T1 by DerivationRestriction or DerivationExtension, T2 is derived from the other type definition by DerivationRestriction, T1 has { variety } union, and one of the { member type definitions } is T2. Note that T1 could be the same as the reference type definition, and T2 could be the same as the other type definition.

214.31 class XMLValidatorMBS

214.31.1 class XMLValidatorMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the XML validator.
Notes: Using the validator in LibXML.

214.31.6 Methods

214.31.7 Constructor(File as FolderItem)

MBS Util Plugin, Plugin Version: 20.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking file path to XML file.
Example:

```
Dim f As FolderItem = SpecialFolder.Desktop.Child("schema.txt")
Dim v As New XMLValidatorMBS(f)
```

Notes:

May raise an XMLException if the XML can't be parsed or the validator can't be initialized.
XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 214.31.8 Constructor(XMLSchema as String) 28678

214.31.8 Constructor(XMLSchema as String)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The constructor taking XML text.
Notes:

May raise an XMLException if the XML can't be parsed or the validator can't be initialized.

For MBS Plugin 20.2 this function accepts also a file name/path to initialize.
XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 214.31.7 Constructor(File as FolderItem) 28678

214.31.9 Destructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

214.31.10 LoadIconvLibrary(path as String, byref Error as String) as boolean

MBS Util Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Loads the iconv library.
Notes:

The XML classes may use libiconv for text encoding conversion.
If you explicitly need, you can load the library on start of solution.

MBS Plugin may try to load iconv.dll/dylib/so automatically when first iconv function is called.

214.31.11 Message(index as Integer) as XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a message by index.
Notes: Index from 0 to MessageCount-1.

214.31.12 Messages as XMLValidatorMessageMBS()

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array of messages recorded while validating.

214.31.13 SetCurrentWorkingDirectory(path as folderitem) as boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes:

The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

- 214.31.14 SetCurrentWorkingDirectory(path as String) as boolean 28680

214.31.14 SetCurrentWorkingDirectory(path as String) as boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets current working directory for the application.
Notes:

The library looks in current directory to find related files.
So if your schema or the XML file to check references other files, please set the diretory.

Returns true on success or false on failure.
See also:

- 214.31.13 SetCurrentWorkingDirectory(path as folderitem) as boolean 28679

214.31.15 ValidateFile(file as FolderItem) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML file against a XML schema.
Example:

```
Dim f As FolderItem = SpecialFolder.Desktop.Child("schema.txt")
Dim v As New XMLValidatorMBS(f)

Dim t As FolderItem = SpecialFolder.Desktop.Child("test.xml")
Dim r As Integer = v.ValidateFile(t)
```

Notes:

Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 214.31.16 ValidateFile(path as string) as Integer 28681

214.31.16 ValidateFile(path as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML file against a XML schema.
Notes:

Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.
Please pass in XML file path and a valid XSD schema.

Use SetCurrentWorkingDirectory with file.parent to set working directory if needed.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.
See also:

- 214.31.15 ValidateFile(file as FolderItem) as Integer 28680

214.31.17 ValidateString(text as string) as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Validates XML text against a XML schema.
Notes:

Validate a document tree in memory.
Returns 0 if the document is schemas valid, a positive error code number otherwise and -1 in case of internal or API error.

See messages array for the logged error and warning messages.

XML should have unix line endings (char 10), be saved as UTF-8 and itself a valid XML, so we can parse it corectly.

214.31.18 Properties

214.31.19 MessageCount as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries number of messages we recorded in validation.
Notes: (Read only property)

214.31.20 Events

214.31.21 Error(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: .

Function: The error event called for validation errors.

214.31.22 Warning(message as XMLValidatorMessageMBS)

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: .

Function: The warning event called for validation warnings.

214.32 class XMLValidatorMessageMBS

214.32.1 class XMLValidatorMessageMBS

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for an error or warning message in XML validator.
Notes: This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.32.2 Blog Entries

- New XML Validator class for Xojo

214.32.3 Blog Entries

- New XML Validator class for Xojo

214.32.4 Methods

214.32.5 Constructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: Desktop only.

Function: The private constructor.

214.32.6 Destructor

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The destructor.

214.32.7 Properties

214.32.8 Code as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The error code.
Notes: (Read only property)

214.32.9 FileName as String

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The filename if available.
Notes: (Read only property)

214.32.10 IsError as Boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this was reported as error and not as warning.
Notes: (Read only property)

214.32.11 IsWarning as Boolean

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether this was reported as warning and not as error.
Notes: (Read only property)

214.32.12 Line as Integer

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The line number in the XML file if available.
Notes: (Read only property)

214.32.13 Message as String

MBS Util Plugin, Plugin Version: 19.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: The message text.
Notes: (Read only property)

214.33 class XMLXPathResultMBS

214.33.1 class XMLXPathResultMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The class for an XPath result.
Notes:

The DOMXPathResult interface represents the result of the evaluation of an XPath 1.0 or XPath 2.0 expression within the context of a particular node. Since evaluation of an XPath expression can result in various result types, this object makes it possible to discover and manipulate the type and value of the result.
This is an abstract class. You can't create an instance, but you can get one from various plugin functions.

214.33.6 Methods

214.33.7 Constructor

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The private constructor.

214.33.8 iterateNext as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Iterates and returns true if the current result is the next item from the sequence or false if there are no more items.
Notes:

Returns True if the current result is the next item from the sequence or false if there are no more items.

Raises exception if ResultType is not ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or if ResultType is not ResultTypeIteratorResult (XPath 2.0).

214.33.9 snapshotItem(size as Integer) as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Sets the current result to the indexth item in the snapshot collection.
Notes:

If index is greater than or equal to the number of items in the list, this method returns false. Unlike the iterator result, the snapshot does not become invalid, but may not correspond to the current document if it is mutated.

Returns true if the current result is the next item from the sequence or false if there are no more items.

Raises exception if ResultType is not ResultTypeUnorderedNodeSnapshot or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if ResultType is not ResultTypeSnapshotResult (XPath 2.0).

214.33.10 Properties

214.33.11 BooleanValue as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the boolean value of this result.
Notes:

Raises exception if ResultType is not ResultTypeBoolean (XPath 1.0) or if current result cannot be properly converted to boolean (XPath 2.0).

Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

214.33.12 IntegerValue as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the integer value of this result (XPath 2 only).
Notes:

The value of this integer result.
Raises exception if current result cannot be properly converted to int (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

214.33.13 InvalidIteratorState as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Signifies that the iterator has become invalid.
Notes:

True if ResultType is ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or ResultTypeIteratorResult (XPath 2.0) and the document has been modified since this result was returned.

Raises exception if ResultType is not ResultTypeUnorderedNodeIterator or ResultTypeOrderedNodeIterator (XPath 1.0) or if ResultType is not ResultTypeIteratorResult (XPath 2.0).
(Read only property)

214.33.14 isNode as Boolean

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns true if the result has a current result and the value is a node (XPath 2 only).
Notes:

This function is necessary to distinguish between a string value and a node of type string as returned by the TypeInfo() function.
(Read only property)

214.33.15 NodeValue as XMLNodeMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the node value of this result.
Notes:

The value of this node result, which may be nil.
Raises exception if ResultType is not ResultTypeAnyUnorderedNode, ResultTypeFirstOrderedNode, ResultTypeUnorderedNodeIterator, ResultTypeOrderedNodeIterator, ResultTypeUnorderedNodeSnapshot, or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if current result is not a node (XPath 2.0). Raises exception if there is no current result in the result object.
(Read only property)

214.33.16 NumberValue as Double

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the number value of this result.
Notes:

If the native double type of the DOM binding does not directly support the exact IEEE 754 result of the XPath expression, then it is up to the definition of the binding to specify how the XPath number is converted to the native binding number.
Raises exception if ResultType is not ResultTypeNumber (XPath 1.0) or if current result cannot be properly converted to double (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

214.33.17 ResultType as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the result type of this result.
Notes:

A code representing the type of this result, as defined by the type constants.
(Read only property)

214.33.18 SnapshotLength as Integer

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: The number of items in the result snapshot.

Notes:

Valid values for snapshotItem indices are 0 to snapshotLength-1 inclusive.

Raises exception if ResultType is not ResultTypeUnorderedNodeSnapshot or ResultTypeOrderedNodeSnapshot (XPath 1.0) or if ResultType is not ResultTypeSnapshotResult (XPath 2.0).
(Read only property)

214.33.19 StringValue as String

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the string value of this result.
Notes:

The value of this string result.
Raises exception if ResultType is not ResultTypeString (XPath 1.0) or if current result cannot be properly converted to string (XPath 2.0).
Raises exception if there is no current result in the result object (XPath 2.0).
(Read only property)

214.33.20 TypeInfo as XMLTypeInfoMBS

MBS XML Plugin, Plugin Version: 23.3, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Returns the DOM type info of the current result node or value (XPath 2 only).
Notes: (Read only property)

214.33.21 Constants

214.33.22 ResultTypeAny = 0

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] This code does not represent a specific type. An evaluation of an XPath expression will never produce this type. If this type is requested, then the evaluation returns whatever type naturally results from evaluation of the expression. If the natural result is a node set when ResultTypeAny was requested, then ResultTypeUnorderedNodeIterator is always the resulting type. Any other representation of a node set must be explicitly requested.

214.33.23 ResultTypeAnyUnorderedNode = 8

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a node set as defined by XPath 1.0 and will be accessed as a single node, which may be null if the node set is empty. Document modification does not invalidate the node, but may mean that the result node no longer corresponds to the current document. This is a convenience that permits optimization since the implementation can stop once any node in the resulting set has been found. If there is more than one node in the actual result, the single node returned might not be the first in document order.

214.33.24 ResultTypeBoolean = 3

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a boolean as defined by XPath 1.0. Document modification does not invalidate the boolean, but may mean that reevaluation would not yield the same boolean.

214.33.25 ResultTypeFirstOrderedNode = 9

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a node set as defined by XPath 1.0 and will be accessed as a single node, which may be null if the node set is empty. Document modification does not invalidate the node, but may mean that the result node no longer corresponds to the current document. This is a convenience that permits optimization since the implementation can stop once the first node in document order of the resulting set has been found. If there are more than one node in the actual result, the single node returned will be the first in document order.

214.33.26 ResultTypeFirstResult = 100

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 2.0] The result is a sequence as defined by XPath 2.0 and will be accessed as a single current value or there will be no current value if the sequence is empty. Document modification does not invalidate the value, but may mean that the result no longer corresponds to the current document. This is a convenience that permits optimization since the implementation can stop once the first item in the resulting sequence has been found. If there is more than one item in the actual result, the single item returned might not be the first in document order.

214.33.27 ResultTypeIteratorResult = 101

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 2.0] The result is a sequence as defined by XPath 2.0 that will be accessed iteratively. Document modification invalidates the iteration.

214.33.28 ResultTypeNumber = 1

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a number as defined by XPath 1.0. Document modification does not invalidate the number, but may mean that reevaluation would not yield the same number.

214.33.29 ResultTypeOrderedNodeIterator = 5

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a node set as defined by XPath 1.0 that will be accessed iteratively, which will produce document-ordered nodes. Document modification invalidates the iteration.

214.33.30 ResultTypeOrderedNodeSnapshot = 7

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a node set as defined by XPath 1.0 that will be accessed as a snapshot list of nodes that will be in original document order. Document modification does not invalidate the snapshot but may mean that reevaluation would not yield the same snapshot and nodes in the snapshot may have been altered, moved, or removed from the document.

214.33.31 ResultTypeSnapshotResult = 102

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 2.0] The result is a sequence as defined by XPath 2.0 that will be accessed as a snapshot list of values. Document modification does not invalidate the snapshot but may mean that reevaluation would not yield the same snapshot and any items in the snapshot may have been altered, moved, or removed from

the document.

214.33.32 ResultTypeString = 2

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a string as defined by XPath 1.0. Document modification does not invalidate the string, but may mean that the string no longer corresponds to the current document.

214.33.33 ResultTypeUnorderedNodeIterator = 4

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a node set as defined by XPath 1.0 that will be accessed iteratively, which may not produce nodes in a particular order. Document modification invalidates the iteration. This is the default type returned if the result is a node set and ResultTypeAny is requested.

214.33.34 ResultTypeUnorderedNodeSnapshot = 6

MBS XML Plugin, Plugin Version: 23.3.

Function: One of the result type constants.
Notes: [XPath 1.0] The result is a node set as defined by XPath 1.0 that will be accessed as a snapshot list of nodes that may not be in a particular order. Document modification does not invalidate the snapshot but may mean that reevaluation would not yield the same snapshot and nodes in the snapshot may have been altered, moved, or removed from the document.

Chapter 215

XMP

215.1 class XMPAssertNotifyMBS

215.1.1 class XMPAssertNotifyMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: This class provides a way to get notified for Assertion.
Notes: Only one instance can be registered at a given time.

215.1.2 Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

215.1.3 Blog Entries

- MBS Real Studio Plugins, version 12.5pr2

215.1.4 Events

215.1.5 Assert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: .

Function: An assertion was reported.
Example:

```
Sub Assert(text as string)
MsgBox text
```

```
End Sub
```

Notes: Display it to the user or just log it for debugging.

215.2 class XMPDateTimeMBS

215.2.1 class XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The expanded type for a date and time.
Notes:

Dates and time in the serialized XMP are ISO 8601 strings. The XMPDateTimeMBS class allows easy conversion with other formats.

DateTime values are occasionally used in cases with only a date or only a time component. A date without a time has zeros in the XMPDateTimeMBS class for all time fields. A time without a date has zeros for all date fields (year, month, and day).

215.2.2 Methods

215.2.3 ClearTimeZone

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Resets the timezone by setting all time zone properties to zero.

215.2.4 Clone as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of this date.
Notes: Not just a new reference to the same object, but a real copy.

215.2.5 Compare(other as XMPDateTimeMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compare the order of two date/time values.
Notes:

Returns:
-1 if self is before other or other=nil
0 if self matches other
+1 if self is after other

215.2.6 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the current date and time.
Notes: The returned time is UTC, properly adjusted for the local time zone. The resolution of the time is not guaranteed to be finer than seconds.
See also:

- 215.2.7 Constructor(text as string) 28696

215.2.7 Constructor(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.
See also:

- 215.2.6 Constructor 28696

215.2.8 ConvertToLocalTime

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make sure a time is local.
Notes: If the time zone is not the local zone, the time is adjusted and the time zone set to be local.

215.2.9 ConvertToUTCTime

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Make sure a time is UTC.
Notes: If the time zone is not UTC, the time is adjusted and the time zone set to be UTC.

215.2.10 IsDateOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether only the date is defined for this datetime object.

215.2.11 IsTimeOnly as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether only the time is defined for this datetime object.

215.2.12 Operator_Convert as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.
See also:

- 215.2.13 Operator_Convert(text as string) 28697

215.2.13 Operator_Convert(text as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.
See also:

- 215.2.12 Operator_Convert as string 28697

215.2.14 SetTimeZone

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Set the local time zone.
Notes: Any existing time zone value is replaced, the other date/time fields are not adjusted in any way.

215.2.15 Str as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.

215.2.16 Properties

215.2.17 Day as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The day of the month in the range 1..31.
Notes: (Read and Write property)

215.2.18 hasDate as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property to tell if the date is defined in this object.
Notes: (Read and Write property)

215.2.19 hasTime as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: A property to tell if the time is defined in this object.
Notes: (Read and Write property)

215.2.20 hasTimeZone as Boolean

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Whether there is a time zone set.
Notes: (Read and Write property)

215.2.21 Hour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The hour in the range 0..23.
Notes: (Read and Write property)

215.2.22 Minute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The minute in the range 0..59.
Notes: (Read and Write property)

215.2.23 Month as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The month in the range 1..12.
Notes: (Read and Write property)

215.2.24 NanoSecond as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Nanoseconds within a second, often left as zero.
Notes: (Read and Write property)

215.2.25 Second as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The second in the range 0..59.
Notes: (Read and Write property)

215.2.26 TimezoneHour as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone hour in the range 0..23.
Notes: (Read and Write property)

215.2.27 TimezoneMinute as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The time zone minute in the range 0..59.
Notes: (Read and Write property)

215.2.28 TimezoneSign as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The "sign" of the time zone, 0 means UTC, -1 is west, +1 is east.
Notes:

The "sign" of the time zone, kTimeIsUTC (0) means UTC, kTimeWestOfUTC (-1) is west, kTimeEastOfUTC (+1) is east.
(Read and Write property)

215.2.29 Year as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The year, can be negative.
Notes: (Read and Write property)

215.2.30 Constants

215.2.31 kXMP_TimeEastOfUTC = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the TimezoneSign property.
Notes: UTC time.

215.2.32 kXMP_TimeIsUTC = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the TimezoneSign property.
Notes: Time zone is east of UTC.

215.2.33 kXMP_TimeWestOfUTC = -1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the TimezoneSign property.
Notes: Time zone is west of UTC.

215.3 class XMPExceptionMBS

215.3.1 class XMPExceptionMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The exception class for the other XMP classes.
Notes:

For current plugins (6.4): Windows and MachO works, Carbon/Classic PEF crashes on an exception. Linux not tested.

Nearly every method or function may raise this exception, so catch it!
Subclass of the RuntimeException class.

215.4 class XMPFilesMBS

215.4.1 class XMPFilesMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for access to the main (document-level) metadata in a file.
Notes:

The Adobe XMP Toolkit's file handling component, XMPFiles, is a front end to a set of format-specific file handlers that support file I/O for XMP. The file handlers implement smart, efficient support for those file formats for which the means to embed XMP is defined in the XMP Specification. Where possible, this support allows:

* Injection of XMP where none currently exists

- Expansion of XMP without regard to existing padding
- Reconciliation of the XMP and other legacy forms of metadata.

TXMPFiles is designed for use by clients interested in the metadata and not in the primary file content; the Adobe Bridge application is a typical example. TXMPFiles is not intended to be appropriate for files authored by an application; that is, those files for which the application has explicit knowledge of the file format.

Supported file formats:
PDF, PostScript, EPS, JPEG, JPEG2K, TIFF, GIF, PNG, SWF, FLA, FLV, MOV, AVI, CIN, WAV, MP3, SES, CEL, MPEG, MPEG2, MPEG4, WMAV, AIFF, P2, XDCAM_FAM, XDCAM_SAM, XDCAM_EX, AVCHD, SonyHDV, HTML, XML, Text, Photoshop, Illustrator, InDesign, AEProject, AEProjTemplate, AEFilterPreset, EncoreProject, PremiereProject, PremiereTitle and UCF.

Based on the XMP-Toolkit-SDK from Adobe.

This constructor crashes on Linux with 14.0 plugins and Xojo 2011r1 and 2011r3. Some change in 2011r4 makes it work, so up to Xojo 2014 we don't see the crash.

215.4.4 Methods

215.4.5 CanPutXMP(xmpPacket as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CanPutXMP() reports whether this file can be updated with a specific XMP packet.
Notes: Use to determine if the file can probably be updated with a given set of XMP metadata. This depends on the size of the packet, the options with which the file was opened, and the capabilities of the handler for the file format. The function obtains the length of the serialized packet for the provided XMP, but does not keep it or modify it, and does not cause the file to be written when closed.
See also:

- 215.4.6 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean 28704

215.4.6 CanPutXMP(xmpPacket as XMPMetaMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function:

CanPutXMP() reports whether this file can be updated with a specific XMP packet,
passed in a string object.
See also:

- 215.4.5 CanPutXMP(xmpPacket as string) as boolean 28704

215.4.7 CheckFileFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CheckFileFormat() tries to determine the format of a file.
Notes:

CheckFileFormat tries to determine the format of a file, returning an format value. It uses the same logic as OpenFile will use to select a smart handler.

path: The path for the file, appropriate for the local operating system. Passed as a UTF-8 string. The path is the same as would be passed to OpenFile.

Returns the file's format if a smart handler would be selected, otherwise kUnknownFile.

215.4.8 CheckPackageFormat(path as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CheckPackageFormat() tries to determine the format of a "package" folder.
Notes:

CheckPackageFormat tries to determine the format of a "package" given the name of the top level folder, returning an XMP_FileFormat value. Examples of recognized packages include the video formats P2, XDCAM, or Sony HDV. These packages contain collections of "clips", stored as multiple files in specific subfolders.

Path: The path for the top level folder, appropriate for the local operating
system. Passed as an UTF-8 string. The path is not the same as would be passed to OpenFile. For example the path passed to CheckPackageFormat might be ".../MyMovie", while the path passed to OpenFile would be ".../MyMovie/SomeClip".

Returns the package's format if a smart handler would be selected, otherwise kUnknownFile.

215.4.9 CloseFile(closeFlags as Integer)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: CloseFile() explicitly closes an opened file.
Notes:

Performs any necessary output to the file and closes it. Files that are opened for update are written to only when closing.

If the file is opened for read-only access (passing kOpenForRead), the disk
file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.

If the file is opened for update (passing kOpenForUpdate), the disk file remains
open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of

how many calls are made to PutXMP().

closeFlags: Option flags for optional closing actions. This bit-flag constant is defined:

- kUpdateSafely - Write into a temporary file then swap for crash safety.

215.4.10 Constructor

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor initializes an object that is associated with no file.
Notes: The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 215.4.11 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) 28706
- 215.4.12 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) 28707

215.4.11 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file for metadata access.
Notes:

Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, appropriate for the local operating system.
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.
- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Throws an exception for serious problems.
See also:

- 215.4.10 Constructor 28706
- 215.4.12 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) 28707

215.4.12 Constructor(path as string, format as Integer=& h20202020, OpenFlags as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alternate constructor associates the new XMPFiles object with a specific file.
Notes:

Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as an UTF-8 string. (use FolderItem.NativePath)
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning
- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 215.4.10 Constructor 28706
- 215.4.11 Constructor(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) 28706

215.4.13 GetFileInfo(byref path as string, byref openFlags as UInt32, byref format as UInt32, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetFileInfo() retrieves basic information about an opened file.
Notes:

path: A buffer in which to return the path passed to OpenFile(). Can be
null if value is not wanted.

openFlags: A variable in which to return the option flags passed to
OpenFile.
format: A variable in which to return the file format.
handlerFlags: [out] A variable in which to return the handler's capability flags.

Returns true if the file object is in the open state; that is, OpenFile() has been called but CloseFile() has not. False otherwise. Even if the file object is open, the actual disk file might be closed in the host file-system sense; see OpenFile().

215.4.14 GetFormatInfo(format as Integer, byref handlerFlags as UInt32) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetFormatInfo() reports what features are supported for a specific file format.
Example:

```
dim flags as UInt32
if XMPFilesMBS.GetFormatInfo(XMPFilesMBS.kJPEGFile, flags) then

if BitwiseAnd(flags, XMPFilesMBS.kCanInjectXMP) <>0 then
MsgBox "Can inject first-time XMP into an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanExpand) <>0 then
MsgBox "Can expand XMP or other metadata in an existing file."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanRewrite) <>0 then
MsgBox "Can copy one file to another, writing new metadata (as in SaveAs)."
end if

if BitwiseAnd(flags, XMPFilesMBS.kCanReconcile) <>0 then
MsgBox "Supports reconciliation between XMP and other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kAllowsOnlyXMP) <>0 then
MsgBox "Allows access to just the XMP, ignoring other forms."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsTNail) <>0 then
MsgBox "File handler returns native thumbnail information."
end if

if BitwiseAnd(flags, XMPFilesMBS.kReturnsRawPacket) <>0 then
MsgBox "File handler returns raw XMP packet information and string."
end if

end if
```

Notes:

The file handlers for different file formats vary considerably in what features they support. Support depends on both the general capabilities of the format and the implementation of the handler for that format.

format: The file format whose support flags are desired.

handlerFlags: A variable in which to return a logical OR of option bit flags.
The following constants are defined:

- kCanInjectXMP - Can inject first-time XMP into an existing file.
- kCanExpand - Can expand XMP or other metadata in an existing file.
- kCanRewrite - Can copy one file to another, writing new metadata (as in SaveAs)
- kCanReconcile - Supports reconciliation between XMP and other forms.
- kAllowsOnlyXMP - Allows access to just the XMP, ignoring other forms.

This is only meaningful if kCanReconcile is set.

- kReturnsTNail - File handler returns native thumbnail information.
- kReturnsRawPacket - File handler returns raw XMP packet information and string.

Even if kReturnsRawPacket is set, the returned packet information might have an
offset of -1 to indicate an unknown offset. While all file handlers should be able to return the raw packet, some might not know the offset of the packet within the file. This is typical in cases where external libraries are used. These cases might not even allow return of the raw packet.

Returns true if the format has explicit "smart" support, false if the format is handled by the default packet scanning plus heuristics.

215.4.15 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetVersionInfo() retrieves version information for the XMPFiles component.

215.4.16 GetXMP(byref xmp as XMPMetaMBS, byref xmppacket as string, byref PacketInfo as XMPPacketInfoMBS) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetXMP() retrieves the XMP metadata from an open file.
Notes:

The function reports whether XMP is present in the file; you can choose to retrieve any or all of the parsed XMP, the raw XMP packet, or information about the raw XMP packet. The options provided when the file

was opened determine if reconciliation is done with other forms of metadata.

xmp: An XMP object in which to return the parsed XMP metadata.
xmppacket: An string in which to return the raw XMP packet as stored in
the file. The encoding of the packet is given in the packetInfo. Returns an
empty string if the low level file handler does not provide the raw packet.
packetInfo: A packetinfo object in which to return the location and form of the raw XMP in the file. PacketInfo.charForm and PacketInfo.writeable reflect the
raw XMP in the file. The parsed XMP property values are always UTF-8. The writeable flag is taken from the packet trailer; it applies only to "format ignorant" writing. The PacketInfo object always reflects the state of the XMP in the file. The offset, length, and character form do not change as a result of calling PutXMP() unless the file is also written. Some file handlers might not return location or contents of the raw packet string. To determine whether one does, check the kReturnsRawPacket bit returned by GetFormatInfo(). If the low-level file handler does not provide the raw packet location, PacketInfo.offset and PacketInfo.length are both 0, PacketInfo.charForm is UTF-8, and PacketInfo.writeable is false.

215.4.17 OpenFile(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 10.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Alternate constructor associates the new XMPFiles object with a specific file.
Notes:

Calls OpenFile() to open the specified file after performing a default construct.

path: The path for the file, specified as folderitem.
format: A format hint for the file, if known.
openFlags: Options for how the file is to be opened (for read or read/write, for example). Use a logical OR of these bit-flag constants:

- kOpenForRead
- kOpenForUpdate
- kOpenOnlyXMP
- kOpenCacheTNail
- kOpenStrictly
- kOpenUseSmartHandler
- kOpenUsePacketScanning
- kOpenLimitedScanning

- kOpenInBackground

The destructor does not call CloseFile(); pending updates are lost when the destructor is run.
See also:

- 215.4.18 OpenFile(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean 28712

215.4.18 OpenFile(path as string, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Opens a file for metadata access.
Notes:

Opens a file for the requested forms of metadata access. Opening the file at a minimum causes the raw XMP packet to be read from the file. If the file handler supports legacy metadata reconciliation then legacy metadata is also read, unless kOpenOnlyXMP is passed. If the file handler supports native thumbnails and kOpenCacheTNail is passed, the native thumbnail is cached.
If the file is opened for read-only access (passing kOpenForRead), the disk file is closed immediately after reading the data from it; the XMPFiles object, however, remains in the open state. You must call CloseFile() when finished using it. Other methods, such as GetXMP(), can only be used between the OpenFile() and CloseFile() calls. The XMPFiles destructor does not call CloseFile(); if you call it without closing, any pending updates are lost.
If the file is opened for update (passing kOpenForUpdate), the disk file remains open until CloseFile() is called. The disk file is only updated once, when CloseFile() is called, regardless of how many calls are made to PutXMP().
Typically, the XMP is not parsed and legacy reconciliation is not performed until GetXMP() is called, but this is not guaranteed. Specific file handlers might do earlier parsing of the XMP. Delayed parsing and early disk file close for read-only access are optimizations to help clients implementing file browsers, so that they can access the file briefly and possibly display a thumbnail, then postpone more expensive XMP processing until later.

path: The path for the file, specified as an UTF-8 string. (use FolderItem.NativePath)
format: The format of the file. If the format is unknown (kUnknownFile) the format is determined from the file content. The first handler to check is guessed from the file's extension. Passing a specific format value is generally just a hint about what file handler to try first (instead of the one based on the extension). If kOpenStrictly is set, then any format other than kUnknownFile requires that the file actually be that format; otherwise an exception is thrown.
openFlags: A set of option flags that describe the desired access. By default (zero) the file is opened for read-only access and the format handler decides on the level of reconciliation that will be performed. A logical OR of these bit-flag constants:

- kOpenForRead - Open for read-only access.

- kOpenForUpdate - Open for reading and writing.
- kOpenOnlyXMP - Only the XMP is wanted, no reconciliation.
- kOpenCacheTNail - Cache thumbnail if possible, GetThumbnail will be called.
- kOpenStrictly - Be strict about locating XMP and reconciling with other forms. By default, a best effort is made to locate the correct XMP and to reconcile XMP with other forms (if reconciliation is done). This option forces stricter rules, resulting in exceptions for errors. The definition of strictness is specific to each handler, there might be no difference.
- kOpenUseSmartHandler - Require the use of a smart handler.
- kOpenUsePacketScanning - Force packet scanning, do not use a smart handler.

Returns true if the file is succesfully opened and attached to a file handler. False for anticipated problems, such as passing kOpenUseSmartHandler but not having an appropriate smart handler. Throws an exception for serious problems.

- 215.4.17 OpenFile(path as folderitem, format as Integer=& h20202020, OpenFlags as Integer=0) as boolean 28711

215.4.19 PutXMP(xmpPacket as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: PutXMP() updates the XMP metadata in this object without writing out the file,
Notes: Overloads the basic form of the function, allowing you to pass the metadata as a string object instead of an XMP object. It is otherwise identical; see details in the canonical form.
See also:

- 215.4.20 PutXMP(xmpPacket as XMPMetaMBS) 28713

215.4.20 PutXMP(xmpPacket as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: PutXMP() updates the XMP metadata in this object without writing out the file.
Notes: This function supplies new XMP for the file. However, the disk file is not written until the object is closed with CloseFile(). The options provided when the file was opened determine if reconciliation is done with other forms of metadata.
See also:

- 215.4.19 PutXMP(xmpPacket as string) 28713

215.4.21 Events

215.4.22 Abort as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: .

Function: This event is called periodically to allow a user to cancel time-consuming operations.
Notes:

The event should return true to signal an abort, which results in an exception being thrown.

215.4.23 Constants

215.4.24 kAEFilterPresetFile = & h46465820

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.25 kAEProjectFile = & h41455020

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.26 kAEProjTemplateFile = & h41455420

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: After Effects Project Template

215.4.27 kAIFFFile = & h41494646

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.28 kAllowsOnlyXMP = & h00000020

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: Allows access to just the XMP, ignoring other forms.

215.4.29 kAllowsSafeUpdate = & h00000200

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: The file handler allows crash-safe file updates.

215.4.30 kArrayLastItem = -1

MBS XMP Plugin, Plugin Version: 9.4.

Function: The index constant for the last item.

215.4.31 kAVCHDFile = & h41564844

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.32 kAVIFile = & h41564920

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: Cineon

215.4.33 kCanExpand = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: Can expand XMP or other metadata in an existing file.

215.4.34 kCanInjectXMP = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: Can inject first-time XMP into an existing file.

215.4.35 kCanReconcile = & h00000010

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: Supports reconciliation between XMP and other forms.

215.4.36 kCanRewrite = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: Can copy one file to another, writing new metadata.

215.4.37 kCELFile = & h43454C20

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: Audition loop

215.4.38 kChar16BitBig = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.
Notes: 16-bit big-endian

215.4.39 kChar16BitLittle = 3

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.
Notes: 16-bit little-endian

215.4.40 kChar16BitMask = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.

215.4.41 kChar32BitBig = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.
Notes: 32-bit big-endian

215.4.42 kChar32BitLittle = 5

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.
Notes: 32-bit little-endian

215.4.43 kChar32BitMask = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.

215.4.44 kChar8Bit = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.
Notes: 8-bit

215.4.45 kCharLittleEndianMask = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.

215.4.46 kCharUnknown = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to define the character format.
Notes: Variable or not-yet-known cases

215.4.47 kCINFile = & h43494E20

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.48 kEncoreProjectFile = & h4E434F52

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.49 kEPSFile = & h45505320

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: encapsulated PostScript

215.4.50 kFLAFile = & h464C4120

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.51 kFLVFile = & h464C5620

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.52 kFolderBasedFormat = & h00001000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: The format is folder oriented, for example the P2 video format.

215.4.53 kGIFFile = & h47494620

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.54 kHandlerOwnsFile = & h00000100

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: The file handler does the file open and close.

215.4.55 kHTMLFile = & h48544D4C

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.56 kIllustratorFile = & h41492020

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.57 kInDesignFile = & h494E4444

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.58 kJPEG2KFile = & h4A505820

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: JPEG 2000, ISO 15444-1

215.4.59 kJPEGFile = & h4A504547

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.60 kMOVFile = & h4D4F5620

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: Quicktime

215.4.61 kMP3File = & h4D503320

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.62 kMPEG2File = & h4D503220

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.63 kMPEG4File = & h4D503420

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: ISO 14494-12 and -14

215.4.64 kMPEGFile = & h4D504547

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.65 kNeedsReadOnlyPacket = & h00000400

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: The file format needs the XMP packet to be read-only.

215.4.66 kNoOptions = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: The constant to specify to use no options.

215.4.67 kOpenCacheTNail = 8

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Cache thumbnail if possible, TXMPFiles::GetThumbnail() will be called.

215.4.68 kOpenForRead = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Open for read-only access.

215.4.69 kOpenForUpdate = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Open for reading and writing.

215.4.70 kOpenInBackground = & h10000000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Set if calling from background thread.

215.4.71 kOpenLimitedScanning = & h00000080

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Only packet scan files "known" to need scanning.

215.4.72 kOpenOnlyXMP = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Only the XMP is wanted, allows space/time optimizations.

215.4.73 kOpenRepairFile = & h00000100

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Attempt to repair a file opened for update, default is to not open (throw an exception).

215.4.74 kOpenStrictly = & h00000010

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Be strict about locating XMP and reconciling with other forms.

215.4.75 kOpenUsePacketScanning = & h00000040

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Force packet scanning, do not use a smart handler.

215.4.76 kOpenUseSmartHandler = & h00000020

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for OpenFile().
Notes: Require the use of a smart handler.

215.4.77 kP2File = & h50322020

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: a collection not really a single file

215.4.78 kPDFFile = & h50444620

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.79 kPhotoshopFile = & h50534420

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.80 kPNGFile = & h504E4720

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.81 kPostScriptFile = & h50532020

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: general PostScript following DSC conventions

215.4.82 kPrefersInPlace = 8

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: Can expand, but prefers in-place update.

215.4.83 kPremiereProjectFile = & h5052504A

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.84 kPremiereTitleFile = & h5052544C

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.85 kReturnsRawPacket = & h00000040

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: File handler returns raw XMP packet information.

215.4.86 kReturnsTNail = & h00000080

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: File handler returns native thumbnail.

215.4.87 kSESFile = & h53455320

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: Audition session

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: a collection not really a single file

215.4.89 kSWFFile = & h53574620

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.90 kTextFile = & h74657874

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.91 kTIFFFile = & h54494646

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.92 kUCFFile = & h55434620

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: Universal Container Format

215.4.93 kUnknownFile = & h20202020

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: Unknown file format constant

215.4.94 kUnknownLength = -1

MBS XMP Plugin, Plugin Version: 9.4.

Function: Constant for an unknown packet length within a file.

215.4.95 kUnknownOffset = -1

MBS XMP Plugin, Plugin Version: 9.4.

Function: Constant for an unknown packet offset within a file.

215.4.96 kUpdateSafely = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for CloseFile().
Notes: Write into a temporary file and swap for crash safety.

215.4.97 kUseNullTermination = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: The length constants for a string to determinate the length automatically.

215.4.98 kUsesSidecarXMP = & h00000800

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for GetFormatInfo
Notes: The file handler uses a "sidecar" file for the XMP.

215.4.99 kWAVFile = & h57415620

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.4.100 kWMAVFile = & h574D4156

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: Windows Media Audio and Video

215.4.101 kXDCAM_EXFile = & h58444358

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: a collection not really a single file

215.4.102 kXDCAM_FAMFile = & h58444346

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: a collection not really a single file

215.4.103 kXDCAM_SAMFile = & h58444353

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.
Notes: a collection not really a single file

215.4.104 kXMLFile = & h584D4C20

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants to specify a file type.

215.5 class XMPIteratorMBS

215.5.1 class XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XMPIteratorMBS class provides a uniform means to iterate over several XMP data structures, including the schema and properties within an XMP object plus global tables such as registered namespaces.
Notes:

Note: Only XMP object iteration is implemented at this time. There are no table iterators yet.

Iteration over the schema and properties within an XMP object is the most important and complex use of XMPIteratorMBS. It is helpful to have a thorough understanding of the XMP data tree. One way to learn this is to create some complex XMP and examine the output of XMPMetaMBS.DumpObject. This is also described in the XMP Specification, in the XMP Data Model chapter.
The top of the XMP data tree is a single root node. This does not explicitly appear in the dump and is never visited by an iterator (that is, it is never returned from XMPIteratorMBS.Next). Beneath the root are schema nodes. These are just collectors for top level properties in the same namespace. They are created and destroyed implicitly. Beneath the schema nodes are the property nodes. The nodes below a property node depend on its type (simple, struct, or array) and whether it has qualifiers.

A XMPIteratorMBS constructor defines a starting point for the iteration and options that control how it proceeds. By default the iteration starts at the root and visits all nodes beneath it in a depth first manner. The root node is not visited, the first visited node is a schema node. You can provide a schema name or property path to select a different starting node. By default this visits the named root node first then all nodes beneath it in a depth first manner.

The XMPIteratorMBS.Next method delivers the schema URI, path, and option flags for the node being visited. If the node is simple it also delivers the value. Qualifiers for this node are visited next. The fields of a struct or items of an array are visited after the qualifiers of the parent.

The options to control the iteration are:

kXMP_IterJustChildren	Visit just the immediate children of the root. Skip the root itself and all nodes below the immediate children. This omits the qualifiers of the immediate children, the qualifier nodes being below what they qualify.
kXMP_IterJustLeafNodes	Visit just the leaf property nodes and their qualifiers.
kXMP_IterJustLeafName	Return just the leaf component of the node names. The default is to return the full path name.
kXMP_IterIncludeAliases	Include aliases as part of the iteration. Since aliases are not actual nodes the default iteration does not visit them.
kXMP_IterOmitQualifiers	Do not visit the qualifiers of a node.

215.5.2 Methods

215.5.3 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Empty constructor which does nothing.
See also:

- 215.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0) 28730
- 215.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 28731
- 215.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0) 28731
- 215.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 28732

215.5.4 Constructor(meta as XMPMetaMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes:

options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.
See also:

- 215.5.3 Constructor 28730
- 215.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0) 28731

- 215.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 28732

215.5.5 Constructor(meta as XMPMetaMBS, schemaNS as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes:

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.
See also:

- 215.5.3 Constructor 28730

- 215.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 28732

215.5.6 Constructor(meta as XMPMetaMBS, schemaNS as string, propName as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the global tables of the XMP toolkit.
Notes:

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

Note: Not yet implemented in the XMP SDK.

- 215.5.7 Constructor(schemaNS as string, propName as string, options as Integer) 28732

215.5.7 Constructor(schemaNS as string, propName as string, options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an iterator for the properties within an XMP object.
Notes:

On success handle is not 0.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

215.5.8 NextItem() as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
See also:

- 215.5.9 NextItem(byref schemaNS as string) as boolean 28733
- 215.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 28734
- 215.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 28734
- 215.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 28735

215.5.9 NextItem(byref schemaNS as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 215.5.8 NextItem() as boolean 28733
- 215.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 28734
- 215.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 28734
- 215.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 28735

215.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.

See also:

- 215.5.8 NextItem() as boolean 28733
- 215.5.9 NextItem(byref schemaNS as string) as boolean 28733
- 215.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 28734
- 215.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 28735

215.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.

See also:

- 215.5.8 NextItem() as boolean 28733
- 215.5.9 NextItem(byref schemaNS as string) as boolean 28733

- 215.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 28734
- 215.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean 28735

215.5.12 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Visit the next node in the iteration.
Notes:

Parameters:

schemaNS	A string that is assigned the schema namespace URI of the current property.
propPath	A string that is assigned the XPath name of the current property.
propValue	A string that is assigned the value of the current property.
options	An integer that is assigned the flags describing the current property.

See also:

- 215.5.8 NextItem() as boolean 28733
- 215.5.9 NextItem(byref schemaNS as string) as boolean 28733
- 215.5.10 NextItem(byref schemaNS as string, byref propPath as string) as boolean 28734
- 215.5.11 NextItem(byref schemaNS as string, byref propPath as string, byref propValue as string) as boolean 28734

215.5.13 Skip(options as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Skip some portion of the remaining iterations.
Notes:

The available option flags are:

kXMP_IterSkipSubtree	= 1	Skip the subtree below the current node.
kXMP_IterSkipSiblings	= 2	Skip the subtree below and remaining siblings of the current node.

215.6 class XMPMetaMBS

215.6.1 class XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The main class for the Adobe XMP SDK.

215.6.2 Blog Entries

- Tip of the day: Change EXIF metadata
- MBS Real Studio Plugins, version 12.5pr2

215.6.3 Blog Entries

- Tip of the day: Change EXIF metadata
- MBS Real Studio Plugins, version 12.5pr2

215.6.4 Methods

215.6.5 AppendArrayItem(schemaNS as string, arrayName as string, arrayOptions as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Appends an item to an array.
Notes:

AppendArrayItem simplifies construction of an array by not requiring that you pre-create an empty array. The array that is assigned is created automatically if it does not yet exist. Each call to AppendArrayItem appends an item to the array. The corresponding parameters have the same use as SetArrayItem. The arrayOptions parameter is used to specify what kind of array. If the array exists, it must have the specified form.

Parameters:

215.6.6 ApplyTemplate(WorkingXMP as XMPMetaMBS, template as XMPMetaMBS, actions as Integer)

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be null or the empty string. Has the same namespace prefix usage as propPath in GetProperty.
arrayOptions	Option flags describing the array form. The only valid bits are those that are part of kXMP_PropArrayFormMask: kXMP_PropValueIsArray (& h200), kXMP_PropArrayIsOrdered (& h400), kXMP_PropArrayIsAlternate (& h800), or kXMP_PropArrayIsAltText (& h1000).
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
itemOptions	Option flags describing the item.

Function: Applies an xmp template.

215.6.7 CatenateArrayItems(schemaNS as string, arrayName as string, separator as string, quotes as string, options as Integer) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Create a single edit string from an array of strings.
Notes:

xmpObj	The XMP object containing the array to be catenated.
schemaNS	The schema namespace URI for the array. Must not be an empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Each item in the array must be a simple string value.
separator	The string to be used to separate the items in the catenated string. Defaults to "; ", ASCII semicolon and space (U+003B, U+0020).
quotes	The characters to be used as quotes around array items that contain a separator. Defaults to '"', ASCII quote (U+0022).
options	Option flags to control the catenation.

returns the string with the catenated array items.

215.6.8 Clone as XMPMetaMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates a copy of the XMPMeta Object.
Notes:

Deep copy, not just a new reference.
Returns nil on any error.

215.6.9 ComposeArrayItemPath(schemaNS as string, arrayName as string, itemIndex as Integer) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for an item in an array.
Notes:

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.

Returns the composed path. This will be of the form <tt>ns:arrayName [i] </tt>, where "ns" is the prefix for schemaNS and "i" is the decimal representation of itemIndex. If the value of itemIndex is kXMP_ArrayLastItem, the path is <tt>ns:arrayName [last()] </tt>.

215.6.10 ComposeFieldSelector(schemaNS as string, arrayName as string, fieldNS as string, fieldName as string, fieldValue as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression to select an alternate item by a field's value.
Notes:

The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeFieldSelector lets you select an item in an array of structs based on the value of one of the fields in the structs. The other form of content addressing is shown in ComposeLangSelector.

For example, consider a simple struct that has two fields, the name of a city and the URI of an FTP site in that city. Use this to create an array of download alternatives. You can show the user a popup built from the values of the city fields. You can then get the corresponding URI as follows:

```
path=ComposeFieldSelector ( schemaNS, "Downloads", fieldNS, "City", chosenCity)
exists = GetStructField ( schemaNS, path, fieldNS, "URI", uri )
```

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field used as the selector. Must not be an empty string.
fieldName	The name of the field used as the selector. Must be a simple XML name, must not be an empty string. It must be the name of a field that is itself simple.
fieldValue	The desired value of the field.

Returns the string with the composed path. This will be of the form <tt>ns:arrayName [fNS:fieldName='fieldValue'] </tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

215.6.11 ComposeLangSelector(schemaNS as string, arrayName as string, langName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression to select an alternate item by language.
Notes:

The path syntax allows two forms of "content addressing" that may be used to select an item in an array of alternatives. The form used in ComposeLangSelector lets you select an item in an alt-text array based on the value of its <tt>xml:lang</tt>qualifier. The other form of content addressing is shown in ComposeFieldSelector.

ComposeLangSelector does not supplant SetLocalizedText or GetLocalizedText.
They should generally be used, as they provide extra logic to choose the appropriate language and maintain consistency with the 'x-default' value. ComposeLangSelector gives you an path expression that is explicitly and only for the language given in the langName parameter.

schemaNS	The namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not be an empty string.
langName	The RFC 3066 code for the desired language.

Returns the composed path. This will be of the form <tt>ns:arrayName [\@xml:lang='langName'] </tt>, where "ns" is the prefix for schemaNS.

215.6.12 ComposeQualifierPath(schemaNS as string, structName as string, qualNS as string, qualName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for a qualifier.
Notes:

schemaNS The namespace URI for the property to which the qualifier is attached. Must not be an empty string.
propName The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string.
qualNS The namespace URI for the qualifier. May be an empty string if the qualifier is in the XML empty namespace.
qualName The name of the qualifier. Must be a simple XML name, must not be an empty string.
Returns the composed path. This will be of the form <tt>ns:propName/?qNS:qualName</tt>, where "ns" is the prefix for schemaNS and "qNS" is the prefix for qualNS.

215.6.13 ComposeStructFieldPath(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Compose the path expression for a field in a struct.
Notes:

schemaNS	The namespace URI for the struct. Must not be null or the empty string.
structName	The name of the struct. May be a general path expression, must not be an empty string.
fieldNS	The namespace URI for the field. Must not be an empty string.
fieldName	The name of the field. Must be a simple XML name, must not be an empty string.

Returns the composed path. This will be of the form <tt>ns:structName/fNS:fieldName</tt>, where "ns" is the prefix for schemaNS and "fNS" is the prefix for fieldNS.

215.6.14 Constructor

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor, creates an empty object.
See also:

- 215.6.15 Constructor(data as memoryblock, Offset as Integer, Size as Integer)

• 215.6.16 Constructor(data as string) 28741

215.6.15 Constructor(data as memoryblock, Offset as Integer, Size as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.
See also:

• 215.6.14 Constructor 28740
• 215.6.16 Constructor(data as string) 28741

215.6.16 Constructor(data as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Construct an object and parse one buffer of RDF into it.
Notes: This constructor creates a new TXMPMeta object and populates it with metadata from a buffer containing serialized RDF. This buffer must be a complete RDF parse stream. Pass "" to construct an empty XMPMetaMBS object. The result of an actual parse is identical to creating an empty object then calling XMPMetaMBS.ParseFromBuffer. The RDF must be complete. If you need to parse with multiple buffers, create an empty object and use XMPMetaMBS.ParseFromBuffer.

• 215.6.14 Constructor 28740
• 215.6.15 Constructor(data as memoryblock, Offset as Integer, Size as Integer) 28741

215.6.17 ConvertFromBool(value as boolean) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from Boolean to string.

215.6.18 ConvertFromDate(value as XMPDateTimeMBS) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from date/time to string.

215.6.19 ConvertFromFloat(value as Double, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from floating point to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "% f".

215.6.20 ConvertFromInt(value as Integer, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "% d".

215.6.21 ConvertFromInt64(value as Int64, format as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from integer to string.
Notes: format: Optional C sprintf format for the conversion. Defaults to "% d".

215.6.22 ConvertToBool(value as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to Boolean.

215.6.23 ConvertToDate(value as string) as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to date/time.

215.6.24 ConvertToFloat(value as string) as Double

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to floating point.

215.6.25 ConvertToInt(value as string) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to integer.

215.6.26 ConvertToInt64(value as string) as Int64

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from string to 64 bit integer.

215.6.27 CountArrayItems(schemaNS as string, arrayName as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Counts array items of given array.
Notes: Returns 0 on any error.

215.6.28 CurrentDateTime as XMPDateTimeMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Current date and time as a XMPDateTimeMBS object.
Notes: Returns nil on any error.

215.6.29 DecodeFromBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Decode from Base64 encoded string to raw data.
Example:

```
dim x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.DecodeFromBase64("dGVzdA==") // test
```

Notes: This is a global method which does not need a valid handle.

215.6.30 DeleteArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteArrayItem deletes the given XMP subtree rooted at the given array item.
Notes:

It is not an error if the array item does not exist.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

215.6.31 DeleteLocalizedText(schemaNS as string="", altTextName as string="", genericLang as string="", specificLang as string="")

MBS XMP Plugin, Plugin Version: 11.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes localized text.

215.6.32 DeleteNamespace(namespaceURI as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Deletes a namespace from the registry.
Notes:

Not implemented?

Does nothing if the URI is not registered, or if the parameter is null or the empty string.

namespaceURI: The URI for the namespace.

215.6.33 DeleteProperty(schemaNS as string, propName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteProperty deletes the given XMP subtree rooted at the given property.
Notes:

It is not an error if the property does not exist.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

215.6.34 DeleteQualifier(schemaNS as string, structName as string, qualNS as string, qualName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteQualifier deletes the given XMP subtree rooted at the given qualifier.
Notes:

It is not an error if the qualifier does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be "" Has the same namespace prefix usage as the propName parameter.

215.6.35 DeleteStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DeleteStructField deletes the given XMP subtree rooted at the given struct field.
Notes:

It is not an error if the field does not exist.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

215.6.36 DoesArrayItemExist(schemaNS as string, arrayName as string, itemIndex as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesArrayItemExist tells if the array item exists.
Notes:

Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.

215.6.37 DoesPropertyExist(schemaNS as string, propName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesPropertyExist tells if the property exists.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.

215.6.38 DoesQualifierExist(schemaNS as string, structName as string, qualNS as string, qualName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesQualifierExist tells if the qualifier exists.
Notes:

Returns true if the qualifier exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be ””. Has the same namespace prefix usage as the propName parameter.

215.6.39 DoesStructFieldExist(schemaNS as string, structName as string, fieldNS as string, fieldName as string) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DoesStructFieldExist tells if the struct field exists.
Notes:

Returns true if the field exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be "". Has the same namespace prefix usage as the structName parameter.

215.6.40 DumpNamespaces(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DumpNamespaces dumps the list of registered namespace URIs and prefixes.
Notes:

This is a global method which does not need a valid handle.
Returns status code. (0=success and -1=error)

215.6.41 DumpObject(output as XMPTextOutputMBS) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: DumpObject dumps the content of an XMP object.
Notes: Returns status code. (0=success and -1=error)

215.6.42 DuplicateSubtree(dest as XMPMetaMBS, sourceNS as string, sourceRoot as string, destNS as string="", destRoot as string="", options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Replicate a subtree from one XMP object into another, possibly at a different location.
Notes:

Parameters:

215.6.43 EncodeToBase64(text as string) as string

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Convert from raw data to Base64 encoded string.

self	The source XMP object.
dest	The destination XMP object.
sourceNS	The schema namespace URI for the source subtree.
sourceRoot	The root location for the source subtree. May be a general path expression, must not be null or the empty string.
destNS	The schema namespace URI for the destination. Defaults to the source namespace.
destRoot	The root location for the destination. May be a general path expression. Defaults to the source location.
options	Option flags to control the separation.

Example:

```
dim x as XMPMetaMBS
x=new XMPMetaMBS
MsgBox x.EncodeToBase64("test") // dGVzdA==
```

Notes: This is a global method which does not need a valid handle.

215.6.44 Erase

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Restores the object to a "just constructed" state.

215.6.45 GetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetArrayItem provides access to items within an array.
Notes:

The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc.

Returns true if the array item exists.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem (-1) always refers to the last existing array item.
itemValue	A string that is assigned the value of the array item, if the array item has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the array item.

215.6.46 GetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, byref actualLang as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetLocalizedText returns information about a selected item in an alt-text array.
Notes:

The array item is selected according to the rules given above.

Returns true if an appropriate array item exists.

Parameters:

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be "". Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag. May be "" if no generic language is wanted.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be null or the empty string.
actualLang	A string that is assigned the language of the selected array item, if an appropriate array item is found.
itemValue	A string that is assigned the value of the array item, if an appropriate array item is found.
options	An integer variable that is assigned option flags describing the array item.

215.6.47 GetNamespacePrefix(namespaceURI as string, byref namespacePrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the prefix for a registered namespace URI.
Notes:

It is not an error if the namespace URI is not registered. The output namespacePrefix string is "" if the namespace URI is not registered.

Parameters:

namespaceURI	The URI for the namespace. Must not be null or the empty string.
namespacePrefix	Returns the prefix registered for this URI, with a terminating ':'.

Returns true if the namespace URI is registered.

This is a global method which does not need a valid handle.

215.6.48 GetNamespaceURI(namespacePrefix as string, byref namespaceURI as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Obtain the URI for a registered namespace prefix.
Notes:

It is not an error if the namespace prefix is not registered. The output namespaceURI string is "" if the namespace prefix is not registered.

Parameters:

namespacePrefix	The prefix for the namespace. Must not be "".
namespaceURI	Returns the URI registered for this prefix.

Returns true if the namespace prefix is registered.

This is a global method which does not need a valid handle.

215.6.49 GetProperty(schemaNS as string, propName as string, byref propValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetProperty is the simplest property getter, mainly for top level simple properties or after using the path composition functions.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. May be an empty string if the first component of the propName path contains a namespace prefix. The URI must be for a registered namespace.
propName	The name of the property. May be a general path expression, must not be an empty string. Using a namespace prefix on the first component is optional. If present without a schemaNS value then the prefix specifies the namespace. The prefix must be for a registered namespace. If both a schemaNS URI and propName prefix are present, they must be corresponding parts of a registered namespace.
propValue	A string that is assigned the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the property.

215.6.50 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes:

Returns true if the property exists.

Parameters:

See also:

- 215.6.51 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

215.6.51 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyBoolean returns the value of a Boolean property as a boolean.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A boolean variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 215.6.50 GetPropertyBoolean(schemaNS as string, propName as string, byref propValue as boolean) as boolean 28752

215.6.52 GetPropertyDate(schemaNS as string, propName as string, byref propValue as XMPDateTimeMBS, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetProperty_Date returns the value of a date/time property as an XMPDateTimeMBS object.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A XMPDateTimeMBS variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

215.6.53 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 215.6.54 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean 28754

215.6.54 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyFloat returns the value of a flaoting point property as a double value.
Notes:

Returns true if the property exists.

Parameters:

See also:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

- 215.6.53 GetPropertyFloat(schemaNS as string, propName as string, byref propValue as Double) as boolean 28754

215.6.55 GetPropertyInt64Double(schemaNS as string, propName as string, byref propValue as Double, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInt64Double returns the value of a 64 bit integer property as a double value.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	A double variable that is assigned the value of the property.
options	An integer variable that is assigned option flags describing the property.

215.6.56 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInteger returns the value of an integer property as an integer.
Notes:

Returns true if the property exists.

Parameters:

See also:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

- 215.6.57 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean 28756

215.6.57 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetPropertyInteger returns the value of an integer property as an integer.
Notes:

Returns true if the property exists.

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An integer variable that is assigned the value of the property.
options	Optional, an integer variable that is assigned option flags describing the property.

See also:

- 215.6.56 GetPropertyInteger(schemaNS as string, propName as string, byref propValue as Integer) as boolean 28755

215.6.58 GetPropertyInteger64(schemaNS as string, propName as string, byref propValue as Int64, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves the value of an integer property as an Int64.
Notes:

Reports whether a property exists, and retrieves its binary value and property type information.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be empty string; see GetProperty() for namespace prefix usage.

propValue: A variable in which to return the binary value.

options: A variable in which to return the option flags describing the property, a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following.

Returns true if the property exists.

215.6.59 GetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, byref qualValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetQualifier provides access to a qualifier attached to a property.
Notes:

The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Note: Qualifiers are only supported for simple leaf properties at this time. (in the XMP SDK)

Returns true if the qualifier exists.

Parameters:

215.6.60 GetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, byref itemValue as string, byref options as Integer) as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: GetStructField provides access to fields within a nested structure.

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	A string variable that is assigned the value of the qualifier, if the qualifier has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the qualifier.

Notes:

The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix. This is unreliable since the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Returns true if the field exists.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An string variable that is assigned the value of the field, if the field has a value. Arrays and non-leaf levels of structs do not have values.
options	An integer variable that is assigned option flags describing the field. May be null if the flags are not wanted.

215.6.61 GetVersionInfo as XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Retrieves runtime version information.

215.6.62 Iterator(schemaNS as string, propName as string, options as Integer) as XMPIteratorMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an iterator for the properties within an XMP object.
Notes:

Returns nil on failure.

schemaNS: Optional schema namespace URI to restrict the iteration. Omitted (visit all schema) by passing "".
propName: Optional property name to restrict the iteration. May be an arbitrary path expression. Omitted (visit all properties) by passing "". If not empty a schema URI must also be provided.
options: Option flags to control the iteration.

The available option flags are:

kXMP_IterJustChildren	= & h100	Just visit the immediate children of the root, default is subtree.
kXMP_IterJustLeafNodes	= & h200	Just visit the leaf nodes, default visits all nodes.
kXMP_IterJustLeafName	= & h400	Return just the leaf part of the path, default is the full path.
kXMP_IterOmitQualifiers	= & h1000	Omit all qualifiers.

215.6.63 MergeFromJPEG(extendedXMP as XMPMetaMBS)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: merges standard and extended XMP retrieved from a JPEG file.
Notes:

When an extended partition stores properties that do not fit into the JPEG file limitationof 64K bytes, this function integrates those properties back into the same XMP object with those from the standard XMP packet.

self: An XMP object which the caller has initialized from the standard XMP packet in a JPEG file. The extended XMP is added to this object.

extendedXMP: An XMP object which the caller has initialized from the extended XMP packet in a JPEG file.

215.6.64 PackageForJPEG(byref standardXMP as string, byref extendedXMP as string, byref extendedDigest as string)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: creates XMP serializations appropriate for a JPEG file.
Notes:

The standard XMP in a JPEG file is limited to 64K bytes. This function serializes the XMP metadata in an XMP object into a string of RDF (see \c SerializeToBuffer) the data does not fit into the 64K byte limit, it creates a second packet string with the extended data.

self: The XMP object containing the metadata.
standardXMP: A string object in which to return the full standard XMP packet.

extendedXMP: A string object in which to return the serialized extended XMP, empty if not needed.

extendedDigest: A string object in which to return an MD5 digest of the serialized extended XMP, empty if not needed.

215.6.65 ParseFromBuffer(buffer as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: ParseFromBuffer parses RDF from a series of input buffers.
Notes:

The buffers may be any length. The buffer boundaries need not respect XML tokens or even Unicode characters.

Parameters:

buffer	Input data buffer. Termination of an input loop is convenient by passing kXMP_ParseMoreBuffers (2) for all real input, then having a final call with a zero length and kXMP_NoOptions.
options	Options controlling the parsing.

The available options are:

kXMP_ParseMoreBuffers	= 2	This is not the last buffer of input, more calls follow.
kXMP_RequireXMPMeta	= 1	The x:xmpmeta XML element is required around rdf:RDF.
kXMP_StrictAliasing	= 4	Do not reconcile alias differences, throw an exception.

Note: The kXMP_StrictAliasing option is not yet implemented.

215.6.66 RegisterNamespace(namespaceURI as string, suggestedPrefix as string, byref registeredPrefix as string) as boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Register a namespace URI with a suggested prefix.
Example:

```
dim x as new XMPMetaMBS
dim registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer
```

Notes:

It is not an error if the URI is already registered, no matter what the prefix is. If the URI is not registered but the suggested prefix is in use, a unique prefix is created from the suggested one. The actual registeed prefix is always returned. The function result tells if the registered prefix is the suggested one.

Parameters:

namespaceURI	The URI for the namespace. Must be a valid XML URI.
suggestedPrefix	The suggested prefix to be used if the URI is not yet registered. Must be a valid XML name.
registeredPrefix	Returns the prefix actually registered for this URI.

Returns true if the registered prefix matches the suggested prefix.

Note: No checking is presently done on either the URI or the prefix.

This is a global method which does not need a valid handle.

215.6.67 RemoveProperties(schemaNS as string="", propName as string="", options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Remove multiple properties from an XMP object.
Notes:

RemoveProperties was created to support the File Info dialog's Delete button, and has been been generalized somewhat from those specific needs. It operates in one of three main modes depending on the schemaNS and propName parameters:
Non-empty schemaNS and propName - The named property is removed if it is an external property, or if the kXMPUI_DoAllProperties option is passed. It does not matter whether the named property is an actual property or an alias.
Non-empty schemaNS and empty propName - The all external properties in the named schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. In addition, aliases from the named schema will be removed if the kXMPUI_IncludeAliases option is passed.
Empty schemaNS and empty propName - All external properties in all schema are removed. Internal properties are also removed if the kXMPUI_DoAllProperties option is passed. Aliases are implicitly handled because the associated actuals are.
It is an error to pass and empty schemaNS and non-empty propName.

xmpObj	The XMP object containing the properties to be removed.
schemaNS	Optional schema namespace URI for the properties to be removed.
propName	Optional path expression for the property to be removed.
options	Option flags to control the deletion. The defined flags are: kXMPUI_DoAllProperties - Do internal properties in addition to external properties. kXMPUI_IncludeAliases - Include aliases in the "named schema" case above.

215.6.68 SeparateArrayItems(schemaNS as string, arrayName as string, options as Integer, catedStr as string)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Separate a single edit string into an array of strings.
Notes:

Parameters:

xmpObj	The XMP object containing the array to be updated.
schemaNS	The schema namespace URI for the array. Must not be null or the empty string.
arrayName	The name of the array. May be a general path expression, must not an empty string. Each item in the array must be a simple string value.
options	Option flags to control the separation.
catedStr	The string to be separated into the array items.

215.6.69 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string=””, baseIndent as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SerializeToBuffer serializes an XMP object into a string as RDF.
Notes:

Returns the serialized RDF.

Parameters:

options	Option flags to control the serialization.
padding	The amount of padding to be added if a writeable XML packet is created. If zero is passed (the default) an appropriate amount of padding is computed.
newline	The string to be used as a line terminator. If empty it defaults to linefeed, U+000A, the standard XML newline.
indent	The string to be used for each level of indentation in the serialized RDF. If empty it defaults to two ASCII spaces, U+0020.
baseIndent	The number of levels of indentation to be used for the outermost XML element in the serialized RDF. This is convenient when embedding the RDF in other text.

The available option flags are:

The specified options must be logically consistent, an exception is thrown if not. You cannot specify both kXMP_OmitPacketWrapper along with kXMP_ReadOnlyPacket, kXMP_IncludeThumbnailPad, or kXMP_ExactPacketLength.
In addition, one of the following encoding options may be included:

See also:

- 215.6.70 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string 28764

kXMP_OmitPacketWrapper	= & h10	Do not include an XML packet wrapper.
kXMP_ReadOnlyPacket	= & h20	Create a read-only XML packet wapper.
kXMP_UseCompactFormat	= & h40	Use a highly compact RDF syntax and layout.
kXMP_WriteAliasComments	= & h400	Include XML comments for aliases.
kXMP_IncludeThumbnailPad	= & h100	Include typical space for a JPEG thumbnail in the padding if no xmp:Thumbnails property is present.
kXMP_ExactPacketLength	= & h200	The padding parameter provides the overall packet length. The actual amount of padding is computed. An exception is thrown if the packet exceeds this length with no padding.

kXMP_EncodeUTF8	= 0	Encode as UTF-8, the default.
kXMP_EncodeUTF16Big	= 2	Encode as big-endian UTF-16.
kXMP_EncodeUTF16Little	= 3	Encode as little-endian UTF-16.
kXMP_EncodeUTF32Big	= 4	Encode as big-endian UTF-32.
kXMP_EncodeUTF32Little	= 5	Encode as little-endian UTF-32.

215.6.70 SerializeToBuffer(options as Integer=0, padding as Integer=0) as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SerializeToBuffer serializes an XMP object into a string as RDF.
Example:

```
dim x as new XMPMetaMBS
dim registeredPrefix as string

call x.RegisterNamespace ("xwnv", "xwnv", registeredPrefix)

x.SetProperty "xwnv","MZSTID","test"

MsgBox x.SerializeToBuffer
```

Notes: Same as other SerializeToBuffer method, but with newline="", indent=0 and baseIndent=0.
See also:

- 215.6.69 SerializeToBuffer(options as Integer, padding as Integer, newline as string, indent as string="", baseIndent as Integer=0) as string

215.6.71 SetArrayItem(schemaNS as string, arrayName as string, itemIndex as Integer, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetArrayItem provides access to items within an array.
Notes:

The index is passed as an integer, you need not worry about the path string syntax for array items, convert a loop index to a string, etc. The array passed to SetArrayItem must already exist. See also AppendArrayItem.

In normal usage the selected array item is modified. A new item is automatically appended if the index is the array size plus 1. A new item may be inserted before or after any item by using one of the following option flags:

kXMP_InsertBeforeItem	= & h4000	Insert a new array item before the selected one.
kXMP_InsertAfterItem	= & h8000	Insert a new array item after the selected one.

Parameters:

schemaNS	The namespace URI for the array. Has the same usage as in GetProperty.
arrayName	The name of the array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
itemIndex	The index of the desired item. Arrays in XMP are indexed from 1. The constant kXMP_ArrayLastItem always refers to the last existing array item.
itemValue	An UTF-8 string that is the value of the array item, if the array item has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the item. See the earlier description.

215.6.72 SetLocalizedText(schemaNS as string, altTextName as string, genericLang as string, specificLang as string, itemValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetLocalizedText modifies the value of a selected item in an alt-text array.
Notes:

Creates an appropriate array item if necessary, and handles special cases for the x-default item.

If the selected item is from a match with the specific language, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a match with the generic language and there are no other generic matches, the value of that item is modified. If the existing value of that item matches the existing value of the x-default item, the x-default item is also modified. If the array only has 1 existing item (which is not x-default), an x-default item is added with the given value.
If the selected item is from a partial match with the generic language and there are other partial matches,

a new item is created for the specific language. The x-default item is not modified.
If the selected item is from the last 2 rules then a new item is created for the specific language. If the array only had an x-default item, the x-default item is also modified. If the array was empty, items are created for the specific language and x-default.

Parameters:

schemaNS	The namespace URI for the alt-text array. Has the same usage as in GetProperty.
altTextName	The name of the alt-text array. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
genericLang	The name of the generic language as an RFC 3066 primary subtag.
specificLang	The name of the specific language as an RFC 3066 tag. Must not be an empty string.
itemValue	An UTF-8 string that is the new value for the appropriate array item.
options	Option flags, none are defined at present.

215.6.73 SetProperty(schemaNS as string, propName as string, propValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetProperty is the simplest property setter, mainly for top level simple properties or after using the path composition functions.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	An UTF-8 string that is the value of the property, if the property has a value. Arrays and non-leaf levels of structs do not have values.
options	Option flags describing the property.

215.6.74 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 215.6.75 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer) 28767

215.6.75 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyBoolean sets the value of a Boolean property from a boolean.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The bool value to be assigned to the property.
options	An integer variable that is assigned option flags describing the property.

See also:

- 215.6.74 SetPropertyBoolean(schemaNS as string, propName as string, propValue as boolean) 28766

215.6.76 SetPropertyDate(schemaNS as string, propName as string, propValue as XMPDateTimeMBS, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyDate sets the value of a date/time property from an XMPDateTimeMBS object.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The XMPDateTimeMBS object to be assigned to the property.
options	Option flags describing the property.

215.6.77 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyFloat sets the value of a floating point property from a double.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

See also:

- 215.6.78 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer) 28768

215.6.78 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyFloat sets the value of a floating point property from a double.
Notes:

Parameters:

See also:

- 215.6.77 SetPropertyFloat(schemaNS as string, propName as string, propValue as Double) 28768

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double float value to be assigned to the property.
options	Option flags describing the property.

215.6.79 SetPropertyInt64Double(schemaNS as string, propName as string, propValue as Double, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInt64Double sets the value of a 64 bit integer property from a double.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The double value to be assigned to the property.
options	Option flags describing the property.

215.6.80 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInteger sets the value of an integer property from an integer.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

See also:

- 215.6.81 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer) 28770

215.6.81 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer, options as Integer)

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetPropertyInteger sets the value of an integer property from an integer.
Notes:

Parameters:

schemaNS	The namespace URI for the property. Has the same usage as in GetProperty.
propName	The name of the property. Has the same usage as in GetProperty.
propValue	The long integer value to be assigned to the property.
options	Option flags describing the property.

See also:

- 215.6.80 SetPropertyInteger(schemaNS as string, propName as string, propValue as Integer) 28769

215.6.82 SetPropertyInteger64(schemaNS as string, propName as string, propValue as Int64, options as Integer=0)

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the value of an integer property using an Int64.
Notes:

Sets a property with a binary value, creating it if necessary.

schemaNS: The namespace URI; see GetProperty().
propName: The name of the property. Can be a general path expression, must not be "" or the empty string; see GetProperty() for namespace prefix usage.
propValue: The new binary value.
options: Option flags describing the property; a logical OR of allowed bit-flag constants; see kPropValueIsStruct and following. Must match the type of a property that already exists.

215.6.83 SetQualifier(schemaNS as string, propName as string, qualNS as string, qualName as string, qualValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetQualifier provides access to a qualifier attached to a property.
Notes:

The namespace for the qualifier is passed as a URI, you need not worry about the path string syntax. In many regards qualifiers are like struct fields. See the introductory discussion of qualified properties for more information.

The names of qualifiers should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
propName	The name of the property to which the qualifier is attached. Has the same usage as in GetProperty.
qualNS	The namespace URI for the qualifier. Has the same URI and prefix usage as the schemaNS parameter.
qualName	The name of the qualifier. Must be a single XML name, must not be an empty string. Has the same namespace prefix usage as the propName parameter.
qualValue	An UTF-8 string that is the value of the qualifier, if the qualifier has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the qualifier.

215.6.84 SetStructField(schemaNS as string, structName as string, fieldNS as string, fieldName as string, fieldValue as string, options as Integer=0)

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: SetStructField provides access to fields within a nested structure.
Notes:

The namespace for the field is passed as a URI, you need not worry about the path string syntax.

The names of fields should be XML qualified names, that is within an XML namespace. The path syntax for a qualified name uses the namespace prefix, which is unreliable because the prefix is never guaranteed. The URI is the formal name, the prefix is just a local shorthand in a given sequence of XML text.

Parameters:

215.6.85 Sort

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

schemaNS	The namespace URI for the struct. Has the same usage as in GetProperty.
structName	The name of the struct. May be a general path expression, must not be an empty string. Has the same namespace prefix usage as propName in GetProperty.
fieldNS	The namespace URI for the field. Has the same URI and prefix usage as the schemaNS parameter.
fieldName	The name of the field. Must be a single XML name, must not be null or the empty string. Has the same namespace prefix usage as the structName parameter.
fieldValue	An UTF-8 string that is the value of the field, if the field has a value. Has the same usage as propValue in GetProperty.
options	Option flags describing the field.

Function: Sorts the data model tree of an XMP object.
Notes:

Use this function to sort the data model of an XMP object into a canonical order. This can be convenient when comparing data models, (e.g. by text comparison of DumpObject output).

At the top level the namespaces are sorted by their prefixes. Within a namespace, the top level properties are sorted by name. Within a struct, the fields are sorted by their qualified name, i.e. their XML prefix:local form. Unordered arrays of simple items are sorted by value. Language Alternative arrays are sorted by the xml:lang qualifiers, with the "x-default" item placed first.

215.6.86 Properties

215.6.87 GlobalOptions as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets or retrieves the set of global option flags.
Notes: (Read and Write computed property)

215.6.88 Name as string

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The object name.
Notes: (Read and Write computed property)

215.6.89 Constants

215.6.90 kAllowCommas = & h10000000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Used by CatenateArrayItems and SeparateArrayItems.

215.6.91 kArrayLastItem = -1

MBS XMP Plugin, Plugin Version: 9.4.

Function: The index constant for the last item.

215.6.92 kDeleteEmptyValues = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Delete properties if the new value is empty.

215.6.93 kDeleteExisting = & h20000000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants.
Notes: Used by SetXyz functions to delete any pre-existing property.

215.6.94 kDoAllProperties = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Do all properties, default is just external properties.

215.6.95 kEncodeUTF16Big = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Use UTF16 big-endian encoding

215.6.96 kEncodeUTF16Little = 3

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Use UTF16 little-endian encoding

215.6.97 kEncodeUTF32Big = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Use UTF32 big-endian encoding

215.6.98 kEncodeUTF32Little = 5

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Use UTF32 little-endian encoding

215.6.99 kEncodeUTF8 = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Use UTF8 encoding

215.6.100 kEncodingMask = & h7

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Bit-flag mask for encoding-type bits

215.6.101 kExactPacketLength = & h200

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: The padding parameter is the overall packet length.

215.6.102 kImplReservedMask = & h70000000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants.

215.6.103 kIncludeAliases = & h800

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Include aliases, default is just actual properties.

215.6.104 kIncludeThumbnailPad = & h100

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Include a padding allowance for a thumbnail image.

215.6.105 kInsertAfterItem = & h8000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option for array item location.
Notes: Insert a new item after the given index.

215.6.106 kInsertBeforeItem = & h4000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option for array item location.
Notes: Insert a new item before the given index.

215.6.107 kIterAliases = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Iterate the global alias table.

215.6.108 kIterClassMask = & hFF

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: The low 8 bits are an enum of what data structure to iterate.

215.6.109 kIterIncludeAliases = & h800

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Include aliases, default is just actual properties.

215.6.110 kIterJustChildren = & h100

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Just do the immediate children of the root, default is subtree.

215.6.111 kIterJustLeafName = & h400

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Return just the leaf part of the path, default is the full path.

215.6.112 kIterJustLeafNodes = & h200

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Just do the leaf nodes, default is all nodes in the subtree.

215.6.113 kIterNamespaces = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Iterate the global namespace table.

215.6.114 kIterOmitQualifiers = & h1000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Omit all qualifiers.

215.6.115 kIterProperties = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for XMPIteratorMBS construction.
Notes: Iterate the property tree of a TXMPMeta object.

215.6.116 kIterSkipSiblings = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for Skip.
Notes: Skip the subtree below and remaining siblings of the current node.

215.6.117 kIterSkipSubtree = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for Skip.
Notes: Skip the subtree below the current node.

215.6.118 kLittleEndianBit = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().

215.6.119 kNoOptions = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: The constant to specify to use no options.

215.6.120 kNS_AdobeStockPhoto = "http://ns.adobe.com/StockPhoto/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.121 kNS_ASF = "http://ns.adobe.com/asf/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.122 kNS_CameraRaw = "http://ns.adobe.com/camera-raw-settings/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.123 kNS_CreatorAtom = "http://ns.adobe.com/creatorAtom/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.124 kNS_DC = "http://purl.org/dc/elements/1.1/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for the Dublin Core schema.

215.6.125 kNS_DICOM = "http://ns.adobe.com/DICOM/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.126 kNS_DM = "http://ns.adobe.com/xmp/1.0/DynamicMedia/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.127 kNS_EXIF = "http://ns.adobe.com/exif/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for Adobe's EXIF schema.

215.6.128 kNS_EXIF_Aux = "http://ns.adobe.com/exif/1.0/aux/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.129 kNS_IPTCCore = "http://iptc.org/std/Iptc4xmpCore/1.0/xmlns/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for the IPTC Core schema.

215.6.130 kNS_JP2K = "http://ns.adobe.com/jp2k/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.131 kNS_JPEG = "http://ns.adobe.com/jpeg/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.132 kNS_PDF = "http://ns.adobe.com/pdf/1.3/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the PDF schema.

215.6.133 kNS_PDFA_Extension = "http://www.aiim.org/pdfa/ns/extension/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.134 kNS_PDFA_Field = "http://www.aiim.org/pdfa/ns/field# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.135 kNS_PDFA_ID = "http://www.aiim.org/pdfa/ns/id/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.136 kNS_PDFA_Property = "http://www.aiim.org/pdfa/ns/property# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.137 kNS_PDFA_Schema = "http://www.aiim.org/pdfa/ns/schema# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.138 kNS_PDFA_Type = "http://www.aiim.org/pdfa/ns/type# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.139 kNS_PDFX = "http://ns.adobe.com/pdfx/1.3/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.140 kNS_PDFX_ID = "http://www.npes.org/pdfx/ns/id/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.

215.6.141 kNS_Photoshop = "http://ns.adobe.com/photoshop/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the Photoshop custom schema.

215.6.142 kNS_PNG = "http://ns.adobe.com/png/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.143 kNS_PSAlbum = "http://ns.adobe.com/album/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.144 kNS_RDF = "http://www.w3.org/1999/02/22-rdf-syntax-ns# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for RDF.

215.6.145 kNS_SWF = "http://ns.adobe.com/swf/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.146 kNS_TIFF = "http://ns.adobe.com/tiff/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for Adobe's TIFF schema.

215.6.147 kNS_WAV = "http://ns.adobe.com/xmp/wav/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.148 kNS_XML = "http://www.w3.org/XML/1998/namespace"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants from outside Adobe.
Notes: The XML namespace for XML.

215.6.149 kNS_XMP = "http://ns.adobe.com/xap/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the XMP "basic" schema.

215.6.150 kNS_XMP_BJ = "http://ns.adobe.com/xap/1.0/bj/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the job management schema.

215.6.151 kNS_XMP_Dimensions = "http://ns.adobe.com/xap/1.0/sType/Dimensions# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the Dimensions type.

215.6.152 kNS_XMP_Font = "http://ns.adobe.com/xap/1.0/sType/Font# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.

215.6.153 kNS_XMP_Graphics = "http://ns.adobe.com/xap/1.0/g/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.

215.6.154 kNS_XMP_G_IMG = "http://ns.adobe.com/xap/1.0/g/img/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: Deprecated XML namespace constant.

215.6.155 kNS_XMP_IdentifierQual = "http://ns.adobe.com/xmp/Identifier/qual/1.0/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for qualifiers of the xmp:Identifier property.

215.6.156 kNS_XMP_Image = "http://ns.adobe.com/xap/1.0/g/img/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of a graphical image. Used for the Thumbnail type.

215.6.157 kNS_XMP_ManifestItem = "http://ns.adobe.com/xap/1.0/sType/ManifestItem# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.

215.6.158 kNS_XMP_MM = "http://ns.adobe.com/xap/1.0/mm/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the XMP digital asset management schema.

215.6.159 kNS_XMP_Note = "http://ns.adobe.com/xmp/note/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.

215.6.160 kNS_XMP_PagedFile = "http://ns.adobe.com/xap/1.0/t/pg/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.

215.6.161 kNS_XMP_ResourceEvent = "http://ns.adobe.com/xap/1.0/sType/ResourceEvent# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the ResourceEvent type.

215.6.162 kNS_XMP_ResourceRef = "http://ns.adobe.com/xap/1.0/sType/ResourceRef# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the ResourceRef type.

215.6.163 kNS_XMP_Rights = "http://ns.adobe.com/xap/1.0/rights/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes: The XML namespace for the XMP copyright schema.

215.6.164 kNS_XMP_ST_Job = "http://ns.adobe.com/xap/1.0/sType/Job# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the JobRef type.

215.6.165 kNS_XMP_ST_Version = "http://ns.adobe.com/xap/1.0/sType/Version# "

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.
Notes: The XML namespace for fields of the Version type.

215.6.166 kNS_XMP_T = "http://ns.adobe.com/xap/1.0/t/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes:

The XML namespace for the XMP text document schema.
Deprecated XML namespace constant.

215.6.167 kNS_XMP_Text = "http://ns.adobe.com/xap/1.0/t/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for qualifiers and structured property fields.

215.6.168 kNS_XMP_T_PG = "http://ns.adobe.com/xap/1.0/t/pg/"

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the XML namespace constants for standard XMP schema.
Notes:

The XML namespace for the XMP paged document schema.
Deprecated XML namespace constant.

215.6.169 kOmitAllFormatting = & h800

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Omit all formatting whitespace.

215.6.170 kOmitPacketWrapper = & h10

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Omit the XML packet wrapper.

215.6.171 kOmitXMPMetaElement = & h1000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Omit the x:xmpmeta element surrounding the rdf:RDF element.

215.6.172 kParseMoreBuffers = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: This is the not last input buffer for this parse stream.

215.6.173 kPropArrayFormMask = & h1E00

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Property type bit-flag mask for all array types

215.6.174 kPropArrayIsAlternate = & h800

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Implies kPropArrayIsOrdered, items are alternates. It is serialized using an rdf:Alt container.

215.6.175 kPropArrayIsAltText = & h1000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Implies kPropArrayIsAlternate, items are localized text. Each array element is a simple property with an xml:lang attribute.

215.6.176 kPropArrayIsOrdered = & h400

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Implies kPropValueIsArray, item order matters. It is serialized using an rdf:Seq container.

215.6.177 kPropArrayIsUnordered = & h200

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The item order does not matter.

215.6.178 kPropArrayLocationMask = & hC000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for the property setting functions.
Notes: Bit-flag mask for array-item location bits

215.6.179 kPropCompositeMask = & h1F00

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Property type bit-flag mask for composite types (array and struct)

215.6.180 kPropHasAliases = & h20000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: This property is the base value (actual) for a set of aliases.This is only returned by GetProperty() and then only if the property name is simple, not an path expression.

215.6.181 kPropHasLang = & h40

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Implies kPropHasQualifiers, property has xml:lang.

215.6.182 kPropHasQualifiers = & h10

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The property has qualifiers, includes rdf:type and xml:lang.

215.6.183 kPropHasType = & h80

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: Implies kPropHasQualifiers, property has rdf:type.

215.6.184 kPropIsAlias = & h10000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: This property is an alias name for another property. This is only returned by GetProperty() and then only if the property name is simple, not an path expression.

215.6.185 kPropIsDerived = & h200000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The value of this property is derived from the document content.

215.6.186 kPropIsInternal = & h40000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The value of this property is "owned" by the application, and should not generally be editable in a UI.

215.6.187 kPropIsQualifier = & h20

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes:

This is a qualifier for some other property, includes rdf:type and xml:lang.
Qualifiers can have arbitrary structure, and can themselves have qualifiers. If the qualifier itself has a structured value, this flag is only set for the top node of the qualifier's subtree.

215.6.188 kPropIsStable = & h100000

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The value of this property is not derived from the document content.

215.6.189 kPropValueIsArray = & h200

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The value is an array (RDF alt/bag/seq). The "ArrayIs..." flags identify specific types of array; default is a general unordered array, serialized using an rdf:Bag container.

215.6.190 kPropValueIsStruct = & h100

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The value is a structure with nested fields.

215.6.191 kPropValueIsURI = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for the property accessor functions.
Notes: The XML string form of the property value is a URI, use rdf:resource attribute. DISCOURAGED

215.6.192 kPropValueOptionsMask = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants of the option bit flags for the property setting functions.
Notes: Bit-flag mask for property-value option bits

215.6.193 kReadOnlyPacket = & h20

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Default is a writeable packet.

215.6.194 kReplaceOldValues = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for RemoveProperties() and AppendProperties().
Notes: Replace existing values, default is to leave them.

215.6.195 kRequireXMPMeta = 1

MBS XMP Plugin, Plugin Version: 9.4.

Function: Require a surrounding x:xmpmeta element.

215.6.196 kStrictAliasing = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the constants for the option bit flags for ParseFromBuffer().
Notes: Do not reconcile alias differences, throw an exception.

215.6.197 kUseCompactFormat = & h40

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Use a compact form of RDF.

215.6.198 kUseNullTermination = 0

MBS XMP Plugin, Plugin Version: 9.4.

Function: The length constants for a string to determinate the length automatically.

215.6.199 kUTF16Bit = 2

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().

215.6.200 kUTF32Bit = 4

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().

215.6.201 kWriteAliasComments = & h400

MBS XMP Plugin, Plugin Version: 9.4.

Function: One of the option bit flags for SerializeToBuffer().
Notes: Show aliases as XML comments.

215.6.202 kXMPFiles_IgnoreLocalText = 2

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the flags for XMPFiles initialize.
Notes: Ignore non-XMP text that uses an undefined "local" encoding.

215.6.203 kXMPFiles_ServerMode = 2

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the flags for XMPFiles initialize.
Notes: Combination of flags necessary for server products using XMPFiles.

215.6.204 kXMPTemplate_AddNewProperties = 8

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the option constants for ApplyTemplate function.
Notes: Perform an Add operation, add properties if they don't already exist.

215.6.205 kXMPTemplate_ClearUnnamedProperties = & h10

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the option constants for ApplyTemplate function.
Notes: Perform a Clear operation, keep named properties and delete everything else.

215.6.206 kXMPTemplate_IncludeInternalProperties = 1

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the option constants for ApplyTemplate function.
Notes: Do all properties, default is just external properties.

215.6.207 kXMPTemplate_ReplaceExistingProperties = 2

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the option constants for ApplyTemplate function.
Notes: Perform a Replace operation, add new properties and modify existing ones.

215.6.208 kXMPTemplate_ReplaceWithDeleteEmpty = 4

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the option constants for ApplyTemplate function.
Notes: Similar to Replace, also delete if the template has an empty value.

215.6.209 kXMP_NS_BWF = "http://ns.adobe.com/bwf/bext/1.0/"

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the XML namespace constants for standard XMP schema.

215.6.210 kXMP_NS_Script = "http://ns.adobe.com/xmp/1.0/Script/"

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the XML namespace constants for standard XMP schema.

215.6.211 kXMP_WriteAliasComments = & h400

MBS XMP Plugin, Plugin Version: 11.0.

Function: One of the option flags for SerializeToBuffer.
Notes: Show aliases as XML comments.

215.6.212 Version = "5.5.0"

MBS XMP Plugin, Plugin Version: 11.0.

Function: The version string of the XMP library.

215.7 class XMPPacketInfoMBS

215.7.1 class XMPPacketInfoMBS

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for information about a xmp packet.

215.7.2 Blog Entries

- Tip of the day: Change EXIF metadata

215.7.3 Blog Entries

- Tip of the day: Change EXIF metadata

215.7.4 Properties

215.7.5 CharForm as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Character format using the values kChar8Bit, kChar16BitBig, etc.
Notes: (Read and Write property)

215.7.6 HasWrapper as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if there is a packet wrapper, the "<?xpacket...>" XML processing instructions.
Notes: (Read and Write property)

215.7.7 Length as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet length in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

215.7.8 Offset as Int64

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet offset in the file in bytes, -1 if unknown.
Notes: (Read and Write property)

215.7.9 PadSize as Integer

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Packet padding size in bytes, zero if unknown.
Notes: (Read and Write property)

215.7.10 Writeable as Boolean

MBS XMP Plugin, Plugin Version: 9.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if there is a packet wrapper and the trailer says writeable by dumb packet scanners.
Notes: (Read and Write property)

215.8 class XMPScannerMBS

215.8.1 class XMPScannerMBS

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class to scan any file stream for XMP data.
Example:

```
dim c,n,i,l as Integer
dim xs as XMPScannerMBS
dim xn as XMPSnipMBS
dim s as string
dim x as XMPMetaMBS
dim b as BinaryStream
dim source as FolderItem

// get file
source=GetOpenFolderItem("any")
if source=nil then Return

b=source.OpenAsBinaryFile(false)

if b=nil then Return

// read file to memory
l=b.Length
s=b.Read(l)

// scan for xmp blocks
MsgBox "Scanning "+str(lenb(s))+" of "+str(l)+" bytes."

xs=new XMPScannerMBS(l)
xs.Scan(s,0)

MsgBox "Found "+str(xs.Report)+" blocks"

n=xs.Report-1

c=0
for i=0 to n

xn=xs.Snip(i)

if xn.State=3 then // found
if xn.Length>50 then
try
b.Position=xn.Offset
```

```
s=b.Read(xn.Length)

// debug output xmp data
'WriteInputXMP dest,s

// try to parse
x=new XMPMetaMBS(s)

// work with xmp meta data
catch r as XMPExceptionMBS
MsgBox "ExtractXMP failed on: "+r.message
end try
else
MsgBox "Found small xmp block? "+str(xn.Length)
end if
end if
next
```

215.8.2 Methods

215.8.3 Constructor

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Default constructor doing nothing.
See also:

- 215.8.4 Constructor(StreamLength as Integer) 28799

215.8.4 Constructor(StreamLength as Integer)

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Constructor to create a XMPScanner which reads the given number of bytes.
See also:

- 215.8.3 Constructor 28799

215.8.5 Report as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Produces a report of what is known about the input stream.
Notes: The snipps found are saved in an array which you can access using the snip() function. Returns the number of entries in this array.

215.8.6 Scan(Buffer as string, Offset as Int64)

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Scans the given part of the input, incorporating it in to the known snips.
Notes: The Offset is the offset of this block of input relative to the entire stream.

215.8.7 Snip(index as UInt32) as XMPSnipMBS

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the snip with the given index.
Notes:

index is zero based.
Returns nil on any error.
You must call Report before this method.

215.8.8 SnipCount as UInt32

MBS XMP Plugin, Plugin Version: 11.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Number of snips found so far.

215.8.9 StreamAllScanned as boolean

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns true if all of the stream has been seen.

215.9 class XMPSnipMBS

215.9.1 class XMPSnipMBS

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The class for the XMP Snips found by the XMPScannerMBS class.

215.9.2 Properties

215.9.3 Access as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The read-only/read-write access from the end attribute.
Notes: (Read and Write property)

215.9.4 BytesAttr as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the bytes attribute, -1 if not present.
Notes: (Read only property)

215.9.5 CharForm as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: How the packet is divided into characters.
Notes:

The values allow easy testing for 16/32 bit and big/little endian.

eChar8Bit	= 0
eChar16BitBig	= 2
eChar16BitLittle	= 3
eChar32BitBig	= 4
eChar32BitLittle	= 5

(Read and Write property)

215.9.6 EncodingAttr as String

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The value of the encoding attribute, if any, with nulls removed.
Notes: (Read and Write property)

215.9.7 Length as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The length in bytes of this snip.
Notes: (Read only property)

215.9.8 Offset as Int64

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The byte offset of this snip within the input stream.
Notes: (Read only property)

215.9.9 OutOfOrder as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: If true, this snip was seen before the one in front of it.
Notes: (Read and Write property)

215.9.10 State as Integer

MBS XMP Plugin, Plugin Version: 6.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: The state of this snip.
Notes:

constants:

(Read and Write property)

eNotSeenSnip	0	This snip has not been seen yet.
ePendingSnip	1	This snip is an input buffer being processed.
eRawInputSnip	2	This snip is raw input, it doesn't contain any part of an XMP packet.
eValidPacketSnip	3	This snip is a complete, valid XMP packet.
ePartialPacketSnip	4	This snip contains the start of a possible XMP packet.
eBadPacketSnip	5	This snip contains a complete, but semantically incorrect XMP packet.

215.10 class XMPTextOutputMBS

215.10.1 class XMPTextOutputMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: An event class for text output.
Notes: You may want to make a subclass which collects all the strings into one string or write them to a file.

215.10.2 Events

215.10.3 Output(text as string) as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: .

Function: New text arrived.
Notes:

You may get more than one event per line.
Return 0 for success or something else for failure.

215.11 class XMPVersionInfoMBS

215.11.1 class XMPVersionInfoMBS

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The XMP Version class.
Example:

```
dim v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

Notes: Constructor sets values.

215.11.2 Properties

215.11.3 Build as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A rolling build number, monotonically increasing in a release.
Notes: (Read and Write property)

215.11.4 Flags as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Individual feature implementation flags.
Notes: (Read and Write property)

215.11.5 IsDebug as boolean

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: True if this is a debug build.
Notes: (Read and Write property)

215.11.6 Major as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The primary release number, the "1" in version "1.2.3".
Notes: (Read and Write property)

215.11.7 Message as String

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: A comprehensive version information string.
Example:

```
dim v as XMPVersionInfoMBS
v=XMPMetaMBS.GetVersionInfo
MsgBox v.Message
```

Notes: (Read and Write property)

215.11.8 Micro as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The tertiary release number, the "3" in version "1.2.3".
Notes: (Read and Write property)

215.11.9 Minor as Integer

MBS XMP Plugin, Plugin Version: 6.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: The secondary release number, the "2" in version "1.2.3".
Notes: (Read and Write property)

Chapter 216

XojoRuntime

216.1 Globals

216.1.1 AllObjectsOfClassMBS(ClassName as String) as Variant()

MBS Util Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, Windows, iOS, Targets: All.

Function: Find all objects with given class using IsA operator.
Example:

```
Dim AllWindows() As Variant = AllObjectsOfClassMBS("Window")
Dim AllMenuItems() As Variant = AllObjectsOfClassMBS("MenuItem")
Dim AllDictionary() As Variant = AllObjectsOfClassMBS("Dictionary")
```

Break

Notes:

Similar to using Runtime.IterateObjects directly, loop over all objects and do a check with ISA operator on each one. The plugin is a bit more efficient doing this and returns matching items as array of variant.

Raises exception if class name is empty or not a known class to the Xojo runtime.

216.1.2 Blog Entries

- MonkeyBread Software Releases the MBS Xojo Plugins in version 21.1
- MBS Xojo Plugins, version 21.1pr4

216.1.3 ArrayDoubleMBS(paramArray values as Double) as Double()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Dim a() As Double = ArrayDoubleMBS(1, 2, 3)

// failes
Dim b() As Double = Array(1,2,3)
```

Notes:

With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

216.1.6 ArrayInt64MBS(paramArray values as Int64) as Int64()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Dim a() As Int64 = ArrayInt64MBS(1, 2, 3.0)

// failes
Dim b() As Int64 = Array(1,2,3.0)
```

Notes:

With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

216.1.9 ArrayIntegerMBS(paramArray values as Integer) as Integer()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
// works
Dim a() As Integer = ArrayIntegerMBS(1, 2, 3.0)

// failes
Dim b() As Integer = Array(1,2,3.0)
```

Notes:

With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

216.1.12 ArrayIsAMBS(v as Variant, ClassName as string) as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if variant contains an array of the given class type.
Example:

```
dim w() as MouseCursor
w.Append System.Cursors.ArrowEastWest
w.Append System.Cursors.ArrowNorthSouth

dim v as Variant = w

if ArrayIsAMBS(w, "MouseCursor") then
MsgBox "OK"
end if
```

Notes:

If the variant contains an array of some class, variant or object and has at least one value, the plugin checks this first value for being of type of the same class. Like an ISA check.
This helps to solve feedback case 12213.
Returns false if variant has no array, if variant is nil, if array is not an array of objects or if first object is nil.

216.1.13 Blog Entries

- MBS Real Studio Plugins, version 12.3pr11

216.1.14 ArrayStringMBS(paramArray values as String) as String()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
Dim a() As String = ArrayStringMBS("Hello", "World")
```

Notes:

With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

216.1.16 ArrayVariantMBS(paramArray values as Variant) as Variant()

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Creates an array with given values.
Example:

```
Dim a() As Variant = ArrayVariantMBS(1, 2, 3.0, True, False)
```

Notes:

With picking the right array function (ArrayDoubleMBS, ArrayStringMBS, ArrayInt64MBS, ArrayVariantMBS or ArrayIntegerMBS), you define what type of array you like. The Array function determinates the type based on value types, so it often isn't what we want.

Pass as many parameters as needed, just like Array() function.

216.1.19 GetArrayAllocatedSizeMBS(v as variant) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries allocated array size in bytes.
Example:

```
Dim a() As Integer // 8 byte per integer in 64-bit

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

Redim a(9) // changes to 80 bytes

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

Redim a(19) // changes to 160 bytes

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))

a.Append 123

System.DebugLog "allocated: "+Str(GetArrayAllocatedSizeMBS(a))
// shows 288, adds space for 16 more values
```

Notes:

This function uses internal knowledge of the array layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

Stopped working on Windows in recent Xojo versions, so we deprecated it.

216.1.20 GetArrayDataPointerMBS(v as variant) as Ptr

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries base pointer for the array data.
Notes:

The pointer changes when append/insert/redim allocates new memory block.

This function uses internal knowledge of the array layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

216.1.21 GetAutoMemoryAddressMBS(o as auto) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries memory address of auto object.
Example:

```
Dim t As Auto = "Hello World"
Dim o As Auto = "Hello "

o = o + "World"

Dim s As Auto = t

Dim ta As Integer = GetAutoMemoryAddressMBS(t)
Dim oa As Integer = GetAutoMemoryAddressMBS(o)
Dim sa As Integer = GetAutoMemoryAddressMBS(s)

// s and t show same address, but o is different
MsgBox Hex(ta)+EndOfLine+Hex(oa)+EndOfLine+Hex(sa)

// and s and t show address in const segment in the app, while o is dynamically allocated and has an heap address
```

Notes: Allows you to compare if two variables refer same object.

216.1.22 GetDelegateParametersMBS(del as variant) as String

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries parameter signature of a delegate.
Example:

```
Dim aDelegate As ADelegate
```

```
aDelegate = AddressOf someFunction

Dim p As String = GetDelegateParametersMBS(aDelegate)
MsgBox p
```

Notes:

This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

216.1.23 Blog Entries

- MBS Xojo Plugins, version 20.3pr8
- Inside Delegates

216.1.24 GetDelegateTargetMBS(del as variant) as Variant

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries target object of a delegate.
Example:

```
Dim aDelegate As ADelegate
aDelegate = AddressOf someFunction

Dim target As Variant = GetDelegateTargetMBS(aDelegate)
MsgBox "target: "+Introspection.GetType(target).fullname
```

Notes:

This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

- Inside Delegates

216.1.26 GetDelegateWeakMBS(del as variant) as Boolean

MBS Util Plugin, Plugin Version: 20.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries weak flag of a delegate.
Example:

```
Dim aDelegate As ADelegate
aDelegate = AddressOf someFunction

Dim weak As Boolean = GetDelegateWeakMBS(aDelegate)
MsgBox "weak: "+Str(weak)
```

Notes:

This function uses internal knowledge of the delegate layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

216.1.27 Blog Entries

- MBS Xojo Plugins, version 20.3pr8
- Inside Delegates

216.1.28 GetObjectMemoryAddressMBS(o as object) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory address of object.
Example:

```
Dim a As Integer = GetObjectMemoryAddressMBS(app)

// show address
MsgBox Hex(a)
```

Notes: Allows you to compare if two variables refer same object.

216.1.29 Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

216.1.30 GetObjectReferenceCountMBS(o as object) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries object reference count.
Example:

```
Dim o As Object = window1

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

dim k as Object = o

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

dim v as Variant = o

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))

v = Nil
k = nil

System.DebugLog "Reference count: "+Str(GetObjectReferenceCountMBS(o))
```

Notes:

This function uses internal knowledge of the object layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

216.1.31 GetStringMemoryAddressMBS(s as string) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries memory address of string.
Example:

```
Dim t As String = "Hello World"
Dim o As String = "Hello "

o = o + "World"
```

```
Dim s As String = t

Dim ta As Integer = GetStringMemoryAddressMBS(t)
Dim oa As Integer = GetStringMemoryAddressMBS(o)
Dim sa As Integer = GetStringMemoryAddressMBS(s)

// s and t show same address, but o is different
MsgBox Hex(ta)+EndOfLine+Hex(oa)+EndOfLine+Hex(sa)

// and s and t show address in const segment in the app, while o is dynamically allocated and has an heap address
```

Notes: Allows you to compare if two variables refer same string.

216.1.32 Blog Entries

- MBS Real Studio Plugins, version 11.2pr8

216.1.33 GetStringReferenceCountMBS(s as string) as integer

MBS Util Plugin, Plugin Version: 20.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries string reference count.
Example:

```
Dim a As String = "World"
Dim s As String = "Hello "+a // use + to make new string

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

Dim k As String = s

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

Dim v As Variant = s

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))

v = ""
k = ""

System.DebugLog "Reference count: "+Str(GetStringReferenceCountMBS(s))
```

Notes:

This function uses internal knowledge of the string layout in memory.
So this will break in case a future Xojo version changes the layout.
Please use only carefully for debugging.

216.1.34 GetTextMemoryAddressMBS(s as text) as integer

MBS Util Plugin, Plugin Version: 17.3, Platforms: macOS, Linux, Windows, Targets: All.

Deprecated: This item is deprecated and should no longer be used. **Function:** Queries memory address of text object.
Example:

```
Dim t As Text = "Hello World"
Dim n As Integer = GetTextMemoryAddressMBS(t)
MsgBox Hex(n)
```

Notes: Allows you to compare if two variables refer same text.

216.1.35 GetVariantArrayMBS(VariantContainingArray as Variant) as Variant()

MBS Util Plugin, Plugin Version: 14.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variant containing array for an array and returns it as an array of variant.
Example:

```
dim test() as Dictionary
test.Append new Dictionary

// this fails
Dim vv As Variant = test
Dim t() As Variant = vv

// this works!
dim v() as Variant = GetVariantArrayMBS(test)
dim dic as Dictionary = v(0)
Break
```

Notes:

Works with all arrays of objects (any type).
Raises exception if the array can't be converted or the variant contains no array.

- 12.2, page 10: News

216.1.38 GetVariantArrayUboundMBS(v as Variant) as Integer

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries array ubound for an array inside a variant.
Notes:

If you have an array in the variant, you'd normally assign it to an array to query values from array.
This function queries ubound directly.
Returns -3 if variant is nil and -2 if variant contains not an object array.
Updated in 13.5 plugins to raise exception is array is nil.

216.1.39 Blog Entries

- Variant Helper functions in MBS Xojo Plugins
- MBS Xojo / Real Studio Plugins, version 13.5pr8
- MBS Real Studio Plugins, version 13.0pr8

216.1.40 GetVariantArrayValueMBS(v as Variant, index as Integer) as Variant

MBS Util Plugin, Plugin Version: 13.0, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries a variant from an array inside a variant.
Example:

```
// some part of app builds an array
dim a() as pair
a.Append 1:"Hello"
```

```
a.Append 2:"World"

// passes it as Variant somewhere else

dim v as Variant = a

// and later you may want to get values back without knowing the array type

// this raises TypeMismatchException
'dim o() as Object = v

// so use plugin to get objects:
dim v1 as Variant = GetVariantArrayValueMBS(v, 0)
dim v2 as Variant = GetVariantArrayValueMBS(v, 1)

// now you can check type and cast to the object type
dim p1 as pair = v1
dim p2 as pair = v2

MsgBox p1.Right+" "+p2.Right
```

Notes:

This function is to allow getting objects from an array inside a variant without known the class used to declare array.
Returns nil on any error.

Updated in 13.5 plugins to raise exception is array is nil.

Also updated in v13.5 to work with object, variant, string, date, integer, double, single, boolean, Int64 arrays. Other array types will raise exception.

216.1.41 Blog Entries

- Variant Helper functions in MBS Xojo Plugins
- MBS Xojo / Real Studio Plugins, version 13.5pr8
- MBS Real Studio Plugins, version 13.0pr8

216.1.42 GetVariantAsDictionaryArrayMBS(v as variant) as Dictionary()

MBS Util Plugin, Plugin Version: 20.4, Platforms: macOS, Linux, Windows, Targets: All.

Function: Casts a variant to a dictionary array.
Example:

```
Dim d As New Dictionary
Dim v() As Variant
v.Append d
v.Append Nil

dim va as Variant = v
'Dim dic() As Dictionary = va // type mismatch exception
Dim dic() As Dictionary = GetVariantAsDictionaryArrayMBS(va) // works

Break
```

Notes:

Raises exception if variant does not have an object/variant array.
If it contains a non-dictionary object, we raise an exception.

216.1.43 Blog Entries

- Variant Helper functions in MBS Xojo Plugins
- MonkeyBread Software Releases the MBS Xojo Plugins in version 20.4
- MBS Xojo Plugins, version 20.4pr7

216.1.44 GetVariantTypeMBS(va as variant) as Integer

MBS Util Plugin, Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: All.

Function: Queries variant type.
Example:

```
Dim i As Int32 = 5
Dim u As UInt32 = 5
Dim vi As Variant = i
Dim vu As Variant = u
Dim ti As Integer = vi.Type // 2
Dim tu As Integer = vu.Type // 2
Dim mi As Integer = GetVariantTypeMBS(vi) // 2
Dim mu As Integer = GetVariantTypeMBS(vu) // 102

Break // check in debugger
```

Notes:

Same as variant.type or VarType() function, but returns 102 for UInt32 and 103 for UInt64.
This way plugin functions internally can distinguish between variants with unsigned vs. signed data types.

216.1.45 Blog Entries

216.1.46 Xojo Developer Magazine

- 19.1, page 11: News

216.1.47 ObjectIsAMBS(o as object, ClassName as string) as boolean

MBS Util Plugin, Plugin Version: 12.3, Platforms: macOS, Linux, Windows, Targets: All.

Function: Checks if a given object is of a given class.
Example:

```
// you must know exact name of class

dim v as Variant = window1

if ObjectIsAMBS(v, "window1.window1") then
MsgBox "OK"
end if

v = System.Cursors.MagnifyLarger

if ObjectIsAMBS(v, "MouseCursor") then
MsgBox "OK"
end if
```

Notes:

Like ISA operator, but with class name as string.
Returns false if o is nil.

216.1.48 Blog Entries

- MBS Real Studio Plugins, version 12.3pr11

216.1.49 SetVariantArrayValueMBS(v as Variant, index as Integer, value as Variant)

MBS Util Plugin, Plugin Version: 16.2, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets an object from an array of objects inside a variant.
Example:

```
// some part of app builds an array
dim a() as pair

// passes it as Variant somewhere else

dim v as Variant = a

// and later you may want to put values in array without knowing object type for array

// this raises TypeMismatchException
'dim o() as Object = v

// so use plugin

SetVariantArrayValueMBS(v, 0, 1:"Hello")
SetVariantArrayValueMBS(v, 1, 2:"World")

MsgBox a(0).Right+" "+a(1).Right
```

Notes:

This function is to allow setting objects in an array inside a variant without known the class used to declare array.
Also updated to work with object, variant, string, date, integer, double, single, boolean, Int64 arrays. Other array types will raise exception.
Be sure to only put objects of right class in the array! Else you risk crashes.

If index is 1 bigger than ubound, we append an element.

216.1.50 Blog Entries

- Variant Helper functions in MBS Xojo Plugins

- MBS Xojo / Real Studio Plugins, version 16.2pr3

216.1.51 GetEncodingOfStringMBS(s as string) as UInt32

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Returns the internal value for the encoding.
Example:

```
dim s as string = "Hello"

MsgBox hex(GetEncodingOfStringMBS(s)) // shows 8000100 for UTF8
```

Notes:

Only useful on Xojo 4.5 and newer.
Some example values for encoding:

MacRoman	0	Also for ASCII or binary data used.
WindowsLatin1	& h0500	ANSI codepage 1252
ISOLatin1	& h0201	ISO 8859-1
NextStepLatin	& h0B01	NextStep encoding
Unicode	& h0100	16 bit Unicode
UTF8	& h08000100	8 bit Unicode
Invalid	& hFFFFFFFF	(Binary)
Invalid	& hFFFF	(Binary)

Renamed from GetStringEncoding to GetEncodingOfString in MBS Plugin 3.1.

216.1.52 Xojo Developer Magazine

- 2.4, page 43: Cross platform streams, We write our own binary stream to save our data by Christian Schmitz

216.1.53 SetEncodingOfStringMBS(s as string, encoding as UInt32)

MBS Util Plugin, Platforms: macOS, Linux, Windows, Targets: All.

Function: Sets the internal value for the encoding of this string.
Example:

```
dim s as string = "√§√√º"
dim t as string = ConvertEncoding(s, encodings.UTF16)
```

```
dim m as MemoryBlock = t // memoryblock has bytes from UTF16 string without knowning the encoding
dim u as string = m // convert back to a string without encoding

MsgBox u // shows wrong characters
SetEncodingOfStringMBS u, 256 // set to UTF-16
MsgBox u
```

Notes:

Only useful on Xojo 4.5 and newer.
Some example values for encoding:

MacRoman	0	Also for ASCII or binary data used.
WindowsLatin1	& h0500	ANSI codepage 1252
ISOLatin1	& h0201	ISO 8859-1
NextStepLatin	& h0B01	NextStep encoding
Unicode	& h0100	16 bit Unicode
UTF8	& h08000100	8 bit Unicode
Invalid	& hFFFFFFFF	(Binary)
Invalid	& hFFFF	(Binary)

Renamed from SetStringEncoding to SetEncodingOfString in MBS Plugin 3.1.

216.1.54 Xojo Developer Magazine

- 2.4, page 43: Cross platform streams, We write our own binary stream to save our data by Christian Schmitz

216.2 class MemoryStatisticsMBS

216.2.1 class MemoryStatisticsMBS

216.2.4 Methods

216.2.5 Compact

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Compacts memory.
Notes: Asks malloc to free empty pages to the OS.

216.2.6 Constructor

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: The constructor.
Notes: Initializes the properties.

216.2.7 MemoryStatistics as MemoryStatisticsMBS

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Queries statistics for malloc.

216.2.8 Properties

216.2.9 BytesFree as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Number of bytes free.
Notes:

Memory used for objects, but now available for reuse with new objects.
And can't be freed usually as several objects share same memory page, so we keep the page.
(Read only property)

216.2.10 BytesTotal as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Total bytes allocated currently from OS.
Notes:

Free and used blocks.
(Read only property)

216.2.11 BytesUsed as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Used bytes of memory.
Notes:

Within total memory, the number of bytes currently in use.
This is what Xojo reports for Runtime.MemoryUsed.
(Read only property)

216.2.12 ChunksFree as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, Linux, iOS, Targets: All.

Function: Number of free chunks.
Notes:

Could be freed.
(Read only property)

216.2.13 ChunksUsed as Integer

MBS MacOSX Plugin, Plugin Version: 21.1, Platforms: macOS, iOS, Targets: All.

Function: Number of chunks in use.
Notes:

Not available on Linux.
(Read only property)

- 218.0.266 Xojo or my RB application itself crashes on launch on Mac OS Classic. Why? 29005

Chapter 218

The FAQ

218.0.1 Can anyone help me convert seconds to time in this format hh:mm:ss?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Sure, here's a routine I use (which has an advantage over the previously-posted Date-based solution in that you don't have to rely on the creation of an object – all that happens is some division and string concatenation):
Example:

```
Function SecsToTimeString(timeInSecs as Integer, padHours as boolean, padMinutes as boolean) as string
// Given an amount time (in seconds), generates a string representing that amount
// of time. The padHours and padMinutes parameters determine whether to display
// hours and minutes if their values are zero.

// Examples:
// timeInSecs = 90, padHours = true; returns "00:01:30"
// timeInSecs = 1, padHours = false, padMinutes = true; returns "00:01"
// timeInSecs = 3601, padMinutes = false; returns "01:00:01"

dim hours, minutes, seconds as Integer
dim hoursString, minutesString as string

hours = timeInSecs / 3600
minutes = (timeInSecs mod 3600) / 60
seconds = timeInSecs mod 60

if hours = 0 then
if padHours then
hoursString = "00:"
else
hoursString = ""
end if
```

```
else
hoursString = Format(hours, "# # \:")
end if
if minutes = 0 then
if hours <>0 or padMinutes then
minutesString = "00:"
else
minutesString = ""
end if
else
minutesString = Format(minutes, "00\:")
end if

return hoursString + minutesString + Format(seconds, "00")
End Function
```

Notes: (from the rb mailinglist)

218.0.2 Do you have plugins for Android?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Since there is no plugin SDK for Android, we have no way to make a plugin for Android.
Notes: We support macOS, Windows, Linux and iOS.

218.0.3 How do I get the proper highlight color on Mac OS X for active/inactive selection?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use functions from NSColor to get proper highlight color in RGB:
Example:

```
Function ProperHighlightColor(active as Boolean) As Color
# if TargetCocoa
Dim theColor As NSColorMBS
If active Then
theColor = NSColorMBS.alternateSelectedControlColor
Else
theColor = NSColorMBS.secondarySelectedControlColor
End If

Dim rgbColor As NSColorMBS = theColor.colorUsingColorSpaceName(NSColorSpaceMBS.NSCalibrate-
```

```
dRGBColorSpace)
If rgbColor <>Nil Then
Dim red as Integer = rgbColor.redComponent * 255.0
Dim green as Integer = rgbColor.greenComponent * 255.0
Dim blue as Integer = rgbColor.blueComponent * 255.0
Return RGB(red, green, blue)
Else
Return HighlightColor
End If
# else
return HighlightColor
# endif
End Function
```

Notes: As you see we convert color to Calibrated RGB for best results.

218.0.4 How to catch delete key?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: The following is the code in keydown event catches delete or backspace keys.
Example:

```
Function KeyDown(Key As String) As Boolean
if asc(key) = 8 or asc(key) = 127 then
MsgBox "Delete"
Return true
end if
End Function
```

218.0.5 How to convert cmyk to rgb?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

The following is the code to convert cmyk values to an RGB color datatype.
It's just a basic estimate of the color values. If you are looking for completely color accurate solution, this is not it. It should work for most people. :)
Example:

```
Function CMYKToRGB(c as Integer, m as Integer, y as Integer, k as Integer) As color
// converts c,m,y,k values (0-100) to color data type RGB
// place this in a method. Supply C,M,Y,K values-
// it returns color datatype

dim color_RGB as color
dim r, g, b as Integer

r=255-round(2.55*(c+k))
if r<0 then
r=0
end if
g=255-round(2.55*(m+k))
if g<0 then
g=0
end if
b=255-round(2.55*(y+k))
if b<0 then
b=0
end if

color_RGB=RGB(r,g,b)

return color_RGB

End Function
```

Notes: (from the rb mailinglist)

218.0.6 How to delete a folder?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: The following is the code deletes a folder recursively.
Example:

```
Sub deletefolder(f as folderitem)
dim files(-1) as FolderItem

if f=nil then Return

// delete single file
if f.Directory=false then
f.Delete
Return
end if

// get a list of all items in that folder
dim i,c as Integer
c=F.Count
for i=1 to c
files.Append f.TrueItem(i)
next

// delete each item
for each fo as FolderItem in files
if fo=nil then
' ignore
elseif fo.Directory then
deletefolder fo
fo.delete
else ' file
fo.Delete
```

```
end if
next

f.Delete
End Sub
```

218.0.7 How to detect if CPU if 64bit processor?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Via CPUID you can ask CPU:
Example:

```
dim c as new CPUIDMBS

if c.Flags(CPUIDMBS.kFeatureLM) then
MsgBox "64-bit CPU"
else
MsgBox "32-bit CPU"
end if
```

Notes: Should work on all intel compatible CPUs.

218.0.8 How to query variant type string for a variant?

Plugin Version: 20.5, Platforms: macOS, Linux, Windows, Targets: .

Answer: The following example function returns type string for variant.
Example:

```
Public Function VariantTypeString(v as Variant) as string
// Xojo's VarType doesn't know Unsigned integers
'Dim type As Integer = VarType(v)

// MBS VarType can detect unsigned integer
Dim type As Integer = GetVariantTypeMBS(v)

Dim IsArray As Boolean = BitwiseAnd(type, Variant.TypeArray) = Variant.TypeArray

// type without array
type = BitwiseAnd(type, Bitwise.OnesComplement(Variant.TypeArray))

// build a dictionary to map types on first call
Static TypeMap As Dictionary
If TypeMap = Nil Then
TypeMap = New Dictionary
TypeMap.Value(Variant.TypeBoolean) = "Boolean"
TypeMap.Value(Variant.TypeCFStringRef) = "CFStringRef"
TypeMap.Value(Variant.TypeColor) = "Color"
TypeMap.Value(Variant.TypeCString) = "CString"
TypeMap.Value(Variant.TypeCurrency) = "Currency"
TypeMap.Value(Variant.TypeDate) = "Date"
TypeMap.Value(Variant.TypeDateTime) = "DateTime"
TypeMap.Value(Variant.TypeDouble) = "Double"
TypeMap.Value(Variant.TypeInt32) = "Int32"
TypeMap.Value(Variant.TypeInt64) = "Int64"
TypeMap.Value(Variant.TypeInteger) = "Integer"
TypeMap.Value(Variant.TypeNil) = "Nil"
TypeMap.Value(Variant.TypeObject) = "Object"
TypeMap.Value(Variant.TypeOSType) = "OSType"
TypeMap.Value(Variant.TypePString) = "PString"
TypeMap.Value(Variant.TypePtr) = "Ptr"
TypeMap.Value(Variant.TypeSingle) = "Single"
TypeMap.Value(Variant.TypeString) = "String"
TypeMap.Value(Variant.TypeStructure) = "Structure"
TypeMap.Value(Variant.TypeText) = "Text"
TypeMap.Value(Variant.TypeWindowPtr) = "WindowPtr"
TypeMap.Value(Variant.TypeWString) = "WString"

// MBS extra types
TypeMap.Value(Variant.TypeInt32+100) = "UInt32"
TypeMap.Value(Variant.TypeInt64+100) = "UInt64"
```

```
End If

// lookup type

# if DebugBuild then
If Not TypeMap.HasKey(type) Then
Break // missing type
End If
# endif

If IsArray Then
Return "Array of " + TypeMap.Lookup(type,"?")
Else
Return TypeMap.Lookup(type,"?")
End If
End Function
```

218.0.9 How to refresh a htmlviewer on Windows?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can ask the browser to reload the website with this code line:
Example:

```
call htmlViewer1.IERunJavaScriptMBS("javascript:document.location.reload()")
```

218.0.10 Is there an example for vector graphics in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Try this example inside the paint event of a window:
Example:

```
dim v as Group2D
dim r as RectShape
dim s as StringShape

const pi=3.14

s=new StringShape
s.Text="Hello World!"
s.TextFont="Geneva"
s.TextSize=24
s.FillColor=rgb(0,0,255)
s.Italic=true
s.y=5
s.x=0

r=new RectShape

r.X=0
r.y=0
r.Height=100
r.Width=180
r.BorderColor=rgb(255,0,0)
r.FillColor=rgb(0,255,0)
r.BorderWidth=5
r.Border=50

v=new Group2d
v.Append r
v.Append s
v.Rotation=pi*-20.0/180.0
v.x=150
v.y=150

g.DrawObject v
```

218.0.11 Picture functions do not preserve resolution values?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Yes, the picture functions return pictures with no/default resolution values.
Example:

```
dim l as Picture = LogoMBS(500)

l.HorizontalResolution = 300
l.VerticalResolution = 300

dim r as Picture = l.Rotate90MBS

MsgBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)

r.HorizontalResolution = l.HorizontalResolution
r.VerticalResolution = l.VerticalResolution

MsgBox str(r.HorizontalResolution)+" x "+str(r.VerticalResolution)
```

Notes:

So please fix them yourself after calling a function.

Maybe in the future this changes, but currently you can't really set this easily from plugin code.

218.0.12 A toolbox call needs a rect - how do I give it one?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer: Fill a memoryblock like this:
Example:

```
Dim MB As Memoryblock
MB = NewMemoryBlock(8)
MB.Short(0) = window1.Top
MB.Short(2) = window1.Left
MB.Short(4) = window1.Height+window1.Top // bottom
MB.Short(6) = window1.Width+window1.Left // right
```

218.0.13 API client not supported?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: If you get this exception message on SQLConnectionMBS.Connect, we may have a problem.
Notes:

First case is that the given thing is not supported (e.g. MS SQL directly on Mac).
Second case is that the plugin compilation went wrong and the support for the database was not linked into the plugin. Like MySQL missing or MS SQL on Windows missing. In that case please contact us to fix the plugin.

218.0.14 Can I access Access Database with Java classes?

Plugin Version: all, Platform: Windows, Targets: .

Answer: You can use ucanaccess to access databases created with Microsoft
Example:

```
dim options(-1) as string

// load all the jar files we have in a folder called java:

dim appFolder as FolderItem = GetFolderItem("")

Dim count as Integer = appFolder.Parent.Child("java").Count
dim libjs() as string
For i as Integer = 1 to count
Dim f As FolderItem = appFolder.Parent.Child("java").item(i)
If f <>Nil and f.Exists Then
libjs.append f.NativePath+";"
End If
Next

// now init virtual machine
dim librery as string = Join(libjs, "")
dim vm as new JavaVMMBS(librery)

if vm.Handle = 0 then
MsgBox "Failed to initialize virtual machine"
else
// now make a new database connection with ucanaccess
dim d as new JavaDatabaseMBS(vm,"net.ucanaccess.jdbc.UcanaccessDriver")
Dim DbFile as FolderItem = appFolder.Parent.Child("Database11.accdb")
dim j as JavaConnectionMBS = d.getConnection("jdbc:ucanaccess://"+DbFile.NativePath)

// select and show values
```

```
dim r as JavaResultSetMBS = j.MySelectSQL("Select * From test")
while r.NextRecord
MsgBox r.getString("FirstName") +" "+ r.getString("LastName")
wend

end if

Exception e as JavaExceptionMBS
MsgBox e.message+" errorcode: "+str(e.ErrorNumber)
```

Notes:

see website:
http://ucanaccess.sourceforge.net/site.html

218.0.15 Can I create PDF from Xojo Report using DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Yes, we have a graphics class integration for DynaPDF.
Notes: Since MBS Plugin in version 19.2, we can integrate reports with Xojo.

218.0.16 Can I use AppleScripts in a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Yes, but they run on the server, not on the client.
Example:

```
dim a as new AppleScriptMBS

// query my application name
a.Compile "tell application ""System Events"" to return name of current application"

// run
a.Execute

// show result
label1.text = a.Result

// shows something like "My Application.fcgi.debug"
```

Notes: This can be useful to control the server from remote, if and only if the your sever is running Mac OS X.

218.0.17 Can I use graphics class with DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Sorry, no. We can't provide a graphics subclass from plugin.
Notes:

The is a feature request to allow graphics subclasses:
Feedback case 11391: feedback://showreport?report_id=11391

218.0.18 Can I use sockets on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Yes, but they run on the server, not on the client.
Notes:

You can use HTTPSocket, SMTPSocket, POP3Socket, SMTPSecureSocket, SecurePOP3Socket, EasyTCPSocket, EasyUDPSocket, AutoDiscovery, our Bonjour classes or our CURL* classes. But all of them work on the server, not on the client.

This means if you search for a printer with Bonjour, you can find the printers in the local network on your server hosting site. Using SMTPSocket may be a good idea for sending emails from the server like notifications.

218.0.19 Can I use your ChartDirector plugin on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Yes, our ChartDirector plugin works just fine on the Xojo Web Edition.
Example:

```
// The data for the pie chart
dim data(-1) as Double=array(55.0, 18.0, 25.0, 22.0, 18.0, 30.0, 35.0)

// The labels for the pie chart, Words are choosen random to check font!
dim labels(-1) as string=array("Germany","Italy","France","Spain","UK","Poland","Russia")

// The colors to use for the sectors
dim colors(-1) as Integer
```

```
colors.Append & h66aaee
colors.Append & heebb22
colors.Append & hbbbbbb
colors.Append & h8844ff

if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype/msttcorefonts"
end if

// Create a PieChart object of size 360 x 300 pixels
dim c as new CDPieChartMBS(700, 600)

c.setBackground(c.linearGradientColor(0, 0, 0, c.getHeight(), & h0000cc, & h000044))
c.setRoundedFrame(& hffffff, 16)
dim tt as CDTextBoxMBS = c.addTitle("ChartDirector Demonstration", "timesbi.ttf", 18)
tt.setMargin(0, 0, 16, 0)
tt.setFontColor(& hFFFFFF)

// Set the center of the pie at (180, 140) and the radius to 100 pixels
c.setPieSize 350,300,150
// Set the sector colors
c.setColors(c.kDataColor, colors)

// Draw the pie in 3D with a pie thickness of 20 pixels
c.set3D(20)

dim t as CDTextBoxMBS = c.setLabelStyle("arialbd.ttf", 10, & h000000)
t.setBackground(CDPieChartMBS.kSameAsMainColor, CDPieChartMBS.kTransparent, CDPieChartMBS.soft-
Lighting(CDPieChartMBS.kRight, 0))
t.setRoundedCorners(8)

// Use local gradient shading for the sectors, with 5 pixels wide
// semi-transparent white (bbffffff) borders
c.setSectorStyle(CDPieChartMBS.kLocalGradientShading, & hbbffffff, 0)

// Set the pie data and the pie labels
c.setData data,labels
call c.setLabelStyle "arialbd.ttf",18

dim pic as picture = c.makeChartPicture
dim wp as new WebPicture(pic, Picture.FormatJPEG) // JPEG makes it smaller and faster

ImageView1.Picture=wp
```

Notes:

Be aware that our plugin produces pictures for you, which you assign to ImageViews. Tranfserring those

pictures takes time, so you can optimize that with using WebPicture class. There you can decide between different compressions to improve speed (use JPEG instead of PNG).

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

218.0.20 Can I use your DynaPDF plugin on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Yes, our DynaPDF plugin works just fine on the Xojo Web Edition.
Notes:

PDF files are created on the server. You may want to offer a preview to the user which uses reduced resolution images to reduce the time to download the PDF.

See our Create PDF example for the Xojo Web Edition.

218.0.21 Can I use your plugin controls on a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: No.

218.0.22 Can you get an unique machine ID?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: There is nothing like an unique machine ID.
Notes:

1:
You can use the MAC IDs of the network interfaces.
This can be changed by the user with software tools.
And the list of network interfaces changes if user reorder the interfaces.

2:
You can use the system folder creation date/time.
This may stay equal after cloning machines or after migration to
new PC.

3:
You can use the Mac Serialnumber.
Mac only and it can happen that a Mac does not have a serial number.

4:
You can use the x86 CPU ID.
This is x86 CPU only and does not avoid running on the same CPU in different PCs.

218.0.23 ChartDirector: Alignment Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: .

Answer: ChartDirector: Alignment Specification
Notes:

In many ChartDirector objects, you may specify the alignment of the object's content relative to its boundary. For example, for a TextBox object, you may specify the text's alignment relative to the box boundary by using TextBox.setAlignment.

The ChartDirector API defines several constants for the alignment options.

ConstantValueDescription

218.0.24 ChartDirector: Color Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: .

Answer: ChartDirector: Color Specification
Notes:

Many functions in the ChartDirector API accept colors as parameters. ChartDirector supports colors specified in web and HTML compatible ARGB format, in which ARGB refers to the Alpha transparency, Red, Green and Blue components of the color.

In addition to ARGB colors, ChartDirector supports "dynamic" colors. A dynamic color is a color that changes depending on the position of the pixels. The "dynamic" colors that ChartDirector supports include "pattern colors", "metal colors", "gradient colors", "zone colors" and "dash line colors".

ChartDirector supports specifying colors indirectly using "palette colors". When a "palette color" is used, the color is specified as an index to a palette. The actual color is looked up from the palette.ARGB Color

BottomLeft	1	The leftmost point on the bottom line.
BottomCenter	2	The center point on the bottom line.
BottomRight	3	The rightmost point on the bottom line.
Left	4	The leftmost point on the middle horizontal line.
Center	5	The center point on the middle horizontal line.
Right	6	The rightmost point on the middle horizontal line.
TopLeft	7	The leftmost point on the top line.
TopCenter	8	The center point on the top line.
TopRight	9	The rightmost point on the top line.
Bottom	2	The center point on the bottom line. Same as BottomCenter.
Top	8	The center point on the top line. Same as TopCenter.
TopLeft2	10	An alternative top-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopLeft2 refers to refers to the left of the top side, while TopLeft refers to the top of the left side. The reverse applies for a horizontal axis.
TopRight2	11	An alternative top-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, TopRight2 refers to refers to the right of the top side, while TopRight refers to the top of the right side. The reverse applies for a horizontal axis.
BottomLeft2	12	An alternative bottom-left position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomLeft2 refers to refers to the left of the bottom side, while BottomLeft refers to the bottom of the left side. The reverse applies for a horizontal axis.
BottomRight2	13	An alternative bottom-right position used in Axis.setTitlePos for axis title positioning only. For a vertical axis, BottomRight2 refers to refers to the right of the bottom side, while BottomRight refers to the bottom of the right side. The reverse applies for a horizontal axis.

ARGB color consists of 4 components - alpha transparency, red, green and blue. The four components are encoded as a 32-bit number, with each component occupying 8 bits. In hexadecimal notation, it is AARRGGBB, where AA, RR, GG and BB are the alpha transparency, red, green and blue components.

Each component ranges from 00 - FF (0 - 255), representing its intensity. For example, pure red color is 00FF0000, pure green color is 0000FF00, and pure blue color is 000000FF. White color is 00FFFFFF, and black color is 00000000.

Most programming language requires you to put special prefix in front of hexadecimal characters. For C++, the prefix is "0x". For example, the syntax for the hexadecimal number 00FFFFFF is 0x00FFFFFF, or simply 0xFFFFFF.
For the alpha transparency component, a zero value means the color is not transparent all at. This is equivalent to traditional RGB colors. A non-zero alpha transparency means the the color is partially transparent. The larger the alpha transparency, the more transparent the color will be. If a partially transparent color is used to draw something, the underlying background can still be seen.

For example, 80FF0000 is a partially transparent red color, while 00FF0000 is a non-transparent red color.

Note that ChartDirector's ARGB color is web and HTML compatible. For example, red is FF0000, the same as in HTML. There are many resources on the web that provide tables in which you can click a color and it will show its HTML color code. These color codes can be used in ChartDirector.

If alpha transparency is FF (255), the color is totally transparent. That means the color is invisible. It does not matter what the RGB components are. So in ChartDirector, only one totally transparent color is used - FF000000. All other colors of the form FFnnnnnn are reserved to represent palette colors and dynamic colors, and should not be interpreted as the normal ARGB colors.

The totally transparent color FF000000 is often used in ChartDirector to disable drawing something. For example, if you want to disable drawing the border of a rectangle, you can set the border color to totally transparent.

For convenience, ChartDirector defines a constant called Transparent, which is equivalent to FF000000.Pattern Color
A pattern color is a dynamic color that changes according to a 2D periodic pattern. When it is used to fill an area, the area will look like being tiled with a wallpaper pattern.

Pattern colors are created using BaseChart.patternColor, BaseChart.patternColor2, DrawArea.patternColor and DrawArea.patternColor2. The patternColor method creates pattern colors using an array of colors as a bitmap. The patternColor2 method creates pattern colors by loading the patterns from image files.

These methods return a 32-bit integer acting as a handle to the pattern color. The handle can be used in any ChartDirector API that expects a color as its input.Metal Color
A metal color is a color of which the brightness varies smoothly across the chart surface as to make the surface looks shiny and metallic. ChartDirector supports using any color as the base color of the metal color. In particular, using yellow and grey as the base colors will result in metal colors that look gold and silver.

Metal colors are most often used as background colors of charts. They are created using CDBaseChartMBS.metalColor, CDBaseChartMBS.goldColor and CDBaseChartMBS.silverColor. The first method allows you to specify an arbitrary base color. The second and third methods use yellow and grey as the base colors, resulting in gold and silver metal colors.

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.Gradient Color
A gradient color is a color that changes progressively across a direction.

Gradient colors are created using BaseChart.gradientColor, BaseChart.gradientColor2, DrawArea.gradientColor and DrawArea.gradientColor2. The gradientColor method creates a 2-point gradient color that changes from color A to color B. The gradientColor2 method creates a multi-point gradient colors that changes from

color A to B to C ....

These methods return a 32-bit integer acting as a handle to the gradient color. The handle can be used in any ChartDirector API that expects a color as its input.

One common use of multi-point gradient colors is to define colors that have metallic look and feel. Please refer to DrawArea.gradientColor2 for details.Dash Line Colors
A dash line color is a color that switches on and off periodically. When used to draw a line, the line will appear as a dash line.

Dash line colors are created using BaseChart.dashLineColor and DrawArea.dashLineColor. They accept a line color and a dash pattern code as arguments, and return a 32-bit integer acting as a handle to the dash line color. The handle can be used in any ChartDirector API that expects a color as its input.Zone Colors
A zone color is for XY charts only. It is a color that automatically changes upon reaching a data threshold value along the x-axis or y-axis. Zone colors are created using Layer.xZoneColor, Layer.yZoneColor, XY-Chart.xZoneColor or XYChart.yZoneColor.Palette Colors
Palette colors are colors of the format FFFFnnnn, where the least significant 16 bits (nnnn) are the index to the palette. A palette is simply an array of colors. For a palette color, the actual color is obtained by looking up the palette using the index. For example, the color FFFF0001 is the second color in the palette (first color is index 0).

The colors in the palette can be ARGB colors or ”dynamic” colors (pattern, gradient and dash line colors).

The first eight palette colors have special significance. The first three palette colors are the background color, default line color, and default text color of the chart. The 4th to 7th palette colors are reserved for future use. The 8th color is a special dynamic color that is equal to the data color of the ”current data set”.

The 9th color (index = 8) onwards are used for automatic data colors. For example, in a pie chart, if the sector colors are not specified, ChartDirector will automatically use the 9th color for the first sector, the 10th color for the second sector, and so on. Similarly, for a multi-line chart, if the line colors are not specified, ChartDirector will use the 9th color for the first line, the 10th color for the second line, and so on.

The ChartDirector API defines several constants to facilitate using palette colors.

ConstantValueDescription

When a chart is created, it has a default palette. You may modify the palette using BaseChart.setColor, BaseChart.setColors, or BaseChart.setColors2.

The advantages of using palette colors are that you can change the color schemes of the chart in one place. ChartDirector comes with several built-in palettes represented by the following predefined constants.

Palette	FFFF0000	The starting point of the palette. The first palette color is (Palette + 0). The nth palette color is (Palette + n - 1).
BackgroundColor	FFFF0000	The background color.
LineColor	FFFF0001	The default line color.
TextColor	FFFF0002	The default text color.
[Reserved]	FFFF0003 - FFFF0006	These palette positions are reserved. Future versions of ChartDirector may use these palette positions for colors that have special significance.
SameAsMainColor	FFFF0007	A dynamic color that is equal to the data color of the current data set. This color is useful for objects that are associated with data sets. For example, in a pie chart, if the sector label background color is SameAsMainColor, its color will be the same as the corresponding sector color.
DataColor	FFFF0008	The starting point for the automatic data color allocation.

ConstantDescription

defaultPalette	An array of colors representing the default palette. This palette is designed for drawing charts on white backgrounds (or lightly colored backgrounds).
whiteOnBlackPalette	An array of colors useful for drawing charts on black backgrounds (or darkly colored backgrounds).
transparentPalette	An array of colors useful drawing charts on white backgrounds (or lightly colored backgrounds). The data colors in this palette are all semi-transparent.

218.0.25 ChartDirector: Font Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: .

Answer: ChartDirector: Font Specification
Notes:

Font Name
In ChartDirector, the font name is simply the file name that contains the font. For example, under the Windows platform, the "Arial" font is "arial.ttf", while the "Arial Bold" font is "arialbd.ttf".

NOTE: Mac OS X Specific Information
In Mac OS X, in addition to ".ttf", ChartDirector also supports Mac OS X font file formats, such as Font Suitcase files and Datafork files (.dfont). These files often contain multiple fonts. For example, the "GillSans.dfont" file contains 6 fonts.

So in addition to the file name, an index is needed to determine the font. The index is specified by appending a " | " character to the font name, followed by the index number. For example, the third font in "GillSans.dfont" is denoted as "GillSans.dfont | 2". (Note: The first font starts at 0.) If no index number is provided, the first font is assumed.

ChartDirector also supports using Mac OS X Font Manager names. For example, one may use "Gill Sans

Light Italic" instead of using "GillSans.dfont | 1" as the font name. However, the Mac OS X Font Manager is active only if someone has logged into the Mac GUI console, so this method is only recommended for developing applications that run on the GUI console.

The sample programs that come with ChartDirector are designed to run on all operating systems, so they use generic font file names (eg. "arial.ttf") instead of Mac OS X specific names. To allow them to run on Mac OS X, ChartDirector on Mac OS X has a built-in table to map common font file names to Mac OS X font names:

"arial.ttf", "arialbd.ttf", "ariali.ttf" and "arialbi.ttf" are mapped to "Arial | 0" (Arial), "Arial | 1" (Arial Bold), "Arial | 2" (Arial Italic) and "Arial | 3" (Arial Bold Italic)

"times.ttf", "timesbd.ttf", "timesi.ttf" and "timesbi.ttf" are mapped to "Times New Roman | 0" (Times New Roman), "Times New Roman | 1" (Times New Roman Bold), "Times New Roman | 2" (Times New Roman Italic) and "Times New Roman | 3" (Times New Roman Bold Italic)

"cour.ttf", "courbd.ttf", "couri.ttf" and "courbi.ttf" are mapped to "Courier New | 0" (Courier New), "Courier New | 1" (Courier New Bold), "Courier New | 2" (Courier New Italic) and "Courier New | 3" (Courier New Bold Italic)

Font Location
ChartDirector on Windows does not come with any font files. It relies on the operating system's font files in the " [windows] \Fonts" directory. To see what fonts are installed in your operating system and their file names, use the File Explorer to view that directory.

ChartDirector on Windows will also search for the font files in the "fonts" subdirectory (if it exists) under the directory where the ChartDirector DLL "chartdir.dll" is installed. This is useful for private fonts. Also, for some especially secure web servers, the web anonymous user may not have access to the " [windows] \Fonts" directory. In this case, you may copy the font files to the above subdirectory.

ChartDirector on Mac OS X relies on operating system font files in "/Library/Fonts" and "/System/Library/Fonts".

ChartDirector on Linux, FreeBSD and Solaris assume the fonts files are in the "fonts" subdirectory under the directory where the ChartDirector shared object "libchartdir.so" is installed. ChartDirector on Linux, FreeBSD and Solaris come with a number of font files in the "fonts" subdirectory.

To keep the download size small, ChartDirector on Linux, FreeBSD and Solaris only come with some commonly used fonts. You may download additional fonts from the Internet. In particular, the Microsoft fonts at
http://sourceforge.net/project/showfiles.php?group_id=34153& release_id=105355
is highly recommended. Please refer to
http://www.microsoft.com/typography/faq/faq8.htm

on how you could use the fonts legally in your system.

ChartDirector supports True Type fonts (.ttf), Type 1 fonts (.pfa and .pfb) and Windows bitmap fonts (.fon). On Mac OS X, ChartDirector also supports Font Suitcase and Datafork (.dfont) files. On Linux, FreeBSD and Solaris, ChartDirector also supports Portable Compiled Fonts (.pcf fonts).

If you want ChartDirector to search other directories for the font files, you may list the directories in an environment variable called "FONTPATH".

If you specify an absolute path name for the font file, ChartDirector will use the absolute path name and will not search other directories.Artificial Boldening and Italicizing
Whereas most popular font comes with different styles for "normal", "bold", "italic" and "bold italic", some fonts only come with one style (the normal style). For example, the Monotype Corsiva font that comes with MS Office only has the normal style (mtcorsva.ttf). For these cases, you may append the "Bold" and/or "Italic" words after the font file name (separated with a space) to ask ChartDirector to artificially bolden and/or italicize the font. For example, you may specify the font name as "mtcorsva.ttf Bold".Font List
Instead of specifying a single font file as the font name, you may specify a list of font files as the font name, separated by semi-colons. This is useful when using international characters that are only available in some fonts.

For example, if you would like to use the Arial font ("arial.ttf") for western characters, and the MingLiu font "mingliu.ttc" for Chinese characters (since the Arial font does not have Chinese characters), you may specify the font name as "arial.ttf;mingliu.ttc". In this case, ChartDirector will try the Arial font first. If it cannot find a certain character there, it will try the MingLiu font.Indirect Font Names
ChartDirector supports several special keywords for specifying the font name indirectly. When these keywords are used as font names, ChartDirector will look up the actual font names from a font table. The keywords are as follows:

KeywordsDescription	
"normal"	This default normal font, which is the first font in the font table. This is initially mapped to "arial.ttf" (Arial).
"bold"	The default bold font, which is the second font in the font table. This is initially mapped to "arialbd.ttf" (Arial Bold).
"italic"	The default italic font, which is the third font in the font table. This is initially mapped to "ariali.ttf" (Arial Italic).
"boldItalic"	The default bold-italic font, which is the fourth font in the font table. This is initially mapped to "arialbi.ttf" (Arial Bold Italic).
"fontN"	The (N + 1)th font in the font table (the first font is "font0").

The font table can be modified using BaseChart.setFontTable or DrawArea.setFontTable.

The advantage of using indirect font names is that you can change the fonts fonts in your charts in one place.Font Index
Most font files contain one font. However, it is possible a font file contains multiple fonts (that is, a font collection). For example, in True Type fonts, font files with extension ".ttc" may represent a font collection.

If a font file contains multiple font, the font index can be used to specify which font to use. By default, the font index is 0, which means the first font in the font file will be used.Font Size
The font size decides how big a font will appear in the image. The font size is expressed in a font unit called points. This is the same unit used in common word processors.

Instead of specifying font size, some ChartDirector API (eg. TextBox.setFontSize) allow you to specify font height and font width separately. You may use different point sizes for font height and font width to create special effects.Font Color
This is the color to draw the font. (See Color Specification on how colors are represented in ChartDirector.)Font Angle
This is the angle in degrees by which the font should be rotated anti-clockwise.Vertical Layout
By default, text are laid out horizontally, with characters being drawn from left to right.

ChartDirector also supports vertical layout, with characters being drawn from top to bottom. For example, you may use BaseChart.addText to add text that are laid out vertically. Vertical layout is common for oriental languages such as Chinese, Japanese and Korean.

218.0.26 ChartDirector: Mark Up Language

Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: .

Answer: ChartDirector: Mark Up Language
Notes:

ChartDirector Mark Up Language (CDML) is a language for including formatting information in text strings by marking up the text with tags.

CDML allows a single text string to be rendered using multiple fonts, with different colors, and even embed images in the text.Font Styles
You can change the style of the text by using CDML tags. For example, the line:

<*font=timesi.ttf,size=16,color=FF0000>Hello <*font=arial.ttf,size=12,color=8000*>world!
will result in the following text rendered:

In general, all tags in CDML are enclosed by <* and *>. Attributes within the tags determine the styles of the text following the tags within the same block.

If you want to include <* in text without being interpreted as CDML tags, use «* as the escape sequence.

The following table describes the supported font style attributes in CDML. See Font Specification for details on various font attributes.

AttributeDescription

font	Starts a new style section, and sets the font name. You may use this attribute without a value (that is, use "font" instead of "font=arial.ttf") to create a new style section without modifying the font name.
size	The font size.
width	The font width. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
height	The font height. This attribute is used to set the font width and height to different values. If the width and height are the same, use the size attribute.
color	The text color in hex format.
bgColor	The background color of the text in hex format.
underline	The line width of the line used to underline the following characters. Set to 0 to disable underline.
sub	Set the following text to be in subscript style. This attribute does not need to have a value. (You may use "sub" as the attribute instead of "sub=1".)
super	Set the following text to be in superscript style.

Set the following text to be in superscript style. This attribute does not need to have a value. (You may use "super" as the attribute instead of "super=1".)

xoffset	Draw the following the text by shifting the text horizontally from the original position by the specified offset in pixels.
yoffset	Draw the following the text by shifting the text vertically from the original position by the specified offset in pixels.
advance	Move the cursor forward (to the right) by the number of pixels as specified by the value this attribute.
advanceTo	Move the cursor forward (to the right) to the position as specified by the value this attribute. The position is specified as the number of pixels to the right of the left border of the block. If the cursor has already passed through the specified position, the cursor is not moved.

Note that unlike HTML tags, no double or single quotes are used in the tags. It is because CDML tags are often embedded as string literals in source code. The double or single quotes, if used, will conflict with the

string literal quotes in the source code. Therefore in CDML, no quotes are necessary and they must not be used.

Also, unlike HTML tags, CDML uses the comma character as the delimiter between attributes. It is because certain attributes may contain embed spaces (such as the font file name). So space is not used as the delimiter and the comma character is used instead.

Note the font attribute above starts a new style section, while other attributes just modify the current style section. You may use <*/font*>to terminate a style section, which will restore the font styles to the state before the style section.Blocks and Lines
In CDML, a text string may contain multiple blocks. A block may contain multiple lines of text by separating them with new line characters ("\n") or with <*br*>. The latter is useful for programming languages that cannot represent new line characters easily.

For example, the line:

<*size=15*><*block*><*color=FF*>BLOCK<*br*>ONE<*/*>and <*block*><*color=FF00*>BLOCK<*br*>TWO
will result in the following text rendered:

The above example contains a line of text. The line contains two blocks with the characters " and " in between. Each block in turn contains two lines. The blocks are defined using <*block*>as the start tag and <*/*>as the end tag.

When a block ends, font styles will be restored to the state before entering the block.Embedding Images
CDML supports embedding images in text using the following syntax:

<*img=my_image_file.png*>
where my_image_file.png is the path name of the image file.

For example, the line:

<*size=20*>A <*img=sun.png*>day
will result in the following text rendered:

ChartDirector will automatically detect the image file format using the file extension, which must either png, jpg, jpeg, gif, wbmp or wmp (case insensitive).

Please refer to BaseChart.setSearchPath or DrawArea.setSearchPath on the directory that ChartDirector will search for the file.

The <*img*>tag may optionally contain width and height attributes to specify its pixel width and height.

In this case, ChartDirector will stretch or compress the image if necessary to the required width and height.Blocks Attributes

CDML supports nesting blocks, that is, a block can contain other sub-blocks. Attributes are supported in the <*block*>tag to control the alignment and orientation of the sub-blocks. The <*img=my_image_file.png*>is treated as a block for layout purposes.

For example, the line:

<*block,valign=absmiddle*><*img=molecule.png*><*block*>Hydrazino\nMolecule<*/*><*/*>
will result in the following text rendered:

The the above starts <*block,valign=absmiddle*>which specifies its content should align with each others in the vertical direction using the absolute middle alignment. The block contains an image, followed by a space characters, and then another block which has two lines of text.

The following table describes the supported attributes inside <*block*>tag:

AttributeDescription

width	The width of the block in pixels. By default, the width is automatically determined to be the width necessary for the contents of the block. If the width attribute is specified, it will be used as the width of the block. If the width is insufficient for the contents, the contents will be wrapped into multiple lines.
height	The height of the block in pixels. By default, the height is automatically determined to be the height necessary for the contents of the block. If the height attribute is specified, it will be used as the height of the block.
maxwidth	The maximum width of the block in pixels. If the content is wider than maximum width, it will be wrapped into multiple lines.
truncate	The maximum number of lines of the block. If the content requires more than the maximum number of lines, it will be truncated. In particular, if truncate is 1, the content will be truncated if it exceeds the maximum width (as specified by maxwidth or width) without wrapping. The last few characters at the truncation point will be replaced with "...".
linespacing	The spacing between lines as a ratio to the default line spacing. For example, a line spacing of 2 means the line spacing is two times the default line spacing. The default line spacing is the line spacing as specified in the font used.
bgColor	The background color of the block in hex format.
valign	The vertical alignment of sub-blocks. This is for blocks that contain sub-blocks. Supported values are baseline, top, bottom, middle and absmiddle.

The value baseline means the baseline of sub-blocks should align with the baseline of the block. The baseline is the underline position of text. This is normal method of aligning text, and is the default in CDML. For images or blocks that are rotated, the baseline is the same as the bottom.

The value top means the top line of sub-blocks should align with the top line of the block.

The value bottom means the bottom line of sub-blocks should align with the bottom line of the block.

The value middle means the middle line of sub-blocks should align with the the middle line of the block. The middle line is the middle position between the top line and the baseline.

The value absmiddle means the absolute middle line of sub-blocks should align with the absolute middle line of the block. The absolute middle line is the middle position between the top line and the bottom line.

halign The horizontal alignment of lines. This is for blocks that contain multiple lines. Supported values are left, center and right.

The value left means the left border of each line should align with the left border of the block. This is the default.

The value center means the horizontal center of each line should align with the horizontal center of the block.

The value right means the right border of each line should align with the right border of the block.

angle Rotate the content of the block by an angle. The angle is specified in degrees in counter-clockwise direction.

218.0.27 ChartDirector: Parameter Substitution and Formatting

Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: .

Answer: ChartDirector: Parameter Substitution and Formatting
Notes:

ChartDirector charts often contain a lot of text strings. For example, sector labels in pie charts, axis labels for x and y axes, data labels for the data points, HTML image maps, etc, are all text strings.

ChartDirector uses parameter substitution to allow you to configure precisely the information contained in

the text and their format.

Format Strings

In parameter substitution, format strings are used to specify the entities to be include into labels and how to format numbers and dates.

For example, when drawing a pie chart with side label layout, the default sector label format string is:

" { label } ({ percent } %)"

When the sector label is actually drawn, ChartDirector will replace " { label } " with the sector name, and " { percent } " with the sector percentage. So the above label format will result is a sector label similar to "ABC (34.56%)".

You may change the sector label format by changing the format string. For example, you may change it to:

" { label } : US$ { value | 2 } K ({ percent } %)"

The sector label will then become something like "ABC: US$ 123.00 (34.56%)".

In general, in ChartDirector parameter substitution, parameters enclosed by curly brackets will be substituted with their actual values when creating the texts.

For parameters that are numbers or dates/times, ChartDirector supports a special syntax in parameter substitution to allow formatting for these values. Please refer to the Number Formatting and Date/Time Formatting sections below for details.

Parameter Expressions

ChartDirector supports numeric expressions in format strings. They are denoted by enclosing the expression with curly brackets and using "=" as the first character. For example:

"USD { value } (Euro { = { value } *0.9 })"

In the above, " { value } " will be substituted with the actual value of the sector. The expression " { = { value } *0.9 } " will be substituted with the actual value of the sector multiplied by 0.9.

ChartDirector parameter expressions support operators "+", "-", "*", "/", "% " (modulo) and "^" (exponentiation). Operators "*", "/", "% ", "^" is computed first, followed by "+" and "-". Operators of the same precedence are computed from left to right). Parenthesis "(" and ")" can be used to change the computation order.

Parameters for Pie Charts

The following table describes the parameters available for pie charts.

Parameter	Description
sector	The sector number. The first sector is 0, while the nth sector is (n-1).
dataSet	Same as { sector } . See above.
label	The text label of the sector.
dataSetName	Same as { label } . See above.
value	The data value of the sector.
percent	The percentage value of the sector.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using BaseChart.addExtraField or BaseChart.addExtraField2.

Parameters for All XY Chart Layers
The followings are parameters that are apply to all XY Chart layers in general. Some layer types may have additional parameters (see below).

Note that certain parameters are inapplicable in some context. For example, when specifying the aggregate label of a stacked bar chart, the { dataSetName } parameter is inapplicable. It is because a stacked bar is composed of multiple data sets. It does not belong to any particular data set and hence does not have a data set name.

{ fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.

Additional Parameters for Line Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Trend Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Box-Whisker Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for HLOC and CandleStick Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Additional Parameters for Vector Layers
The followings are parameters that are in additional to the parameters for all XY Chart layers.

Parameters for All Polar Layers
The followings are parameters that are apply to all Polar Chart layers in general. Some layer types may

have additional parameters (see below).

{ fieldN } means the extra field is indexed by the data point number. The Pth data point corresponds to the Pth element of the extra field.

Additional Parameters for PolarVector Layers
The followings are parameters that are in additional to the parameters for all Polar Chart layers.

Parameters for Axis
The following table describes the parameters available for pie charts.

Number Formatting
For parameters that are numbers, ChartDirector supports a number of formatting options in parameter substitution.

For example, if you want a numeric field { value } to have a precision of two digits to the right of the decimal point, use ',' (comma) as the thousand separator, and use '.' (dot) as the decimal point, and you may use { value | 2,. } . The number 123456.789 will then be displayed as 123,456.79.

For numbers, the formatting options are specified using the following syntax:

{ [param] | [a] [b] [c] [d] }

where:

If this field starts with "E" or "e", followed by a number, it means formatting the value using scientific notation with the specified number of decimal places. If the "E" or "e" is not followed by a number, 3 is assumed.

For example, { value | E4 } will format the value 10.3 to 1.0300E+1, and { value | e4 } will format the same value to 1.0300e+1.

If this field starts with "G" or "g", followed by a number, it means formatting the value using the scientific notation only if the value is large and requires more than the specified number of digits, or the value is less than 0.001. If scientific notation is used, the number following "G" or "g" also specifies the number of significant digits to use. If the "G" or "g" is not followed by a number, 4 is assumed.

For example, consider the format string { value | G4 } . The value 10 will be formatted to 10. The value 100000 will be formatted to 1.000E+5. Similarly, for { value | g4 } , the value 10 will be formatted to 10, while the value 100000 will be formatted to 1.000e+5.

If you skip this argument, ChartDirector will display the exact value using at most 6 decimal places.

You may skip [b] [c] [d] . In this case, the default will be used.

Date/Time Formatting
For parameters that are dates/times, the formatting options can be specified using the following syntax:

{ [param] | [datetime_format_string] }

where [datetime_format_string] must start with an english character (A-Z or a-z) that is not "G", "g", "E" or "e", and may contain any characters except ' } '. (If it starts with "G", "g", "E" or "e", it will be considered as a number format string.)

Certain characters are substituted according to the following table. Characters that are not substituted will be copied to the output.

For example, a parameter substitution format of { value | mm-dd-yyyy } will display a date as something similar to 09-15-2002. A format of { value | dd/mm/yy hh:nn:ss a } will display a date as something similar to 15/09/02 03:04:05 pm.

If you want to include characters in the format string without substitution, you may enclose the characters in single or double quotes.

For example, the format { value | mmm '<*color=dd0000*>'yyyy } will display a date as something like Jan <*color=dd0000*>2005 (the <*color=dd0000*>is a CDML tag to specify red text color). Note that the <*color=dd0000*>tag is copied directly without substitution, even it contains "dd" which normally will be substituted with the day of month.
Escaping URL/HTML/CDML characters
Parameter substitution is often used to create HTML image maps. In HTML, some characters has special meanings and cannot be used reliably. For example, the '>' is used to represent the end of an HTML tag.

Furthermore, if the field happens to be used as an URL, characters such as '?', '& ' and '+' also have special meanings.

By default, ChartDirector will escape template fields used in URL and query parameters when generating image maps. It will modify URL special characters to the URL escape format "% XX" (eg. "?" will become "% 3F"). After that, it will modify HTML special characters to the HTML escape format "& amps;# nn;" (eg. ">" will become "& amps;# 62;".). Similarly, it will escape other attributes in the image map using HTML escape format (but not URL escape format).

In addition to escaping HTML and URL special characters, ChartDirector will also remove CDML fields in

creating image maps. It is because CDML is only interpreted in ChartDirector, should not be useful outside of ChartDirector (such as in browser tool tips).

In some cases, you may not want ChartDirector to escape the special characters. For example, if the parameters have already been escaped before passing to ChartDirector, you may want to disable ChartDirector from escaping them again.

ChartDirector supports the following special fields to control the escape methods - " { escape_url } ", " { noescape_url } ", " { escape_html } ", " { noescape_html } ", " { escape_cdml } " and { noescape_cdml } ". These fields enable/disable the escape methods used in the template fields that follow them.

218.0.28 ChartDirector: Shape Specification

Plugin Version: 8.2, Platforms: macOS, Linux, Windows, Targets: .

Answer: ChartDirector: Shape Specification
Notes:

Several ChartDirector API accept shape specification as arguments. For example, BarLayer.setBarShape and BarLayer.setBarShape2 can be used to specify shapes of bars in bar charts, while DataSet.setDataSymbol, DataSet.setDataSymbol4, PolarLayer.setDataSymbol and PolarLayer.setDataSymbol4 can be used to specify shapes for data symbols.

Note that in addition to shapes, in many cases ChartDirector also accepts images or custom draw objects for data representation. For example, see DataSet.setDataSymbol2, DataSet.setDataSymbol3, PolarLayer.setDataSymbol2 and PolarLayer.setDataSymbol3.

Built-In Shapes

Built-in shapes are specified as integers. The integers can be explicit constants, or can be generated by a ChartDirector method for parameterized shapes. For example, a circle is represented by an explicit constant CircleShape (=7). On the other hand, the number representing a polygon depends on the number of sides the polygon has, so it is generated by using the PolygonShape method, passing in the number of sides as argument.

The following table illustrates the various ChartDirector shapes:

Custom Shapes

In ChartDirector, custom shapes are specified as an array of integers x0, y0, x1, y1, x2, y2 ... representing the coordinates of the vertices of the custom polygonal shape.

The polygon should be defined with a bounding square of 1000 x 1000 units, in which the x-axis is from -500 to 500 going from left to right, and the y-axis is from 0 to 1000 going from bottom to top.

ChartDirector will automatically scale the polygon so that 1000 units will become to the pixel size as requested by the various ChartDirector API.

As an example, the shape of the standard diamond shape in ChartDirector is represented as an array with 8 numbers:

0, 0, 500, 500, 0, 1000, -500, 500

218.0.29 Copy styled text?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: How to quickly copy styled text from one textarea to another?
Example:

```
# if TargetWin32 then
TextArea1.WinRTFDataMBS = TextArea2.WinRTFDataMBS
# elseif TargetMacOS then
TextArea1.NSTextViewMBS.textStorage.setAttributedString TextArea2.NSTextViewMBS.textStorage
# else
TextArea1.StyledText = TextArea2.StyledText
# endif
```

Notes: The code above uses special plugin functions on Mac and Windows and falls back to framework for Linux.

218.0.30 Do you have code to validate a credit card number?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can check the checksum to tell if a credit card number is not valid.
Example:

```
Dim strNumber As String
Dim nLength as Integer
Dim nValue as Integer
Dim nChecksum as Integer
Dim nIndex as Integer
```

```
strNumber = EditField1.Text
nLength = Len(strNumber)
nChecksum = 0

For nIndex = 0 To nLength - 2
nValue = Val(Mid(strNumber, nLength - (nIndex + 1), 1)) * (2 - (nIndex Mod 2))
If nValue <10 Then
nChecksum = nChecksum + nValue
Else
nChecksum = nChecksum + (nValue - 9)
End If
Next

If Val(Mid(strNumber, Len(strNumber), 1)) = (10 - (nChecksum Mod 10)) Mod 10 Then
MsgBox("The credit card number looks valid")
Else
MsgBox("The credit card number is invalid")
End IF
```

Notes:

Here's some code that will validate the checksum for a credit card. It works for Visa, MasterCard, American Express and Discover. Not sure about others, but I imagine they use the same basic algorithm. Of course, this doesn't actually mean that the credit card is valid, it's only useful for helping the user catch typos.

The above code doesn't have any error checking and it expects that the credit card number will be entered without spaces, dashes or any other non-numeric characters. Addressing those issues will be an exercise left to the reader. :)

(From Mike Stefanik)

218.0.31 Do you have plugins for X-Rite EyeOne, eXact or i1Pro?

Plugin Version: all, Targets: .

Answer: Our EyeOne plugin is available on request for licensees of the X-Rite SDKs.
Notes:

Please first go to X-Rite and get a SDK license.
Than we can talk about the plugin.

218.0.32 Does SQL Plugin handle stored procedures with multiple result sets?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Yes, the plugin can work with multiple recordsets.
Notes:

You need to use SQLCommandMBS class. When you get back results, you use FetchNext to walk over all records in the first result set. Than you simply start again with FetchNext to get the second record set. Even the RecordSet functions should work, just use them twice to get all records from both record sets.

218.0.33 Does the plugin home home?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Yes, we like to know who is using the plugin, so the plugin may contact our server.
Example:

none.

Notes:

Please note that this does not affect your users as the plugin will only do this in the IDE and the relevant plugin part is never included in your applications.

The plugin if used for some hours, does contact our server to provide statistical data about Xojo version and OS versions. This way we know what versions are used. We can return the version number of the current plugin which may be visible in future versions somehow. And we transmit partial licenses data so we can track use of illegal license keys.

If you do not like to have this, you can block Xojo IDE from contacting our website via your Firewall.
Blocking the transfer will not disable the plugin or change the features.
Or contact us for a plugin version which explicitly does not contain this feature.

218.0.34 folderitem.absolutepath is limited to 255 chars. How can I get longer ones?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Paths on a Mac are not unique, so use them only to display them to the user.
Example:

```
Function AbsolutePath(f as FolderItem) As String
Dim s as string
```

```
Dim nf as FolderItem
nf = f
s = ""
while nf<>nil
s = nf.name + ":" + s
nf = nf.parent
wend
Return s
End Function
```

218.0.35 Has anyone played round with using CoreImage to do things like add dissolve transitions say when changing from one tab to another within a window?

Platform: macOS, Targets: .

Answer: This code implements animations for a tabpanel change:
Example:

```
// in a tabpanel.change event:

dim r as CGSTransitionRequestMBS
dim co as new CGSConnectionMBS
dim cw as CGSWindowMBS
dim ct as CGSTransitionMBS
static OldTab as Integer

cw=co.CGSWindow(window1)
If cw = Nil Then
return // 10.3...
End If
r=new CGSTransitionRequestMBS
r.TransitionType=r.CGSFlip
r.HasBackGround=false
r.HasBackColor=false
r.Win=cw
// watch the value of the clicked tab versus the last tab
if tabpanel1.Value=0 or tabpanel1.Value <OldTab then
r.TransitionOption=r.CGSLeft
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
```

```
else
MsgBox "Error creating the transition."
end if
else
r.TransitionOption=r.CGSRight
ct=co.NewTransition(r)
if ct<>Nil then
Refresh
ct.Invoke(1)
ct.Wait(1)
ct.Release
else
MsgBox "Error creating the transition."
end if
end if
// Keep track of the last tab clicked
OldTab = tabpanel1.Value
```

Notes: See CGS* classes for more details.

218.0.36 How about Plugin support for older OS X?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: We support in general Mac OS X 10.5 and newer.
Notes:

All the 64-bit plugins on Mac require OS X 10.7.
Intel 32-bit plugins on Mac require OS X 10.5 or newer.

Currently the ChartDirector 6, GraphicsMagick and GameKit plugins requires Mac OS X 10.6.
Also for SQL Plugin the built in SQLite library requires 10.6.

218.0.37 How can I detect whether an Intel CPU is a 64bit CPU?

Plugin Version: all, Targets: .

Answer: Look on the CPU family returned by sysctl:
Example:

```
Function is64bit() As Boolean

# if TargetLittleEndian
```

```
dim m as MemoryBlock = NewMemoryBlock(8)
dim family as Integer
dim s as string

m=SystemControlNameToMIBMBS("hw.cpufamily")
m=SystemControlMBS(m)

if m<>nil then
m.LittleEndian=True
family=m.Long(0)

const CPUFAMILY_INTEL_6_14 = & h73d67300 //* "Intel Core Solo" and "Intel Core Duo" (32-bit
Pentium-M with SSE3) */
const CPUFAMILY_INTEL_6_15 = & h426f69ef //* "Intel Core 2 Duo" */
const CPUFAMILY_INTEL_6_23 = & h78ea4fbc //* Penryn */
const CPUFAMILY_INTEL_6_26 = & h6b5a4cd2 //* Nehalem */

Select case family
case CPUFAMILY_INTEL_6_14
Return false
case CPUFAMILY_INTEL_6_15
Return true
case CPUFAMILY_INTEL_6_23
Return true
case CPUFAMILY_INTEL_6_26
Return true
// newer CPUs may be missing here
end Select

end if

# endif

Return false

Exception
Return false
End Function
```

Notes: This code is written for Mac OS X where you only have a limited number of possible CPUs.

218.0.38 How can I disable the close box of a window on Windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: The following code will remove the close item from the system menu of the window.
Example:

```
# if TargetWin32 then
Declare Function GetSystemMenu Lib "user32" (hwnd as Integer, bRevert as Integer) as Integer
Declare Function RemoveMenu Lib "user32" (hMenu as Integer, nPosition as Integer, wFlags as Integer) as Integer
Dim hSysMenu as Integer
hSysMenu = GetSystemMenu(me.WinHWND, 0)
RemoveMenu hSysMenu, & HF060, & H0
# endif
```

Notes: The window may not be updated directly.

218.0.39 How can I get all the environment variables from Windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Try this code:
Example:

```
# if targetWin32
declare function GetEnvironmentStrings Lib "kernel32" () as ptr
dim m as memoryBlock
dim n as Integer

m=GetEnvironmentStrings()

n=0
do
msgBox m.cstring(n)
while m.byte(n)<>0
n=n+1
wend
n=n+1
loop until m.byte(n)=0
# endif
```

Notes: The MBS Plugin has an EnvironmentMBS class for this.

218.0.40 How can i get similar behavior to Roxio Toast or iTunes where clicking a 'burn' button allows the next inserted blank CD-R to bypass the Finder and be accepted by my application?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You need to get a media reservation.
Example:

```
dim d as DRDeviceMBS // get a device
d.AcquireMediaReservation
```

Notes:

Use the plugin function AcquireMediaReservation and later release it using ReleaseMediaReservation.
See plugin examples on how to use it and check Apples DiscRecording framework documentation for more details.

218.0.41 How can I get text from a PDF?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Crossplatform you can use DynaPDF Pro.
Notes:

On Mac OS X you can also use PDFKit for the same job.
While DynaPDF Pro gives you each bit of text with rotation, font information and encoding details, PDFKit gives you only the text string for a PDF page.

218.0.42 How can I get text from a Word Document?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: to get the text string from a doc file, use the NSAttributedStringMBS class.
Notes:

The NSAttributedStringMBS class is Mac OS X only and we have currently no solution for Windows or Linux.

Use the NSAttributedStringMBS.initWithDocFormat(data as string) as boolean method.

218.0.43 How can I get the item string for a given file creator?

Plugin Version: all, Targets: .

Answer: Try this function:
Example:

```
Sub pullNativeDocs(aCREA As string)
Dim result as Integer
Dim m, k as memoryBlock
Dim f as folderItem
Dim newType as string
Dim anIcon As picture
Dim ofs as Integer

Declare Function GetFileTypesThatAppCanNativelyOpen Lib "Carbon" (appVRefNumHint as Short, appSig-
nature as OSType, nativeTypes as Ptr) as Short Inline68K("701CABFC")
Declare Function GetDocumentKindString Lib "Carbon" (docVRefNum as Short, docType as OSType, doc-
Creator as OSType, kindString as ptr) as Short Inline68K("7016ABFC")

listBox1.deleteAllRows

m = newMemoryBlock(1024)
result = GetFileTypesThatAppCanNativelyOpen(Volume(0).MacVRefNum, aCREA, m)
if result <>0 then
listBox1.addRow "<Not found.>"
return
end if

do
if m.byte(ofs*4) = 0 then
exit
else
newType = m.OSTypeMBS(ofs*4)
listBox1.addRow newType
k = newMemoryBlock(64)
result = GetDocumentKindString(Volume(0).MacVRefNum, newType, aCREA, k)
if result = 0 then
listBox1.cell(ofs,1) = k.pString(0)
ofs = ofs + 1
else
listBox1.cell(ofs,1) = "(unknown)"
end if

end if
loop

End Sub
```

Notes: Change "Translation" to "CarbonLib" for Mac OS X.

218.0.44 How can I launch an app using it's creator code?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Send an AppleEvent "odoc" with the creator code to the Finder ("MACS"):
Example:

```
Function LaunchByCreator(C As String) As Boolean
Dim A As AppleEvent
A = NewAppleEvent("aevt","odoc","MACS")
A.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf",nil,C)
return A.Send
End Function
```

218.0.45 How can I learn what shared libraries are required by a plugin on Linux?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Please use the ldd command in the terminal.
Notes:

You build an app on any platform, but for Linux.
For the resulting .so files in the libs folder, you can run the ldd command with the library path as parameter.
It shows you references lib files and you can make sure you have those installed.

This is a sample run of our graphicsmagick plugin:

```
cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$ ldd libMBSGraphicsMagickPlugin17744.so
linux-gate.so.1 =>(0xb76ee000)
libdl.so.2 =>/lib/i386-linux-gnu/libdl.so.2 (0xb6f0e000)

cs@Ubuntu32:
textasciitilde /MeinProgramm/MeinProgramm Libs$

As you see all library have been found and their load address is printed behind the na,e.
If a library is missing, you usually see the address missing there or being zero.

218.0.46 How can I validate an email address?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can try this code:
Example:

```
Dim re As RegEx
re = New RegEx
Dim rm As RegExMatch

re.SearchPattern = " [ a-z0-9!# $ % & '*+/=?^_' { | }
textasciitilde - ] +(?:\. [ a-z0-9!# $ % & '*+/=?^_' { | }
textasciitilde - ] +)*@(?: [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?\.)+ [ a-z0-9 ] (?: [ a-z0-9- ] * [ a-z0-9 ] )?"
rm = re.Search(editField1.Text)

if rm = Nil Then
StaticText2.text = editField1.Text + " not valid email"
Else
StaticText2.Text = editField1.Text + " is valid"
End if
```

Notes:

Adapted from:
http://www.regular-expressions.info/email.html

218.0.47 How do I decode correctly an email subject?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: The following code can be used to decode an email subject including several encodings including Base 64.
Example:

```
dim src as string // input

dim theRegex as Regex
dim theRegexMatch as RegexMatch
dim result, infoCharset, encodedPart as string
dim theStart as Integer

if instr(src, "=?") >0 then
theRegex = new Regex
theRegex.Options.Greedy = false
```

```
theRegex.searchPattern = "(.*)=\?(.+)\?(Q | B)\?(.+)\?="
theRegexMatch = theRegex.search(src)
while theRegexMatch <>nil
theStart = theRegexMatch.subExpressionStartB(0) + len(theRegexMatch.subExpressionString(0))

result = result + theRegexMatch.subExpressionString(1)
infoCharset = theRegexMatch.subExpressionString(2)
encodedPart = theRegexMatch.subExpressionString(4)
if theRegexMatch.subExpressionString(3) = "B" then
encodedPart = DecodeBase64(encodedPart)
elseif theRegexMatch.subExpressionString(3) = "Q" then
encodedPart = DecodeQuotedPrintable(encodedPart)
end if
if right(result, 1) = " " then
result = mid(result, 1, len(result)-1)
end if
encodedPart = encodedPart.DefineEncoding(GetInternetTextEncoding(infoCharset))
result = result + encodedPart

theRegex.SearchStartPosition = theStart
theRegexMatch = theRegex.search()
wend

result = result + mid(src, theStart+1)

else
result = src
end if
// theRegexMatch = theRegex.search

msgbox result
```

Notes:

May not look nice depending on the controls used.
This is no longer needed when using MimeEmailMBS class which decodes for you.

218.0.48 How do I enable/disable a single tab in a tabpanel?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Use the TabpanelEnabledMBS method.
Example:

```
TabpanelEnabledMBS(tabpanel1, 1, false)
```

Notes:

Use Carbon for MachO and CarbonLib for Mac Carbon and AppearanceLib for Mac OS Classic as library. For Cocoa, please use enabled property of NSTabViewItemMBS class.

218.0.49 How do I find the root volume for a file?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Try this function:
Example:

```
Function GetRootVolume(f as FolderItem) as FolderItem
dim root, dum as folderItem
if f <>nil then
root = f // f might be the volume
do
dum = root.parent
if dum <>nil then
root = dum
end if
loop until dum = nil
return root
end if
End Function
```

218.0.50 How do I get the current languages list?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:
Example:

```
dim p as new CFPreferencesMBS
dim a as CFArrayMBS
dim s as CFStringMBS
dim o as CFObjectMBS
dim sa(-1) as string

o=p.CopyAppValue("AppleLanguages",".GlobalPreferences")

if o<>Nil then
```

```
a=CFArrayMBS(o)

dim i,c as Integer

c=a.Count-1
for i=0 to c
o=a.Item(i)

if o isa CFStringMBS then
s=CFStringMBS(o)
sa.Append s.str
end if
next
end if

MsgBox Join(sa,EndOfLine)
```

Notes:

On Mac OS X you can get the list of current languages like this list:

de
en
ja
fr
es
it
pt
pt-PT
nl
sv
nb
da
fi
ru
pl
zh-Hans
zh-Hant
ko

Which has German (de) on the top for a German user.
This code has been tested on Mac OS X 10.5 only.

218.0.51 How do I get the Mac OS Version?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:
Example:

```
dim i as Integer
if system.gestalt("sysv", i) then
//do this in an 'If' in case you don't get any value back at all and system.gestalt returns boolean
if i = & h750 then //If OS is 7.5
//do stuff
elseif i = & h761 then //If OS is 7.6.1
//do stuff
end if
end if
```

Notes: The MBS Plugin has a function SystemInformationMBS.OSVersionString for this.

218.0.52 How do I get the printer name?

Plugin Version: all, Targets: .

Answer: For Mac OS Classic see the code below and for Mac OS X use the Carbon Print Manager Classes from the MBS Plugin.
Example:

```
dim s as String
dim i as Integer

s=app.ResourceFork.GetResource("STR ",-8192)
if s<>"" then
i=ascb(leftb(s,1))
s=mid(s,2,i)

MsgBox s
end if
```

Notes:

A note from Craig Hoyt:

After looking at your example I had a little deja-vu experience. Several
years ago I played around with this same code if FutureBasic. I discovered

that it did not and still doesn't provide the 'Printer Name', it does return the print driver name. If it returns 'LaserWriter 8' as the print driver you can look into this file and get the 'PAPA' resource # -8192 to get the actual Printer Name. Unfortunately this does not hold true for other printers. My Epson and HP Printers (the Epson has an Ethernet Card and the HP is USB) do not provide this info in their drivers. As far as I can tell it only returns the name by polling the printer itself.

218.0.53 How do I make a metal window if RB does not allow me this?

Plugin Version: all, Platform: macOS, Targets: .

Answer: The following declare turns any window on Mac OS X 10.2 or newer into a metal one.
Example:

```
declare sub ChangeWindowAttributes lib "Carbon" (win as windowptr, a as Integer, b as Integer)

ChangeWindowAttributes window1,256,0
```

Notes: May not look nice depending on the controls used.

218.0.54 How do I make a smooth color transition?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

I'd like to show in a report some bars, which start with color A and end with color B.

The color change should be very smooth.

My problem: If I would start from 255,0,0 and end by 0,0,0, I would have 255 different colors. If the bars are longer than 255 pixels, would this look nice?
Example:

```
// Window.Paint:
Sub Paint(g As Graphics)
dim w,w1,x,p as Integer
dim c1,c2,c as color
dim p1,p2 as Double
```

```
c1=rgb(255,0,0) // start color
c2=rgb(0,255,0) // end color

w=g.Width
w1=w-1

for x=0 to w1
p1=x/w1
p2=1.0-p1

c=rgb(c1.red*p1+c2.red*p2, c1.green*p1+c2.green*p2, c1.blue*p1+c2.blue*p2)

g.ForeColor=c
g.DrawLine x,0,x,g.Height

next
End Sub
```

Notes: Try the code above in a window paint event handler.

218.0.55 How do I read the applications in the dock app?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Use CFPreferencesMBS class like in this example:
Example:

```
// Reads file names from persistent dock applications and puts them into the list

dim pref as new CFPreferencesMBS

dim persistentapps as CFStringMBS = NewCFStringMBS("persistent-apps")
dim ApplicationID as CFStringMBS = NewCFStringMBS("com.apple.dock")
dim tiledata as CFStringMBS = NewCFStringMBS("tile-data")
dim filelabel as CFStringMBS = NewCFStringMBS("file-label")

// get the array of persistent applications from dock preferences
dim o as CFObjectMBS = pref.CopyValue(persistentapps, ApplicationID, pref.kCFPreferencesCurrentUser,
pref.kCFPreferencesAnyHost)

if o isa CFArrayMBS then
dim a as CFArrayMBS = CFArrayMBS(o)

// walk over all items in array
dim c as Integer = a.Count-1
```

```
for i as Integer = 0 to c

// get dictionary describing item
o = a.Item(i)

if o isa CFDictionaryMBS then
dim d as CFDictionaryMBS = CFDictionaryMBS(o)

// and pick tile data dictionary
o = d.Value(tiledata)
if o isa CFDictionaryMBS then
d = CFDictionaryMBS(o)

// and pick there the file label
o = d.Value(filelabel)
if o isa CFStringMBS then
// and display it
dim name as string = CFStringMBS(o).str
List.AddRow name
end if
end if
end if

next

else
MsgBox "Failed to read dock preferences."
end if
```

Notes: You can use the CFPreferencesMBS.SetValue to change a value and CFPreferencesMBS.Synchronize to write the values to disc. You may need to restart the Dock.app if you modified things.

218.0.56 How do I truncate a file?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: In a binarystream you can set the length property to truncate.

218.0.57 How do update a Finder's windows after changing some files?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:

Example:

```
dim f as folderitem // some file
dim ae as appleevent
ae=newappleevent("fndr","fupd","MACS")
ae.folderitemparam("—-")=f
if not ae.send then
//something went wrong
end if
```

Notes: The folderitem.finderupdate from the MBS Plugin does something like this.

218.0.58 How to access a USB device directly?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: First, it depends on the device.
Notes:

Some devices can be talked directly from user mode code, but some require a kernel driver.

For some devices you can use plugins to access them like:

- Audio and Video sources using the QTGrabberClassMBS
- Mass storage devices using the folderitem class.
- Serial devices using the System.SerialPort function.
- HID USB devices can be used with MacHIDMBS, WinHIDMBS or LinuxHIDInterface class.
- Any USB device may be used with MacUSBMBS or WinUSBMBS classes.

In general it is always the best to take the most high level access to have others do the work for the details.

218.0.59 How to add icon to file on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use FolderItem.AddCustomIcon or NSWorkspaceMBS.setIcon functions.
Notes: Please close any open stream for the file you want to add an icon.

218.0.60 How to ask the Mac for the Name of the Machine?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Using Apple Events you can use this code:
Example:

```
Function Computername() As string

dim theEvent as AppleEvent
dim err as boolean

theEvent = newAppleEvent("mchn","getd","MACS")

err = theEvent.send

return theevent.ReplyString

End Function
```

Notes:

Code above is for Mac OS 9!
Also the MBS Plugin has a function for this which may be faster and work also on Macs without Filesharing (which handles this event).

218.0.61 How to automatically enable retina in my apps?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can run a build script on each build with this code:
Example:

```
Dim App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSHighResolutionCapable""
YES")
```

Notes: This will set the NSHighResolutionCapable flag to YES.

218.0.62 How to avoid leaks with Cocoa functions?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can try this code on Mac OS X:
Example:

```
// in a Timer Action event:
Sub Action()
static LastPool as NSAutoreleasePoolMBS = nil
static CurrentPool as NSAutoreleasePoolMBS = nil

LastPool = CurrentPool
CurrentPool = new NSAutoreleasePoolMBS
End Sub
```

Notes:

With Xojo 2009r4 the code above should not be needed as Xojo runtime does automatically handle the NSAutoreleasePools for you. For older Xojo versions you need to use code with a timer with the action event above to avoid memory leaks.

Please do not use Xojo 2009r4 and newer with plugins before version 9.5. You can get crashes there which typically show a line with a objc_msgSend call.

218.0.63 How to avoid trouble connecting to oracle database with SQL Plugin?

Plugin Version: all, Platform: macOS, Targets: .

Answer: For oracle the most important thing is to point the plugin to the libraries from oracle.
Notes:

In environment variables, the paths like ORACLE_HOME must be defined.
On Mac OS X you also need to define DYLD_LIBRARY_PATH to point to the dylib files from oracle.

For that you need to modify /etc/launchd.conf for Mac OS X 10.8 and newer.
In older versions those variables in .MacOSX/environment.plist file in user's home.

Another way for the case you bundle things inside your app is to use the LSEnvironment key in info.plist.
In info.plist it looks like this:

```
<key>LSEnvironment</key>
<dict>
<key>test</key>
<string>Hello World</string>
</dict>
```

218.0.64 How to avoid ___NSAutoreleaseNoPool console messages in threads?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You need to use your own NSAutoreleasePool on a thread like this:
Example:

```
sub MyThread.run
dim pool as new NSAutoreleasePoolMBS
// do work here

pool=nil
end sub
```

Notes:

For more details read here:
http://developer.apple.com/mac/library/documentation/Cocoa/Reference/Foundation/Classes/NSAutorelease-Pool_Class/Reference/Reference.html

218.0.65 How to bring app to front?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: On Mac you can use this code:
Example:

```
// First way:
app.FrontMostMBS = true

// second way:
dim p as new ProcessMBS
p.GetCurrentProcess
p.FrontProcess = true

// third way:
NSApplicationMBS.sharedApplication.activateIgnoringOtherApps(true)

// for Windows:
RemoteControlMBS.WinBringWindowToTop
```

Notes: This will bring a Mac app to the front layer.

218.0.66 How to bring my application to front?

Plugin Version: all, Platform: macOS, Targets: .

Answer: This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
Dim A As AppleEvent
A = NewAppleEvent("misc","actv","")
If Not A.Send then
Beep
end if
```

Notes: (Code is Mac only)

218.0.67 How to catch Control-C on Mac or Linux in a console app?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use SignalHandlerMBS class for this.
Example:

```
// watch for Control-C on Mac
call SignalHandlerMBS.SetFlagHandler(2)

dim ende as boolean = false
do
if SignalHandlerMBS.IsFlagSet(2) then
Print "Flag 2 set. Existing..."
ende = true
end if

DoEvents 1
loop until ende
```

Notes: The signal is catched, a flag is set and you can ask later in your normal application flow for the result.

218.0.68 How to change name of application menu?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer: Use this code to change the application menu name on Mac OS X:

Example:

```
dim mb as new MenubarMBS
dim m as MenuMBS = mb.item(1) // 1 is in my tests the app menu
if m<>Nil then
m.MenuTitle = "Hello World"
end if
```

Notes: This code is for Carbon only.

218.0.69 How to change the name in the menubar of my app on Mac OS X?

Plugin Version: all, Platform: macOS, Targets: .

Answer:

You mean it screws up if the file name of the bundle itself is different than the name of the executable file in the MacOS folder within the bundle? If so, you should find something like this within your Info.plist file (or the 'plst' resource that the RB IDE builds for you):

```
<key>CFBundleExecutable</key>
<string>Executable file name here</string>
```

Just make sure that file name matches.

However, if your question involves how you can change the name of the app that appears in the menu and the dock, that's different. You can make this name different from the file name by changing the CFBundleName key:

```
<key>CFBundleName</key>
<string>Name for menu here</string>
```

Note that if you use my free AppBundler program, this second part is taken care of for you – just fill in a custom name in the right field. You can find AppBundler (from Thomas Reed) at http://www.bitjuggler.com/products/appbundler/ .

218.0.70 How to check if a folder/directory has subfolders?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use code like this to check all items in a folder:
Example:

```
Function HasSubFolder(folder as FolderItem) As Boolean
dim c as Integer = folder.Count

for i as Integer = 1 to c
dim item as FolderItem = folder.TrueItem(i)

if item<>Nil and item.Directory then
Return true
end if
next

End Function
```

Notes:

We use trueitem() here to avoid resolving alias/link files.
Also we check for nil as we may not have permission to see all items.
And if one is a directory, we return without checking the rest.

218.0.71 How to check if Macbook runs on battery or AC power?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Please use our IOPowerSourcesMBS class like this:
Example:

```
Function PowerSourceState() as Integer
dim p as new IOPowerSourcesMBS

// check all power sources
dim u as Integer = p.Count-1
for i as Integer = 0 to u
dim d as CFDictionaryMBS = p.Item(i)
if d<>nil then
// check if they have a power source state key:
dim o as CFObjectMBS = d.Value(NewCFStringMBS("Power Source State"))
if o isa CFStringMBS then
dim s as string = CFStringMBS(o).str
```

```
'MsgBox s

if s = "AC Power" then
Return 1
elseif s = "Battery Power" then
Return 2
end if
end if
end if
next
Return 0 // unknown
End Function
```

Notes: If you want to check the CFDictionaryMBS content, simply use a line like "dim x as dictionary = d.dictionary" and check the contents in the debugger.

218.0.72 How to check if Microsoft Outlook is installed?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: If you need Outlook for Scripting, you should simply check registry for the required Outlook.Application class:
Example:

```
Function OutlookInstalled() As Boolean
# if TargetWin32 then

try
dim r as new RegistryItem("HKEY_CLASSES_ROOT\Outlook.Application\CLSID", false)

Return true

catch r as RegistryAccessErrorException
// not installed
Return false

end try

# else

// Windows only, so false on other platforms
Return false

# endif
```

```
End Function
```

218.0.73 How to check on Mac OS which country or language is currently selected?

Plugin Version: all, Platform: macOS, Targets: .

Answer: The code below returns a country value.
Example:

```
dim result as Integer

IF TargetMacOS THEN

CONST smScriptLang = 28
CONST smSystemScript = -1

DECLARE FUNCTION GetScriptManagerVariable LIB "Carbon" ( selector as Integer) as Integer
DECLARE FUNCTION GetScriptVariable LIB "Carbon" ( script as Integer, selector as Integer) as Integer

result=GetScriptVariable(smSystemScript, smScriptLang)

END IF
```

Notes:

Returns values like:

For more values, check "Script.h" in the frameworks.

218.0.74 How to code sign my app with plugins?

Plugin Version: all, Platform: macOS, Targets: .

Answer: When you try to code sign the application with plugin dylibs on Mac OS X, you may see error message that there is actually a signature included.
Notes:

Please use the -f command line parameter with codesign utility to overwrite our MBS signature.
We sign our plugins for MacOS, iOS and Windows to make sure they have not been modified.

In terminal, you do like this:

cd <Path to folder of app>

xattr -cr <Appname>.app
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.dylib
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app/Contents/Frameworks/*.framework
codesign -f -s "Developer ID Application: <Your Name>" <Appname>.app

Please use the name of your certificate (See keychain), the name of your app and the path to the app folder.
If you have helper apps you need to sign them first.
You can use a build step to automatically sign your app on build.

218.0.75 How to collapse a window?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Use this function (Mac only):
Example:

```
Sub CollapseRBwindow(w as window, CollapseStatus as boolean)
dim state, err as Integer
dim wh as MemoryBlock

Declare Function CollapseWindow Lib "Carbon" (window as Integer,collapse as Integer) as Integer

IF CollapseStatus THEN
state = 1
ELSE
state = 0
END IF

err = CollapseWindow(w.MacWindowPtr, state)

End Sub
```

Notes:

Also the MBS Plugin has a window.collapsedmbs property you can set.
For Windows the MBS Plugin has a window.isiconicmbs property.

218.0.76 How to compare two pictures?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can try this code:
Example:

```
Function ComparePictures(p as picture,q as picture) as Integer
dim r,u as RGBSurface
dim x,y,n,m,h,w as Integer
dim w1,w2,h1,h2,d1,d2 as Integer
dim c1,c2 as color

h1=p.Height
h2=q.Height
w1=p.Width
w2=q.Width
d1=p.Depth
d2=q.Depth

if d1<>d2 then
Return 1
elseif w1<>w2 then
return 2
elseif h1<>h2 then
Return 3
else
r=p.RGBSurface
u=q.RGBSurface

if r=nil or u=nil then
Return -1
else
h=h1-1
w=w1-1
m=min(w,h)

for n=0 to m
c1=r.Pixel(n,n)
c2=u.Pixel(n,n)
if c1<>c2 then
Return 4
end if
next

for y=0 to h
for x=0 to w
c1=r.Pixel(x,y)
c2=u.Pixel(x,y)
```

```
if c1<>c2 then
Return 5
end if
next
next

// 0 for equal
// -1 for error (no RGBsurface)
// 1 for different depth
// 2 for different width
// 3 for different height
// 4 for different pixels (fast test)
// 5 for different pixels (slow test)
end if
end if

Exception
Return -1
End Function
```

Notes: Remember that this only works on bitmap pictures, so the picture.BitmapMBS function may be useful.

218.0.77 How to compile PHP library?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You have to download the source code and compile a static version of the library.
Notes:

This instructions were written based on PHP 5.2.6 on Mac OS X:

- Best take a new Mac with current Xcode version installed.
- Download the source code archive. e.g. "php-5.2.6.tar.bz2"
- Expand that archive on your harddisc.
- Open terminal window
- change directory to the php directory. e.g. "cd /php-5.2.6"
- execute this two lines to define the supported CPU types and the minimum Mac OS X version:
- export CFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"
- export CXXFLAGS="-arch ppc -arch i386 -mmacosx-version-min=10.3"

- the command "./configure help" does show the configure options.
- use configure with a line like this:
- ./configure –enable-embed –with-curl -enable-ftp –enable-zip –enable-sockets –enable-static –enable-soap –with-zlib –with-bz2 –enable-exif –enable-bcmath –enable-calendar
- start the compilation with "make all"
- other option is to use "make install" which first does the same as "make all" and than does some installation scripts.
- you may get an error about a duplicate symbole _yytext. Search the file "zend_ini_scanner.c", search a line with "char *yytext;" and change it to "extern char *yytext;".
- On the end you get a lot of error messages, but you have a working library (named libphp5.so) file in the invisible ".libs" folder inside your php source folder.

Possible problems and solutions:

- If the path to your files has spaces, you can get into trouble. e.g. "/RB Plugins/PHP" is bad as files will be searched sometimes in "/RB".
- If you have in /usr/local/lib libraries which conflict with the default libraries, you can get into trouble.
- If you installed some open source tools which compiled their own libraries, you can get into conflicts.
- if you have to reconfigure or after a problem, you may need to use "make clean" before you start "make all" again.

Feel free to install additional libraries and add more packages to the configure line.

218.0.78 How to convert a BrowserType to a String with WebSession.Browser?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use code like this:
Example:

```
Function GetBrowserName(s as WebSession.BrowserType) As string
Select case s
case WebSession.BrowserType.Android
Return "Andriod"
case WebSession.BrowserType.Blackberry
Return "Blackberry"
case WebSession.BrowserType.Chrome
Return "Chrome"
case WebSession.BrowserType.ChromeOS
```

```
Return "ChromeOS"
case WebSession.BrowserType.Firefox
Return "Firefox"
case WebSession.BrowserType.InternetExplorer
Return "InternetExplorer"
case WebSession.BrowserType.Opera
Return "Opera"
case WebSession.BrowserType.Safari
Return "Safari"
case WebSession.BrowserType.SafariMobile
Return "SafariMobile"
case WebSession.BrowserType.Unknown
Return "Unknown"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

218.0.79 How to convert a EngineType to a String with WebSession.Engine?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use code like this:
Example:

```
Function GetRenderingEngineName(s as WebSession.EngineType) As string
Select case s
case WebSession.EngineType.Gecko
Return "Gecko"
case WebSession.EngineType.Presto
Return "Presto"
case WebSession.EngineType.Trident
Return "Trident"
case WebSession.EngineType.Unknown
Return "Unknown"
case WebSession.EngineType.WebKit
Return "WebKit"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

218.0.80 How to convert a PlatformType to a String with WebSession.Platform?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use code like this:
Example:

```
Function GetPlatformName(s as WebSession.PlatformType) As string
Select case s
case WebSession.PlatformType.Blackberry
Return "Blackberry"
case WebSession.PlatformType.iPad
Return "iPad"
case WebSession.PlatformType.iPhone
Return "iPhone"
case WebSession.PlatformType.iPodTouch
Return "iPodTouch"
case WebSession.PlatformType.Linux
Return "Linux"
case WebSession.PlatformType.Macintosh
Return "Macintosh"
case WebSession.PlatformType.PS3
Return "PS3"
case WebSession.PlatformType.Unknown
Return "Unknown"
case WebSession.PlatformType.WebOS
Return "WebOS"
case WebSession.PlatformType.Wii
Return "Wii"
case WebSession.PlatformType.Windows
Return "Windows"
else
Return "Unkown: "+str(integer(s))
end Select

End Function
```

218.0.81 How to convert a text to iso-8859-1 using the TextEncoder?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.

Example:

```
dim outstring as string
dim theMac, thePC as textencoding
dim Mac2PC as textconverter

theMac = getTextEncoding(0) // MacRoman
thePC = getTextEncoding(& h0201) // ISOLatin1

Mac2PC = getTextConverter(theMac, thePC)
// if you wanted to do the opposite just create a converter
// PC2Mac = getTextConverter(thePC, theMac)

outstring = Mac2PC.convert("Bj√rn, this text should be converted")
Mac2PC.clear
```

Notes:

You have to call Mac2PC.clear after every conversion to reset the encoding engine.
See also newer TextConverterMBS class.

218.0.82 How to convert ChartTime back to Xojo date?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: We have this example code:
Example:

```
Function ChartTimeToDate(ChartTime as Double) As date
static diff as Double = 0.0

if diff = 0.0 then
dim d2 as Double = CDBaseChartMBS.chartTime(2015, 1, 1)
dim da as new date(2015, 1, 1)
dim ts as Double = da.TotalSeconds

diff = ts - d2
end if

dim d as new date
d.TotalSeconds = diff + ChartTime

Return d
End Function
```

Notes: As you see we calculate the difference in base date from Date and ChartTime and later use difference to convert.

218.0.83 How to convert line endings in text files?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can simply read file with TextInputStream and write with new line endings using TextOutputStream class.
Example:

```
dim inputfile as FolderItem = SpecialFolder.Desktop.Child("test.txt")
dim outputfile as FolderItem = SpecialFolder.Desktop.Child("output.txt")
dim it as TextInputStream = TextInputStream.Open(inputfile)
dim ot as TextOutputStream = TextOutputStream.Create(outputfile)

ot.Delimiter = EndOfLine.Windows // new line ending
while not it.EOF
ot.WriteLine it.ReadLine
wend
```

Notes: TextInputStream will read any input line endings and with delimiter property in TextOutputStream you can easily define your new delimiter.

218.0.84 How to convert picture to string and back?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use this plugin functions:
Notes:

JPEG:

JPEGStringToPictureMBS(buf as string) as picture
JPEGStringToPictureMBS(buf as string,allowdamaged as Boolean) as picture
PictureToJPEGStringMBS(pic as picture,quality as Integer) as string

PNG:

PictureToPNGStringMBS(pic as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single) as string
PictureToPNGStringMBS(pic as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as

string
PictureToPNGStringMBS(pic as picture, mask as picture, gamma as single, Interlace as Boolean, FilterType as Integer) as string
PNGStringToPictureMBS(data as string, gamma as single) as picture
PNGStringToPNGPictureMBS(data as string, gamma as single) as PNGpictureMBS

Tiff:

TIFFStringToPictureMBS(data as string) as picture
TIFFStringToTiffPictureMBS(data as string) as TiffPictureMBS

BMP:

BMPStringtoPictureMBS(data as string) as picture
Picture.BMPDataMBS(ResolutionValueDPI as Integer=72) as string

GIF:

GifStringToGifMBS(data as string) as GIFMBS
GifStringToPictureMBS(data as string) as Picture

218.0.85 How to copy an array?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use a function like this to copy an array:
Example:

```
Function CopyArray(a() as Double) as Double()
dim r() as Double
for each v as Double in a
r.Append v
next
Return r
End Function
```

Notes:

If needed make several copies of this method with different data types, not just double.
For a deep copy of an array of objects, you need to change code to also make a copy of those objects.

218.0.86 How to copy an dictionary?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use a function like this to copy a dictionary:
Example:

```
Function CopyDictionary(d as Dictionary) As Dictionary
dim r as new Dictionary
for each key as Variant in d.keys
r.Value(key) = d.Value(key)
next
Return r
End Function
```

Notes:

If needed make several copies of this method with different data types, not just double.
For a deep copy of an dictionary of objects, you need to change code to also make a copy of those objects.

218.0.87 How to copy parts of a movie to another one?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer: The code below copies ten seconds of the snowman movie to the dummy movie starting at the 5th second.
Example:

```
dim f as FolderItem
dim md as EditableMovie
dim ms as EditableMovie

f=SpecialFolder.Desktop.Child("Our First Snowman.mov")
ms=f.OpenEditableMovie

ms.SelectionStartMBS=5
ms.SelectionLengthMBS=10

f=SpecialFolder.Desktop.Child("dummy.mov")
md=f.CreateMovie

msgbox str(md.AddMovieSelectionMBS(ms))
```

Notes: If result is not 0, the method fails.

218.0.88 How to create a birthday like calendar event?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:
Example:

```
// start a connection to the calendar database
dim s as new CalCalendarStoreMBS

// needed for the error details
dim e as NSErrorMBS

dim r as CalRecurrenceRuleMBS = CalRecurrenceRuleMBS.initYearlyRecurrence(1, nil) // repeat every year without end

dim a as new CalAlarmMBS // add alarm
a.action = a.CalAlarmActionDisplay
a.relativeTrigger = -3600*24 // 24 Hours before

// create a new calendar
dim c as new CalEventMBS

dim d as new date(2011, 04, 20) // the date

dim calendars() as CalCalendarMBS = s.calendars

// set properties
c.Title="Test Birthday"
c.startDate=d
c.recurrenceRule = r
c.calendar=calendars(0) // add to first calendar
c.addAlarm(a)
c.endDate = d
c.isAllDay = true

// save event
call s.saveEvent(c,s.CalSpanAllEvents, e)
if e<>nil then
MsgBox e.localizedDescription
else
MsgBox "New event was created."
end if
```

Notes: This adds an event to iCal for the given date with alarm to remember you and repeats it every year.

218.0.89 How to create a GUID?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use the UUIDMBS class for this.

218.0.90 How to create a Mac picture clip file?

Plugin Version: all, Platform: Windows, Targets: .

Answer: You can use code like this one.
Example:

```
dim f As FolderItem
dim p As Picture

f=SpecialFolder.Desktop.Child("Test.pictClipping")
if f=nil then Return

p=new Picture(300,200,32) 'Make a sample picture
p.Graphics.ForeColor=RGB(0,255,255)
p.Graphics.FillOval 0,0,99,99
p.Graphics.ForeColor=RGB(255,0,0)
p.Graphics.DrawOval 0,0,99,99

dim r As ResourceFork 'ResourceFork is needed for a clip file

// Please define a file type Any
r=f.CreateResourceFork("Any")

// get PICT data using plugin function
dim pictdata as string = p.PicHandleDataMBS
r.AddResource(pictdata,"PICT",256,"Picture")

dim m as new MemoryBlock(8)

m.LittleEndian = false
m.Int16Value(0) = 0
m.Int16Value(2) = 0
m.Int16Value(4) = p.Width
m.Int16Value(6) = p.Height

r.AddResource(m,"RECT",256,"")
```

```
'Values taken from a sample file and irrelevant to the problem
dim data as string = DecodeBase64("AQAAAAAAAAAAAAAAAAACAFRDRVIAAAABAAAAAAAAAABUQ0lQAAAAA
r.AddResource(data,"drag",128,"") 'ditto
r.Close
```

Notes: In general Apple has deprecated this, but a few application still support clippings.

218.0.91 How to create a PDF file in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Check our DynaPDF plugin and the examples.
Notes:

An alternative can be to use the CoreGraphics and Cocoa functions on Mac OS X.
For Windows, we can only suggest our DynaPDF plugin.

218.0.92 How to create EmailAttachment for PDF Data in memory?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use code like the one below:
Example:

```
Function EmailAttachmentFromPDFData(PDFData as string, filename as string) As EmailAttachment
dim a as new EmailAttachment

a.data = EncodeBase64(PDFData, 76)
a.ContentEncoding = "base64"
a.MIMEType = "application/pdf"
a.MacType = "PDF "
a.MacCreator = "prvw"
a.Name = filename

Return a
End Function
```

Notes:

Compared to sample code from Xojo documentation, we set the mime type correct for PDF.
The MacType/MacCreator codes are deprecated, but you can still include them for older Mac email clients.

”prvw” is the creator code for Apple’s preview app.

218.0.93 How to create PDF for image files?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use DynaPDF like this:
Example:

```
Function CreatePrintPDF(jpgFiles() as folderitem, pdfFile as FolderItem, PageWidth as Integer, PageHeight
as Integer) As Boolean
// have files?
If pdfFile = Nil Then Return False
If jpgFiles = Nil Then Return False

If jpgFiles.Ubound <0 Then Return False

// new DynaPDF
Dim pdf As New MyDynapdfMBS

// page width/height in MilliMeter
Dim pdfWidth as Integer = PageWidth * 72 / 25.4
Dim pdfHeight as Integer = PageHeight * 72 / 25.4

// put your license here
Call pdf.SetLicenseKey ”Starter”

// create pdf
Call pdf.CreateNewPDF pdfFile

// set a couple of options
Call pdf.SetPageCoords(MyDynaPDFMBS.kpcTopDown)
Call pdf.SetResolution(300)
Call pdf.SetUseTransparency(False)
Call pdf.SetSaveNewImageFormat(False)
Call pdf.SetGStateFlags(MyDynaPDFMBS.kgfUseImageColorSpace, False)
Call pdf.SetJPEGQuality(100)

// set page size
Call pdf.SetBBox(MyDynaPDFMBS.kpbMediaBox, 0, 0, pdfWidth, pdfHeight)
Call pdf.SetPageWidth(pdfWidth)
Call pdf.SetPageHeight(pdfHeight)

// append pages with one image per page
For i as Integer = 0 To jpgFiles.Ubound
Call pdf.Append
Call pdf.InsertImageEx(0, 0, pdfWidth, pdfHeight, jpgFiles(i), 1)
```

```
Call pdf.EndPage
Next

// close
Call pdf.CloseFile

Return True
End Function
```

Notes:

This is to join image files in paper size to a new PDF.
e.g. scans in A4 into an A4 PDF.

218.0.94 How to CURL Options translate to Plugin Calls?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Below a few tips on how to translate command line CURL calls to plugin calls.
Notes:

curl -vX PUT http://localhost:5984/appserials/78569238475/DocumentRegister.docx?rev=3-25634563456 –data-binary @DocumentRegister.docx -H "Content-Type: application/msword"

- The option -v means verbose. You can use OptionVerbose and listen for messages in the DebugMessage event.
- The option -X PUT means we want to do a HTTP PUT Request. So set OptionPut to true. Also you will want to set OptionUpload to true as you upload data.
- We have the URL which you put into OptionURL property.
- The –data-binary option tells CURL to pass the given data. With the @ before the data, it is intrepreted as a file name, so the data is read from the given file. You'll need to open this file and pass data with the Read event as needed. (See CURLS ftp file upload example project)
- The last option -H specifies an additional header for the upload. Pas this additional header with the SetOptionHTTPHeader method.

curl -X PUT http://127.0.0.1:5984/appserials/f2f4e540bf8bb60f61cfcd4328001c59 -d ' { "type":"Product","description":"Application Serial","acronym":"AppSerial","dateAdded":"2011-03-21 14:57:36" } '

- Option -X PUT like above.

- Pass the URL again in OptionURL
- This time data is passed in command line for CURL. You'd put this data in the quotes into a string and make it available in the Read event. (See CURLS ftp upload example project)

218.0.95 How to delete file with ftp and curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
dim d as CURLMBS // your curl object

// delete file
dim ws() As String
ws.Append "DELE Temp.txt"

d.SetOptionPostQuote(ws)
```

Notes:

Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applications. To delete use DELE and the file path.

218.0.96 How to detect display resolution changed?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: On Mac OS X simply listen for display changed notifications.
Notes: Use the "Distribution Notification Center.rbp" example project as a base and use it to listen to notifications with the name "O3DeviceChanged".

218.0.97 How to detect retina?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Please use Window.BackingScaleFactorMBS to query the factor.
Example:

```
msgbox str(window1.BackingScaleFactorMBS)
```

218.0.98 How to disable force quit?

Plugin Version: all, Platform: macOS, Targets: .

Answer:

Please visit this website and get the control panel for Mac OS 9 there:
http://www3.sk.sympatico.ca/tinyjohn/DFQ.html

For Mac OS X use the MBS Plugin with the SetSystemUIModeMBS method.
Notes: Please use presentationOptions in NSApplicationMBS for Cocoa applications.

218.0.99 How to disable the error dialogs from Internet Explorer on javascript errors?

Plugin Version: all, Platform: Windows, Targets: .

Answer: You can use this code in the htmlviewer open event:
Example:

```
if targetwin32 then
htmlviewer1._ole.Content.value("Silent") = True
end if
```

Notes: This disables the error dialogs from Internet Explorer.

218.0.100 How to display a PDF file in Xojo?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: On Mac OS X you can use CoreGraphics or PDFKit to display a PDF.
Notes:

An alternative can be to load the PDF into a htmlviewer so the PDF plugin can display it.
On Windows you may need to use the Acrobat ActiveX control from Adobe or launch Acrobat Reader.

218.0.101 How to do a lottery in RB?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Try this function:
Example:

```
Sub Lotto(max as Integer,count as Integer,z() as Integer)
// Lotto count numbers of max put into the array z beginning at index 0
dim n(0) as Integer ' all the numbers
dim m as Integer ' the highest field in the current array
dim i,a,b,d as Integer ' working variables

'fill the array with the numbers
m=max-1
redim n(m)

for i=0 to m
n(i)=i+1
next

' unsort them by exchanging random ones
m=max*10
for i=1 to m
a=rnd*max
b=rnd*max

d=n(a)
n(a)=n(b)
n(b)=d
next

' get the first count to the dest array
m=count-1
redim z(m)
for i=0 to m
z(i)=n(i)
next

'sort the result
z.sort
End Sub

Sub Open()
// Test it

dim za(0) as Integer ' the array of the numbers

lotto 49,6,za ' 6 of 49 in Germany

' and display them
staticText1.text=str(za(0))+chr(13)+str(za(1))+chr(13)+str(za(2))+chr(13)+str(za(3))+chr(13)+str(za(4))+chr(13)+str(za
End Sub
```

218.0.102 How to do an asycron DNS lookup?

Plugin Version: all, Platform: Windows, Targets: .

Answer: use CFHostMBS class (Mac OS X only).
Notes:

Xojo internal functions and plugin DNS functions are sycronized.
You can use DNSLookupThreadMBS class for doing them asyncron.

218.0.103 How to draw a dushed pattern line?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can try this code:
Example:

```
// call like this: DrawDushedPatternLine g,0,0,width,height,10

Sub DrawDushedPatternLine(g as graphics,x1 as Integer,y1 as Integer,x2 as Integer,y2 as Integer, partlen as Integer)
dim x,y,ox,oy as Double
dim dx,dy as Double
dim w,h,d as Double
dim b as Boolean

w=x2-x1
h=y2-y1

d=sqrt(w*w+h*h)

dx=w/d*partlen
dy=h/d*partlen

b=true
x=x1
while (x<x2) and (y<y2)
ox=x
oy=y

x=x+dx
y=y+dy

if b then
```

```
g.DrawLine ox,oy,x,y
end if

b=not b
wend

End Sub
```

Notes: It would be possible to add this to the plugin, but I think it's better if you do it in plain Xojo code, so it even works on Windows.

218.0.104 How to draw a nice antialiased line?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

This code can help you althrough it's not perfect.
You need to set lc to the current color you use.
Example:

```
Sub drawLine(xs as Integer, ys as Integer, xe as Integer, ye as Integer, face as RGBSurface, lineColor as color)
dim intX, intY, count, n, xDiff, yDiff as Integer
dim v, v1, floatX, floatY, xx, yy, xStep, yStep as Double
dim c as color

const st=1.0

xDiff=xe-xs
yDiff=ye-ys
count=max(abs(xDiff), abs(yDiff))
xStep=xDiff/count
yStep=yDiff/count
xx=xs
yy=ys
for n=1 to count
intX=xx
intY=yy
floatX=xx-intX
floatY=yy-intY

v=(1-floatX)*(1-floatY)*st
v1=1-v
```

```
c=face.pixel(intX, intY)
face.pixel(intX, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*(1-floatY)*st
v1=1-v
c=face.pixel(intX+1, intY)
face.pixel(intX+1, intY)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=(1-floatX)*floatY*st
v1=1-v
c=face.pixel(intX, intY+1)
face.pixel(intX, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)
v=floatX*floatY*st
v1=1-v
c=face.pixel(intX+1, intY+1)
face.pixel(intX+1, intY+1)=rgb(v*lineColor.red+v1*c.red, v*lineColor.green+v1*c.green, v*lineColor.blue+v1*c.blue)

xx=xx+xStep
yy=yy+yStep
next

End Sub
```

Notes: PS: st should be 1 and face should be a RGBSurface or a Graphics object.

218.0.105 How to dump java class interface?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: In terminal you can use "javap -s <classname>" to display the class with the method names and parameters.
Notes: For example show ResultSet class: javap -s java.sql.ResultSet

218.0.106 How to duplicate a picture with mask or alpha channel?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use code like this function:
Example:

```
Function Duplicate(extends p as Picture) As Picture
# if RBVersion >= 2011.04 then
if p.HasAlphaChannel then

// create nw picture and copy content:
```

```
dim q as new Picture(p.Width, p.Height)
q.Graphics.DrawPicture p,0,0

Return q

end if
# endif

// create new picture
dim q as new Picture(p.Width, p.Height, 32)

// get mask
dim oldMask as Picture = p.mask(false)
if oldMask = nil then
// no mask, so simple copy
q.Graphics.DrawPicture p,0,0
Return q
end if

// remove mask
p.mask = nil

// copy picture and mask
q.Graphics.DrawPicture p, 0, 0
q.mask.Graphics.DrawPicture oldMask,0,0

// restore mask
p.mask = oldmask

Return q
End Function
```

Notes:

Simply copy it to a module and call it like this: q = p.duplicate.
The code above works with old Xojo versions because of the # if even if your RS version does not support alpha channel pictures. This way it's future proof.

218.0.107 How to enable assistive devices?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use AppleScript code like below:
Notes:

```
tell application "System Events"
activate

set UI elements enabled to true

return UI elements enabled
end tell
```

You can run this with AppleScriptMBS class.

218.0.108 How to encrypt a file with Blowfish?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use code like this:
Example:

```
dim fi as FolderItem = SpecialFolder.Desktop.Child("test.xojo_binary_project")
dim fo as FolderItem = SpecialFolder.Desktop.Child("test.encrypted")

// read input
dim bi as BinaryStream = BinaryStream.Open(fi)
dim si as string = bi.Read(bi.Length)
bi.Close

// encrypt
dim so as string = BlowfishMBS.Encrypt("MyKey",si)

// write output
dim bo as BinaryStream = BinaryStream.Create(fo)
bo.Write so
bo.Close
```

Notes: Of course you can decrypt same way, just use Decrypt function and of course swap files.

218.0.109 How to extract text from HTML?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use both RemoveHTMLTagsMBS and DecodingFromHTMLMBS like this:
Example:

```
dim html as string = "<p><B>Gr& uuml;& szlig;e</B></P>"
dim htmltext as string = RemoveHTMLTagsMBS(html)
dim text as string = DecodingFromHTMLMBS(htmltext)

MsgBox text // shows: Gr√º√üe
```

Notes:

You can use it together with RemoveHTMLTagsMBS to remove html tags. What you get will be the text without tags.
DecodingFromHTMLMBS turns HTML escapes back to unicode characters. Like & auml; to √§.

218.0.110 How to find empty folders in a folder?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Try this code:
Example:

```
dim folder as folderitem // your folder

dim c as Integer = folder.count
for i as Integer = 1 to c
dim item as folderitem = folder.trueitem(i)
if item = nil then
// ignore
elseif item.directory then
// folder
if item.count = 0 then
// found empty folder
end if
end if
next
```

218.0.111 How to find iTunes on a Mac OS X machine fast?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can try Launch Services.
Example:

```
dim f as FolderItem
```

```
f=LaunchServicesFindApplicationForInfoMBS("hook","com.apple.iTunes","iTunes.app")

MsgBox f.NativePath
```

218.0.112 How to find network interface for a socket by it's name?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use our plugin to build a lookup table.
Example:

```
Function FindNetworkInterface(name as string) As NetworkInterface
name = name.trim

if name.len = 0 then Return nil

// search by IP/MAC
dim u as Integer = System.NetworkInterfaceCount-1
for i as Integer = 0 to u
dim n as NetworkInterface = System.GetNetworkInterface(i)
if n.IPAddress = name or n.MACAddress = name then
Return n
end if
next

// use MBS Plugin to build a mapping
dim interfaces() as NetworkInterfaceMBS = NetworkInterfaceMBS.AllInterfaces
dim map as new Dictionary

for each n as NetworkInterfaceMBS in interfaces
dim IPv4s() as string = n.IPv4s
dim IPv6s() as string = n.IPv6s

for each IPv4 as string in IPv4s
map.Value(IPv4) = n.Name
next
for each IPv6 as string in IPv6s
map.Value(IPv6) = n.Name
next
if n.MAC<>"" then
map.Value(n.MAC) = n.Name
end if
next

// now search interfaces by name, IPv4 or IPv6
for i as Integer = 0 to u
```

```
dim n as NetworkInterface = System.GetNetworkInterface(i)
if map.Lookup(n.IPAddress, "") = name then
Return n
end if

if map.Lookup(n.MACAddress, "") = name then
Return n
end if
next

End Function
```

Notes: The code above uses a lookup table build using NetworkInterfaceMBS class to find the network interface by name.

218.0.113 How to find version of Microsoft Word?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use code like this:
Example:

```
// find Word
dim f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.microsoft.Word","")

// open bundle
dim c as new NSBundleMBS(f)

// read info
dim d as Dictionary = c.infoDictionary

// show version
MsgBox d.Lookup("CFBundleVersion","")
```

Notes: Older versions of Word can be found with creator code "MSWD".

218.0.114 How to fix CURL error 60/53 on connecting to server?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You probably connect with SSL and you have no valid certificate.
Example:

```
dim d as new CURLSMBS

// Disable SSL verification
d.OptionSSLVerifyHost = 0 // don't verify server
d.OptionSSLVerifyPeer = 0 // don't proofs certificate is authentic

// With SSL Verification:
dim cacert as FolderItem = Getfolderitem("cacert.pem")
d.OptionCAInfo = cacert.NativePath
d.OptionSSLVerifyHost = 2 // verify server
d.OptionSSLVerifyPeer = 1 // proofs certificate is authentic
```

Notes:

You can either use the code above to disable the SSL verification and have no security.
Or you use the cacert file and enable the verification. Than you only get a connection if the server has a valid certificate.

see also:
http://curl.haxx.se/ca/

218.0.115 How to format double with n digits?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use the FormatMBS function for this.
Example:

```
dim d as Double = 123.4567890
listbox1.AddRow FormatMBS("% f", d)
listbox1.AddRow FormatMBS("% e", d)
listbox1.AddRow FormatMBS("% g", d)

listbox1.AddRow FormatMBS("% 5.5f", d)
listbox1.AddRow FormatMBS("% 5.5e", d)
listbox1.AddRow FormatMBS("% 5.5g", d)

d = 0.000000123456
listbox1.AddRow FormatMBS("% f", d)
listbox1.AddRow FormatMBS("% e", d)
listbox1.AddRow FormatMBS("% g", d)

listbox1.AddRow FormatMBS("% 5.5f", d)
listbox1.AddRow FormatMBS("% 5.5e", d)
listbox1.AddRow FormatMBS("% 5.5g", d)
```

Notes:

see FormatMBS for details.
In general % f is normal style, % e is scientific and % g is whichever gives best result for given space.

218.0.116 How to get a time converted to user time zone in a web app?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use the WebSession.GMTOffset property.
Example:

```
Sub Open()
// current date on server
dim d as new date
dim s as string = d.LongTime

// adjust to client GMT offset
d.GMTOffset = d.GMTOffset + Session.GMTOffset

dim t as string = D.LongTime

MsgBox s+EndOfLine+t
End Sub
```

218.0.117 How to get an handle to the frontmost window on Windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: This function returns a handle for the frontmost window:
Example:

```
Function GetForegroundWindowHandle() as Integer
# if targetwin32 then
declare function GetForegroundWindow Lib "user32.dll" as Integer
Return GetForegroundWindow()
# endif
End Function
```

218.0.118 How to get CFAbsoluteTime from date?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer: Use code like this:
Example:

```
dim d as new date
dim t as CFTimeZoneMBS = SystemCFTimeZoneMBS
dim g as new CFGregorianDateMBS
g.Day = d.Day
g.Month = d.Month
g.Year = d.Year
g.Minute = d.Minute
g.Hour = d.Hour
g.Second = d.Second

dim at as CFAbsoluteTimeMBS = g.AbsoluteTime(t)
dim x as Double = at.Value

MsgBox str(x)
```

Notes:

As you see we need a timezone and put the date values in a gregorian date record.
Now we can query absolute time for the given timezone.

218.0.119 How to get client IP address on web app?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use the WebSession.RemoteAddress property.
Example:

```
Sub Open()
Title = Session.RemoteAddress
End Sub
```

218.0.120 How to get fonts to load in charts on Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Please use the SetFontSearchPath method in the CDBaseChartMBS class to specify where your

fonts are.
Example:

```
if TargetLinux then
CDBaseChartMBS.SetFontSearchPath "/usr/share/fonts/truetype;/usr/share/fonts/truetype/msttcorefonts"
else
// on Mac and Windows we use system fonts.
end if

// also you can later switch default fonts:

dim Chart as CDBaseChartMBS // your chart

# If TargetARM And TargetLinux Then
// use specific fonts on Linux on Raspberry Pi
Call Chart.setDefaultFonts("/usr/share/fonts/truetype/piboto/PibotoLt-Regular.ttf","/usr/share/fonts/truetype/piboto/Pi
# EndIf
```

Notes:

On macOS, iOS and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

218.0.121 How to get fonts to load in DynaPDF on Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Please use the AddFontSearchPath method in the DynaPDFMBS class to specify where your fonts are.
Example:

```
dim d as new DynaPDFMBS
if TargetLinux then
call d.AddFontSearchPath "/usr/share/fonts/truetype", true
else
// on Mac and Windows we use system fonts.
end if
```

Notes:

On Mac OS X and Windows, the fonts are loaded from the system's font folder.

e.g. if you use ubuntu, you can install the ttf-mscorefonts-installer package and call this method with "/usr/share/fonts/truetype/msttcorefonts" as the path. No backslash on the end of a path, please.

218.0.122 How to get GMT time and back?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use the date class and the GMTOffset property.
Example:

```
// now
dim d as new date

// now in GMT
dim e as new date
e.GMTOffset = 0

// show
MsgBox str(d.TotalSeconds,"0.0")+" "+str(e.TotalSeconds, "0.0")

dim GMTTimeStamp as Double = e.TotalSeconds

// restore
dim f as new date

// add GMT offset here
f.TotalSeconds = GMTTimeStamp + f.GMTOffset*3600
// because here it's removed
f.GMTOffset = f.GMTOffset

MsgBox d.ShortTime+" ("+str(d.GMTOffset)+") "+str(d.TotalSeconds,"0.0")+EndOfLine+_
e.ShortTime+" ("+str(e.GMTOffset)+") "+str(e.TotalSeconds,"0.0")+EndOfLine+_
f.ShortTime+" ("+str(f.GMTOffset)+") "+str(f.TotalSeconds,"0.0")
```

Notes: It's sometimes a bit tricky with the date class as setting one property often changes the others.

218.0.123 How to get good crash reports?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Check this website from the webkit website:
Notes: http://webkit.org/quality/crashlogs.html

218.0.124 How to get list of all threads?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use the runtime module like in this function:
Example:

```
Function Threads() As Thread()
# pragma DisableBackgroundTasks
dim t() as Thread

Dim o as Runtime.ObjectIterator=Runtime.IterateObjects
While o.MoveNext
if o.Current isa Thread then
t.Append thread(o.current)
end if
Wend

Return t
End Function
```

Notes:

This returns an array of all thread objects currently in memory.
The pragma is important here as it avoids thread switches which may cause a thread to be created or deleted.

218.0.125 How to get parameters from webpage URL in Xojo Web Edition?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use the Webpage.ParametersReceived event.
Example:

```
Sub ParametersReceived(Variables As Dictionary)
for each key as Variant in Variables.keys
MsgBox key+" ->"+Variables.Value(key)
next
End Sub
```

Notes: The text encodings of this strings is not defined in Xojo 2010r5. Please use DefineEncoding.

218.0.126 How to get the color for disabled textcolor?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Ask the appearance manager:
Example:

```
Function GetThemeTextColor(inColor as Integer, inDepth as Integer, inColorDev as Boolean) As Color
declare function GetThemeTextColor lib "Carbon" (inColor as Integer, inDepth as Integer, inColorDev as
Boolean, outColor as Ptr) as Integer

dim i as Integer
dim col as MemoryBlock

col = newMemoryBlock(6)

i = GetThemeTextColor(inColor, inDepth, inColorDev, col)

return RGB(col.UShort(0)\256, col.UShort(2)\256, col.UShort(4)\256)
End Function
```

Notes:

The color for this is:

const kThemeTextColorDialogInactive = 2.

c = GetThemeTextColor(kThemeTextColorDialogInactive, Screen(0).Depth, true)

For Mac OS X you should use "CarbonLib" instead of "AppearanceLib" ...

218.0.127 How to get the current free stack space?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can something like the code below:
Example:

```
Sub ShowStackSize()
dim threadid as Integer
dim size as Integer

declare function GetCurrentThread lib "Carbon" (byref threadid as Integer) as short
declare function ThreadCurrentStackSpace lib "Carbon" (threadid as Integer, byref size as Integer) as short
```

```
if GetCurrentThread(threadid)=0 then
if 0=ThreadCurrentStackSpace(threadid,size) then
MsgBox str(size)
end if
end if
End Sub
```

Notes: For Mac OS 9, use "ThreadLib" instead of "CarbonLib". You can use # if if you like for that.

218.0.128 How to get the current timezone?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer:

You can use the TimeZoneMBS class or the CFTimeZoneMBS class.
Or code like below:
Example:

```
Function GMTOffsetInMinutes() as Integer
// Returns the offset of the current time to GMT in minutes.
// supports Mac OS and Windows, but not Linux yet (let me know if
// you have code for that, please)
//
// Note that the offset is not always an even multiple of 60, but
// there are also half hour offsets, even one 5:45h offset

// This version by Thomas Tempelmann (rb@tempel.org) on 25 Nov 2005
// with a fix that should also make it work with future Intel Mac targets.
//
// Using code from various authors found on the RB NUG mailing list

dim result, bias, dayLightbias as Integer
dim info as memoryBlock
dim offset as Integer

# if targetMacOS then

Declare Sub ReadLocation lib "Carbon" (location As ptr)

info = NewMemoryBlock(12)
ReadLocation info
if false then
// bad, because it does not work on Intel Macs:
```

```
'offset = info.short(9) * 256 + info.byte(11)
else
offset = BitwiseAnd (info.long(8), & hFFFFFF)
end

offset = info.short(9) * 256 + info.byte(11)
offset = offset \60
return offset

# endif

# if targetWin32 then

Declare Function GetTimeZoneInformation Lib "Kernel32" ( tzInfoPointer as Ptr ) as Integer
// returns one of
// TIME_ZONE_ID_UNKNOWN 0
// – Note: e.g. New Delhi (GMT+5:30) and Newfoundland (-3:30) return this value 0
// TIME_ZONE_ID_STANDARD 1
// TIME_ZONE_ID_DAYLIGHT 2

info = new MemoryBlock(172)
result = GetTimeZoneInformation(info)

bias = info.Long(0)
// note: the original code I found in the NUG archives used Long(84) and switched to Long(0)
// only for result=1 and result=2, but my tests found that Long(0) is also the right value for result=0

if result = 2 then
daylightBias = info.long(168)
end if
offset = - (bias + dayLightbias)
return offset

# endif

End Function
```

218.0.129 How to get the current window title?

Plugin Version: all, Platform: macOS, Targets: .

Answer: The code below returns the current window title for the frontmost window on Mac OS X if Accessibilty services are
Example:

```
Function CurrentWindowTitle() As string
```

```
// your application needs permissions for accessibility to make this work!

dim SystemWideElement,FocusedApplicationElement,FocusedWindowElement as AXUIElementMBS
dim FocusedApplication,FocusedWindow,Title as AXValueMBS
dim s as String
dim cs as CFStringMBS

SystemWideElement=AccessibilityMBS.SystemWideAXUIElement
if SystemWideElement<>nil then
FocusedApplication=SystemWideElement.AttributeValue(AccessibilityMBS.kAXFocusedApplicationAttribute)
if FocusedApplication.Type=AccessibilityMBS.kAXUIElementMBSTypeID then
FocusedApplicationElement=new AXUIElementMBS
FocusedApplicationElement.Handle=FocusedApplication.Handle
FocusedApplicationElement.RetainObject

FocusedWindow=FocusedApplicationElement.AttributeValue(AccessibilityMBS.kAXFocusedWindowAttribute)

if FocusedWindow<>nil and AccessibilityMBS.kAXUIElementMBSTypeID=FocusedWindow.Type then

FocusedWindowElement=new AXUIElementMBS
FocusedWindowElement.Handle=FocusedWindow.Handle
FocusedWindowElement.RetainObject

Title=FocusedWindowElement.AttributeValue(AccessibilityMBS.kAXTitleAttribute)
if Title<>nil and Title.Type=kCFStringMBSTypeID then
cs=new CFStringMBS
cs.handle=Title.Handle
cs.RetainObject
Return cs.str
end if
end if
end if
end if
End Function
```

218.0.130 How to get the cursor blink interval time?

Plugin Version: all, Platform: macOS, Targets: .

Answer: On Mac OS you can use GetCaretTime from the toolbox.
Example:

```
declare function GetCaretTime lib "Carbon" () as Integer

MsgBox str(GetCaretTime())+" ticks"
```

Notes: 60 ticks make one second.

218.0.131 How to get the list of the current selected files in the Finder?

Plugin Version: all, Platform: macOS, Targets: .

Answer:

Use the AppleScript like this one:

```
tell application "finder"
return selection
end tell
```

Which translates into this AppleEvent:

```
Process("Finder").SendAE "core,getd,'—-':obj { form:prop, want:type(prop), seld:type(sele), from:'null'() }
"
```

and as Xojo code it looks like this:
Example:

```
dim ae as appleevent
dim o1 as appleeventObjectSpecifier
dim f as folderItem
dim aList as appleeventdescList
dim i as Integer
dim dateiname as string

// setup the AppleEvent
o1=getpropertyObjectDescriptor( nil, "sele")
ae= newappleEvent("core", "getd", "MACS")
ae.objectSpecifierParam("—-")=o1

// send it
if ae.send then
// got the list
alist=ae.replyDescList

// now show the list of filename into an editfield:

for i=1 to alist.count
f=alist.folderItemItem(i)

dateiname=f.name
```

```
// editfield1 with property "mulitline=true"!
editfield1.text=editfield1.text + dateiname + chr(13)
next
end if
```

218.0.132 How to get the Mac OS system version?

Plugin Version: all, Platform: macOS, Targets: .

Answer: The following code queries the value and displays the version number:
Example:

```
dim first as Integer
dim second as Integer
dim third as Integer
dim l as Integer

if System.Gestalt("sysv",l) then

Third=Bitwiseand(l,15)
second=Bitwiseand(l\16,15)
first=Bitwiseand(l\256,15)+10*Bitwiseand(l\256\16,15)
end if

if First>=10 then
msgbox "Mac OS X "+str(First)+"."+str(Second)+"."+str(third)
else
msgbox "Mac OS "+str(First)+"."+str(Second)+"."+str(third)
end if
```

218.0.133 How to get the Mac OS Version using System.Gestalt?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:
Example:

```
Dim s As String
Dim b As Boolean
Dim i, resp as Integer

// Systemversion
```

```
b = System.Gestalt("sysv", resp)
If b then
s = Hex(resp)
For i =Len(s)-1 DownTo 1
s=Left(s,i)+"."+Mid(s,i+1)
Next
MsgBox "Systemversion: Mac OS " + s
end if
```

Notes: The MBS Plugin has a SystemInformationMBS.OSVersionString function for this.

218.0.134 How to get the screensize excluding the task bar?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Try this code:
Notes: Use the Screen class with the available* properties.

218.0.135 How to get the size of the frontmost window on Windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Try this code:
Notes:

Make yourself a class for the WindowRect with four properties:

```
Bottom as Integer
Left as Integer
Right as Integer
Top as Integer
```

Add the following method to your class:

```
Sub GetWindowRect(windowhandle as Integer)
dim err as Integer
dim mem as memoryBlock
# if targetwin32 then
Declare Function GetWindowRect Lib "user32.dll" (hwnd as Integer, ipRect As Ptr) as Integer

mem = newmemoryBlock(16)
```

```
err = GetWindowRect(windowhandle, mem)
Left = mem.long(0)
Top = mem.Long(4)
Right = mem.Long(8)
Bottom = mem.Long(12)
# endif
End Sub
```

Good to use for the MDI Master Window!

218.0.136 How to get the source code of a HTMLViewer?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:
Example:

```
// for Windows:

msgbox HTMLViewer1.IEHTMLTextMBS

// for MacOS with WebKit 2.x:

msgbox HTMLViewer1.WKWebViewMBS.HTMLText
```

218.0.137 How to get Xojo apps running Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You need to install some requuire packages.
Notes:

You need CUPS as well as GTK packages. On 64 bit systems also the ia32-libs package.

Please note that you need a x86 compatible Linux. So no PPC, Power, ARM or other CPUs.

218.0.138 How to handle really huge images with GraphicsMagick or ImageMagick?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Sometimes it may be better to use an extra application to process images.

Notes:

A typical 32 bit app made with Xojo can use around 1.8 GB on Windows and 3 GB on Mac OS X. Some images may be huge, so that processing them causes several copies of the image to be in memory. With a 500 MB image in memory, doing a scale or rotation may require a temp image. So with source, temp and dest images with each 500 MB plus your normal app memory usage, you may hit the limit of Windows with 1.8 GB.

In that case it may be worth running a tool like gm in the shell class. gm is the command line version of GraphicsMagick. There you can run the 64 bit version which is not limited in memory like your own application. Also you can monitor progress and keep your app responsive.

218.0.139 How to handle tab key for editable cells in listbox?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use code like this function:
Example:

```
Function HandleTabInList(list as listbox, row as Integer, column as Integer, key as String) As Boolean
// Handle tab character in Listbox.CellKeyDown event

Select case asc(key)
case 9
if Keyboard.AsyncShiftKey then
// back

// look for column left
for i as Integer = column-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next

// not found, so look in row before
row = row - 1
if row >= 0 then
for i as Integer = list.ColumnCount-1 downto 0
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next
end if
else
// forward
```

```
// look for column right
for i as Integer = column+1 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next

// not found, so look in row below
row = row + 1
if row <list.ListCount then
for i as Integer = 0 to list.ColumnCount-1
if list.ColumnType(i) >= list.TypeEditable then
list.EditCell(row, i)
Return true
end if
next
end if
end if
end Select
End Function
```

Notes:

You call it from CellKeyDown event like this:

```
EventHandler Function CellKeyDown(row as Integer, column as Integer, key as String) As Boolean
if HandleTabInList(me, row, column, key) then Return true
End EventHandler
```

As you see in the code, we handle tab and shift + tab for moving back and forward. Also we wrap to previous/next row if needed. Feel free to extend this to wrap from last to first row or create a new row for editing.

218.0.140 How to hard link MapKit framework?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Our MapKit classes weak link the framework. If you need hard linking it for the App Store, you can add this method to a class:
Example:

```
Sub ReferenceMapKit()
// just put this in window or app class
```

```
# if TargetMachO and Target64Bit then
Declare sub testing Lib "MapKit" Selector "test" (id as ptr)
testing(nil)
# endif

End Sub
```

Notes:

No need to call the method.
Just having it in a window or app, will cause the compiler to hard link the framework.

218.0.141 How to have a PDF downloaded to the user in a web application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use a WebHTMLViewer control and load the PDF file with the PDF plugin from the browser.
Example:

```
dim CurrentFile as WebFile // a property of the WebPage

// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer
CurrentFile.ForceDownload = true

// start the download
showurl(CurrentFile.url)
```

Notes: See our Create PDF example for the Xojo Web Edition.

218.0.142 How to hide all applications except mine?

Platform: macOS, Targets: .

Answer: The code below will on Mac OS hide all applications except your one:
Example:

```
dim p as new ProcessMBS
```

```
p.GetFirstProcess
do
if not p.FrontProcess then
p.Visible=false
end if
loop until not p.GetNextProcess
```

218.0.143 How to hide script errors in HTMLViewer on Windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Set Internet Explorer to silent mode with code like this:
Example:

```
htmlviewer1.__ole.Content.value("Silent") = True
```

Notes: Simply put this code in the open event of your htmlviewer control (using me instead of htmlviewer1).

218.0.144 How to hide the grid/background/border in ChartDirector?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: If you want to hide something in a chart, simply assign the kTransparent constant as color.

218.0.145 How to hide the mouse cursor on Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this declare:
Example:

```
Declare Sub HideCursor Lib "Carbon" () Inline68K("A852")

HideCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

218.0.146 How to insert image to NSTextView or TextArea?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: With NSTextViewMBS you can use this code to insert file:
Example:

```
// insert a file to textview

Public Sub InsertFile(textview as NSTextViewMBS, f as FolderItem)
// read to file
dim b as BinaryStream = BinaryStream.Open(f)
dim s as string = b.Read(b.Length)

// build wrapper
dim fileWrapper as NSFileWrapperMBS = NSFileWrapperMBS.initRegularFileWithContents(s)
fileWrapper.preferredFilename = f.name

// make attachment
dim fileAttachment as new NSTextAttachmentMBS(fileWrapper)
dim attributedString as NSAttributedStringMBS = NSAttributedStringMBS.attributedStringWithAttachment(fileAttachment)

// add to a NSTextViewMBS
textview.insertText attributedString

End Sub
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

218.0.147 How to jump to an anchor in a htmlviewer?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer: You can use javascript to change the current window's location.
Example:

```
// load website
htmlviewer1.LoadURL "http://www.monkeybreadsoftware.net/addressbook-abpersonmbs.shtml"

// later jump to anchor named "16":

if TargetWin32 then
call HTMLViewer1.IERunJavaScriptMBS "window.location = ""# 16"""
end if
```

218.0.148 How to keep a movieplayer unclickable?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: To keep the user away from clicking on a playing Movie you can just drop a Canvas in front of the Movieplayer and take the clicks there.
Example:

```
Function Canvas1.MouseDown(X as Integer, Y as Integer) as boolean
return true // take it and do nothing
End Function
```

218.0.149 How to keep my web app from using 100% CPU time?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: On Linux and MacOS you can use renice command in the terminal. On Windows use the task manager to reduce priority.
Notes:

If you launch your app with nohup on Linux or Mac OS X like this from the terminal or a script:

nohup /webapps/MyApp/MyApp &

you can simply have a second line saying this:

renice 20 $!

which tells the system to lower priority to lowest value for the latest background process.

218.0.150 How to kill a process by name?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can kill a process (or application) by name if you loop over all the processes and kill the one you need.
Example:

```
dim p as new ProcessMBS
p.GetfirstProcess ' get first
```

```
do
if p.name = "TextEdit" then
call p.KillProcess
Return
end if
loop until not p.GetNextProcess
```

Notes: You may want to check the result of killProcess function. Not every user is allowed to kill every application.

218.0.151 How to know how many CPUs are present?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this function:
Example:

```
Function GetCPUCount() as Integer
Declare Function MPProcessors Lib "Carbon" () as Integer

Return MPProcessors()
End Function
```

Notes: Your app will than need that library to launch on Classic. To avoid this the MBS plugin checks if this library is available and return 1 if it's not available.

218.0.152 How to know the calling function?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: On Mac you can use a helper function like this this code:
Example:

```
Public Function CallingFunction() as string
// Query name of calling function of a function

# Pragma BreakOnExceptions false

try

// raise a dummy exception
dim r as new NilObjectException
```

```
raise r

catch x as NilObjectException

// get stack
dim stack() as string = x.Stack

// pick function name and return
dim name as string = stack(2)
Return name

end try
End Function
```

Notes: You need to include function names in your application.

218.0.153 How to launch an app using it's creator code?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Send an AppleEvent "oapp" with the creator code to the Finder ("MACS"):
Example:

```
Dim a as AppleEvent
dim creator as string

creator = "MSIE" ' here the Internet Explorer

a = NewAppleEvent("aevt", "odoc", "MACS")
a.Timeout = -1

a.ObjectSpecifierParam("—-") = GetUniqueIDObjectDescriptor("appf", nil, creator)

if not a.send then
msgBox "An error has occured"
else

end if
```

218.0.154 How to launch disc utility?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use this code:
Example:

```
dim f as FolderItem = LaunchServicesFindApplicationForInfoMBS("","com.apple.DiskUtility","")

if f<>Nil then
f.Launch
end if
```

Notes: This works even if people renamed the disc utility or moved it to another folder.

218.0.155 How to make a lot of changes to a REAL SQL Database faster?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You may try to embed your changes to the database between two transaction calls.
Example:

```
dim db as Database // some database

db.SQLExecute "BEGIN TRANSACTION"
// Do some Stuff
db.SQLExecute "END TRANSACTION"
```

Notes: This can increase speed by some factors.

218.0.156 How to make a NSImage object for my retina enabled app?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use code like this:
Example:

```
Function NewRetinaImage(pic as Picture, mask as Picture = nil) As NSImageMBS
// first make a NSImageMBS from it
dim n as new NSImageMBS(pic, mask)

// now set to half the size, so we have 2x pixels for the image
n.size = new NSSizeMBS(n.width/2, n.height/2)

// and return
Return n
End Function
```

Notes:

The thing to do is to have 2x the pixels, but assign a size to the image which gives it the right size in points. You can pass the NSImageMBS from here to NSMenuItemMBS. For Retina displays, the full resolution is used. For others it will be reduced.

218.0.157 How to make a window borderless on Windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Try this declares:
Example:

```
// Sets window to borderless popup type, and sets its initial dimensions.
// Call this method, then Win32SetBorderlessPos, and then RB's Show
// method. Use RB Frame type 7 (Global Floating Window).

Const SWP_NOMOVE = & H2
Const SWP_FRAMECHANGED = & H20
Const HWND_TOPMOST = -1
Const GWL_STYLE = -16
Const WS_POPUPWINDOW = & H80880000

Dim styleFlags as Integer

# If TargetWin32 Then

Declare Function SetWindowLong Lib "user32" Alias "SetWindowLongA" (hwnd as Integer, nIndex as Integer, dwNewLong as Integer) as Integer
Declare Function SetWindowPos Lib "user32" (hwnd as Integer, hWndInstertAfter as Integer, x as Integer, y as Integer, cx as Integer, cy as Integer, flags as Integer) as Integer

styleFlags = SetWindowLong( w.WinHWND, GWL_STYLE, WS_POPUPWINDOW )
styleFlags = BitwiseOr( SWP_FRAMECHANGED, SWP_NOMOVE )
styleFlags = SetWindowPos( w.WinHWND, HWND_TOPMOST, 0, 0, wd, ht, styleFlags )

# EndIf
```

218.0.158 How to make an alias using AppleEvents?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:
Example:

```
Sub MakeAlias(folder as folderitem, target as folderitem, aliasname as string)
dim ev as AppleEvent
dim myResult as boolean
dim properties as AppleEventRecord

ev = NewAppleEvent("core","crel","MACS")
ev.MacTypeParam("kocl") = "alis"
ev.FolderItemParam("to ") = target
ev.FolderItemParam("insh") = folder

properties=new AppleEventRecord
properties.StringParam("pnam")=aliasname

ev.RecordParam("prdt")=properties

myResult = ev.send
// true on success, false on error
End Sub
```

Notes:

Call it like this:
MakeAlias SpecialFolder.Desktop, SpecialFolder.Desktop.Child("Gif Copy.rb"), "test.rb alias"

Seems to not work on Mac OS X 10.6

218.0.159 How to make AppleScripts much faster?

Plugin Version: all, Platform: macOS, Targets: .

Answer: use "ignoring application responses" like in this example:
Notes:

```
on run { fn,fpx,fpy }
ignoring application responses
tell app "Finder" to set the position of folder fn to fpx,fpy
end ignoring
end run
```

218.0.160 How to make double clicks on a canvas?

Plugin Version: all, Platform: macOS, Targets: .

Answer:

Update: Newer Xojo versions support DoubleClick event, so you don't need this code.

Here's my tip from the tips list on how to add a double-click event to the Canvas control. The technique could easily be used for a window or any Rectcontrol:

Because of its built-in drawing methods, the Canvas control is often used to create custom interface controls. But while the Canvas control has event handlers for most mouse events, it doesn't have an event handler for DoubleClick events. Fortunately, you can add a double-click event handler to a Canvas control easily. Basically, you're going to create a new class based on Canvas and add a double-click event to that. You can then use the new class anytime you need a Canvas with a double-click event.

To create a new Canvas class with a DoubleClick event handler, do this:

1. Add a new class to your project.
2. Set the Super property of the new class to "Canvas".
3. Change the name of this new class to "DoubleClickCanvas".

A double-click occurs when two clicks occur within the users double-click time (set in the Mouse control panel on both Macintosh and Windows) and within five pixels of each other. So, you'll need a few properties to store when and where the last click occurred.

4. Add a new property with the following declaration and mark it as private: lastClickTicks as Integer
5. Add a new property with the following declaration and mark it as private: lastClickX as Integer
6. Add a new property with the following declaration and mark it as private: lastClickY as Integer

Since the Canvas control doesn't have a DoubleClick event, you will need to add one.

7. Add a new event to your class by choosing New Event from the Edit menu and enter "DoubleClick" as the event name.

Double-clicks occur on MouseUp. In order for the mouseUp event to fire, you must return True in the MouseDown event.

8. In the MouseDown event, add the following code:
Return True

In the MouseUp event, you will need to determine what the users double-click time is. This value is represented on both the Mac and Windows in ticks. A tick is 1/60th of a second. Since there isn't a built-in function for this, you'll need to make a toolbox call. The mouseUp event code below makes the appropriate toolbox call for both Macintosh and Windows. It then compares the time of the users last click to the time of the current click and compares the location of the users last click to the location of the current click.

9. Add the following code to the MouseUp event:

```
dim doubleClickTime, currentClickTicks as Integer

# if targetMacOS then
Declare Function GetDblTime Lib "Carbon" () as Integer
doubleClickTime = GetDblTime()
# endif

# if targetWin32 then
Declare Function GetDoubleClickTime Lib "User32.DLL" () as Integer
doubleClickTime = GetDoubleClickTime()/60 // convert to ticks from milliseconds
# endif

currentClickTicks = ticks
//if the two clicks happened close enough together in time
if (currentClickTicks - lastClickTicks) <= doubleClickTime then
//if the two clicks occured close enough together in space
if abs(X - lastClickX) <= 5 and abs(Y - LastClickY) <= 5 then
DoubleClick //a double click has occured so call the event
end if
end if
lastClickTicks = currentClickTicks
lastClickX = X
lastClickY = Y
```

10. Now to test out your new DoubleClickCanvas, drag the class from the Project window to a window in your project to create an instance of it.

11. Double-click on the canvas you just added to your window to open the Code Editor. Notice that the canvas has a DoubleClick event handler. In this event handler, add the following code:

```
BEEP
```

218.0.161 How to make my Mac not sleeping?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Just inform the Mac OS about some system activity with code like this:

Example:

```
Sub UpdateSystemActivity()

# if TargetCarbon
declare function myUpdateSystemActivity lib "Carbon" alias "UpdateSystemActivity" (activity as Integer)
as short

const OverallAct = 0 // Delays idle sleep by small amount */
const UsrActivity = 1 // Delays idle sleep and dimming by timeout time */
const NetActivity = 2 // Delays idle sleep and power cycling by small amount */
const HDActivity = 3 // Delays hard drive spindown and idle sleep by small amount */
const IdleActivity = 4 // Delays idle sleep by timeout time */

dim e as Integer

e=myUpdateSystemActivity(UsrActivity)

// you may react on an error if e is not 0 after the call.

# endif
End Sub
```

Notes:

You may use another constant if you prefer some different behavior.
Call it maybe every second.

218.0.162 How to make my own registration code scheme?

Plugin Version: all, Platform: Windows, Targets: .

Answer: There are excellent articles about how to make a registratin code scheme, but you can also simply use our RegistrationEngineMBS class.
Notes: If you need a license text, why not use the one from Xojo as a starting point?

218.0.163 How to make small controls on Mac OS X?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can try this code on Mac OS X:
Example:

```
'/*
```

```
'* Use the control's default drawing variant. This does not apply to
'* Scroll Bars, for which Normal is Large.
'*/
const kControlSizeNormal = 0

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Check Box, Combo Box, Radio Button, Scroll Bar, Slider and Tab
'* controls.
'*/
const kControlSizeSmall = 1

'/*
'* Use the control's small drawing variant. Currently supported by
'* the Indeterminate Progress Bar, Progress Bar and Round Button
'* controls.
'*/
const kControlSizeLarge = 2

'/*
'* Control drawing variant determined by the control's bounds. This
'* ControlSize is only available with Scroll Bars to support their
'* legacy behavior of drawing differently within different bounds.
'*/
const kControlSizeAuto = & hFFFF

const kControlSizeTag = "size"

declare function SetControlData lib "Carbon" (controlhandle as Integer, part as short, tagname as OS-
Type, size as Integer, data as ptr) as short

dim m as MemoryBlock

m=NewMemoryBlock(2)
m.UShort(0)=kControlSizeSmall

Title=str(SetControlData(CheckBox1.Handle, 0, kControlSizeTag, 2, m))
```

218.0.164 How to mark my Mac app as background only?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can run a build script on each build with this code:
Example:

```
Dim App As String = CurrentBuildLocation + "/" + CurrentBuildAppName + ".app"
```

```
Call DoShellCommand("/usr/bin/defaults write " + App + "/Contents/Info ""NSUIElement"" YES")
```

Notes: This will set the NSUIElement flag to YES.

218.0.165 How to move a file or folder to trash?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use code like below:
Example:

```
Function MoveToTrash(f as FolderItem) As Boolean
# if TargetMacOS then
dim r as FolderItem
dim e as Integer = MacFileOperationMBS.MoveObjectToTrashSync(f, r, MacFileOperationMBS.kFSFileOperationDefaultOptions)

if e = 0 then
Return true // Ok
end if

# elseif TargetWin32 then
dim w as new WindowsFileCopyMBS

dim flags as Integer = w.FileOperationAllowUndo + w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if

flags = w.FileOperationNoErrorUI + w.FileOperationSilent + w.FileOperationNoConfirmation
if w.FileOperationDelete(f, flags) then
Return true // OK
end if
# else
// Target not supported
break
Return false
# endif
End Function
```

Notes:

If you want to move a file to trash, you could use f.movefileto f.trashfolder, but that will overwrite existing

files in the trash. You can use our MacFileOperationMBS class to move a file on Mac to the trash. And it uses the same code as the Finder, so files are renamed when the same name is already in use in the trash:

On Windows we use WindowsFileCopyMBS class.
Requires Mac OS X 10.5.

218.0.166 How to move an application to the front using the creator code?

Plugin Version: all, Platform: macOS, Targets: .

Answer: This makes SimpleText (Code ttxt) to the frontmost application:
Example:

```
dim a as appleevent

a=newappleEvent("misc","actv","ttxt")

if a.send then
end if
```

Notes: (Code is Mac only)

218.0.167 How to move file with ftp and curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can set post/pre quotes to have ftp commands executed before or after the download/upload.
Example:

```
dim d as CURLMBS // your curl object

// rename/move file
dim ws() As String
ws.Append "RNFR Temp.txt"
ws.append "RNTO MyFile.txt"

d.SetOptionPostQuote(ws)
```

Notes:

Use SetOptionPostQuote, SetOptionPreQuote or SetOptionQuote.
The ftp commands you pass here are native ftp commands and not the commands you use with ftp applica-

tions. So rename is two commands. First RNFR to tell where to rename from and second RNTO with the new file name. To delete use DELE and the file path.

218.0.168 How to normalize string on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use code like below:
Example:

```
Function Normalize(t as string) As string
const kCFStringNormalizationFormD = 0 // Canonical Decomposition
const kCFStringNormalizationFormKD = 1 // Compatibility Decomposition
const kCFStringNormalizationFormC = 2 // Canonical Decomposition followed by Canonical Composition
const kCFStringNormalizationFormKC = 3 // Compatibility Decomposition followed by Canonical Composition

dim s as CFStringMBS = NewCFStringMBS(t)
dim m as CFMutableStringMBS = s.Normalize(kCFStringNormalizationFormD)

Return m.str
End Function
```

Notes: This uses Apple's CFString functions to normalize unicode variants.

218.0.169 How to obscure the mouse cursor on Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this declare:
Example:

```
Declare Sub ObscureCursor Lib "Carbon" ()

ObscureCursor
```

Notes: The MBS Plugin has this function, but it's not supported for Windows.

218.0.170 How to open icon file on Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Use the NSImageMBS class like this:
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.ico")
dim n as new NSImageMBS(f)

window1.Backdrop = n.CopyPictureWithMask
```

218.0.171 How to open PDF in acrobat reader?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this code:
Example:

```
dim pdf as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open PDF in Acrobat Reader on Mac:

// find app
dim bundleID as string = "com.adobe.Reader"
dim app as FolderItem = LaunchServicesFindApplicationForInfoMBS("", bundleID, "")

if app<>nil then

// launch app with parameters

dim docs() as FolderItem
docs.Append pdf

dim param as new LaunchServicesLaunchParameterMBS
param.Defaults = true
param.Application = app

dim x as FolderItem = LaunchServicesOpenXMBS(docs, param)

// on failure, simply launch it
if x = nil then
pdf.Launch(true)
end if

else
```

```
pdf.Launch(true)
end if
```

Notes: On Windows, simply use pdf.launch or WindowsShellExecuteMBS.

218.0.172 How to open printer preferences on Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use our OpenMacOSXPreferencesPaneMBS function like this:
Example:

```
dim e as Integer = OpenMacOSXPreferencesPaneMBS("PrintAndFax")
if 0 = e then
MsgBox "OK"
elseif e = -43 then
MsgBox "File not found."
else
MsgBox "Error: "+str(e)
end if
```

218.0.173 How to open special characters panel on Mac?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: We have functions for that in Cocoa and Carbon.
Example:

```
dim a as new NSApplicationMBS
a.orderFrontCharacterPalette
```

Notes:

For Cocoa, you can use orderFrontCharacterPalette method in NSApplicationMBS class.

Or simply for Carbon and Cocoa the ShowCharacterPaletteMBS method.

218.0.174 How to optimize picture loading in Web Edition?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use the WebPicture class.
Notes:

Take your picture and create a WebPicture object. Store this WebPicture in a property of the WebPage, Session or app (as global as possible). On the first time you use this picture on an user session, the browser will load it. Second time you use it, the browser will most likely pick it from the cache.
Having pictures in App or some module reuses the same picture for all sessions which reduces memory footprint.
This does not work well with pictures you change very often or use only for one webpage on one user.

If you like to see an example, check our Map example.

218.0.175 How to parse XML?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use code like this:
Example:

```
dim s as string = "<test><test /></test>"

try
dim x as new XmlDocument(s)
MsgBox "OK"
catch xe as XmlException
MsgBox "invalid XML"
end try
```

Notes: If you got an exception, you have a parse error.

218.0.176 How to play audio in a web app?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use the HTML5 audio tag and control it with javscript.
Notes:

This is just another example app I made today. It plays a christmas song. The audio file is provided by the application to the server, so no external web server is needed and this application can run stand alone. To compile and run you need Xojo 2010r5.

In the open event we search the audio files and open them as binarystreams. We create the two webfile objects. Those webfiles are part of the app class, so we have them globally. There we set the data with the content of our streams. We also define file names and mime types. They are needed so browser know what we have here:

```
audioFileM4V = new WebFile
audioFileM4V.Data = bM.Read(BM.Length)
audioFileM4V.Filename = "music.m4a"
audioFileM4V.MIMEType = "audio/m4a"

audioFileOGG = new WebFile
audioFileOGG.Data = bO.Read(BO.Length)
audioFileOGG.Filename = "music.ogg"
audioFileOGG.MIMEType = "audio/ogg"
```

Next in the open event of the webpage we have a PageSource control. The location is set to be before content. In the open event we define the html code for this. First we pick the URLs for the audio files. Than we build the html to use the audio tag. As you see, we give it an ID for later use and have it preload automatically. If you add an autoplay tag, you can have the audio play right away. Inside the audio tag we have two sources so we provide audio for both Firefox (OGG) and Safari (MPEG4). Finally we have a text to display if HTML5 audio tag is not supported.

You can set the source in the EditSource event:

```
dim urlo as string = app.audioFileOGG.URL
dim urlm as string = app.audioFileM4V.URL
me.Source = "<audio id=""mymusic"" preload=""auto""><source src=""""+urlo+"""" type=""audio/ogg"" />
<source src=""""+urlm+"""" type=""audio/mpeg"" />Your browser does not support the audio element.</audio>"
```

Next in the Play button we execute code to play the audio. This is a short javascript code which searches in the html document for the element with the ID "mymusic" which is the ID of our audio tag above. Once we got the object, we call it's play method to start playback.

```
me.ExecuteJavaScript("document.getElementById('mymusic').play();")
```

same for pause:

```
me.ExecuteJavaScript("document.getElementById('mymusic').pause();")
```

and finally for changing volume:

me.ExecuteJavaScript("document.getElementById('mymusic').volume="+str(me.Value/100.0)+";")

218.0.177 How to pretty print xml?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use the XML Transform method with the right XLS.
Notes:

Learn more here:
http://docs.xojo.com/index.php/XMLDocument.Transform

218.0.178 How to print to PDF?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: This code below shows how to redirect printing to a PDF file on Mac OS X.
Example:

```
// get Xojo printer setup
dim p as new PrinterSetup

// now put it into NSPrintInfo to manipulate
dim n as new NSPrintInfoMBS
n.SetupString = p.SetupString

// change destination to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
n.SetSaveDestination(f)

// move back
p.SetupString = n.SetupString

// and print as usual
dim g as Graphics = OpenPrinter(p)
g.DrawString "Hello World", 20, 20
```

Notes: And you can use normal graphics class for that.

218.0.179 How to query Spotlight's Last Open Date for a file?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use a MDItemMBS objec to query this value:
Example:

```
Function LastOpenedDate(Extends F As FolderItem, DefaultOtherDates As Boolean = True) As Date
# If TargetMacOS Then
Dim xMDItem as New MDItemMBS(F)
Dim xDate as Variant

If xMDItem <>Nil Then
xDate = xMDItem.GetAttribute(xMDItem.kMDItemLastUsedDate).DateValue
If xDate IsA Date Then Return xDate
Else
If xDate <>Nil Then Break
End If
# EndIf

If DefaultOtherDates Then
If F.ModificationDate <>Nil Then Return F.ModificationDate
If F.CreationDate <>Nil Then Return F.CreationDate
End If
End Function
```

Notes: Thanks for Josh Hoggan for this example code.

218.0.180 How to quit windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Try this code:
Example:

```
# if targetwin32 then
dim i1,i2,r as Integer
declare function ExitWindowsEx lib "user32" (uFlags as Integer, dwReserved as Integer) as Integer
i1 = 2
i2 = 0
r = ExitWindowsEx(i1,i2)
if r<>0 then
' Error()
end if

# endif
```

Notes:

uFlags parameters:

'4 = EWX_Force
'0 = EWX_Logoff
'2 = EWX_Reboot
'1 = EWX_shutdown, should shut down computer

Also check the ExitWindowsMBS method.

218.0.181 How to read a CSV file correctly?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: With all the rules for quotes and delimiters, you can simply use the SplitCommaSeparatedValuesMBS method in our plugins like this:
Example:

```
dim f as FolderItem = SpecialFolder.Desktop.Child("test.csv")
dim t as TextInputStream = f.OpenAsTextFile

while not t.EOF
dim s as string = t.ReadLine(encodings.ASCII)

dim items() as string = SplitCommaSeparatedValuesMBS(s, ";", """")

List.AddRow ""
dim u as Integer = UBound(items)
for i as Integer = 0 to u
List.Cell(List.LastIndex,i) = items(i)
next

wend
```

Notes: Please make sure you choose the right text encoding.

218.0.182 How to read the command line on windows?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Try this code:
Example:

```
# if targetwin32 then
dim line as string
Dim mem as MemoryBlock

Declare Function GetCommandLineA Lib "kernel32" () As Ptr

mem=GetCommandLineA()
s=mem.cstring(0)

# endif
```

Notes: Newer Xojo versions have a system.commandline property.

218.0.183 How to render PDF pages with PDF Kit?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Try this code:
Example:

```
// choose a file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")

// open it as PDF Document
dim sourceFile as New PDFDocumentMBS(f)

if sourceFile.handle <>0 then // it is a PDF file

// get upper bound of pages
dim c as Integer = sourceFile.pageCount-1

// from first to last page
for n as Integer = 0 to c

// pick that page
dim page as PDFPageMBS = sourceFile.pageAtIndex(n)

// render to image
dim p as NSImageMBS = page.Render

// and convert to RB picture and display
Backdrop = p.CopyPictureWithMask
```

```
next

end if
```

Notes: PDFKit works only on Mac OS X.

218.0.184 How to restart a Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Ask the Finder via Apple Events:
Example:

```
dim ae as appleevent
ae=newappleEvent("FNDR","rest","MACS")
if not ae.send then
msgBox "The computer couldn't be restarted."
end if
```

218.0.185 How to resume ftp upload with curl plugin?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: CURL supports that and you simply need to set the right options.
Notes:

First of course OptionUpload must be true. Second OptionFTPAppend must be true so the OptionResumeFrom is used. Store there (or in OptionResumeFromLarge) your start value.
Don't forget to implement the read event and return data there as requested.

218.0.186 How to rotate a PDF page with CoreGraphics?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: This code opens a PDF and draws the first page into a new PDF with 90¬∞ rotation.
Example:

```
// Rotate a PDF page

// our files
dim sourcefile as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
```

```
dim destfile as FolderItem = SpecialFolder.Desktop.Child("rotated.pdf")

// open PDF
dim pdf as CGPDFDocumentMBS = sourcefile.OpenAsCGPDFDocumentMBS

// query media size of first page
dim r as CGRectMBS = pdf.MediaBox(1)

// create new PDF
dim c as CGContextMBS = destfile.NewCGPDFDocumentMBS(r,"title","Author","Creator")

// create rotated rectangle
dim nr as new CGRectMBS(0,0,r.Height,r.Width)

// create new page
c.BeginPage nr
c.SaveGState

const pi = 3.14159265

// rotate by 90¬∞
c.RotateCTM pi*1.5

// fix origin
c.TranslateCTM -r.width,0

// draw PDF
c.DrawCGPDFDocument pdf,r,1

// cleanup
c.RestoreGState
c.EndPage

c = nil

// show in PDF viewer
destfile.Launch
```

Notes: This code is Mac only as it needs CoreGraphics.

218.0.187 How to rotate image with CoreImage?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Use the code like the one below:

Example:

```
// Rotate image with CoreImage

// load image
dim f as FolderItem = SpecialFolder.Desktop.Child("test.png")
dim image as new CIImageMBS(f)

// rotate 45 degree
dim n as new NSAffineTransformMBS
n.rotateByDegrees(45)

dim TransformFilter as new CIFilterAffineTransformMBS
TransformFilter.inputImage = image
TransformFilter.inputTransform = n

// get result
dim resultImage as CIImageMBS = TransformFilter.outputImage

// for saving to file
dim outputImage as NSImageMBS = resultImage.RenderNSImage(false)

f = SpecialFolder.Desktop.Child("output.png")
dim b as BinaryStream = BinaryStream.Create(f, true)
b.Write outputImage.PNGRepresentation

// as Xojo picture object for display
dim pic as Picture = outputImage.CopyPictureWithMask

Backdrop = pic
```

218.0.188 How to run a 32 bit application on a 64 bit Linux?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Install 32 bit compatibility libraries.
Notes:

The package is called ia32-libs for ubuntu (and others).
Some applications need to be run on a 32 bit system as they need some hardware related libraries. Like libUSB or libHID for USB devices.

218.0.189 How to save HTMLViewer to PDF with landscape orientation?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use NSPrintInfoMBS to change the options for PrintToPDFFile function.
Example:

```
// make it landscape
dim n as NSPrintInfoMBS = NSPrintInfoMBS.sharedPrintInfo
n.orientation = n.NSLandscapeOrientation

// save html to file
dim f as FolderItem = SpecialFolder.Desktop.Child("test.pdf")
call HTMLViewer1.PrintToPDFFileMBS(f,10,30,10,30)
```

Notes:

You may want to reset options later.
This code is only for Mac OS X.

218.0.190 How to save RTFD?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: How to load PDF to htmlviewer on desktop?
Example:

```
Public Sub LoadPDFData(viewer as HTMLViewer, PDFData as string)
Dim base64string As String = EncodeBase64(PDFData)

// remove line endings to make it a big line
base64string = ReplaceLineEndings(base64string, "")

// build data URL
// https://en.wikipedia.org/wiki/Data_URI_scheme
Dim dataURL As String = "data:application/pdf; base64," + base64string

// show in webviewer
HTMLViewer1.LoadURL(dataURL)

// may not work everywhere due to URL length limit
// for Web projects, use WebFile instead!
End Sub
```

Notes:

This avoids a temporary file, which may also work.
For Web Apps, please use WebFile.

218.0.191 How to save RTFD?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: With NSTextViewMBS you can use this code to save to RTFD:
Example:

```
// save text as RTFD including image attachments
dim f as FolderItem = GetSaveFolderItem(FileTypes1.ApplicationRtfd, "test.rtfd")

if f = nil then Return

dim a as NSAttributedStringMBS = textView.textStorage
dim w as NSFileWrapperMBS = a.RTFDFileWrapperFromRange(0, a.length, DocumentAttributes)

dim e as NSErrorMBS
if w.writeToFile(f, e) then

else
MsgBox e.LocalizedDescription
end if
```

Notes: For TextArea you can query the underlaying NSTextViewMBS object via TextArea.NSTextViewMBS method.

218.0.192 How to scale a picture proportionally with mask?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportinalScaledWithMask(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor

dim faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
```

```
dim w as Integer = Pic.Width * faktor
dim h as Integer = Pic.Height * faktor

// create new picture
dim NewPic as new Picture(w,h,32)

// check if we have a mask and clear it
dim m as picture = pic.mask(False)
pic.mask = nil

// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

if m <>nil then
// restore mask and scale it
pic.mask = m
NewPic.mask.Graphics.DrawPicture m, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height
end if

// return result
Return NewPic
End Function
```

Notes: This version handles mask. As you see we actually have to remove mask in order to copy the picture part correctly.

218.0.193 How to scale a picture proportionally?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: For a proportional scaling, we calculate the new picture size relative to the target maximum size.
Example:

```
Function ProportionalScaled(extends pic as Picture, Width as Integer, Height as Integer) As Picture
// Calculate scale factor

dim faktor as Double = min( Height / Pic.Height, Width / Pic.Width)

// Calculate new size
dim w as Integer = Pic.Width * faktor
dim h as Integer = Pic.Height * faktor

// create new picture
dim NewPic as new Picture(w,h,32)
```

```
// draw picture in the new size
NewPic.Graphics.DrawPicture Pic, 0, 0, w, h, 0, 0, Pic.Width, Pic.Height

// return result
Return NewPic
End Function
```

Notes:

This does not handle mask, but you can scale the mask the same way and assign it to the new picture. (see other FAQ entry with mask)

218.0.194 How to scale/resize a CIImageMBS?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Use the CIFilterLanczosScaleTransform filter to scale down a picture to a specific size.
Example:

```
Dim pic As Picture = LogoMBS(500)
Dim image As CIImageMBS = CIImageMBS.imageWithPicture(pic)

Dim filter As New CIFilterLanczosScaleTransformMBS

Const targetWidth = 600.0
Const targetHeight = 400.0

Dim scale As Double = targetHeight / image.Extent.Height
Dim aspect As Double = targetWidth / (image.Extent.Width * scale)

filter.inputImage = image
filter.inputScale = scale
filter.inputAspectRatio = aspect

Dim result As Picture = filter.outputImage.RenderPicture

Backdrop = result
```

Notes: This is same code as our scaleTo convenience method.

218.0.195 How to scale/resize a picture?

Plugin Version: all, Platform: Windows, Targets: .

Answer: There are several ways to scale or resize a picture. The easiest way may be the ScaleMBS function in the Picture class.
Example:

```
dim Original,Scaled as Picture

Original=LogoMBS(500)
Scaled=Original.ScaleMBS(100,100,true)
```

Notes:

The plugin ways:
- GraphicsMagick can scale/resize.
- CoreImage scale filter may result in the fastest and best images on Mac OS X 10.4.
- NSImageMBS can scale, but is Mac OS X only.
- CGImageMBS can scale, but is Mac OS X only.
- CIImageMBS can scale, but is Mac OS X only.
- QuickTime Graphics exporter and importer can be connected to scale. (this was used more often a few years ago)
- ImageMagick can scale very nice and crossplatform. But the ImageMagick libraries are big.
- The picture.ScaleMBS function is self written and results in equal output on Mac, Windows and Linux without any additional libraries installed.
- Picture.ScalingMBS does crossplatform scaling with several modes.

with pure Xojo:
- make a new picture and draw the old one with new size inside.

218.0.196 How to search with regex and use unicode codepoints?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can specify unicode characters in search string with backslash x and digits.
Example:

```
dim r as RegExMbs
dim s as string
dim c as Integer

s="123 √§√√º ABC 456"

r=new RegExMBS
```

```
if r.Compile(".√.") then
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if

r=new RegExMBS
if r.Compile(".\xF6.") then // finds √ using Unicode codepoint
c=r.Execute(s,0)
MsgBox str(c)+" "+str(r.Offset(0))+" "+str(r.Offset(1))
// shows: 1 4 10
// 1 for ubound of the offset array
// 4 for 4 bytes before the matched pattern
// 10 for the 10 bytes before the end of the matched pattern
end if
```

218.0.197 How to see if a file is invisible for Mac OS X?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this function:
Example:

```
Function Invisible(F As FolderItem) As Boolean
Dim TIS As TextInputStream
Dim S,All As String
Dim I as Integer
dim g as folderitem

If Left(F.Name,1)="." or not f.visible Then
Return True
End If

g=F.Parent.Child(".hidden")
If g.Exists Then
TIS=g.OpenAsTextFile
if tis<>Nil then
All=TIS.ReadAll
For I=1 to CountFields(All,Chr(11))
S=NthField(All, Chr(11), I)
If S=F.name Then
Return True
End If
```

```
Next
end if
End if
End Function
```

218.0.198 How to set cache size for SQLite or REALSQLDatabase?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You use the pragma cache_size command on the database.
Example:

```
// set cache size to 20000 pages which is about 20 MB for default page size
dim db as REALSQLDatabase
db.SQLExecute "PRAGMA cache_size = 20000"
```

Notes:

Default cache size is 2000 pages which is not much.
You get best performance if whole database fits in memory.
At least you should try to have a cache big enough so you can do queries in memory.
You only need to call this pragma command once after you opened the database.

218.0.199 How to set the modified dot in the window?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this declares:
Example:

```
window1.ModifiedMBS=true
```

218.0.200 How to show a PDF file to the user in a Web Application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use a WebHTMLViewer control and load the
Example:

```
dim CurrentFile as WebFile // a property of the WebPage
```

```
// define the PDF file
CurrentFile = new WebFile
CurrentFile.Filename = "test.pdf"
CurrentFile.MIMEType = "application/pdf"
CurrentFile.Data = "some pdf data" // MyDynaPDF.GetBuffer

// load into html viewer
HTMLViewer1.URL = CurrentFile.URL
```

Notes: See our Create PDF example for the Xojo Web Edition.

218.0.201 How to show Keyboard Viewer programmatically?

Platform: macOS, Targets: .

Answer: Use Xojo or AppleScript to launch the KeyboardViewerServer.app.
Example:

```
dim a as new AppleScriptMBS
dim text as string
dim lines(-1) as string

lines.append "set theApplication to ""KeyboardViewerServer"""
lines.append "set thePath to ""/System/Library/Components/KeyboardViewer.component/Contents/Shared-
Support/KeyboardViewerServer.app"""
lines.append ""
lines.append "set POSIXPath to ((POSIX file thePath) as string)"
lines.append "tell application ""System Events"" to set isRunning to 0 <(count (application processes whose
name is theApplication))"
lines.append "if isRunning then tell application POSIXPath to quit"
lines.append "delay 0.15"
lines.append ""
lines.append "ignoring application responses"
lines.append " tell application POSIXPath to run"
lines.append "end ignoring"

text=join(lines,EndOfLine.macintosh)

a.Compile text
a.Execute
```

Notes:

AppleScript code:

```
set theApplication to "KeyboardViewerServer"
set thePath to "/System/Library/Components/KeyboardViewer.component/Contents/SharedSupport/KeyboardViewerServer.app"

set POSIXPath to ((POSIX file thePath) as string)
tell application "System Events" to set isRunning to 0 <(count (application processes whose name is theApplication))
if isRunning then tell application POSIXPath to quit
delay 0.15

ignoring application responses
tell application POSIXPath to run
end ignoring
```

218.0.202 How to show the mouse cursor on Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Try this declare:
Example:

```
Declare Sub ShowCursor Lib "Carbon" ()

ShowCursor
```

Notes: The MBS Plugin has this function and supports it on Windows, too.

218.0.203 How to shutdown a Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Ask the Finder via Apple Events:
Example:

```
dim ae as appleevent
ae=newappleEvent("FNDR","shut","MACS")
if not ae.send then
msgBox "The computer couldn't be shutdown."
end if
```

Notes:

Or toolbox call (Attention: This method will stop the computer immediataly: No document asked to be saved, all applications quitting without knowing).

```
Declare Sub ShutDwnPower Lib "Carbon" ()
ShutDwnPower
```

218.0.204 How to sleep a Mac?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Ask the Finder via Apple Events:
Example:

```
dim ae as appleevent
ae=newappleEvent("FNDR","slep","MACS")
if not ae.send then
msgBox "The computer doesn't want to sleep."
end if
```

218.0.205 How to speed up rasterizer for displaying PDFs with DynaPDF?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Here a few speed tips:
Notes:

- Use the DynaPDFRasterizerMBS function instead of our render functions.
- Reuse DynaPDFRasterizerMBS as long as the target picture size doesn't change.
- Import only the PDF pages you want to display.
- Let DynaPDF do zooming, rotating or other effects instead of you change it.

218.0.206 How to use PDFLib in my RB application?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: The PDFlib plugin was discontinued in favor of our DynaPDF plugin.
Notes: If you need help to move, please contact us.

218.0.207 How to use quotes in a string?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Just double them.
Example:

msgbox "This String contains ""quotes""."

218.0.208 How to use Sybase in Web App?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Please use our MBS Xojo SQL Plugin to connect to a Sybase Database in your web application.
Notes:

If you see db.Connect giving the error message "cs_ctx_alloc ->CS_MEM_ERROR", than some things are not setup right for Sybase.
The Apache process may not have all the SYBASE environment variables being set when the CGI was launched.

Adding these lines to /etc/httpd/conf/httpd.conf stopped the faux memory errors for us:

SetEnv LD_LIBRARY_PATH /opt/sybase/OCS-15_0/lib:/opt/sybase/OCS-15_0/lib3p64:/opt/sybase/OCS-15_0/lib3p:
SetEnv SYBROOT /opt/sybase
SetEnv SYBASE_OCS /opt/sybase
SetEnv SYBASE /opt/sybase

218.0.209 How to use the Application Support folder?

Plugin Version: all, Platform: macOS, Targets: .

Answer:

I was saving a registration code for an app to the Preferencefolder.
People on the list have suggested that it would be better in
the ApplicationSupportFolder. How do I save the file called CWWPrefs

into that folder using MBS?

I have checked for examples and the docs but can't see how to apply it

```
//f = SpecialFolder.Preferences.child("CWWPrefs")
f = ApplicationSupportFolderMBS(-32768)
```

Example:

```
dim folder,file as FolderItem

folder = createApplicationSupportFolderMBS(-32763)

if folder=nil then
// Some very old Mac OS Versions may not support it
// or the plugin may fail for any reason
folder=SpecialFolder.Preferences
end if

file=folder.Child("CWWPrefs")

MsgBox file.NativePath
```

Notes: You may not be able to write there with a normal user account!

218.0.210 How to use the IOPMCopyScheduledPowerEvents function in Xojo?

Plugin Version: all, Platform: macOS, Targets: .

Answer: You can use the following code which does this using the SoftDeclareMBS class.
Example:

```
Sub Open()
dim c as CFDateMBS
dim t as CFAbsoluteTimeMBS

// get current date
c=NewCFDateMBS

// in absolute time (seconds since x)
t=c.AbsoluteTime

// add 600 seconds (= 10 Minutes)
t.Value=t.Value+600
```

```
// Make a Date from it
c=t.Date

// Schedule the event
// 0 on success
// E00002C1 for missing root rights
Title=hex(schedulePowerEvent(c, "wake"))

// Just for information, display the scheduled stuff
CFShowMBS CopyScheduledPowerEvents
End Sub

Function CopyScheduledPowerEvents() As cfarrayMBS
dim s as SoftDeclareMBS
dim m as MemoryBlock

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMCopyScheduledPowerEvents") then
if s.CallFunction(0,nil) then
Return NewCFArrayMBSHandle(s.Result,true)
else
MsgBox "Failed to Call IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOPMCopyScheduledPowerEvents."
end if
else
MsgBox "Failed to load IOKit."
end if

Return nil
End Function

Function SchedulePowerEvent(time_to_wake as CFDateMBS, Type as CFStringMBS) as Integer
dim s as SoftDeclareMBS
dim m as MemoryBlock

'/*
'* Types of power event
'* These are potential arguments to IOPMSchedulePowerEvent().
'* These are all potential values of the kIOPMPowerEventTypeKey in the CFDictionaries
'* returned by IOPMCopyScheduledPowerEvents().
'*/
'/*!
'@define kIOPMAutoWake
'@abstract Value for scheduled wake from sleep.
```

```
'*/
'# define kIOPMAutoWake "wake"
'
'/*!
'@define kIOPMAutoPowerOn
'@abstract Value for scheduled power on from off state.
'*/
'# define kIOPMAutoPowerOn "poweron"
'
'/*!
'@define kIOPMAutoWakeOrPowerOn
'@abstract Value for scheduled wake from sleep, or power on. The system will either wake OR
'power on, whichever is necessary.
'*/
'
'# define kIOPMAutoWakeOrPowerOn "wakepoweron"
'/*!
'@define kIOPMAutoSleep
'@abstract Value for scheduled sleep.
'*/
'
'# define kIOPMAutoSleep "sleep"
'/*!
'@define kIOPMAutoShutdown
'@abstract Value for scheduled shutdown.
'*/
'
'# define kIOPMAutoShutdown "shutdown"

s=new SoftDeclareMBS

if s.LoadLibrary("IOKit.framework") then
if s.LoadFunction("IOPMSchedulePowerEvent") then

m=NewMemoryBlock(12)
m.Long(0)=time_to_wake.handle
m.Long(4)=0 // nil
m.Long(8)=type.Handle

if s.CallFunction(3,m) then
Return s.Result
end if
end if
end if

End Function
```

Notes: Requires Mac OS X and to execute root rights.

218.0.211 How to validate a GUID?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use this function below which uses a regular expression to verify that the string is a valid UUID/GUID:
Example:

```
Function IsGUID(guid as string) As Boolean
dim r as new RegEx

r.SearchPattern = "^(\{ { 0,1 } ( [ 0-9a-fA-F ] ) { 8 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 4 } -( [ 0-9a-fA-F ] ) { 12 } \} { 0,1 } )$ "

Return r.Search(guid)<>nil
End Function
```

Notes: Simply parsing the GUID with CFUUIDMBS does not give the same result as CFUUIDMBS will also take a string like "DDDD".

218.0.212 How to walk a folder hierarchie non recursively?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Use code like this one:
Example:

```
Sub Walk(folder as FolderItem)
dim folders() as FolderItem

folders.Append folder

while UBound(folders)>=0

dim currentFolder as FolderItem = folders.pop

dim c as Integer = currentFolder.Count
for i as Integer = 1 to c
dim item as FolderItem = currentFolder.TrueItem(i)

if item = Nil then
// no permission
```

```
elseif item.Visible then // only visible

if item.Directory then
folders.Append item
else
// work with file here
end if

end if

next

wend
End Sub
```

Notes:

As you see we go with a long loop which runs until we don't have more folders to process.
We ignore items we can't access due to permission limits.
And we only work visible items.
If you like, check folderitem.isBundleMBS on item to handle packages and applications better on Mac OS X.

218.0.213 I got this error: PropVal, QDPictMBS.Name (property value), Type mismatch error. Expected CGDataProviderMBS, but got Variant, Name:QDPictMBS

Plugin Version: all, Platform: macOS, Targets: .

Answer: The plugins MacOSX and MacOSXCF belong together. If you use one part, please also install the other part.
Notes: We splitted the plugin because the Xojo IDE on Windows crashed on compilation.

218.0.214 I registered the MBS Plugins in my application, but later the registration dialog is shown.

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: There are two main reasons.
Notes:

1. you may use the plugin before registering them. This is often the case if you register in a window open event and use the plugin in a control open event.

On the console on Mac OS X or Windows, you may see a message like this "MBS Plugins were used by the application before the RegisterMBSPlugin function was called. Please fix this in your code!".

2. you may have mixed different plugin versions which are not compatible.
In this case you can see a message "Internal plugin registration error." on the console on Mac OS X. Newer plugins may show a message dialog reporting this. Older version simply think they are not registered.

If the installer just merges old and new applications, users may have libraries of older and newer plugin versions in the libs folder. If your application loads the wrong version, the registration fails.

If you use remote debugging, make sure you clear the tempory files there, too. Otherwise you may have old DLLs on your hard disc which may disturb your application.

You can run into issues if you use your registration code on different places of your app. Please register only once in app.open (or app Constructor). If you have several codes, simply call them one after the other.

Also check that you only call RegisterMBSPlugin with valid serial number. If you later call RegisterMBSPlugin with Demo like in example code above, you remove the license.

Next check if you can clear the Xojo caches and that helps. This includes the Xojo Scratch folder and the Plugins & Project caches. Simply locate those folders and delete them. For Windows look in hidden AppData folder in your user folder. For Mac, please check
textasciitilde /Library/Caches and your temp folders.

Finally make sure you use the right serial number. Not an older one or a misspelled one.

218.0.215 I want to accept Drag & Drop from iTunes

Plugin Version: all, Platform: macOS, Targets: .

Answer: You need to accept AcceptMacDataDrop "itun" and Handle the DropObject.
Example:

```
Sub Open()
window1.AcceptMacDataDrop "itun"
End Sub

Sub DropObject(obj As DragItem)
dim s as string
dim f as folderItem
dim d as CFDictionaryMBS
dim o as CFObjectMBS
```

```
dim key as CFStringMBS
dim dl as CFDictionaryListMBS
dim i,c as Integer
dim u as CFURLMBS
dim file as FolderItem

if obj.MacDataAvailable("itun") then
s = obj.MacData("itun")

// Parse XML
o=NewCFObjectMBSFromXML(NewCFBinaryDataMBSStr(s))

// Make dictionary
if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)

// get Tracks Dictionary
key=NewCFStringMBS("Tracks")
o=d.Value(key)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)
dl=d.List

// Walk over all entries in the Tracks dictionary
c=dl.Count-1
for i=0 to c
o=dl.Value(i)

if o isa CFDictionaryMBS then
d=CFDictionaryMBS(o)

key=NewCFStringMBS("Location")
o=d.Value(key)
if o isa CFStringMBS then
u=NewCFURLMBSCFStringMBS(CFStringMBS(o),nil)

file=u.file
if file<>nil then
MsgBox file.NativePath
end if
end if
end if
next
end if
end if
end if
End Sub
```

Notes: The code above inside a window on Xojo 5.5 with MBS Plugin 5.3 will do it nice and show the paths.

218.0.216 I'm drawing into a listbox but don't see something.

Plugin Version: all, Targets: .

Answer: If you draw this in a listbox cellbackground, you need to draw on the correct position
Example:

```
Function CellBackgroundPaint(g As Graphics, row as Integer, column as Integer) As Boolean
dim f as FolderItem
f=SpecialFolder.Desktop
f.DrawWideIconMBS(g,listbox1.left,listbox1.top+row*20,16)
Return true
End Function
```

Notes: Try this in a listbox. The Graphics object there has a cliping and an offset which the plugin doesn't know about.

218.0.217 I'm searching for a method or so to move a window from position x.y to somewhere else on the screen.

Platform: macOS, Targets: .

Answer:

The code I produced in RB isn't smooth enough. Is there a call in MBS, if not, can it be done? The speed of it has to be like the show of a DrawerWindow.

Try the declare below for Carbon. With WindowLib it will work on Mac OS 8.5 and newer.
Notes: See Window.Transition functions.

218.0.218 If I use one of your plug-ins under windows, would this then impose the use of dll after compilation or my would my compiled soft still be a stand-alone single file software?

Platforms: macOS, Linux, Windows, Targets: .

Answer: Stand alone.
Notes:

Xojo compiles all used plugins into the application binary.
Some plugin parts need external dlls but you will find that in the documentation. (e.g. pdflib for some classes)

218.0.219 Is the fn key on a powerbook keyboard down?

Plugin Version: all, Platform: macOS, Targets: .

Answer: I am unable to figure out how or if it is possible to detect if the fn key is down on a powerbook keyboard. Is it possible?
Example:

```
' Window.Open Event of a blank project:

dim i as Integer

for i=0 to 127
if keyboard.asynckeydown(i) then
title=str(i) // found
return
end if
next
title="" // not found
```

Notes: This test application shows the keycode (decimal) 63 for the fn key.

218.0.220 Is there a case sensitive Dictionary?

Plugin Version: all, Targets: .

Answer: The MBS Plugin has several classes which can work as a replacement.
Notes:

First you could use VariantToVariantHashMapMBS or VariantToVariantOrderedMapMBS.
If you know that all keys are Strings or Integers only, you can use the specialized classes which are a little bit faster due to avoiding variants:

IntegerToIntegerHashMapMBS class
IntegerToIntegerOrderedMapMBS class
IntegerToStringHashMapMBS class
IntegerToStringOrderedMapMBS class
IntegerToVariantHashMapMBS class

IntegerToVariantOrderedMapMBS class
StringToStringHashMapMBS class
StringToStringOrderedMapMBS class
StringToVariantHashMapMBS class
StringToVariantOrderedMapMBS class

218.0.221 Is there a way to use the MBS plugin to get only the visible item and folder count on a volume?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can use the DirectorySizeMBS class for this as in the example below:
Example:

```
dim d as DirectorySizeMBS

d=new DirectorySizeMBS

// volume(1) as my boot volume is very full
if d.update(volume(1),true,0) then
MsgBox str(d.VisibleItemCount)+" visible items, "+str(d.HiddenItemCount)+" invisible items."
end if
```

Notes:

Complete Question: Is there a way to use the MBS plugin to get only the visible item and folder count on a volume? The FileCount and FolderCount properties of VolumeInformationMBS seem to provide the total # of items including invisible items such as .DS_Store and more importantly .Trashes which is causing me a great amount of difficulty during a recursive scan of a volume. I've got a progress bar which uses the total of the filecount and foldercount properties as the maximum value, but my routine needs to filter out all invisible items, as it is creating a catalog of a volume for archiving purposes. Any thoughts how I could get accurate number.

218.0.222 Is there an easy way I can launch the Displays preferences panel?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Use the code below:
Example:

```
dim error as Integer
```

```
error=OpenMacOSXPreferencesPaneMBS("Displays")
if error<>0 then
MsgBox "Failed to launch QuickTime System Preferences panel."
end if
```

218.0.223 List of Windows Error codes?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: We have a list of windows error codes on our website.
Notes: http://www.monkeybreadsoftware.de/xojo/winerror.shtml

218.0.224 Midi latency on Windows problem?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: The issue is system related, not a problem with RB or the plugin.
Notes:

Two things will adversely affect the timing:

(1) latency of the software synthesizer output driver. The default Windows wavetable synthesizer has considerable latency. I don't know how many milliseconds, but it is noticeable.

(2) latency of the digital audio output driver. Different systems have different drivers for different audio hardware. My Dell laptop has a minimum 15ms latency in the audio driver.

These two things put together were causing a very sluggish MIDI response. I was able to verify these as the culprits by routing MIDI directly out of RB into a sample player, which only introduces the latency of (2) and does not include latency of (1).

I don't know how widely known are these facts, if not then you may want to add this information to the documentation, since Windows programmers using the MIDI plugin may not know those problems, and might mistakenly blame your plugin, as I did :) Sorry about that!

(From Aaron Andrew Hunt)

218.0.225 My Xojo Web App does not launch. Why?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Here is a list of checks to do for linux apache installations with Xojo or Xojo Web applications:
Notes:

Just a list of checks to do for linux apache installations:

- You have 64bit linux? Than you need 32 bit compatibility libraries.
- The folder of your app is writable? Set permissions to 777.
- The cgi script is executable? Set permissions to 755.
- The app file itself is executable? Set permissions to 755.
- You uploaded cgi file as text, so it has unix line endings? (this often gives error "Premature end of script headers" in apache log)
- You uploaded config.cfg file and made it writable? Set permissions to 666.
- Your apache allows execution of cgi scripts? You enabled cgi for apache and uncommented addhandler command for CGI on a new apache installation?
- You uploaded the app file and libraries as binary files? Upload as text breaks them.
- You did upload the libs folder?
- You don't have code in app.open, session.open and other events which crashes app right at launch?
- You don"t have a print command in your app.open event? (see feedback case 23817)
- You allowed htaccess file to overwrite permissions?

218.0.226 SQLDatabase not initialized error?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Before you can use SQLDatabaseMBS, it must be initialized.
Example:

```
dim d as new SQLDatabaseMBS
```

Notes:

This happens normally when you use "new SQLDatabaseMBS".
But if you just have a SQLConnectionMBS and get a recordset there, the initialization may not have happend, yet.
So please simply add a line "dim d as new SQLDatabaseMBS" to your app.open code after registration, so the plugin part can initialize and late provide recordsets.

218.0.227 Textconverter returns only the first x characters. Why?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

Some older Xojo versions limit the Textconverter to around 1024 characters in input and output.
This should be fixed with RB5.
Notes: Xojo seems not to support Textconverters at all on Windows.

218.0.228 The type translation between CoreFoundation/Foundation and Xojo data types.

Plugin Version: all, Platform: macOS, Targets: .

Answer: The plugin does conversion between Cocoa/Carbon data types and native Xojo data types. The following list help you knowing what the current plugins support:
Notes:

Cocoa NSObject to Variant:

nil ->nil
NSDictionary ->Dictionary
NSData ->MemoryBlock
NSString ->String
NSAttributedString ->NSAttributedStringMBS
NSDate ->Date
NSNumber ->double/integer/Int64/UInt64/UInt32/Boolean
NSURL ->String
NSValue with NSRect ->NSRectMBS
NSValue with NSPoint ->NSPointMBS
NSValue with NSSize ->NSSizeMBS
NSValue with NSRange ->NSRangeMBS
NSValue with QTTime ->QTTimeMBS
NSValue with QTTimeRange ->QTTimeRangeMBS
NSArray ->Array of Variant
QuartzFilter ->QuartzFilterMBS

- ->*MBS

Variant to Cocoa NSObject:

nil ->nil
Dictionary ->NSDictionary
Boolean ->NSNumber

Integer ->NSNumber
Color ->NSColor
Int64 ->NSNumber
Single ->NSNumber
Double ->NSNumber
Date ->NSDate
MemoryBlock ->NSData
String ->NSString
NSImageMBS ->NSImage
NSAttributedStringMBS ->NSAttributedString
NSColorMBS ->NSColor
NSRectMBS ->NSValue with NSRect
NSSizeMBS ->NSValue with NSSize
NSPointMBS ->NSValue with NSPoint
NSRangeMBS ->NSValue with NSRange
NSBurnMBS ->NSBurn
NSViewMBS ->NSView
NSFontMBS ->NSFont
NSParagraphStyleMBS ->NSParagraphStyle
NSAttributedStringMBS ->NSAttributedString
WebPolicyDelegateMBS ->WebPolicyDelegate
WebUIDelegateMBS ->WebUIDelegate
WebFrameLoadDelegateMBS ->WebFrameLoadDelegate
WebResourceLoadDelegateMBS ->WebResourceLoadDelegate
NSIndexSetMBS ->NSIndexSet
QTTimeMBS ->QTTime
QTTimeRangeMBS ->QTTimeRange
Array of Variant ->NSArray
Array of String ->NSArray
CFStringMBS ->NSString
CFNumberMBS ->NSNumber
CFDataMBS ->NSData
CFURLMBS ->NSURL
CFArrayMBS ->NSArray
CFDictionaryMBS ->NSDictionary
CFBinaryDataMBS ->NSDate

Carbon CFTypeRef to Variant:

CFDictionaryRef ->Dictionary
CFStringRef ->String
CFDataRef ->String
CFURL ->String
CFNumber ->Integer/Double/Int64
CFArray ->Array
CFDate ->date
nil ->nil

CGColorSpace ->CGColorSpaceMBS
CGColor ->CGColorMBS
CGImage ->CGImageMBS
CF* ->CF*MBS

Variant to Carbon CFTypeRef:

Dictionary ->CFDictionaryRef
Boolean ->CFBooleanRef
Color ->CFNumberRef
Integer ->CFNumberRef
Int64 ->CFNumberRef
Single ->CFNumberRef
Double ->CFNumberRef
String ->CFStringRef
Color ->CGColorRef
Date ->CFDateRef
nil ->nil
Memoryblock ->CFDataRef
FolderItem ->CFURLRef
Dictionary ->CFDictionaryRef
Array of Variant/String/Date/Double/Single/Int64/Integer ->CFArray
CGRectMBS ->CGRect as CFDataRef
CGSizeMBS ->CGSize as CFDataRef
CGPointMBS ->CGPoint as CFDataRef
CGColorMBS ->CGColor
CGColorSpaceMBS ->CGColorSpace
CGImageMBS ->CGImage
CGDataConsumerMBS ->CGDataConsumer
CGDataProviderMBS ->CGDataProvider
CF*MBS ->CF*

Strings without encodings should be put into dictionaries as memoryblocks.

218.0.229 Uploaded my web app with FTP, but it does not run on the server!

Plugin Version: all, Platform: Windows, Targets: .

Answer: If you see errors like a simple "Segmentation Fault" on Linux or some other wired errors, you may want to check your FTP upload mode. It must be binary for web apps. ASCII mode corrupts the application.

218.0.230 What classes to use for hotkeys?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Please use CarbonHotKeyMBS class on Mac and WindowsKeyFilterMBS on Windows.
Notes: CarbonHotKeyMBS will also work fine in Cocoa apps.

218.0.231 What do I need for Linux to get picture functions working?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: In order to get our plugins working on Linux systems without GUI, the plugin loads graphics libraries dynamically.
Notes:

To get it working, the plugin tries to load gtk with this paths:

- libgtk-x11-2.0.so"
- libgtk-x11-2.0.so.0"
- /usr/lib/libgtk-x11-2.0.so"
- /usr/lib32/libgtk-x11-2.0.so"
- /usr/lib/libgtk-x11-2.0.so.0"
- /usr/lib32/libgtk-x11-2.0.so.0"

gdk is loaded with this paths:

- libgdk-x11-2.0.so"
- libgdk-x11-2.0.so.0"
- /usr/lib/libgdk-x11-2.0.so"
- /usr/lib32/libgdk-x11-2.0.so"
- /usr/lib/libgdk-x11-2.0.so.0"
- /usr/lib32/libgdk-x11-2.0.so.0"

For the paths without explicit path, the system will search in /lib, /usr/lib and all directories in the LD_LIBRARY_PATH environment variable.

218.0.232 What does the NAN code mean?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

218.0.233 What font is used as a 'small font' in typical Mac OS X apps?

Plugin Version: all, Platform: macOS, Targets: .

Answer:

Xojo 4.5 has a constant "SmallSystem" to use for a font name.
For older versions try this code:
Example:

```
Sub GetThemeFont(fontType as Integer, ByRef fontName as String, ByRef fontSize as Integer, ByRef fontStyle as Integer)
dim err as Integer
dim theFont, theFontSize, theFontStyle as MemoryBlock

const smSystemScript = -1

Declare Function GetThemeFont Lib "Carbon" (inFontID as Integer, inScript as Integer, outFontName as Ptr, outFontSize as Ptr, outStyle as Ptr) as Integer

theFont = NewMemoryBlock(256) //Str255
theFontSize = NewMemoryBlock(2) //SInt16
theFontStyle = NewMemoryBlock(1) //Style

err = GetThemeFont(fontType, smSystemScript, theFont, theFontSize, theFontStyle)

if err = 0 then
fontName = theFont.PString(0)
fontSize = theFontSize.UShort(0)
fontStyle = theFontStyle.Byte(0)
else
fontName = ""
fontSize = 0
fontStyle = 0
end if
End Sub
```

218.0.234 What is last plugin version to run on Mac OS X 10.4?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Last Version with 10.4 support is version 15.4.
Notes:

With version 15.4 you can build applications for OS X 10.4 and newer.
For Version 16.0 we disabled 10.4 and moved minimum to 10.5. We may be able to enable it again to build a version of 16.x, but may need to charge for this by hour.

218.0.235 What is last plugin version to run on PPC?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Last Version with PPC is 15.4.
Notes:

With version 15.4 you can build PPC applications for OS X 10.4 and newer.
For Version 16.0 we disabled PPC. We may be able to enable it again to build a PPC version of 16.x, but may need to charge for this by hour.

218.0.236 What is last version of the plugins for macOS 32-bit?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Please use version 23.0 or older.
Notes:

We stopped including 32-bit code for macOS in version 23.1.
Please us older versions if you use an old Xojo.

Xojo 2017r3 and newer load our 64-bit plugins.

218.0.237 What is the difference between Timer and WebTimer?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Time is server side and WebTimer client side.
Notes: Timer is the normal timer class in Xojo. It runs on the server. On the side the WebTimer runs on the client. It triggers a request to the server to perform the action. So a WebTimer is good to keep the connection running and the website updated regularly. A timer on the server is good to make regular jobs like starting a database backup every 24 hours.

218.0.238 What is the list of Excel functions?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Below a list of function names known by LibXL.
Notes:

LibXL parses the functions and writes tokens to the excel file. So even if Excel can do more functions, we can only accept the ones known by LibXL.

ABS, ABSREF, ACOS, ACOSH, ACTIVE.CELL, ADD.BAR, ADD.COMMAND, ADD.MENU, ADD.TOOLBAR, ADDRESS, AND, APP.TITLE, AREAS, ARGUMENT, ASC, ASIN, ASINH, ATAN, ATAN2, ATANH, AVEDEV, AVERAGE, AVERAGEA, BAHTTEXT, BETADIST, BETAINV, BINOMDIST, BREAK, CALL, CALLER, CANCEL.KEY, CEILING, CELL, CHAR, CHECK.COMMAND, CHIDIST, CHIINV, CHITEST, CHOOSE, CLEAN, CODE, COLUMN, COLUMNS, COMBIN, CONCATENATE, CONFIDENCE, CORREL, COS, COSH, COUNT, COUNTA, COUNTBLANK, COUNTIF, COVAR, CREATE.OBJECT, CRITBINOM, CUSTOM.REPEAT, CUSTOM.UNDO, DATE, DATEDIF, DATESTRING, DATEVALUE, DAVERAGE, DAY, DAYS360, DB, DBCS, DCOUNT, DCOUNTA, DDB, DEGREES, DELETE.BAR, DELETE.COMMAND, DELETE.MENU, DELETE.TOOLBAR, DEREF, DEVSQ, DGET, DIALOG.BOX, DIRECTORY, DMAX, DMIN, DOCUMENTS, DOLLAR, DPRODUCT, DSTDEV, DSTDEVP, DSUM, DVAR, DVARP, ECHO, ELSE, ELSE.IF, ENABLE.COMMAND, ENABLE.TOOL, END.IF, ERROR, ERROR.TYPE, EVALUATE, EVEN, EXACT, EXEC, EXECUTE, EXP, EXPONDIST, FACT, FALSE, FCLOSE, FDIST, FILES, FIND, FINDB, FINV, FISHER, FISHERINV, FIXED, FLOOR, FOPEN, FOR, FOR.CELL, FORECAST, FORMULA.CONVERT, FPOS, FREAD, FREADLN, FREQUENCY, FSIZE, FTEST, FV, FWRITE, FWRITELN, GAMMADIST, GAMMAINV, GAMMALN, GEOMEAN, GET.BAR, GET.CELL, GET.CHART.ITEM, GET.DEF, GET.DOCUMENT, GET.FORMULA, GET.LINK.INFO, GET.MOVIE, GET.NAME, GET.NOTE, GET.OBJECT, GET.PIVOT.FIELD, GET.PIVOT.ITEM, GET.PIVOT.TABLE, GET.TOOL, GET.TOOLBAR, GET.WINDOW, GET.WORKBOOK, GET.WORKSPACE, GETPIVOTDATA, GOTO, GROUP, GROWTH, HALT, HARMEAN, HELP, HLOOKUP, HOUR, HYPERLINK, HYPGEOMDIST, IF, INDEX, INDIRECT, INFO, INITIATE, INPUT, INT, INTERCEPT, IPMT, IRR, ISBLANK, ISERR, ISERROR, ISLOGICAL, ISNA, ISNONTEXT, ISNUMBER, ISPMT, ISREF, ISTEXT, ISTHAIDIGIT, KURT, LARGE, LAST.ERROR, LEFT, LEFTB, LEN, LENB, LINEST, LINKS, LN, LOG, LOG10, LOGEST, LOGINV, LOGNORMDIST, LOOKUP, LOWER, MATCH, MAX, MAXA, MDETERM, MEDIAN, MID, MIDB, MIN, MINA, MINUTE, MINVERSE, MIRR, MMULT, MOD, MODE, MONTH, MOVIE.COMMAND, N, NA, NAMES, NEGBINOMDIST, NEXT, NORMDIST, NORMINV, NORMSDIST, NORMSINV, NOT, NOTE, NOW, NPER, NPV, NUMBERSTRING, ODD, OFFSET, OPEN.DIALOG, OPTIONS.LISTS.GET, OR, PAUSE, PEARSON, PERCENTILE, PERCENTRANK, PERMUT, PHONETIC, PI, PIVOT.ADD.DATA, PMT, POISSON, POKE, POWER, PPMT, PRESS.TOOL, PROB, PRODUCT, PROPER, PV, QUARTILE, RADIANS, RAND, RANK, RATE, REFTEXT, REGISTER, REGISTER.ID, RELREF, RENAME.COMMAND, REPLACE, REPLACEB, REPT, REQUEST, RESET.TOOLBAR, RESTART, RESULT, RESUME, RETURN, RIGHT, RIGHTB, ROMAN, ROUND, ROUNDBAHTDOWN, ROUNDBAHTUP, ROUNDDOWN, ROUNDUP, ROW, ROWS, RSQ, RTD, SAVE.DIALOG, SAVE.TOOLBAR, SCENARIO.GET, SEARCH, SEARCHB, SECOND, SELECTION, SERIES, SET.NAME, SET.VALUE, SHOW.BAR, SIGN, SIN, SINH, SKEW, SLN, SLOPE, SMALL, SPELLING.CHECK, SQRT, STANDARDIZE, STDEV, STDEVA, STDEVP, STDEVPA, STEP, STEYX, SUBSTITUTE, SUBTOTAL, SUM, SUMIF, SUMPRODUCT, SUMSQ, SUMX2MY2, SUMX2PY2, SUMXMY2, SYD, T, TAN, TANH, TDIST, TERMINATE, TEXT, TEXT.BOX, TEXTREF, THAIDAYOFWEEK, THAIDIGIT, THAIMONTHOFYEAR, THAINUMSOUND, THAINUMSTRING, THAISTRINGLENGTH, THAIYEAR, TIME, TIMEVALUE,

TINV, TODAY, TRANSPOSE, TREND, TRIM, TRIMMEAN, TRUE, TRUNC, TTEST, TYPE, UNREGISTER, UPPER, USDOLLAR, USERDEFINED, VALUE, VAR, VARA, VARP, VARPA, VDB, VIEW.GET, VLOOKUP, VOLATILE, WEEKDAY, WEIBULL, WHILE, WINDOW.TITLE, WINDOWS, YEAR and ZTEST.

218.0.239 What is the replacement for PluginMBS?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Use the SoftDeclareMBS class to load libraries dynamically.

218.0.240 What to do on Xojo reporting a conflict?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

I get an error like "This item conflicts with another item of the same name" when using one of the plugin functions.

Xojo just wants to tell you that you dropped something in the plugins folder what is not a plugin.
Notes: Some users dropped the examples, the documentation or other files into the plugins folder. Don't do it.

218.0.241 What to do with a NSImageCacheException?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer: You need to add exception handlers for NSExceptionMBS in order to catch this exception.
Notes:

You may also add code to write the stack of the exception into a log file for later locating the error source.

A NSImage has several image representations in memory. So basicly you pass in the base image and for whatever size an image is needed, the NSImage class will create a cache image representation of the requested size so on the next query it can use that cache for the same requested size.

218.0.242 What to do with MySQL Error 2014?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: You can get this error on MySQL if you have a recordset open while you create another one.

218.0.243 What to do with SQL Plugin reporting Malformed string as error?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Please make sure the table and/or database fields have a text encoding set.
Notes:

For Firebird our plugin tries to use UTF-8 encoding if possible and to correctly convert between various tables, the tables and their fields need to have a text encoding defined.
e.g. if the text field in the table is windows-1252 and the other ISO 8859-5, then the Firebird database can convert them to UTF-8 and deliver texts to the plugin.
If encoding is set to none, it may get confused for non-ascii text.

218.0.244 Where is CGGetActiveDisplayListMBS?

Plugin Version: all, Platform: Windows, Targets: .

Answer: This is now CGDisplayMBS.GetActiveDisplayList.

218.0.245 Where is CGGetDisplaysWithPointMBS?

Plugin Version: all, Platform: Windows, Targets: .

Answer: This is now CGDisplayMBS.GetDisplaysWithPoint.

218.0.246 Where is CGGetDisplaysWithRectMBS?

Plugin Version: all, Platform: Windows, Targets: .

Answer: This is now CGDisplayMBS.GetDisplaysWithRect.

218.0.247 Where is CGGetOnlineDisplayListMBS?

Plugin Version: all, Platform: Windows, Targets: .

Answer: This is now CGDisplayMBS.GetOnlineDisplayList.

218.0.248 Where is GetObjectClassNameMBS?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Please use this replacement method:
Example:

```
Function GetObjectClassNameMBS(o as Object) As string
dim t as Introspection.TypeInfo = Introspection.GetType(o)
Return t.FullName
End Function
```

Notes: GetObjectClassNameMBS was removed from the plugins.

218.0.249 Where is NetworkAvailableMBS?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: We removed NetworkAvailableMBS some versions ago. It was not working right and basicly it's not useful. If you want to check whether you have a network, than do a DNS resolve:
Example:

```
// two independend domain names
const domain1 = "www.google.com"
const domain2 = "www.macsw.de"

// resolve IPs
dim ip1 as string = DNSNameToAddressMBS(Domain1)
dim ip2 as string = DNSNameToAddressMBS(Domain2)

// if we got IPs and not the same IPs (error/login pages)
if len(ip1)=0 or len(ip2)=0 or ip1=ip2 then
MsgBox "no connection"
else
MsgBox "have connection"
end if
```

Notes: This way you can detect whether you got something from DNS. And you can make sure that a DNS redirection to a login page won't catch you.

218.0.250 Where is StringHeight function in DynaPDF?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Use the function GetFTextHeight or GetFTextHeightEx.
Notes: Be aware that GetFTextHeight works with format commands and you may want to escape your text if you don't use them.

218.0.251 Where is XLSDocumentMBS class?

Plugin Version: all, Platform: macOS, Targets: .

Answer: This class has been removed in favor of XLBookMBS class.
Notes: This classes have been removed XLSCellMBS, XLSDocumentMBS, XLSFormatRecordMBS, XLSMergedCellsMBS, XLSRowMBS and XLSSheetMBS.

218.0.252 Where to get information about file formats?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

Please visit this web page:
http://www.wotsit.org

218.0.253 Where to register creator code for my application?

Plugin Version: all, Platform: macOS, Targets: .

Answer:

Register at Apple:
http://developer.apple.com/dev/cftype/information.html

218.0.254 Which Mac OS X frameworks are 64bit only?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Some frameworks from Mac OS X do not support 32 bit applications, so we can't provide plugins for Xojo until 64bit target is available.
Notes:

For Mac OS X 10.8:

- Accounts
- EventKit
- GLKit
- Social

and in 10.9:

- Accounts
- AVKit
- EventKit
- GameController
- GLKit
- MapKit
- MediaLibrary
- Social
- SpriteKit

In general Apple makes all new frameworks being 64 bit only.

218.0.255 Which plugins are 64bit only?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Some of our plugins work only in 64 bit modes as operation systems do not provide 32 bit code.
Notes: This effects currently: EventKit, Accounts, Social frameworks from Apple and our matching plugins.

218.0.256 Why application doesn't launch because of a missing ddraw.dll!?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Some RB versions require that you install DirectX from Microsoft on your Windows.

218.0.257 Why application doesn't launch because of a missing shlwapi.dll!?

Plugin Version: all, Platform: Windows, Targets: .

Answer: Some RB versions require that you install the Internet Explorer from Microsoft on your Windows.
Notes: This bug is for several older Windows 95 editions.

218.0.258 Why do I hear a beep on keydown?

Plugin Version: all, Platform: Windows, Targets: .

Answer: When the user presses a key, RB goes through all keydown event handlers till on returns true.
Notes: If no keydown event handler returns true for the key, a beep is performed.

218.0.259 Why does folderitem.item return nil?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer: Because Xojo fails to make a folderitem for you. Reason may be an alias file which can't be resolved or simply that you don't have enough access rights to read the folder content.
Notes: A more rarely reason is that the directory changed and the file with the given index or name does no longer exist.

218.0.260 Why doesn't showurl work?

Plugin Version: all, Platforms: macOS, Linux, Windows, Targets: .

Answer:

There are three main reasons:

1. showurl is not supported by Xojo in 68k applications.
2. there is now application defined for the protocol (e.g. http) in the Internet Control panel.
3. You don't have Internet Config installed.

You can use the InternetConfigMBS class to check for this stuff.

218.0.261 Why don't the picture functions not work on Linux?

Plugin Version: all, Platform: macOS, Targets: .

Answer: Please make sure libcairo is installed.
Notes:

For accessing pictures on Linux, the MBS Plugin relays on the cairo library.
Please install the package if you don't have it already.
Our plugin looks for library called libcairo.so or libcairo.so.2.

218.0.262 Why have I no values in my chart?

Plugin Version: all, Platforms: macOS, Windows, Targets: .

Answer: You have no data points visible, there may be several reasons:
Notes:

For example one of the data values may be infinite or invalid.
Or the scaling may be out of range, so you simply see nothing.

218.0.263 Will application size increase with using plugins?

Plugin Version: all, Platform: Windows, Targets: .

Answer: All plugins used by your application will be included in the application.
Notes:

If you use no plugins, your application will not change size.
And if you use one class from the plugins, your application size will increase by a few kilobytes.
The documentation of the plugins include a list of all plugin parts and their sizes for the different platforms.

218.0.264 XLS: Custom format string guidelines

Plugin Version: all, Platform: macOS, Targets: .

Answer: You have to download the source code and compile a static version of the library.
Notes:

Up to four sections of format codes can be specified. The format codes, separated by semicolons, define the formats for positive numbers, negative numbers, zero values, and text, in that order. If only two sections are specified, the first is used for positive numbers and zeros, and the second is used for negative numbers. If only one section is specified, it is used for all numbers. Four sections example:

,# # # .00_); [Red] (# ,# # # .00);0.00;"sales "@

The following table describes the different symbols that are available for use in custom number formats.

Specify colors

To set the text color for a section of the format, type the name of one of the following eight colors in square brackets in the section. The color code must be the first item in the section.

Instead of using the name of the color, the color index can be used, like this [Color3] for Red. Valid numeric indexes for color range from 1 to 56, which reference by index to the legacy color palette.
Specify conditions

To set number formats that will be applied only if a number meets a specified condition, enclose the condition in square brackets. The condition consists of a comparison operator and a value. Comparison operators include: = Equal to; >Greater than; <Less than; >= Greater than or equal to, <= Less than or equal to, and <>Not equal to. For example, the following format displays numbers that are less than or equal to 100 in a red font and numbers that are greater than 100 in a blue font.
[Red] [<=100] ; [Blue] [>100]
If the cell value does not meet any of the criteria, then pound signs ("# ") are displayed across the width of the cell.
Dates and times

Examples

218.0.265 Xojo doesn't work with your plugins on Windows 98.

Plugin Version: all, Platform: Windows, Targets: .

Answer: Please upgrade your Windows version.

218.0.266 Xojo or my RB application itself crashes on launch on Mac OS Classic. Why?

Plugin Version: all, Targets: .

Answer:

You may check if the application has enough memory to be loaded.
RB should have on Mac OS Classic more than 20 MB of RAM.
I prefered to use 50 MB and for an application a 10 MB partition is a good way to start.

Parameter	Description
x	The x value of the data point. For an enumerated x-axis (see Axis.setLabels on what is an enumerated axis), the first data point is 0, and the nth data point is (n-1).
xLabel	The bottom x-axis label of the data point.
x2Label	The top x-axis label of the data point.
value	The value of the data point.
accValue	The sum of values of all data points that are in the same x position and same data group as the current data point, and with data set number less than or equal to the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
totalValue	The sum of values of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
percent	The percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
accPercent	The accumulated percentage of the data point based on the total value of all data points that are in the same x position and same data group as the current data point. This is useful for stacked charts, such as stacked bar chart and stacked area chart.
gpercent	The percentage of the data point based on the total value of all data points in a layer.
dataSet	The data set number to which the data point belongs. The first data set is 0. The nth data set is (n-1).
dataSetName	The name of the data set to which the data point belongs.
dataItem	The data point number within the data set. The first data point is 0. The nth data point is (n-1).
dataGroup	The data group number to which the data point belongs. The first data group is 0. The nth data group is (n-1).
dataGroupName	The name of the data group to which the data point belongs.
layerId	The layer number to which the data point belongs. The first layer is 0. The nth layer is (n-1).
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2.

diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by data set number. The Pth data set corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth data set corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
zx	The symbol scale in the x dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
zy	The symbol scale in the y dimension. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.
z	The symbol scale without distinguishing the dimension to use. Applicable for layers with symbol scales set by LineLayer.setSymbolScale.

Parameter	Description
slope	The slope of the trend line.
intercept	The y-intercept of the trend line.
corr	The correlation coefficient in linear regression analysis.
stderr	The standard error in linear regression analysis.

Parameter	Description
top	The value of the top edge of the box-whisker symbol.
bottom	The value of the bottom edge of the box-whisker symbol.
max	The value of the maximum mark of the box-whisker symbol.
min	The value of the minimum mark of the box-whisker symbol.
med	The value of the median mark of the box-whisker symbol.

Parameter	Description
high	The high value.
low	The low value.
open	The open value.
close	The close value.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
radius	The radial value of the data point.
value	Same as { radius } . See above.
angle	The angular value of the data point.
x	Same as { angle } . See above.
label	The angular label of the data point.
xLabel	Same as { label } . See above.
name	The name of the layer to which the data point belongs.
dataSetName	Same as { name } . See above.
i	The data point number. The first data point is 0. The nth data point is (n-1).
dataItem	Same as { i } . See above.
z	The symbol scale. Applicable for layers with symbol scales set by PolarLayer.setSymbolScale.
fieldN	The (N + 1)th extra field. For example, { field0 } means the first extra field. An extra field is an array of custom elements added using Layer.addExtraField, Layer.addExtraField2, BaseChart.addExtraField or BaseChart.addExtraField2.

diFieldN	Same as fieldN. See above.
dsFieldN	Similar to fieldN, except that dsFieldN means the extra field is indexed by layer index. The Pth layer corresponds to the Pth element of the extra field.
dsdiFieldN	Similar to fieldN, except that dsdiFieldN means the extra fields are indexed by both the data set number and data point number. The Pth data item of the Qth layer corresponds to the Pth element of the (N + Q)th extra field.

Parameter	Description
dir	The direction of the vector.
len	The length of the vector.

Parameter	Description
value	The axis value at the tick position.
label	The axis label at the tick position.

Parameter	Description
[param]	The name of the parameter
[a]	If this field a number, it specifies the number of decimal places (digits to the right of the decimal point).

[b]

textasciitilde ' for no thousand separator. The default is '
textasciitilde ', which can be modified using BaseChart.setNumberFormat.

The thousand separator. Should be a non-alphanumeric character (not 0-9, A-Z, a-z). Use '

[c]

The decimal point character. The default is '.', which can be modified using BaseChart.setNumberFormat.

[d]

textasciitilde ' for no negative sign character. The default is '-', which can be modified using BaseChart.setNumberFormat.

The negative sign character. Use '

Parameter	Description
yyyy	The year in 4 digits (e.g. 2002)
yyy	The year showing only the least significant 3 digits (e.g. 002 for the year 2002)
yy	The year showing only the least significant 2 digits (e.g. 02 for the year 2002)
y	The year showing only the least significant 1 digits (e.g. 2 for the year 2002)
mmm	The month formatted as its name. The default is to use the first 3 characters of the english month name (Jan, Feb, Mar ...). The names can be configured using BaseChart.setMonthNames.
mm	The month formatted as 2 digits from 01 - 12, adding leading zero if necessary.
m	The month formatted using the minimum number of digits from 1 - 12.
MMM	The first 3 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
MM	The first 2 characters of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
M	The first character of the month name converted to upper case. The names can be configured using BaseChart.setMonthNames.
dd	The day of month formatted as 2 digits from 01 - 31, adding leading zero if necessary.
d	The day of month formatted using the minimum number of digits from 1 - 31.
w	The name of the day of week. The default is to use the first 3 characters of the english day of week name (Sun, Mon, Tue ...). The names can be configured using BaseChart.setWeekDayNames.
hh	The hour of day formatted as 2 digits, adding leading zero if necessary. The 2 digits will be 00 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
h	The hour of day formatted using the minimum number of digits. The digits will be 0 - 23 if the 'a' option (see below) is not specified, otherwise it will be 01 - 12.
nn	The minute formatted as 2 digits from 00 - 59, adding leading zero if necessary.
n	The minute formatted using the minimum number of digits from 00 - 59.
ss	The second formatted as 2 digits from 00 - 59, adding leading zero if necessary.
s	The second formatted using the minimum number of digits from 00 - 59.
a	Display either 'am' or 'pm', depending on whether the time is in the morning or afternoon. The text 'am' and 'pm' can be modified using BaseChart.setAMPM.

Shape Id	Value	Description
SquareShape	1	Square shape. See (1, 1) above.
DiamondShape	2	Diamond shape. See (2, 1) above.
TriangleShape	3	Triangle shape pointing upwards. See (3, 1) above.
RightTriangleShape	4	Triangle shape pointing rightwards. See (4, 1) above.
LeftTriangleShape	5	Triangle shape pointing leftwards. See (5, 1) above.
InvertedTriangleShape	6	Triangle shape pointing downwards. See (1, 2) above.
CircleShape	7	Circle shape. See (2, 2) above.
StarShape	[Method]	Star shapes of various points. See (2, 3), (2, 4), (2, 5), (3, 1), (3, 2), (3, 3), (3, 4), (3, 5) above for stars with 3 to 10 points.
PolygonShape	[Method]	Polygon shapes symmetrical about a vertical axis with a vertex at the top center position. See (4, 1), (4, 3), (4, 5), (5, 1) for polygons of 5 to 8 sides.
Polygon2Shape	[Method]	Polygon shapes symmetrical about a vertical axis but without any vertex at the top center position. See (4, 2), (4, 4) for polygons of 5 and 6 sides.
CrossShape	[Method]	'+' shapes. See (5, 2), (5, 3), (5, 4), (5, 5), (6, 1), (6, 2), (6. 3) for '+' shape with arm width of 0.1 - 0.7.
Cross2Shape	[Method]	'X' shapes. See (6, 4), (6, 5), (7, 1), (7, 2), (7, 3), (7, 4), (7, 5) for 'X' shapes with arm width of 0.1 - 0.7.

langEnglish	0	Roman script
langFrench	1	Roman script
langGerman	2	Roman script

Nan	Meaning
1	Invalid square root (negative number, usually)
2	Invalid addition (indeterminate such as infinity + (-infinity))
4	Invalid division (indeterminate such as 0/0)
8	Invalid multiplication (indeterminate such as 0*infinity)
9	Invalid modulo such as (a mod 0)
17	Try to convert invalid string to a number like val(”x7”)
33	Invalid argument in a trig function
34	Invalid argument in an inverse trig function
36	Invalid argument in a log function
37	Invalid argument in Pow function
38	Invalid argument in toolbox financial function
40	Invalid argument in hyperbolic function
42	Invalid argument in a gamma function

Symbol	Description and result
0	Digit placeholder. For example, if the value 8.9 is to be displayed as 8.90, use the format # .00
#	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall not display extra zeros when the number typed has fewer digits on either side of the decimal than there are # symbols in the format. For example, if the custom format is # .# # , and 8.9 is in the cell, the number 8.9 is displayed.
?	Digit placeholder. This symbol follows the same rules as the 0 symbol. However, the application shall put a space for insignificant zeros on either side of the decimal point so that decimal points are aligned in the column. For example, the custom format 0.0? aligns the decimal points for the numbers 8.9 and 88.99 in a column.
. (period)	Decimal point.
%	Percentage. If the cell contains a number between 0 and 1, and the custom format 0% is used, the application shall multiply the number by 100 and adds the percentage symbol in the cell.
, (comma)	Thousands separator. The application shall separate thousands by commas if the format contains a comma that is enclosed by number signs (#) or by zeros. A comma that follows a placeholder scales the number by one thousand. For example, if the format is # .0,, and the cell value is 12,200,000 then the number 12.2 is displayed.
E- E+ e- e+	Scientific format. The application shall display a number to the right of the "E" symbol that corresponds to the number of places that the decimal point was moved. For example, if the format is 0.00E+00, and the value 12,200,000 is in the cell, the number 1.22E+07 is displayed. If the number format is # 0.0E+0, then the number 12.2E+6 is displayed.
$ -+/():space	Displays the symbol. If it is desired to display a character that differs from one of these symbols, precede the character with a backslash (\). Alternatively, enclose the character in quotation marks. For example, if the number format is (000), and the value 12 is in the cell, the number (012) is displayed.
\	Display the next character in the format. The application shall not display the backslash. For example, if the number format is 0\!, and the value 3 is in the cell, the value 3! is displayed.
*	Repeat the next character in the format enough times to fill the column to its current width. There shall not be more than one asterisk in one section of the format. If more than one asterisk appears in one section of the format, all but the last asterisk shall be ignored. For example, if the number format is 0*x, and the value 3 is in the cell, the value 3xxxxxx is displayed. The number of x characters that are displayed in the cell varies based on the width of the column.
_ (underline)	Skip the width of the next character. This is useful for lining up negative and positive values in different cells of the same column. For example, the number format _(0.0_);(0.0) aligns the numbers 2.3 and -4.5 in the column even though the negative number is enclosed by parentheses.
"text"	Display whatever text is inside the quotation marks. For example, the format 0.00 "dollars" displays 1.23 dollars when the value 1.23 is in the cell.
@	Text placeholder. If text is typed in the cell, the text from the cell is placed in the format where the at symbol (@) appears. For example, if the number format is "Bob "@" Smith" (including quotation marks), and the value "John" is in the cell, the value Bob John Smith is displayed.
